Use of strobilurin type compounds for combating phytopathogenic fungi containing an amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors III

5 Description

The present invention relates the use of strobilurin type compounds of formula I and the N-oxides and the salts thereof for combating phytopathogenic fungi containing an amino acid substitution F129L in the mitochondrial cytochrome b protein (also referred to as F129L mutation in the mitochondrial cytochrome b gene) conferring resistance to Qo inhibitors (QoI), and to methods for combating such fungi. The invention also relates to novel compounds, processes for preparing these compounds, to compositions comprising at least one such compound, to plant health applications, and to seeds coated with at least one such compound. The present invention also relates to a method for controlling soybean rust fungi (*Phakopsora pachyrhizi*) with the amino acid substitution F129L in the mitochondrial cytochrome b protein.

"Qo inhibitor," as used herein, includes any substance that is capable of diminishing and/or inhibiting respiration by binding to a ubihydroquinone oxidation center of a cytochrome bc₁ complex in mitochondria. The oxidation center is typically located on the outer side of the inner mitochondrial membrane. Many of these compounds are also known as strobilurin-type or strobilurin analogue compounds.

The mutation F129L in the mitochondrial cytochrome b (CYTB) gene shall mean any substitution of nucleotides of codon 129 encoding "F" (phenylalanine; e.g. TTT or TTC) that leads to a codon encoding "L" (leucine; e.g. TTA, TTG, TCG, CTT, CTC, CTA or CTG), for example the substitution of the first nucleotide of codon 129 'T' to 'C' (TTT to CTT), in the CYTB (cytochrome b) gene resulting in a single amino acid substitution in the position 129 from F to L in the cytochrome b protein. Such F129L mutation is known to confer resistance to Qo inhibitors.

QoI fungicides, often referred to as strobilurin-type fungicides (Sauter 2007: Chapter 13.2. Strobilurins and other complex III inhibitors. In: Krämer, W.; Schirmer, U. (Ed.) – Modern Crop Protection Compounds. Volume 2. Wiley-VCH Verlag 457-495), are conventionally used to control a number of fungal pathogens in crops. Qo inhibitors typically work by inhibiting respiration by binding to a ubihydroquinone oxidation center of a cytochrome bc₁ complex (electron transport complex III) in mitochondria. Said oxidation center is located on the outer side of the inner mitochondrial membrane. A prime example of the use of QoIs includes the use of, for example, strobilurins on wheat for the control of *Septoria tritici* (also known as *Mycosphaerella graminicola*), which is the cause of wheat leaf blotch. Unfortunately, widespread use of such QoIs has resulted in the selection of mutant pathogens which are resistant to such QoIs (Gisi et al., Pest Manag Sci 56, 833-841, (2000)). Resistance to QoIs has been detected in several phytopathogenic fungi such as *Blumeria graminis*, *Mycosphaerella fijiensis*, *Pseudoperonospora cubensis* or *Venturia inaequalis*. The major part of resistance to QoIs in agricultural uses has been attributed to pathogens containing a single amino acid residue substitution G143A in the cytochrome b gene for their cytochrome bc₁ complex, the target protein of QoIs which have been found to be controlled by specific QoIs (WO 2013/092224). Despite several commercial QoI fungicides have also been widely used in soybean rust control, the single amino acid residue substitution G143A in the cytochrome b protein conferring resistance to QoI fungicides was not observed.

Instead soybean rust acquired a different genetic mutation in the cytochrome b gene causing

a single amino acid substitution F129L which also confers resistance against QoI fungicides. The efficacy of QoI fungicides used against soybean rust conventionally, i.e. pyraclostrobin, azoxystrobin, picoxystrobin, orysastrobin, dimoxystrobin and metominostrobin, has decreased to a level with practical problems for agricultural practice (e.g. Klosowski et al (2016) Pest Manag Sci 72, 1211-1215).

Although it seems that trifloxystrobin was less affected by the F129L amino acid substitution to the same degree as other QoI fungicides such as azoxystrobin and pyraclostrobin, trifloxystrobin was never as efficacious on a fungal population bearing the F129L QoI resistance mutation as on a sensitive population (Crop Protection 27, (2008) 427-435).

WO 2017/157923 discloses the use of the tetrazole compound 1-[2-[[1-(4-chlorophenyl)-pyrazol-3-yl]oxymethyl]-3-methylphenyl]-4-methyltetrazol-5-one for combating phytopathogenic fungi containing said F129L amino acid substitution.

Thus, new methods are desirable for controlling pathogen induced diseases in crops comprising plants subjected to pathogens containing a F129L amino acid substitution in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors. Furthermore, in many cases, in particular at low application rates, the fungicidal activity of the known fungicidal strobilurin compounds is unsatisfactory, especially in case that a high proportion of the fungal pathogens contain a mutation in the mitochondrial cytochrome b gene conferring resistance to Qo inhibitors. Besides there is an ongoing need for new fungicidally active compounds which are more effective, less toxic and/or environmentally safer. Based on this, it was also an object of the present invention to provide compounds having improved activity and/or a broader activity spectrum against phytopathogenic fungi and/or even further reduced toxicity against non target organisms such as vertebrates and invertebrates.

The strobilurin-analogue compounds used to combat phytopathogenic fungi containing a F129L amino acid substitution in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors according to the present invention differ from trifloxystrobin inter alia by containing a specific group attached to the central phenyl ring in ortho position to the side chain defined herein as R³.

Synthesis

The compounds can be obtained by various routes in analogy to prior art processes known (e.g EP 463488) and, advantageously, by the synthesis shown in the following schemes 1 to 4 and in the experimental part of this application.

A suitable method to prepare compounds I is illustrated in Scheme 1.

Scheme 1:

It starts with the conversion of a ketone to the corresponding oxime using hydroxylamine hydrochloride and a base such as pyridine, sodium hydroxide or sodium acetate in polar solvents

such as methanol, methanol-water mixture, or ethanol at reaction temperatures of 60 to 100 °C, preferably at about 65 °C. In cases where a *E/Z* mixture was obtained, the isomers could be separated by purification techniques known in art (e.g. column chromatography, crystallization, distillation etc.). Then, coupling with the intermediate IV, wherein X is a leaving group such as halogen, toluene- and methanesulfonates, preferably X is Cl or Br, is carried out under basic conditions using e.g. sodium hydride, cesium carbonate or potassium carbonate as a base and using an organic solvent such as dimethyl formamide (DMF) or acetonitrile, preferably cesium carbonate as base and acetonitrile as solvent at room temperature (RT) of about 24 °C. The ester compound I wherein R¹ is O can be converted to the amide of formula I wherein R¹ is NH by reaction with methyl amine (preferably 40% aq. solution) using tetrahydrofuran (THF) as solvent at RT.

Another general method to prepare the compounds I is depicted in Scheme 2.

Scheme 2:

Intermediate IV is reacted with *N*-hydroxysuccinimide VI, using a base such as triethylamine in DMF. The reaction temperature is usually 50 to 70 °C preferably about 70 °C. Conversion to the corresponding *O*-benzylhydroxyl amine, intermediate VIII, was achieved through removal of the phthalimide group, preferably using hydrazine hydrate in methanol as solvent at 25 °C. Alternatively, removal of the phthalimide group using methyl amine in methanol as solvent at 25 °C can provide intermediate IX. Intermediate VIII and intermediate IX, respectively can be condensed with ketones using acetic acid or pyridine in methanol as solvent at temperature of 50 to 65 °C. Alternatively, the condensation could also be carried out with titanium (IV) ethoxide (Ti(OEt)₄) using THF as solvent at about 70 °C. The desired product is usually accompanied by an undesired isomer, which can be removed e.g. by column chromatography, crystallization.

A general method for preparation of intermediate IV is shown in Scheme 3.

Scheme 3:

Compound XI could be obtained from X by lithium-halogen exchange or by generating Grignard reagent and further reaction with dimethyl oxalate or chloromethyl oxalate in presence of a sol-

vent. The preferred solvent is THF, 2-methyl-THF and the temperature can be between -70 to -78 °C. Conversion of intermediate XI to intermediate XII can be achieved using N-methylhydroxylamine hydrochloride and a base such as pyridine or sodium acetate in polar solvents such as methanol. The reaction temperature is preferably about 65 °C. An *E/Z* mixture is usually obtained, the isomers can be separated by purification techniques known in art (e.g. column chromatography, crystallization). Bromination of intermediate XII provides the desired intermediate compounds IV, wherein R¹ is O and R² = N. This reaction of intermediate XII with N-bromosuccinimide in solvents such as carbon tetrachloride, chlorobenzene, acetonitrile, using radical initiators such as 1,1'-azobis (cyclohexanecarbonitrile) or azobisisobutyronitrile and is carried out at temperatures of 70 to 100 °C. The preferred radical initiator is 1,1'-azobis (cyclohexanecarbonitrile), preferred solvent chlorobenzene and preferred temperature 80 °C.

The synthesis of compounds containing different substituents R³ follows similar sequence as in Scheme 3, wherein R³ is bromo. Coupling of intermediate III with intermediate IV, wherein R³ is bromo, provides compounds I as described above. Using standard chemical reactions, such as Suzuki or Stille reaction, the bromo group can be converted e.g. to other R³ substituents such as cycloalkyl, alkoxy and alkenyl. Additional transformations e.g. of ethenyl provide compounds I with other R³ substituents such as ethyl, CN and haloalkyl.

Most of the ketones of general formula II were commercially available, however for the ones which were not commercially available, preparation of these was carried out in house using methods known in prior art. Scheme 4 depicts various methods known in literature for the synthesis of these ketones.

Scheme 4:

The ketone II can be obtained from the corresponding halogen bearing precursors XIV, wherein X is preferably bromine or iodine. Lithium-halogen exchange (J Org Chem, 1998, 63 (21), 7399-7407) in compound XIII using n-butyllithium or synthesis of the corresponding Grignard reagent (Nature Comm, 2017, 8(1), 1-7) using THF as solvent, and subsequent reaction with N-methoxy-N-methylacetamide at about -70 to -78 °C can provide the ketone II. Alternatively, the coupling reaction of compound XIV and tributyl(1-ethoxyvinyl)stannane in presence of a transition metal catalyst, preferably palladium, with suitable ligands in a solvent such as dioxane and at a reaction temperature of about 100 °C, followed by treatment with 1N HCl can provide ketone II (Org Lett, 2016, 18(7), 1630-1633, WO 2018/115380). Reaction of XIV with 1,4-butanediol vinyl ether in the presence of transition metal catalyst, preferably palladium with suitable ligands and solvent such as 1,2-propane diol and base such as sodium carbonate and reaction temperature of about 120 °C followed by treatment with 1N HCl can provide ketone II (Chem A Eur J, 2008, 14(18), 5555-5566). Another method uses acid compounds XV, which can be converted to the corresponding Weinreb amide or carboxylic ester XVII and subsequent reaction with methyl-

magnesium bromide (MeMgBr) in solvent such as THF and temperatures of -78 to 0 °C, preferably 0 °C, to provide ketone II. Another method uses the reaction of nitrile XVI with MeMgBr which is carried out in solvent such as THF or toluene, preferably THF, and reaction temperature is 25 to 60 °C, preferably 60 °C, followed by treatment with 1N HCl (Eur J Med Chem, 2015, 102, 582-593).

The compounds I and the compositions thereof, respectively, are suitable as fungicides effective against a broad spectrum of phytopathogenic fungi, including soil-borne fungi, in particular from the classes of Plasmodiophoromycetes, Peronosporomycetes (syn. Oomycetes), Chytridiomycetes, Zygomycetes, Ascomycetes, Basidiomycetes, and Deuteromycetes (syn. Fungi imperfecti). They can be used in crop protection as foliar fungicides, fungicides for seed dressing, and soil fungicides.

The compounds I and the compositions thereof are preferably useful in the control of phytopathogenic fungi on various cultivated plants, such as cereals, e. g. wheat, rye, barley, triticale, oats, or rice; beet, fruits, leguminous plants such as soybean, oil plants, cucurbits, fiber plants, citrus fruits, vegetables, lauraceous plants, energy and raw material plants, corn; tobacco; nuts; coffee; tea; bananas; vines (table grapes and grape juice grape vines); natural rubber plants; or ornamental and forestry plants; on the plant propagation material, such as seeds; and on the crop material of these plants.

According to the invention all of the above cultivated plants are understood to comprise all species, subspecies, variants, varieties and/or hybrids which belong to the respective cultivated plants, including but not limited to winter and spring varieties, in particular in cereals such as wheat and barley, as well as oilseed rape, e.g. winter wheat, spring wheat, winter barley etc.

Corn is also known as Indian corn or maize (*Zea mays*) which comprises all kinds of corn such as field corn and sweet corn. According to the invention all soybean cultivars or varieties are comprised, in particular indeterminate and determinate cultivars or varieties.

The term "cultivated plants" is to be understood as including plants which have been modified by mutagenesis or genetic engineering to provide a new trait to a plant or to modify an already present trait.

The compounds I and compositions thereof, respectively, are particularly suitable for controlling the following causal agents of plant diseases: rusts on soybean and cereals (e.g. *Phakopsora pachyrhizi* and *P. meibomia* on soybean; *Puccinia tritici* and *P. striiformis* on wheat); molds on specialty crops, soybean, oil seed rape and sunflowers (e.g. *Botrytis cinerea* on strawberries and vines, *Sclerotinia sclerotiorum*, *S. minor* and *S. rolfsii* on oil seed rape, sunflowers and soybean); Fusarium diseases on cereals (e.g. *Fusarium culmorum* and *F. graminearum* on wheat); downy mildews on specialty crops (e.g. *Plasmopara viticola* on vines, *Phytophthora infestans* on potatoes); powdery mildews on specialty crops and cereals (e.g. *Uncinula necator* on vines, *Erysiphe* spp. on various specialty crops, *Blumeria graminis* on cereals); and leaf spots on cereals, soybean and corn (e.g. *Septoria tritici* and *S. nodorum* on cereals, *S. glycines* on soybean, *Cercospora* spp. on corn and soybean).

The compounds I and compositions thereof, respectively, are also suitable for controlling harmful microorganisms in the protection of stored products or harvest, and in the protection of materials.

The compounds I are employed as such or in form of compositions by treating the fungi, the plants, plant propagation materials, such as seeds; soil, surfaces, materials, or rooms to be protected from fungal attack with a fungicidally effective amount of the active substances. The application can be carried out both before and after the infection of the plants, plant propagation

materials, such as seeds; soil, surfaces, materials or rooms by the fungi.

An agrochemical composition comprises a fungicidally effective amount of a compound I. The term "fungicidally effective amount" denotes an amount of the composition or of the compounds I, which is sufficient for controlling harmful fungi on cultivated plants or in the protection of stored products or harvest or of materials and which does not result in a substantial damage to the treated plants, the treated stored products or harvest, or to the treated materials. Such an amount can vary in a broad range and is dependent on various factors, such as the fungal species to be controlled, the treated cultivated plant, stored product, harvest or material, the climatic conditions and the specific compound I used.

Plant propagation materials may be treated with compounds I as such or a composition comprising at least one compound I prophylactically either at or before planting or transplanting.

The user applies the agrochemical composition usually from a predosage device, a knapsack sprayer, a spray tank, a spray plane, or an irrigation system. Usually, the agrochemical composition is made up with water, buffer, and/or further auxiliaries to the desired application concentration and the ready-to-use spray liquor or the agrochemical composition according to the invention is thus obtained. Usually, 20 to 2000 liters, preferably 50 to 400 liters, of the ready-to-use spray liquor are applied per hectare of agricultural useful area.

The compounds I, their N-oxides and salts can be converted into customary types of agrochemical compositions, e. g. solutions, emulsions, suspensions, dusts, powders, pastes, granules, pressings, capsules, and mixtures thereof. Examples for composition types (see "Catalogue of pesticide formulation types and international coding system", Technical Monograph No. 2, 6th Ed. May 2008, CropLife International) are suspensions (e. g. SC, OD, FS), emulsifiable concentrates (e. g. EC), emulsions (e. g. EW, EO, ES, ME), capsules (e. g. CS, ZC), pastes, pastilles, wettable powders or dusts (e. g. WP, SP, WS, DP, DS), pressings (e. g. BR, TB, DT), granules (e. g. WG, SG, GR, FG, GG, MG), insecticidal articles (e. g. LN), as well as gel formulations for the treatment of plant propagation materials, such as seeds (e. g. GF). The compositions are prepared in a known manner, such as described by Mollet and Grubemann, Formulation technology, Wiley VCH, Weinheim, 2001; or by Knowles, New developments in crop protection product formulation, Agrow Reports DS243, T&F Informa, London, 2005. The invention also relates to agrochemical compositions comprising an auxiliary and at least one compound I. Suitable auxiliaries are solvents, liquid carriers, solid carriers or fillers, surfactants, dispersants, emulsifiers, wetters, adjuvants, solubilizers, penetration enhancers, protective colloids, adhesion agents, thickeners, humectants, repellents, attractants, feeding stimulants, compatibilizers, bactericides, anti-freezing agents, anti-foaming agents, colorants, tackifiers and binders.

The agrochemical compositions generally comprise between 0.01 and 95 %, preferably between 0.1 and 90%, more preferably between 1 and 70 %, and in particular between 10 and 60 %, by weight of active substance (e.g. at least one compound I). Further, the agrochemical compositions generally comprise between 5 and 99.9 %, preferably between 10 and 99.9 %, more preferably between 30 and 99 %, and in particular between 40 and 90 %, by weight of at least one auxiliary.

When employed in plant protection, the amounts of active substances applied are, depending on the kind of effect desired, from 0.001 to 2 kg per ha, preferably from 0.005 to 2 kg per ha, more preferably from 0.05 to 0.9 kg per ha, and in particular from 0.1 to 0.75 kg per ha.

In treatment of plant propagation materials, such as seeds, e. g. by dusting, coating, or drenching, amounts of active substance of generally from 0.1 to 1000 g, preferably from 1 to 1000 g, more preferably from 1 to 100 g and most preferably from 5 to 100 g, per 100 kg of plant propagation material (preferably seeds) are required.

Various types of oils, wetters, adjuvants, fertilizers, or micronutrients, and further pesticides (e. g. fungicides, growth regulators, herbicides, insecticides, safeners) may be added to the compounds I or the compositions thereof as premix, or, not until immediately prior to use (tank mix). These agents can be admixed with the compositions according to the invention in a weight ratio of 1:100 to 100:1, preferably 1:10 to 10:1.

Mixing the compounds I or the compositions comprising them in the use form as fungicides with other fungicides results in many cases in an expansion of the fungicidal spectrum of activity or in a prevention of fungicide resistance development. Furthermore, in many cases, synergistic effects are obtained (synergistic mixtures).

The following list of pesticides II, in conjunction with which the compounds I can be used, is intended to illustrate the possible combinations but does not limit them:

Green House and detached leaf tests

5

The compound was dissolved in a mixture of acetone and/or dimethylsulfoxide and the wetting agent/emulsifier Wettol, which is based on ethoxylated alkylphenoles, in a ratio (volume) solvent-emulsifier of 99 to 1 to give a total volume of 5 ml. Subsequently, water was added to total volume of 100 ml. This stock solution was then diluted with the described solvent-emulsifier-water mixture to the final concentration given in the table below.

Use example 1. Curative control of soybean rust on soybeans caused by *Phakopsora pachyrhizi* (PHAKPA K4)

Leaves of potted soybean seedlings were inoculated with spores of *Phakopsora pachyrhizi*.

15

The strain used contains the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors. To ensure the success of the artificial inoculation, the plants were transferred to a humid chamber with a relative humidity of about 95% and 20 to 24 °C for 24 hr. The next day the plants were cultivated for 3 days in a greenhouse chamber at 23 to 27 °C and a relative humidity between 60 and 80 %. Then the plants were sprayed to run-off with the previously described spray solution, containing the concentration of active ingredient or their mixture as described below. The plants were allowed to air-dry. Then the trial plants were cultivated for up to 14 days in a greenhouse chamber at 23 to 27 °C and a relative humidity between 60 and 80 %. The extent of fungal attack on the leaves was visually assessed as % diseased leaf area, the disease level of untreated controls was usually higher than 85 %.

Use example 2. Protective control of soybean rust on soybeans caused by *Phakopsora pachyrhizi* (PHAKPA P2)

Leaves of potted soybean seedlings were sprayed to run-off with the previously described spray solution, containing the concentration of active ingredient or their mixture as described below. The plants were allowed to air-dry. The trial plants were cultivated for 2 days in a greenhouse chamber at 23-27 °C and a relative humidity between 60 and 80 %. Then the plants were inoculated with spores of *Phakopsora pachyrhizi*. The strain used contains the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors. To ensure the success the artificial inoculation, the plants were transferred to a humid chamber with a relative humidity of about 95 % and 20 to 24 °C for 24 hr. The trial plants were cultivated for up to 14 days in a greenhouse chamber at 23 to 27 °C and a relative humidity between 60 and 80 %. The extent of fungal attack on the leaves was visually assessed as % diseased leaf area, the disease level of untreated controls was usually higher than 85 %.

Use example 3. Protective control of soybean rust on soybeans caused by *Phakopsora pachyrhizi* (PHAKPA P6)

Leaves of potted soybean seedlings were sprayed to run-off with the previously described

spray solution, containing the concentration of active ingredient as described below. The plants were allowed to air-dry. The trial plants were cultivated for six days in a greenhouse chamber at 23-27 °C and a relative humidity between 60 and 80 %. Then the plants were inoculated with spores of *Phakopsora pachyrhizi*. The strain used contains the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors. To ensure the success the artificial inoculation, the plants were transferred to a humid chamber with a relative humidity of about 95 % and 23 to 27 °C for 24 hr. The trial plants were cultivated for up to 14 days in a greenhouse chamber at 23 to 27 °C and a relative humidity between 60 and 80 %. The extent of fungal attack on the leaves was visually assessed as % diseased leaf area, the disease level of untreated controls was usually higher than 85 %.

Use example 4. Protective control of soybean rust on detached soybean leaves caused by *Phakopsora pachyrhizi* (PHAKPA P1 DL)

Leaves of potted soybean seedlings were sprayed to run-off with the previously described spray solution, containing the concentration of active ingredient as described below. The plants were left for drying in a green house chamber at 20 °C and 14 hours lightning over night. The next day, leaves were harvested and placed on water agar plates. Subsequently, the leaves were inoculated with spores of *Phakopsora pachyrhizi*. Two different isolates were used: one being sensitive to Qo inhibitors (wt); and one which contains the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors (F129L). Inoculated leaves were incubated for 16 to 24 h at room temperature in a dark dust chamber, followed by incubation for 2 to 3 weeks in an incubator at 20 °C and 12 hours light/day. The extent of fungal attack on the leaves was visually assessed as % diseased leaf area.

Micro titer plate tests

The active compounds were formulated separately as a stock solution having a concentration of 10,000 ppm in dimethyl sulfoxide. The stock solutions were mixed according to the ratio, pipetted onto a micro titer plate (MTP) and diluted with water to the stated concentrations.

After addition of the respective spore suspension as indicated in the different use examples below, plates were placed in a water vapor-saturated chamber at a temperature of 18°C. Using an absorption photometer, the MTPs were measured at 405 nm 7 days after the inoculation. The measured parameters were compared to the growth of the active compound-free control variant (100%) and the fungus-free blank value to determine the relative growth in % of the pathogens in the respective active compounds.

Use example 5. Activity against *Pyricularia oryzae* causing rice blast (PYRIOR)

A spore suspension of *Pyricularia oryzae* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution was used.

Use example 6. Activity against *Septoria tritici* causing leaf blotch on wheat (SEPTTR)

A spore suspension of *Septoria tritici* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution was used.

Use example 7. Activity against *Colletotrichum orbiculare* causing anthracnose (COLLLA)

A spore suspension of *Colletotrichum orbiculare* in an aqueous 2% malt solution was used.

Use example 8. Activity against *Leptosphaeria nodorum* causing wheat leaf spots (LEPTNO)

A spore suspension of *Leptosphaeria nodorum* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution was used.

Use example 9. Activity against *Alternaria solani* causing early blight (ALTESO, wt and F129L)

Two different spore suspensions of *Alternaria solani* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution were used: a sensitive wild-type isolate (wt) and a Qo inhibitor-resistant isolate containing the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors (F129L).

Use example 10. Activity against *Pyrenophora teres* causing net blotch on barley (PYRNTE, wt and F129L)

Two different spore suspensions of *Pyrenophora teres* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution were used: a sensitive wild-type isolate (wt) and a Qo inhibitor-resistant isolate containing the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors (F129L).

Use example 11. Activity against *Cercospora sojina* causing frog-eye leaf spot of soybeans (CERCSO)

A spore suspension of *Cercospora sojina* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution was then added.

Use example 12. Activity against *Microdochium nivale* causing snow mould (MONGNI)

A spore suspension of *Microdochium nivale* in an aqueous biomalt or yeast-bactopeptone-glycerine or DOB solution was used.

The results of the abovementioned use examples are given in the following Tables.

The test results in Tables 1 and C1 to C4 below are given for the control of phytopathogenic fungi containing the amino acid substitution F129L in the mitochondrial cytochrome b protein conferring resistance to Qo inhibitors.
