UNITED STATES PATENT OFFICE.

SEVERIN M. HAUGE, OF FORT DODGE, IOWA.

TOILET-PAPER HOLDER.

1,113,007.

Specification of Letters Patent.

Patented Oct. 6, 1914.

Application filed April 13, 1914. Serial No. 831,640.

To all whom it may concern:

Be it known that I, SEVERIN M. HAUGE, a citizen of the United States, residing at Fort Dodge, in the county of Webster and State of Iowa, have invented certain new and useful Improvements in Toilet-Paper Holders, of which the following is a specification.

This invention relates to toilet paper holders and one of the principal objects of the invention is to provide a toilet paper holder of simple construction which can be attached at the side of the bowl and which will also serve the purpose of an advertising medium or name plate for the plumber.

Another object of the invention is to provide a toilet paper holder which can be readily connected by the bolt used for holding the seat on the bowl, and to thus obviate the necessity of boring in the tiled walls of a fire-proof building to support the bracket or holder.

Still another object of the invention is to provide a holder which can be quickly operated for supporting a roll of paper.

These and other objects may be attained by means of the construction illustrated in the accompanying drawings, in which:

Figure 1 is a front elevation of a toilet paper holder supported upon the seat of a toilet bowl, Fig. 2 is a front elevation of the paper holder unsupported, and on a larger scale than Fig. 1, and Fig. 3 is an edge view of the same.

Referring to the drawings, the numeral 1 designates the frame of a holder as an entirety, said frame comprising the vertical members 2 and 3 connected by a cross bar 4 at the top, and provided with an inwardly bent pintle 5 upon the member 2. The member 3 is bent outwardly to form a supporting arm or bracket, provided with a loop 6 which may be used to accommodate the bolt which secures the seat to the bowl and which may also serve to support the paper holder. The parallel arms or members 7 and 8 are slightly twisted or disposed in such a manner as to hold the frame portion of the holder in a vertical position when secured by the bolt, and the member 8 is provided with a hook 9 at its inner end, the bill of said hook lying in contact with the inner portion of the member 3. A spiral spring 10 is provided at one end with an eye 11, which permanently engages the

hook 9, while the opposite end of the spring is provided with a pintle bearing loop or eye 12 to receive the pintle 5.

Mounted to slide on the members 2 and 3 is a combined paper weight and advertising medium or name plate, which comprises a metal plate, preferably nickel plated and provided with oppositely disposed guide sleeves. The plate 13, at its opposite sides, is bent to form guide sleeves 14 mounted to slide up and down freely upon the members 2 and 3, and to bear upon the opposite surface of the roll of paper, to prevent it from unwinding too freely. An advertisement *a* may be impressed or otherwise applied to the plate.

In securing a paper roll to the spring 10 the spring is compressed until the pintle bearing 12 is disconnected from the pintle 5, thus permitting the spring to assume a more or less vertical position by movement of the eye 11 upon the hook 9. When the spring has been inserted through the central opening in the roll of paper, the pintle 5 may readily be inserted in the bearing 12, with the paper weight 13 resting upon the outer surface of the roll.

From the foregoing it will be obvious that a paper holder made in accordance with this invention may readily be formed of wire of the required gage at very slight expense, while the advantages of the construction described are many and important, especially in fire proof buildings, since the holder can be readily installed without requiring an extra amount of labor in attaching the same.

Various changes may be made in construction, combination, and arrangement of parts without departing from the spirit and scope of the invention as defined in the claims.

What is claimed is:

1. A toilet paper holder comprising a wire frame provided with an inwardly extending pintle, a spiral spring for supporting a roll of paper permanently connected at one end to said frame, and adapted to be compressed for attachment to said pintle.

2. A paper holder comprising a wire frame having a supporting arm provided with a loop to receive a bolt for supporting the holder upon a toilet bowl, a spiral spring for supporting the paper roll, said spring having an eye at one end to permanently engage a hook on the frame, the opposite

end of said spring being provided with a pintle-bearing to receive a pintle formed on the frame.

3. A toilet paper holder comprising a frame, an arm for supporting the holder, a spiral spring for supporting the paper roll, said spring being detachable at one end, and a combined sliding weight and advertising medium adapted to rest upon the roll of

paper to prevent too free unwinding of the paper.

In testimony whereof I affix my signature in presence of two witnesses.

SEVERIN M. HAUGE.
