(57) **ABSTRACT**

A client-server system for corporate travel planning, expense reporting and travel management that utilizes a corporate database server to enable accurate and timely pre-travel and post-travel decision making that is fed by a travel planning process and an expense reporting process, plus a SABRE data feed of all booked data and back office system data as well as a hand-off of exchange and void ticket information that comprises a Travel Planning module, a Travel Decision Maker module, and a Travel Expense Reporting module. The system uses a corporate database environment communicating with a real-time CRS data feed that enhances the Travel Planning module by offering the traveler live choices of air, car, and hotel availability based upon company travel policy as well as live access to current or company negotiated fares while also allowing the Travel Decision Maker module to make comparisons between booked information and actual current travel data.

The image shows a screenshot of a software interface titled "SABRE Travel Planner". The interface includes a menu bar with options: "Reservation", "Edit", "View", "Request", "Options", and "Help". Below the menu is a toolbar with various icons representing different travel services. A central calendar displays the months from January to December for the year 1995. A dialog box is open over the calendar, titled "Frequent Trip - Reserving". The dialog contains the text "One Moment Please... Reserving Your Request" and a "Cancel" button. The number "444" is handwritten in the dialog. The calendar grid shows dates from 1 to 31, with the number "442" handwritten on the date 7. At the bottom of the interface, there are labels for "Detailed Itinerary" and "Status Line".

**SYSTEM FOR CORPORATE TRAVEL PLANNING AND MANAGEMENT**

**CROSS-REFERENCE TO RELATED APPLICATIONS**

[0001] This application is a continuation of U.S. patent application Ser. No. 08/951,630, filed Oct. 16, 1997, which is a continuation of U.S. patent application Ser. No. 08/524,381, filed Sep. 6, 1995, now abandoned, which are hereby incorporated herein in their entirety by reference.

**TECHNICAL FIELD OF THE INVENTION**

[0002] This invention relates in general to a travel and transportation information system, and in particular to, a client-server system that communicates with an airline Computerized Reservation System and places travel information directly in the hands of the corporate traveler.

**BACKGROUND OF THE INVENTION**

[0003] Historically, corporate travel has often escaped the close scrutiny by management that was used for every other function of the corporation. Travel dollars were seen as a necessary evil and were spent until the corporate balance sheet showed more problem than promise. Recently, corporations have aggressively examined every process and paradigm to re-engineer and transform themselves into a lean and highly-productive corporate machine that can support success and growth. As a result, travel dollars became one of the first expenses tightly controlled or cut.

[0004] Given that approximately \$130 billion were spent on travel in 1994, Corporate Travel Managers are examining and implementing a variety of solutions to manage costs and change the aura that typically surrounds corporate travel expenses. For example, corporations have consolidated travel management in credit card services, published corporate travel policies, and mandated the use of preferred travel providers.

[0005] Corporate policies, however, that force a frequent traveler to sit through a two hour connection or stay in a less than mid-line hotel off the beaten path have driven the typical frequent traveler to come up with creative ways to circumvent the travel policy in order to meet their own personal requirements. Frequent travelers are bypassing policy at every turn to maintain their productivity and to take advantage of any perks that compensate them for long hours away from home. This scenario compounds the already huge information deficit Corporate Travel Managers are struggling to resolve including travelers' circumvention of corporate policy which results in travel data being totally lost.

[0006] From a corporate standpoint, travel has an impact on the traveler, the Corporate Travel Manager, the Department Manager, Accounts Payable and the Corporation itself. The traveler seeks an easy and fast way to arrange travel. Under conventional methods however, the traveler must arrange trips through a series of telephone conversations with a travel management firm or agency. In addition, the traveler seeks an automated expense reporting system. Present methods which combine manual and automated forms may require repetitive data input of previously requested travel information for report presentation. In addition, the approval and reimbursement of expenses is typically manual.

[0007] The Corporate Travel Manager needs a true summary of the total corporate travel expenses by category. Presently, the Corporate Travel Manager may estimate travel expenses and category breakdowns based upon report information from Travel Management Firms, corporate credit card companies, or preferred vendors. These estimates may be inaccurate, however, if the traveler made on-the-road trip changes, did not comply with usage of corporate travel agencies or credit card, or stayed in a hotel that is not the same as the one which was booked. Corporate Travel Managers must also stay informed as to the status of preferred vendor agreements. Historically, summaries of the corporation's actual market share performance was provided by travel management firms or the preferred vendor. These summaries, however, were typically not provided on a timely basis, provided minimal information on a pre-travel basis, and provided no method for self-validation of performance.

[0008] Department managers need pre-travel reporting of travel expenses and possible violations of travel policy. Presently, random manual notification of policy violations is provided by travel management firms to the Corporate Travel Manager. Typically, this notification is insufficient or not timely enough to allow Department Managers to enforce corporate policy on a pre-travel basis. Department Managers also desire an automated expense reporting system. Current methods require manual processing of approval and reimbursements of expenses by Department Managers.

[0009] Accounts Payable desires an automated processing system for expense reports. Current methods require manual auditing, posting, and payments of expense reports.

[0010] Many of the limitations on the current corporate travel planning and management systems stem from the corporate traveler's dependence on travel management firms. Travel management firms currently function as the central hub for all travel service and information regarding travel for the corporate traveler. There is a total reliance on the travel management firm by the travelers for trip planning and management as well as by the Corporate Travel Managers for summary reporting.

[0011] Therefore, a need has arisen for a corporate travel planning and management system which operates on a corporate database environment that allows automated travel planning from a corporate traveler's desktop, pre-travel decision support to inform a corporation of planned travel expenditures before corporate dollars are spent, and automated expense reporting.

**SUMMARY**

[0012] The present invention comprises a client-server system for corporate travel planning and management which operates on a corporate database environment, comprising desktop LAN software as well as a Travel Planning module and a Travel Expense Reporting module which together provide solutions for two of the manual and most costly areas of corporate business travel management. The two modules may coexist as fully-functional, stand-alone modules or be integrated into a Travel Decision Maker module creating a comprehensive travel management system.

[0013] The Travel Planning module of the present invention provides the corporate traveler with a desktop system

that provides a graphical user interface to real-time Computerized Reservation Service (CRS) Data for efficient travel planning and booking. The system targets two of the most prevalent types of corporate trips, the simple 2-4 segment trips that include air, car, and hotel accommodations as well as the common or repeat trip, estimated at 40%-70% of all corporate travel.

[0014] The Travel Planning module interacts with locally stored traveler and corporate profiles in a relational database that function as filters against real-time CRS Data output to ensure the appropriate corporate vendor preferences are displayed to and booked by the corporate traveler. The present invention enables the traveler to complete the entire booking process, which results in the creation of a Personal Name Record (PNR), or to create a PNR with a booking request which a travel agency completes.

[0015] The Travel Expense Reporting module of the present invention provides to the traveler's desktop a system that automates the preparation of travel expense reports. The system also automates the routing of expense report to assure appropriate authorization, accurate expense reimbursement and timely posting of expense totals to a corporation's general ledger.

[0016] In addition, the present invention provides automated summary reporting of the actual costs of corporate travel. The reporting is enabled by the relational database, which resides in the corporate environment, that tracks all data from the expense report process and provides comparisons to yearly vendor market share contracts and budgets. A number of automated reports are provided to both the Corporate Travel Manager and Department-level Managers to enable timely and proactive management of corporate resources.

[0017] The Travel Decision Maker module of the present invention incorporates information that results from the Trip Planning and Expense Reporting modules to enable comprehensive pre-travel and post-travel reporting for Corporate Travel Managers and Department Managers. The Pre-travel and post-travel information that feeds the Travel Decision Makers module is integrated into a relational database via the travel planning and expense reporting processes.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0018] For a more complete understanding of the present invention, including its features and advantages, reference is now made to the detailed description, taken in conjunction with the accompanying drawings of which:

[0019] FIG. 1 is a simplified diagram of the platform of the present invention as it may look in a corporation;

[0020] FIG. 2 is a simplified block diagram of the modules of the present invention;

[0021] FIG. 3 is a simplified block diagram of the system of the present invention;

[0022] FIG. 4 is more detailed block diagrams of the trip planning system of FIG. 3;

[0023] FIG. 5 is more detailed block diagrams of the update static tables system of FIG. 3;

[0024] FIG. 6 is more detailed block diagrams of the update static tables system of FIG. 3;

[0025] FIG. 7 is more detailed block diagrams of the interface manager system of FIG. 3;

[0026] FIG. 8 is more detailed block diagrams of the pre-trip management system of FIG. 3;

[0027] FIG. 9 is more detailed block diagrams of the utilities function system of FIG. 3;

[0028] FIG. 10 is more detailed block diagrams of the expense reporting system of FIG. 3;

[0029] FIG. 11 is more detailed block diagrams of the post-trip management system of FIG. 3;

[0030] FIG. 12 is more detailed block diagrams of the post-trip management system of FIG. 3;

[0031] FIG. 13 is more detailed block diagrams of the post-trip management system of FIG. 3;

[0032] FIG. 14, consisting of 14A-14X, is a series of graphical user interfaces for scheduling a trip;

[0033] FIG. 15, consisting of 15A-15G, is a series of graphical user interfaces for scheduling repeat trips; and

[0034] FIG. 16, consisting of 16A-16M, is a series of graphical user interfaces for creating an expense report.

#### DETAILED DESCRIPTION OF THE INVENTION

[0035] The client-server system of the present invention for corporate travel planning and management 10 is shown in simplified platform diagram form in FIG. 1. The client interface of the present invention may be deployed on any conventional personal computer or client workstation 12, running a suitable operating system such as Windows, OS/2, or MacIntosh. The client workstation 12 is in communication with an E-mail server 14 via a conventional network connection 16. The E-mail system may operate any standard E-mail protocol such as VIM or MAPI. The client workstation 12 is in communication with a corporate database server 18 via network connection 20. The corporate database server 18 may operate any open relational database environment such as Oracle or Sybase. The corporate database server 18 may be a pentium (NT), or Unix having 32-64 MB of memory.

[0036] A department manager workstation 22 is in communication with the E-mail server 14 the via network connection 16 and the corporate database server 18 via the network connection 20. The department manager workstation 22 may be any conventional personal computer with a suitable operating system as specified above. The travel manager workstation 24 is in communication with the E-mail server 14 via network connection 16 and in communication with the corporate database server 18 via the network connection 20. The travel manager workstation 24 may be a conventional 486 personal computer having 16 MB RAM of memory.

[0037] The E-mail server 14 is in communication with any conventional travel agency 26 via a telecommunication link 28. The telecommunication link 28 preferably consists of high speed modems and telephone lines or the equivalent thereof. The travel agency 26 is in communication with any airline computerized reservation system such as American Airlines' SABRE Computerized Reservation System 30 via

a telecommunication link **32**. The corporate database server **18** communicates with the gateway **34** using a TCP/IP sockets interface, which is the industry standard cross-platform interprocess communication protocol. The gateway **34** will provide a Generalized Data Stream (GDS) style request and reply interface with the CRS **30** via telecommunication link **36**.

[0038] A simplified block diagram of the corporate travel planning and management system generally designated **38** is represented in **FIG. 2**. The corporate centric client-server system **38** comprises Travel Planning module **40**, Travel Expense Reporting module **42**, and Travel Decision Maker module **44**. From the client workstation **12**, the Travel Planning module **40** receives and sends availability, fare and booking data **46** from the CRS **30**. The Travel Planning module **40** receives policies and preferences data **48** from the corporate database **18** and sends authorization request data **50** to the corporate database **18**. The Travel Expense Reporting module **42** receives trip and card data **52** and expense policy data **54** from the corporate database **18**. The Travel Expense Reporting module **42** sends expense detail data **56** and summary expense totals **58** to the corporate database **18**. The Travel Decision Maker module **44** receives pre-trip booking data **60** and actual expenses data **62** from the corporate database **18**. The Travel Decision Maker module **44** receives GDS data **64** from the CRS **30**. The Travel Decision Maker module **44** sends trip record data **66** to the corporate database **18**.

[0039] A simplified block diagram of the functional elements of the corporate centric client-server system **38** is depicted in **FIG. 3**. The functional elements comprise trip planning **68**, update static tables **70**, interface manager **72**, pre-trip management **74**, utility functions **76**, security **78**, expense reporting **80**, and post-trip management **82**.

[0040] Turning now to **FIG. 4**, the trip planning **68** of **FIG. 3** is described in greater detail. The first step in trip planning **68** is a trip request process **84**. Entry into the trip request process **84** can be done by either the corporate traveler **86** or by a corporate travel arranger (not pictured). The trip request process **84** may also be backfilled through a CRS PNR download if the trip originated with a telephone request. The Corporate traveler **86** must enter an employee number **88** and the trip parameters **90** during the trip request process **84**. After the trip request process **84** has been initiated, the employee record data **92** is retrieved from the employee profile database **94** located in the corporate database **18**. The corporate travel policy data **96** from the corporate travel policy database **98** located in the corporate database **18** is also downloaded during the trip request process **84**. The employee profile database **94** includes information such as seat preferences, special meals, frequent flier, account numbers, hotels, car rental, connecting flights, and airline equipment preferences.

[0041] The next step in trip planning **68** is the build itinerary process **100**. The build itinerary process **100** allows the traveler **86** to enter basic trip parameters and either request a booking or make a booking with direct access to CRS **30** availability and fare information or allows the traveler **86** to pull up saved, repeat itinerary data **102** from the repeat itinerary file database **104** and provide a new departure date and autofilled trip parameters for use in an availability display. For routine trips, the traveler **86** may fill

the trip parameters section from stored repeat itinerary data **106** and subsequently add, modify or delete segments for the itinerary of a specific trip.

[0042] For standard or non-routine trips, the build itinerary process **100** allows the traveler **86** to enter basic trip parameters such as departure date, time and city, arrival date, time and city, and hotel and car requirements. The traveler **86** will input in a batch all the travel requirements (air, hotel, car) grouped by segment. The build itinerary process **100** via communication with CRS **30** displays flight availability data **108**, fare data **110** and highlights preferred vendor data from the corporate travel policy **112**. The traveler **86** is able to make only one selection from the availability data **108** for each segment. The traveler **86** can change selection if desired using the display window. As selections are made, an in-process itinerary will be built and displayed to the traveler **86** showing information as it is selected or adding to what has been previously selected. The in-process itinerary will display the associated cost of each item as well as a running total of the entire trip, including air, hotel, car and a grand total.

[0043] From the availability data **108**, the traveler **86** may request a list of preferred hotels in the destination city. The display will highlight which hotels can be booked via CRS **30** access and also those that would need to be contacted directly. The traveler **86** can request availability at one or more of the preferred hotels. The build itinerary process **100** also allows display of preferred chains as well as preferred hotels specified to a city location which are stored in the local property table **114**.

[0044] The traveler **86** may request a list of preferred rental car vendors through CRS **30**. Special negotiated rates for a vendor in a specific city stored in local car table **116**, when present, will override the data returned from CRS **30**. The build itinerary process **100** returns a queued PNR **118** including air, hotel and car requirements to CRS **30**.

[0045] The trip planning process **68** further comprises the authorized trip request process **120**. The authorized trip request process **120** provides for the routing of the trip request form to the appropriate authorizer (not pictured) and provides the authorization utility. Once authorized, the traveler **86** is notified of the authorization electronically. Actual routing of the trip request form is determined in the authorization table **122** and the travel policy table **98**. The routing may be to a specific person or a specific manager position. The trip request form is electronically signed for the traveler **86** before it is routed for approval. The approver is able to review a version of the trip request form that allows the approver to view the completed itinerary, the cost, the purpose for the trip and the remarks fields. The approver is also able to review the traveler's **86** request for a travel cash advance.

[0046] If the approver does not approve the request, the authorized trip request process **120** requires that the approver input a description of the reason for disapproval. The trip request is then routed back to the originator of the request. If the originator was a travel arranger, a copy of the disapproval will be sent to the traveler **86**. If the approver does approve the request, it is routed to the next processing step, for example, travel agency **26**. The trip request form is electronically signed for the approver whether the request is approved or disapproved.

[0047] Another feature of the trip planning 68 is the cancel booking process 124, which allows the traveler 86 a quick means of cancelling a booked trip from the client workstation 12. The cancelled booking process 124 displays an abbreviated list of all booked trip records whose departure date is equal to or greater than today's system date. The traveler 86 receives stored trip data 126 from the trip table 128 and may select a stored trip to cancel from the list. Once a cancelled trip button is activated on the screen, the traveler 86 may send cancellation data 130 to the CRS 30. A response from the CRS 30 will be displayed back to the traveler 86 confirming the cancellation is complete.

[0048] Now referring to FIG. 5, a block diagram representing the update static tables process 70 of FIG. 3 is presented. All of the corporation's static tables are presumably part of the corporate centric client-server system 38 implementation process. Each corporation defines the static tables in order to start using the corporate centric client-server system 38. Typically, a system administrator inputs the update travel policy data 132, the update exception codes data 134, the update projects data 136, the update reason codes data 138, the update GL accounts data 140, the update department information data 142, the update category data 144, the update budget figures data 146, the update accounting periods data 148, the update expense policy data 150, the update employment profile data 152, the update company profile data 154, the travel policy table 98, the exception codes table 158, the project table 160, the validation error codes table 162, the GL accounts table 164, the department table 166, the expense categories table 168, the budget figures table 170, the accounting period table 172, the expense policy table 174, the employee profile table 94, and the company profile table 178, each of which are part of the larger corporate database 18. All static tables 70 have the ability to add new records, update existing records, and delete unused records.

[0049] Now referring to FIG. 6, the system administrator may update the static table 70 by inputting the update airline agreements data 180, the update carrier codes data 182, the update city/airport codes data 184, the update currency exchange rates data 186, the update car table data 190, the update property table data 192, the update chain codes data 194, the update currency codes data 196, and the update other codes data 198, respectively updating the airline agreements table 200, the carrier codes table 202, the city/airport codes table 204, the currency exchange table 206, the local car table table 116, the local property table 114, the chain code table 212, the currency code table 214, and the other codes table 216, each of which are part of the corporate database 18.

[0050] Referring now to FIG. 7, a block diagram detailing the interface manager 72 of FIG. 3 is depicted. The interface manager 72 involves processing CRS 30 data which consists of five distinct processes: the drive GDS query process 218, the pull apart PNR process 220, the validate data fields process 222, the check policy process 224, and the modify trip record process 226. The drive GDS query process 218 resides on the CRS Supersaver 34 and serves to retrieve the GDS data 64 for each PNR. After the GDS data 64 is retrieved, the GDS data 64 is forwarded to the corporate database 18 where the parsing of the stream is performed and the trip is inserted into the interface manager table 228.

[0051] The pull-apart PNR process 220 reads GDS data 64 and maps the CRS elements to the interface manager table 228.

[0052] The validate data fields process 222 ensures the integrity of the data being inserted into the trip table 128. An incomplete PNR or a PNR containing a value that cannot be found in the static tables 70 will be rejected by the validate datafields process 222 and the queued for reprocessing through CRS 30. The PNR's which pass the validation data fields process 222 are assigned a unique trip number that does not already exist in the trip table 128 and such valid trips are inserted into the trip table 128.

[0053] The check policy process 224 has a hierarchical order of application, for example, project policy takes precedence over employee policy and a negotiated hotel rate takes precedence over a company-preferred vendor. In the check policy process 224, each policy violation is flagged and the violation is assigned a code type based upon the nature of the violation. Depending upon how the violation is set up in the policy record, the violation will either simply be an item on a report, or it may be queued to an individual specified in the employee or project record for approval or rejection. The status of the violation is stored within the policy exception table 230. Data from trip table 128 is compared against data from the travel policy table 98, the local car table table 116, the local property table 114, and the airline agreement table 200. If the check policy process 224 finds any violations, a code from the exception code table 158 is applied and then stored in the policy exceptions table 230.

[0054] The modify trip record process 226 allows the traveler 86 to maintain non-purged PNR's in the interface manager table 228. Maintenance may occur at two levels, a high-level delete of detail older than a specified date, or a modification utility which allows fixes to fields such as project I.D. which, once repaired, will enable the PNR to populate the trip table 128.

[0055] Now referring to FIG. 8, a detailed block diagram of the pre-trip management 74 of FIG. 3 is pictured. The analyze vendor goal share process 232 imports data from the local car table 116, the airline agreements table 200, the local property table 114, and the trip table 128. The analyze vendor goal share process 232 analyzes each preferred airline vendor on a specified city pair and divides the number of segments booked on that airline by the total number of segments booked and compares the obtained percentage with the share agreement for that airline.

[0056] The review and approve exceptions process 234 imports data from the trip table 128, the exception table table 238, and the department roll-up table 236 and creates exception reporting for the overall corporation, an overall cost center, an individual, trend analysis, year-to-date totals, and chronic policy violators.

[0057] The destination analysis by date process 240 uses data from the trip table 128 and reports to the corporate travel manager all destination cities where multiple travelers 86 will be traveling on a given date or date range for the purpose of managing opportunities for obtaining zone fares or discounted group hotel rates.

[0058] The analyze booked versus budgeted travel and entertainment expense process 242 imports data from the

trip table **128** and travel and expense budget table **244** to show projected cost of booked trips, a comparison between booked and budgeted expenses, and a trend analysis for forecasting if the travel budget will be met based upon trends.

[**0059**] The query unauthorized trips process **246** imports data from the department roll-up table **236** and trip table **128** to provide department managers or corporate travel managers information regarding unauthorized trips that require either authorization or cancellation. Department managers or Corporate Travel Managers may either cancel or authorize trips and electronic notification of cancelled trips will be sent to the traveler **86**.

[**0060**] The exception trends report process **250** imports data from the department roll-up table **236**, the exception table **238**, the trip table **128**, the accounting periods table **172**, and the calendar year table **248**. The exception trends report process **250** provides a trend analysis of travel policy exceptions for a defined time frame. Both written and graphical reports show trends of exceptions by individual, by type, and by department as well as the known costs of those exceptions.

[**0061**] The vendor chain analysis process **252** imports data from the trip table **128**, the chain codes table **212**, the accounting periods table **172** and the calendar year table **248** and provides an analysis of the booked plus actual activity for a specific date range for a given hotel or car chain. The output includes a total transaction count for number of room/nights or car/days plus a summary of the dollar value of each transaction as well as an average room/car nights per booking and average daily rates.

[**0062**] Now referring to **FIG. 9**, a detailed block diagram of the utility functions **76** of **FIG. 3** is depicted. The import back office data process **254** creates an electronic handoff of data from agency back office system **256** such as ADS or TravelBase, at a defined frequency. The import back office data process **254** is a means by which agency invoice numbers associated with tickets, refunds or exchanges are obtained by the corporate database **18**.

[**0063**] The extract summary trip data process **258** provides nightly updates to the trip table **128** and provides data to the summary air trip table **260** and summary city trip table **262**.

[**0064**] The archive/delete expense detail process **264** allows input of date parameters such that select expense detailed records that match date parameters are purged from the expense detail table **266** and placed in the archive expense table **268**.

[**0065**] The archive/delete trip detailed process **270** allows input of the date parameters such that select trip records that match date parameters are purged from the trip table **128** and placed in the archive table **272**.

[**0066**] Now turning to **FIG. 10**, a detailed block diagram of the expense reporting **80** from **FIG. 3** is pictured. The create expense form process **274** provides secured access to the expense forms, autofills the forms with data from the employee profile table **94** and allows the traveler **86** to construct an expense report semi-automatically as well as by pulling stored data from the trip table **128**. The create expense form process **274** imports data from the expense

category table **168**, the expense policy table **174**, and the travel policy table **98** and provides this information to the traveler **86** so that the traveler **86** can construct a policy compliant expense report.

[**0067**] The create expense form process **274** also imports data from the currency exchange table and allows the traveler **86** to process currency exchange conversions. When the traveler **86** has completed the expense report, a filled expense form is electronically forwarded to the expense form table **276**, where it is assigned a unique expense form number. The number is assigned the first time an expense form is saved. The number is associated with an optional receipt envelope which may be printed at any time after the initial saving of the expense report has taken place. There is also a traveler reference number to support pre-bar coded envelopes for receipts.

[**0068**] The update expense form process **278** allows the traveler **86** to modify or cancel an expense report. The traveler **86** may import expense form data from expense form table **276** and modify an expense form until it has been approved or may pull up disapproved expense forms for modification and resubmission. An unsubmitted or disapproved expense report may also be cancelled.

[**0069**] The perform validations process **280** checks an expense form against data from the travel policy table **98** to identify unapproved policy violations. Policy violations on the expense form are highlighted and the approver has access to explanations for each of the errant fields. The approver will be able to approve the violations or return the form to the traveler **86** with comments.

[**0070**] The approve expense form process **282** comprises two methods of expense approval. First, the manager level approval gives the manager the option of rejecting an expense form if, for example, it exceeds the data provided from the average cost table **284**. If the manager rejects the expense form, it can be routed back to the traveler **86** with comments. If the manager approves the expense form, it is routed to the Accounts Payable **286** for further processing. All approved expense data is also routed to the expense totals table **288**. In the second case, the corporation can define situations when approval will be automatic and the expense form is routed directly to the Accounts Payable department **286**.

[**0071**] Now turning to **FIG. 11**, a detailed block diagram of the post-trip management **82** of **FIG. 3** is depicted. The analyze air usage process **290** imports data from the trip table **128**, the airline agreements table **200**, and the summary air city table **292**. The analyze air usage process **290** reports the percentage of goal share achieved for a specified city pair carrier, percent of goal share achieved for a carrier overall, overall usage for a given city pair, overall air cost for a given city pair, and average leg fare cost for a given city pair.

[**0072**] The analyze car usage process **294** imports data from the local car table **116**, the trip table **128** and the summary trip table **296**. The analyze car usage process **294** reports percent of goal share achieved for specified chain in a specified city, percent of goal share achieved for chain overall, overall usage for a given city, overall car dollar spent in a given city, overall chain usage, and average car rental day cost in each city. The analyze hotel usage process **298** imports data from the local property table **114**, the summary trip table **296** and the trip table **128**.

[0073] The analyze hotel usage process 298 reports percent of goal share achieved for a specified hotel chain in a specified city, percent of goal share achieved for a chain overall, overall usage for a given city, overall hotel dollars spent in a given city, overall chain usage, and average hotel night cost in each city.

[0074] The analyze policy exceptions process 300 imports data from the expense table 288, the expense category table 168, the department roll-up table 302, the trip table 128, the employee/department table 304, the travel policy table 98, and the exception data and summaries table 306. The analyze policy exceptions process 300 creates on request reports, for example, for monthly reporting of exceptions by employee and by type, overall monthly exception trends by employee and type, overall monthly exception trends by department and type, and overall exceptions by type and monthly trends.

[0075] The analyze expenses process 308 imports data from the expense summaries table 310, the expense table 288, the expense category table 168, the department roll-up table 302, the employee/department table 304, and the travel and expense budget table 244. The analyze expenses process 308 creates a report that shows trends by overall company, summary by department, summary by project, and summary by employee.

[0076] The ticket tracking process 312 imports data from the trip table 128 and the expense trip table 314. The ticket tracking process 312 reports on the status of any given ticket, lists tickets older than a given number of days that have not appeared on an expense report or been refunded or voided, lists tickets returned for refund which have not been credited, and reports unrefunded tickets or miscellaneous change orders available for exchange.

[0077] Now turning to FIG. 12, a detailed block diagram of post-trip management 82 of FIG. 3 is detailed. The analyze employee expenses process 316, uses data from the expense employee summary table 318, the average costs table 284, the expense category table 168, the city/airport codes table 204, and the employee profile table 94. The analyze employee expense process 316 summarizes for a given time period employee expenses by category as well as shows trends in employee expenses by category.

[0078] The analyze company expenses process 318 uses data from the company profile table 178, the average costs table 284, the expense category table 168, the city/airport codes table 204, the department table 320, the project detail table 322, the expense project summary table 324, the expense company summary table 326, the department roll-up table 302, and the travel and expense budget table 244. The analyze company expenses process 318 creates a summary for a given time period of company expenses by category and by project as well as trends in company expenses by project and by category.

[0079] The analyze department expenses process 328 imports data from the employee profile table 94, the city/airport codes table 204, the expense department summary table 330, the department table 320, the project detail table 322, the expense project summary table 324, the department roll-up table 302, the travel and the expense budget table 244, the expense table 288, the average costs table 284, and the expense category table 168. The analyze department

expenses process 328 creates a summary for a given time period of departmental expenses by category and by project. The analyze department expenses process 328 also reports trends in departmental expenses by category and by project.

[0080] Now turning to FIG. 13, a detailed block diagram of another aspect of the post-trip management 82 of FIG. 3 is depicted. The employee trip policy violations process 330 imports data from employee trip exception the summary table 332, the carrier codes table 202, the trip exception table 334, the travel policy table 98, the expense detail table 336, the trip table 128, the car type codes table 338, the chain codes table 212, the city/airport codes table 204, the exception codes table 158, the expense category table 168, and the employee profile table 94. The employee trip policy violations process 330 creates a summary for a given time period of employee trip violations by category and violation trends by category.

[0081] The department trip violations process 340 imports data from the department trip exception summary table 342, the travel policy table 98, and the city/airport codes table 204. The department trip policy violations process 340 creates a summary for a given time period of department trip violations by category and reports trends in department trip violations.

[0082] The department expense policy violations process 344 uses data from the city/airport codes table 204, the exception codes table 158, the expense category table 168, the average costs table 284, the expense policy table 174, the department expense exception summary table 348, the company expense exception summary table 350, and the department table 320. The department expense policy violations process 344 creates a summary for a given time period of departmental expense policy violations by category and trends in departmental expense policy violations. The employee expense violations process 352 uses data from the employee profile data base 94, the average costs table 284, the expense policy table 174, the expense detail table 346, the expense explanations table 354, the expense policy exceptions table 356, the company expense exception summary table 350, and the employee expense exception summary table 358. The employee expense violations process 352 creates a summary for a given time period of employee expense violations by category and trends in employee expense violations.

[0083] Now turning to FIG. 14, which consists of FIG. 14A-14X, which are drawings that depict graphical user interfaces for trip planning module 68 as described above in reference to FIG. 4. The traveler 86 places a cursor 360 on the New Trip icon 362 and energizes the New Trip icon 362. The traveler 86 then enters the purpose of the trip and charge center for the trip and purpose of trip in the Charge Center window 364 then energizes Okay button 366 with cursor 360. The traveler 86 selects origination and destination data in Flight Request-Segment 1 window 368 and energizes the Search button 370 with the cursor 360. The traveler 86 selects a flight from the Flight List window 372 which makes a record of the flight in the Trip Activity Log 374 and the Calendar 376. The traveler 86 selects the Continuing Trip icon 378 and selects an origination and destination in the Flight Request-Segment 2 window 380. The traveler 86 selects flight data from the Flight List window 82 and a record of the selected flight is made in the Trip Activity Log 374 and the Calendar 376.

[0084] The traveler 86 selects the Hotel icon 384. From the Hotel Request Information window 386, the traveler 86 may search for hotels in the destination city. The traveler 86 selects from a list of hotels from the Hotel List window 388. A record of the hotel selection is made in the Trip Activity Log 374 and on the Calendar 376.

[0085] The traveler 86 may select the Rental Car icon 390 to see the Car Request Information window 392. After energizing the Search button 394, the traveler 86 receives a list of available cars and prices in the destination city from the Car List window 396. After the traveler 86 selects a car, a record of the car selected is made in the Trip Activity Log 374 and on the Calendar 376.

[0086] The traveler 86 selects the Cost icon 398 to view the Trip Price Information window 400. From the Trip Price Information window 400, the traveler 86 may search for cheaper flights by energizing the Search for Cheaper Flights button 402 which brings up the BargainFinderPlus Parameters window 404. From the BargainFinderPlus Parameters window 404, the traveler 86 may search for cheaper flights by selecting from a menu of parameters. After completing the search, results are displayed from the BargainFinderPlus Search Results window 406 from which the traveler 86 may select from a menu of flights. The traveler 86 may select a different flight by energizing Yes button 408 in the Replace Flights Message window 410. A record of this transaction is made by updating the Trip Activity Log 374 and the Calendar 376.

[0087] The traveler 86 may confirm ticketing by energizing the Confirm Ticketing icon 412. From the Confirmation-Ticket Delivery window 414, the traveler 86 may choose a method for obtaining tickets by energizing Okay button 416. The travel Itinerary window 418 is then displayed for the traveler 86.

[0088] The traveler 86 may create a reservation by pressing the Finish icon 420. If the traveler 86 wishes to finish the reservation process and send it on to the travel agency for processing, the traveler 86 may energize Yes button 422 in the Finish Reservations window 424. The resulting display shows the the Trip Activity Log 374 and the Calendar 376 with current travel information.

[0089] Now turning to FIG. 15, which consists of FIG. 15A-15G, which are diagrams of graphical user interfaces for repeat trip planning as described above in reference to FIG. 4. The traveler 86 energizes the Frequent Trip icon 426 to receive a menu of frequent trips in the Frequent Trip window 428. The traveler 86 then requests additional details from a selected frequent trip by energizing the Details button 430. If the appropriate frequent trip was selected, the traveler 86 energizes Okay button 432 from the Frequent Trip Details window 434. The traveler 86 then energizes the Select Trip button 436 from the Frequent Trip window 428. The traveler 86 then inputs the date on which travel will begin and energizes the Reserve button 438 in the Frequent Trip Dates window 440. As this information is being processed, the Frequent Trip-Reserving window 442 is viewed by the traveler 86. If Cancel button 444 is not depressed, the Frequent Trip Completed window 446 is displayed and the traveler 86 finishes the reservation process by energizing Yes button 448.

[0090] Now turning to FIG. 16, which consists of FIG. 16A-16M, which are diagrams of graphical user interfaces

for creating an expense report as described above in reference to FIG. 10. The traveler 86 selects New Expense Report icon 450 or Modify Expense Report icon 452 from the Expense Report window 454 which shows the status of saved expense reports in an Expense Report Log window 456. Energizing the New Expense Report icon 450 or the Modify Expense Report icon 452 brings up the Expense Data Range window 458, from which the traveler 86 enters or the corporate database 18 autofills date, project and purpose of the trip/expense parameters. The traveler 86 then energizes the Okay button 460 to view the Air Item Detail window 462 from which the traveler 86 enters or the corporate database 18 autofills charge parameters for the selected city pair 464. The traveler 86 may also enter an explanation of expenses in the Explanation window 466.

[0091] The traveler 86 then energizes the Okay button 468 to view the Car Item Detail window 470 from which the traveler 86 enters or the corporate database 18 autofills car rental and car receipt parameters. The corporate database 18 also provides corporate policy data 472 to the traveler 86. The traveler 86 then energizes the Okay button 474 to view the Hotel Item Detail window 476 from which the traveler 86 enters or the corporate database 18 autofills hotel booking and hotel receipt parameters. The traveler 86 then energizes the Okay button 478 to view the Meals Detail window 480 from which the traveler 86 enters or the corporate database 18 autofills reimbursement parameters. The traveler 86 then energizes the Okay button 478 to view the Business Entertainment Detail window 484 from which the traveler 86 enters or the corporate database 18 autofills entertainment parameters. To return to the Expense Report window 454, the traveler 86 energizes the Okay button 486.

[0092] The traveler 488 may select the Calculate Totals icon 488 to bring up the Calculate Totals window 490. Expense are totaled by date or by type for the traveler 86. The traveler 86 may also input payment instructions.

[0093] The traveler 86 may check for policy compliance by energizing the Check Policy button 492 from the Calculate Totals window 490 of the Check Policy icon 494 from the Expense Report window 454. The traveler 86 views the Check Policy Compliance window 496 while the system does a policy check. The traveler 86 may request explanation of policy violations by energizing the View Exceptions button 498. The traveler 86 may also energizing the Okay button 500 to view the expense report in Expense Report window 502. The traveler 86 submits the expense report for approval by energizing the Submit for Approval icon 504.

[0094] Although the invention has been described in detail, it is to be clearly understood that the same is by way of illustration and example only and is not to be taken by way of limitation, the spirit and scope of the invention being limited only to the terms of the appended claim.

What is claimed is:

1. A client-server system for corporate travel planning, expense reporting and travel management comprising:

- a computerized reservation system;
- a relational database server communicably linked to the computerized reservation system; and
- a travel planning, expense reporting and travel management system resident within a personal computer pro-

viding a graphical user interface for communication between the computer user, the travel planning, expense reporting and travel management system and the relational database server.

2. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 1 wherein the relational database server stores traveler and corporate profiles which interface between the travel planning, expense reporting and travel management system and the computerized reservation system.

3. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 1 wherein the travel planning, expense reporting and travel management system further comprises a travel planning module and a travel expense reporting module.

4. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel planning module includes means for automated approval of travel requests before travel expenses are incurred.

5. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel planning module includes a series of graphical user interfaces for the planning and booking of a non-routine trip including air, hotel and car accommodations.

6. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel planning module includes a series of graphical user interfaces for the planning and booking of a repeat trip including air, hotel and car accommodations.

7. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel expense reporting module further comprises means for automated expense report approval.

8. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel expense reporting module further comprises means for automated expense report approval.

9. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel expense reporting module includes a series of graphical user interfaces for providing corporate policy information from the relational database server.

10. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel expense reporting module includes a series of graphical user interfaces that are pre-populated with trip data from the relational database server.

11. The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 3 wherein the travel planning, expense reporting and travel management system further comprises a travel decision maker module that incorporates information from the trip planning module and the expense reporting module for providing pre-travel and post-travel reporting.

12. A method for corporate travel planning, expense reporting and travel management utilizing a personal computer communicably linked to a relational database server that is communicably linked to a computerized reservation system that provides travel information from the computerized reservation system to the relational database server and the travel planning, expense reporting and travel management system that comprises the steps of:

preparing a travel request;

obtaining approval for travel;

preparing an expense report; and

obtaining approval for the expense report.

13. The method for corporate travel planning, expense reporting and travel management as recited in claim 12 wherein the step of preparing a travel request further comprises the steps of:

energizing a new trip icon;

providing corporate policy data from the relational database;

specifying a purpose for the trip;

selecting an origination point and a destination point;

selecting a flight time to travel from the origination point and the destination point;

selecting a flight time for the return flight from the destination point to the origination point;

creating a record of the flight information;

energizing a hotel icon;

requesting hotel information;

selection a hotel;

creating a record of the hotel information;

energizing a car icon;

requesting car information;

selection a car;

creating a record of the car information;

energizing a cost icon;

searching for a cheaper flight;

selecting a cheaper flight; and

sending the travel request to a travel agency for booking.

14. The method for corporate travel planning, expense reporting and travel management as recited in claim 12 wherein the step of preparing a travel request further comprises the steps of:

energizing a frequent trip icon;

selecting a frequent trip;

inputting a date for the trip; and

sending the travel request to a travel agency for booking.

15. The method for corporate travel planning, expense reporting and travel management as recited in claim 12 wherein the step of obtaining approval for travel further comprises the steps of:

electronically sending the travel request to an approver;

providing the approver with corporate policy data from the relational database;

electronically approving the travel request; and

electronically notifying the traveler of approval.

**16.** The method for corporate travel planning, expense reporting and travel management as recited in claim 12 wherein the step of preparing an expense report further comprises the steps of:

- energizing a new expense report icon;
- specifying the date and purpose of the expense;
- detailing the air, car, hotel, meal and business entertainment expenses;
- calculating expense totals;
- checking for corporate policy compliance;
- creating an expense report; and
- electronically routing the expense report for approval.

**17.** The method for corporate travel planning, expense reporting and travel management as recited in claim 12 wherein the step of obtaining approval for the expense report further comprises the steps of:

- electronically sending the expense report to an approver;
- providing the approver with corporate policy data from the relational database;
- electronically approving the the expense report; and
- electronically notifying the traveler of approval.

**18.** A client-server system for corporate travel planning, expense reporting and travel management comprising:

- a computerized reservation system;

a relational database server communicably linked to the computerized reservation system; and

a travel planning, expense reporting and travel management system resident within a personal computer providing a graphical user interface for communication between the computer user, the travel planning, expense reporting and travel management system and the relational database server, the travel planning, expense reporting and travel management system comprising a travel planning module, a travel expense reporting module and a travel decision maker module, the travel planning module includes means for automated approval of travel requests before travel expenses are incurred and a series of graphical user interfaces for the planning and booking of routine and non-routine trips including air, hotel and car accommodations, the travel expense reporting module includes means for automated expense report approval and means for automated expense report approval and routing, and the travel decision maker module incorporates information from the trip planning module and the expense reporting module for providing pre-travel and post-travel reporting.

**19.** The client-server system for corporate travel planning, expense reporting and travel management as recited in claim 18 wherein the relational database server stores traveler and corporate profiles which interfaces between the travel planning, expense reporting and travel management system and the computerized reservation system.

\* \* \* \* \*
