(81) Designated States (unless otherwise indicated, for every kind of national protection available): AE, AG, AL, AM, AO, AT, AU, AZ, BA, BB, BG, BH, BN, BR, BW, BY, BZ, CA, CH, CL, CN, CO, CR, CU, CZ, DE, DJ, DK, DM, DO, DZ, EC, EE, EG, ES, FI, GB, GD, GE, GH, GM, GT, HN, HR, HU, ID, IL, IN, IR, IS, JO, JP, KE, KG, KH, KN, KP, KR, KW, KZ, LA, LC, LK, LR, LS, LU, LY, MA, MD, ME, MG, MK, MN, MW, MX, MY, MZ, NA, NG, NI, NO, NZ, OM, PA, PE, PG, PH, PL, PT, QA, RO, RS, RU, RW, SA, SC, SD, SE, SG, SK, SL, SM, ST, SV, SY, TH, TJ, TM, TN, TR, TT, TZ, UA, UG, US, UZ, VC, VN, ZA, ZM, ZW.

(54) Title: COMPOSITIONS AND METHODS FOR INDUCING HUMORAL AND CELLULAR IMMUNITIES AGAINST TUMORS AND CANCER

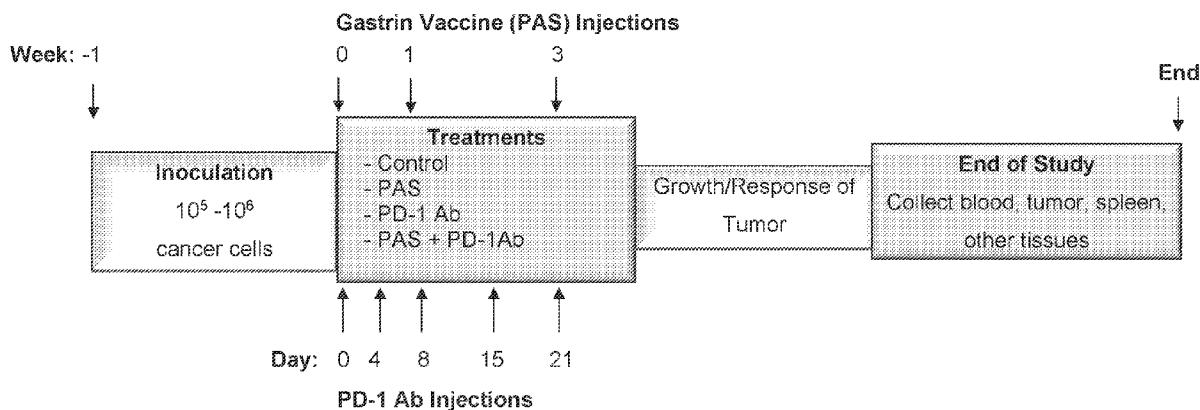

FIG. 1

(57) Abstract: Provided are methods for sensitizing gastrin-associated tumors and/or cancers in subjects to inducers of humoral and cellular immune responses. In some embodiments, the methods relate to administering compositions that have anti-gastrin antibodies, gastrin peptides, and/or nucleic acids that inhibit expression of gastrin gene products to subjects. Also provided are methods for preventing, reducing, and/or eliminating the formation of fibroses associated with tumors and/or cancers, and methods for treating gastrin-associated tumors and/or cancers that include administering to subjects in need thereof a first agent that provides and/or induces an anti-gastrin humoral or cellular immune response in the subject and a second agent that includes one or more stimulators of cellular immune responses against the tumors and/or cancers.

**(84) Designated States** (*unless otherwise indicated, for every kind of regional protection available*): ARIPO (BW, GH, GM, KE, LR, LS, MW, MZ, NA, RW, SD, SL, ST, SZ, TZ, UG, ZM, ZW), Eurasian (AM, AZ, BY, KG, KZ, RU, TJ, TM), European (AL, AT, BE, BG, CH, CY, CZ, DE, DK, EE, ES, FI, FR, GB, GR, HR, HU, IE, IS, IT, LT, LU, LV, MC, MK, MT, NL, NO, PL, PT, RO, RS, SE, SI, SK, SM, TR), OAPI (BF, BJ, CF, CG, CI, CM, GA, GN, GQ, GW, KM, ML, MR, NE, SN, TD, TG).

- with sequence listing part of description (Rule 5.2(a))

## DESCRIPTION

COMPOSITIONS AND METHODS FOR INDUCING HUMORAL AND CELLULAR  
IMMUNITIES AGAINST TUMORS AND CANCER

## 5 CROSS-REFERENCE TO RELATED APPLICATION

This application claims the benefit of U.S. Provisional Patent Application Serial No. 62/520,267, filed June 15, 2017, the disclosure of which is incorporated herein by reference in its entirety.

## TECHNICAL FIELD

10 The presently disclosed subject matter relates to compositions and methods for inducing both humoral and cellular immunities against tumors and cancers. In some embodiments, the presently disclosed subject matter relates to administering to a subject in need thereof a therapeutic inducer of a humoral or cellular immune response against a gastrin peptide and/or in combination with an  
15 inducer of a cellular immune response against the tumor or the cancer.

## BACKGROUND

Pancreatic cancer, generally referred to as pancreatic ductal adenocarcinoma (PDAC) is a complex disease involving the successive accumulation of genetic mutations in several cell growth regulatory pathways.  
20 What begins as relatively benign lesions in a pancreatic intraepithelial neoplasia (PanIN; Hruban et al., 2008) progresses into a diversity of abnormal gene expression patterns, genomic instability, and ultimately invasive cancer that is resistant to treatment.

Histologically, PDAC is generally well-differentiated and is primarily defined  
25 by acinar-ductal metaplasia, the presence of immunosuppressive inflammatory cells, lack of cytotoxic T-cells, and the presence of a dense fibrotic stroma. These manifestations can vary greatly in extent and can occur without overt clinical symptoms, which makes early diagnosis of PDAC a rarity. The PDAC tumor stroma consists of mesenchymal cells such as fibroblasts and pancreatic stellate  
30 cells (PSCs), extracellular matrix proteins, peri-tumoral nerve fibers, endothelial cells, and immune cells. The specific mechanisms influencing the stromal cells to produce the abundant desmoplastic effects involve growth factor activation, collagen and extracellular matrix synthesis and secretion (Zhang et al., 2007), as

well as the expression of numerous regulators of vascular and cytokine-mediated processes (Hidalgo et al., 2012).

Invasive PDAC constitutes the vast majority (>85%) of carcinomas of ductal lineage. PDAC is characterized by uncontrolled infiltration and early metastases. The presumed precursors of ductal adenocarcinoma are the PanIN microscopic lesions that undergo intraductal proliferative changes and ultimately a series of neoplastic transformations from PanIN-1A to PanIN-3 and full-blown malignant carcinoma.

Important characteristics of PDAC are aberrant expression of the gastrin/cholecystokinin receptor (CCK-B) on the surface of tumor cells (Smith et al., 1994) as well as the expression of high levels of gastrin by the tumor (Prasad et al., 2005). Both gastrin (Smith, 1995) and cholecystokinin (Smith et al., 1990; Smith et al., 1991) proteins stimulate pancreatic tumor growth through an autocrine mechanism (Smith et al., 1996a; Smith et al., 1998b), and inhibition of either gastrin expression (Matters et al., 2009), or blockage of CCK-B receptor function (Fino et al., 2012; Smith & Solomon, 2014) inhibits cancer growth.

In spite of impressive success in the treatment of many cancers over the years, tragically there has been little to no success in the market approval of breakthrough therapeutics for PDAC (see Hidalgo, 2010; Ryan et al., 2014), which carries the poorest prognosis of all gastrointestinal malignancies (Siegel et al., 2016). The current five-year survival rate for PDAC is approximately 6%, the lowest of any cancer (Siegel et al., 2016).

The poor outcome of PDAC has not changed for the past 30 years. A multidisciplinary diagnosis followed by surgery and chemo- and radiation therapy is the first-line treatment approach. However, therapies based on the small molecule chemotherapeutics gemcitabine and 5-fluorouracil do not produce satisfying outcomes and mean survival with these regimens remain less than 1 year (Hoff et al., 2011, Conroy et al., 2011).

Contributing factors to the poor survival rates include the inability to diagnose this disease in the early stages, the heterogeneity of cellular and anatomical tumor cells, the high rate of metastasis, and the presence of a dense fibrotic microenvironment that inhibits drug penetration and exposure (Neesse et al., 2013). Inaccessibility of the tumor results in a relative resistance of PDAC to

standard chemotherapy and immunotherapy agents (Templeton & Brentnall, 2013) and contributes to the poor prognosis for this fatal disease.

The host immune response is another key factor contributing to the recalcitrant and aggressive nature of PDAC. Immune cells, which are so prominent in the microenvironment of PDAC, do not support anti-tumor immunity (Zheng et al., 2013). Rather, these cells (including macrophages, T-regulatory (T<sub>reg</sub>) cells, and neutrophils), actually promote tumor growth and invasion. In fact, one of the hallmarks of PDAC is its ability to evade immune destruction (Hanahan & Weinberg, 2011).

Cancers, including PDAC, employ many tools to escape and/or defeat attack from the patient's immune system (Pardoll, 2012; Weiner & Lotze, 2012). Components of the tumor metabolic milieu have been shown to regulate these responses (Feig et al., 2012; Quante et al., 2013). A major breakthrough in cancer therapeutics came with the discovery of immune checkpoint pathways that are often regulated by tumor cells as a mechanism of immune resistance (Leach et al., 1996). Antibodies that target proteins in the checkpoint pathways, such as cytotoxic T lymphocyte-associated antigen 4 (CTLA-4), programmed cell death protein 1 (PD-1), and programmed cell death ligand 1 (PD-L1), have been developed and have been shown to be clinically effective in reversing immunoresistance in some cancers, such as melanoma, non-small cell lung carcinoma (NSCLC), and renal cancer (Pardoll, 2012). However, PDAC is characterized by a tumor microenvironment that has a predominance of immune-suppressing T regulatory (T<sub>reg</sub>) cells, lacks CD8<sup>+</sup> tumor-infiltrating effector T cells (Feig et al., 2012; Vonderheide & Bayne, 2013; Zheng et al., 2013), and is poorly vascularized. The fibrotic nature of the dense stromal environment as well as the lack of accessibility through the bloodstream explains in part the observation that PDAC responds only modestly, at best, to anti-PD-1 and anti-PD-L1 antibodies (Brahmer et al., 2012, Zhang, 2018).

The expression level of the checkpoint ligand PD-L1 on the surface of PDAC cells is believed to be another determinant of response to immune checkpoint inhibitor immunotherapy (Zheng, 2017). Some studies have suggested that a low level of PD-L1 expression correlates with the lack of response to immune checkpoint inhibitors (Soares et al., 2015), and that stimulation of PD-1 or PD-L1 expression can help to facilitate the effectiveness of anti-checkpoint protein

antibodies (Lutz et al., 2014). In other studies of PDAC, PD-L1 was found to be highly expressed in a majority of tumor cells as well as in many tumor samples (Lu et al., 2017). Thus, the effectiveness of immune checkpoint inhibitor therapy could potentially be enhanced by considering the status of PD-L1 in the tumor and in seeking methods for regulating PD-L1 expression to accompany PDAC-targeted therapy.

Currently, clinical trials for treatment of PDAC include combining antibody immune checkpoint inhibitors with chemotherapy, radiation, chemokine inactivation (olaptosed), cyclin dependent kinase inhibition (abemaciclib), TGF- $\beta$  Receptor I kinase inhibitors (galunisertib), focal adhesion kinase inhibitors (defactinib), CSF1R inhibitors (Pexidartinib), vitamin D, and Poly ADP ribose polymerase inhibitors (niraparib). These studies are aimed at combining agents that might improve the physical penetration of and/or the immune cell presence in the PDAC tumor microenvironment, as well as to improve the effectiveness of immune checkpoint inhibitor treatment. In a recent report (Smith et al., 2018), inhibition of CCK-B receptor function reduced PDAC fibrosis and improved the effectiveness of antibody therapy using an anti-PD-1 antibody (Ab) and an anti-CTLA-4 Ab.

Given the complexity of the PDAC tumor, a deeper understanding is needed of how novel strategies can be used to modify the immune phenotype of the PDAC microenvironment across the heterogeneity of patients and to make the tumor more responsive to both chemo- and immune-based therapies.

Gastric cancer is another devastating cancer, and gastric adenocarcinoma in particular has one of the poorest prognoses of all cancers, with a 5-year survival of up to 30% (Ferlay et al., 2013). Early detection of this malignancy is elusive and requires intentional screening practices, which are not commonly utilized. Most diagnoses are already in advanced stage with median survival of 9-10 months (Wagner et al., 2010; Ajani et al., 2017). The current standard of care for gastric cancer includes surgery when appropriate, followed by radiation and/or chemotherapy with DNA synthesis inhibitors like 5-fluorouracil and/or DNA damaging agents such as cis-platinum.

Targeted therapies have also begun to emerge for the treatment of some gastric cancers. Tumors that express the human epidermal growth factor receptor 2 (EGFR2) can be treated with trastuzumab (sold under the tradename

HERCEPTIN® by Genentech, Inc., South San Francisco, California, United States of America) in combination with chemotherapy. Some gastric cancers are also responsive to anti-angiogenesis drugs such as ramucirumab (sold under the tradename CYRAMZA® by Eli Lilly and Company, Indianapolis, Indiana, United States of America). Additional targeted therapies are urgently needed to improve the dismal prognosis for this prevalent malignancy.

Gastric adenocarcinomas typically overexpress gastrin as well as the receptor for gastrin, called the CCK-B receptor (Smith et al., 1998a; McWilliams et al., 1998), and gastrin-mediated proliferative effects upon binding to CCK-B lead to an uncontrolled autocrine cycle of growth and expression in these tumors. Blocking the function of gastrin as a means of therapy for this cancer has been a focus of research for many years (reviewed in Rai et al., 2012). Among the candidates for targeted therapy, the gastrin vaccine Polyclonal Antibody Stimulator (PAS) has shown significant promise in improving survival in gastric cancer in Phase 2 clinical trials and in pancreatic cancer in Phase 2 and Phase 3 clinical trials. PAS vaccination has been shown to elicit a humoral immune response as demonstrated by the production of neutralizing antibodies to gastrin. By eliminating gastrin, the vaccine slows tumor growth and has potential to provide long-term tumor killing activity.

Cancer vaccines that raise an immune response against specific tumor antigens are an attractive treatment strategy when the immune-mediated immobilization or inactivation of the target antigen does not have deleterious effects elsewhere in the body. Peptide vaccines have the potential advantage of narrowing the specificity of the immune response, but they can sometimes have the disadvantage of eliciting a weak immunogenicity. Careful selection of peptide composition as well as incorporation of adjuvant molecules and delivery systems can be necessary to insure a robust response as well as to initiate induction of the desired immunity pathway. Peptides as short as 9-11 amino acids can generate a specific CD8+ T cell-mediated response, though a change of even one amino acid in the epitope can prevent the response (Gershoni et al., 2007).

The choice of epitopes to be included on the peptide requires the consideration of type of immune response desired, including MHC class II epitopes to induce CD4+ helper T cells and MHC class I CD8 epitopes to induce helper T cells and CD8+ cytotoxic T lymphocytes (Li et al., 2014).

The combination of a gastrin peptide vaccine, such as PAS, combined with an immune checkpoint inhibitor represents a novel approach to improving outcome in cancers that are subject to growth stimulation by the gastrin peptide hormone.

5

## SUMMARY

This Summary lists several embodiments of the presently disclosed subject matter, and in many cases, lists variations and permutations of these embodiments. This Summary is merely exemplary of the numerous and varied embodiments. Mention of one or more representative features of a given embodiment is likewise exemplary. Such an embodiment can typically exist with or without the feature(s) mentioned; likewise, those features can be applied to other embodiments of the presently disclosed subject matter, whether listed in this Summary or not. To avoid excessive repetition, this Summary does not list or suggest all possible combinations of such features.

15 In some embodiments, the presently disclosed subject matter provides pharmaceutical compositions comprising a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor and an immune checkpoint inhibitor. In some embodiments, the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody. In some  
20 embodiments, the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and  
25 EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue.

In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier, optionally via a linker. In some embodiments, the  
30 immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.

In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

5 In some embodiments, the presently disclosed pharmaceutical compositions further comprise an adjuvant, optionally an oil-based adjuvant.

In some embodiments, the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and  
10 programmed cell death 1 receptor ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

15 In some embodiments, the gastrin-associated tumor and/or cancer is pancreatic cancer.

In some embodiments of the presently disclosed pharmaceutical compositions, the first agent comprises an amount of a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence  
20 selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4) effective to induce an anti-gastrin humoral response and the second agent comprises an amount of an immune checkpoint inhibitor that is effective to induce or enhance a cellular immune  
25 response against a gastrin-associated tumor or cancer when administered to a subject who has gastrin-associated tumor or cancer. In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue.

In some embodiments of the presently disclosed pharmaceutical  
30 compositions, the first agent comprises one or more anti-CCK-B receptor antibodies and is present in the pharmaceutical composition in an amount sufficient to reduce or inhibit gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer when administered to a subject that has a gastrin-associated tumor or cancer.

In some embodiments, the presently disclosed subject matter also provides methods for treating a gastrin-associated tumor or cancer in a subject. In some embodiments, the methods comprise administering to the subject an effective amount of a composition that comprises a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor; and a second agent that induces and/or provides a cellular immune response against the gastrin-associated tumor or cancer. In some embodiments, the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody. In some embodiments, the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier, optionally via a linker, which in some embodiments can be selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester. In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length. In some embodiments, the composition further comprises an adjuvant, optionally an oil-based adjuvant. In some embodiments, the inducer of the cellular immune response against the gastrin-associated tumor or cancer comprises an immune checkpoint inhibitor. In some embodiments, the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

In some embodiments of the presently disclosed methods, the gastrin-associated tumor and/or cancer is pancreatic cancer. In some embodiments, the composition induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer. In some embodiments, the composition is administered in a dose selected from the group consisting of about 50 µg to about 1000 µg, about 50 µg to about 500 µg, about 100 µg to about 1000 µg, about 200 µg to about 1000 µg, and about 250 µg to about 500 µg, and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.

In some embodiments, the presently disclosed subject matter also provides methods for treating gastrin-associated tumors and/or cancers. In some embodiments, the methods comprise administering to a subject in need thereof a first agent that directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer and a second agent comprising a stimulator of a cellular immune response against the tumor and/or the cancer. In some embodiments, the first agent directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer by providing and/or inducing a humoral immune response against a gastrin peptide, optionally wherein the agent is selected from the group consisting of an anti-gastrin antibody and a gastrin peptide that induces production of neutralizing anti-gastrin antibodies in the subject; and/or comprises a nucleic acid that inhibits expression of a gastrin gene product. In some embodiments, the anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17). In some embodiments, the epitope is present within the amino acid sequence EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), or EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the gastrin peptide comprises an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the first agent comprises the gastrin peptide conjugated to an immunogenic carrier, optionally an immunogenic carrier selected from the group consisting of diphtheria

toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the gastrin peptide is conjugated to the immunogenic carrier via a linker, optionally a linker that comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester. In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length. In some embodiments, the first agent further comprises an adjuvant, optionally an oil-based adjuvant. In some embodiments, the second agent is an immune checkpoint inhibitor. In some embodiments, the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, and Avelumab.

In some embodiments of the presently disclosed method, the gastrin-associated tumor and/or cancer is pancreatic cancer. In some embodiments, the first agent induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer.

In some embodiments, the presently disclosed subject matter provides methods for inhibiting growth of a gastrin-associated tumor and/or cancer in a subject. In some embodiments, the methods comprise administering to the subject a composition that comprises a first agent comprising a gastrin immunogen, one or more anti-gastrin antibodies, one or more anti-CCK-B receptor antibodies, or any combination thereof; and a second agent comprising an immune checkpoint inhibitor. In some embodiments, the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody. In some embodiments, the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO:

4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier, optionally wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier via a linker, optionally wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester. In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length. In some embodiments, methods employ a composition that further comprises an adjuvant, optionally an oil-based adjuvant. In some embodiments, the inducer of the cellular immune response against the gastrin-associated tumor or cancer comprises an immune checkpoint inhibitor. In some embodiments, the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

In some embodiments of the presently disclosed methods, the gastrin-associated tumor and/or cancer is pancreatic cancer. In some embodiments, the composition employed in the presently disclosed methods induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer. In some embodiments, the composition is administered in a dose selected from the group consisting of about 50  $\mu$ g to about 1000  $\mu$ g, about 50  $\mu$ g to about 500  $\mu$ g, about 100  $\mu$ g to about 1000  $\mu$ g, about 200  $\mu$ g to about 1000  $\mu$ g, and about 250  $\mu$ g to about 500  $\mu$ g, and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.

The presently disclosed subject matter also provides in some embodiments methods for inducing and/or enhancing cellular immune responses against gastrin-associated tumors and/or cancers in subjects. In some embodiments, the methods comprise administering to a subject that has a gastrin-associated tumor or cancer an effective amount of a composition comprising an agent that reduces or inhibits gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer. In some embodiments, the agent comprises a gastrin peptide, an anti-gastrin antibody, an anti-CCK-B receptor antibody, or any combination thereof. In some embodiments, the gastrin peptide comprises a gastrin-17 (G17) peptide or an immunogenic fragment thereof. In some embodiments, the gastrin peptide or the immunogenic fragment thereof comprises, consists essentially of, or consists of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the agent comprises a gastrin peptide conjugated to an immunogenic carrier, optionally wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the gastrin peptide is conjugated to the immunogenic carrier via a linker, optionally a linker comprising a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester. In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length. In some embodiments, the composition employed in the presently disclosed methods further comprises an adjuvant, optionally an oil-based adjuvant.

In some embodiments, the presently disclosed subject matter also provides methods for sensitizing tumors and/or cancers associated with gastrin and/or CCK-B receptor signaling in subject to inducers of cellular immune responses directed against the tumors and/or cancers. In some embodiments, the methods comprise administering to the subject a composition comprising a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide, and a second agent that induces and/or provides a

cellular immune response against the tumor and/or the cancer, or a combination thereof, optionally wherein the first agent and the second agent are individually selected from the group consisting of a gastrin peptide and/or a fragment and/or a derivative thereof that induces a cellular immune response or production of neutralizing anti-gastrin antibodies in the subject and a neutralizing anti-gastrin antibody and/or a fragment and/or derivative thereof and; and/or a composition comprising a nucleic acid that inhibits expression of a gastrin gene product; and/or a composition comprising an agent that blocks the biological function of gastrin at the CCK-B receptor. In some embodiments, the anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17). In some embodiments, the epitope is present within the amino acid sequence EGPWLEEEEE (SEQ ID NO: 1) or EGPWLEEEEE (SEQ ID NO: 2) or EGPWLEEEEEAY (SEQ ID NO: 3) OR EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the composition comprises the gastrin peptide conjugated to an immunogenic carrier. In some embodiments, the gastrin peptide comprises an amino acid sequence selected from the group consisting of SEQ ID NO: 1, SEQ ID NO: 2, SEQ ID NO: 3 and SEQ ID NO: 4. In some embodiments, the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the gastrin peptide is conjugated to the immunogenic carrier via a linker. In some embodiments, the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester. In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length. In some embodiments, the composition employed in the presently disclosed methods further comprises an adjuvant, optionally an oil-based adjuvant. In some embodiments, the inducer of the cellular immune response against the gastrin-associated tumor and/or cancer comprises an immune checkpoint inhibitor. In some embodiments, the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor

ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and  
5 Durvalumab.

In some embodiments of the presently disclosed methods, the gastrin-associated tumor and/or cancer is pancreatic cancer. In some embodiments, the composition induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer. In some embodiments, the composition is  
10 administered in a dose selected from the group consisting of about 50 µg to about 1000 µg, about 50 µg to about 500 µg, about 100 µg to about 1000 µg, about 200 µg to about 1000 µg, and about 250 µg to about 500 µg, and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if  
15 administered, is administered 1 or 2 weeks after the second dose.

The presently disclosed subject matter also provides in some embodiments methods for preventing, reducing, and/or eliminating formation of fibrosis associated with tumors and/or cancers. In some embodiments, the methods comprise contacting cells of tumors and/or cancers with an agent that directly or  
20 indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer. In some embodiments, the agent provides and/or induces a humoral immune response against a gastrin peptide, optionally wherein the agent is selected from the group consisting of an anti-gastrin antibody, and/or a fragment and/or derivative thereof, and a gastrin peptide that induces production of  
25 neutralizing anti-gastrin antibodies in the subject; and/or comprises a nucleic acid that inhibits expression of a gastrin gene product; and/or comprises a small molecule compound that blocks the function of the gastrin hormone. In some embodiments, the anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17). In some embodiments, the epitope is present  
30 within the amino acid sequence EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), or EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the agent comprises the gastrin peptide that

induces production of neutralizing anti-gastrin antibodies conjugated to an immunogenic carrier. In some embodiments, the gastrin peptide comprises an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue at amino acid 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the gastrin peptide is conjugated to the immunogenic carrier via a linker, optionally a linker comprising a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester. In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length. In some embodiments, the agent further comprises an adjuvant, optionally an oil-based adjuvant. In some embodiments, the presently disclosed methods further comprise contacting the tumor and/or the cancer with a second agent comprising a stimulator of a cellular immune response against the tumor and/or the cancer. In some embodiments, the second agent is an immune checkpoint inhibitor. In some embodiments, the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, and Avelumab. In some embodiments of the presently disclosed methods, the tumor and/or cancer is pancreatic cancer.

The presently disclosed subject matter also provides in some embodiments uses of the pharmaceutical compositions disclosed herein for producing a medicament for treating a gastrin-associated tumor or cancer.

The presently disclosed subject matter also provides in some embodiments uses of the presently disclosed pharmaceutical compositions for treating a gastrin-associated tumors and/or cancer.

The presently disclosed subject matter also provides in some embodiments uses of the presently disclosed pharmaceutical compositions for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount  
5 of a pharmaceutical composition as disclosed herein sufficient to enhance the number of CD4<sup>-</sup>/CD8<sup>-</sup> T<sub>EMRA</sub> cells in the subject that respond to the gastrin-associated tumor or cancer.

The presently disclosed subject matter also provides in some embodiments uses of the presently disclosed pharmaceutical compositions for increasing the  
10 number of T<sub>EMRA</sub> cells in a subject that respond to a gastrin-associated tumor or cancer.

The presently disclosed subject matter also provides in some embodiments uses of compositions comprising an immune checkpoint inhibitor and a gastrin immunogen to treat a gastrin-associated tumor or cancer.

The presently disclosed subject matter also provides in some embodiments uses of compositions comprising an immune checkpoint inhibitor and a gastrin immunogen for the preparation of a medicament to treat a gastrin-associated  
15 tumor or cancer.

The presently disclosed subject matter also provides in some embodiments uses of the presently disclosed pharmaceutical compositions for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer.  
20 In some embodiments, the presently disclosed subject matter relates to administering to a subject having a gastrin-associated tumor or cancer an amount of a pharmaceutical composition as disclosed herein sufficient to enhance the number of CD8<sup>+</sup> tumor infiltrating lymphocytes. In some embodiments, the use results in improved survival, reduction of tumor growth, and/or enhanced efficacy of chemotherapy and/or immune checkpoint therapy as compared to that seen in  
25 subjects that do not receive a pharmaceutical composition as disclosed herein.

Use of the pharmaceutical composition of any one of claims 1-13 for  
30 preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount of the pharmaceutical composition of any one of claims 1-13 sufficient to reduce the number of FoxP3<sup>+</sup> inhibitory T-regulatory cells.

Thus, it is an object of the presently disclosed subject matter to provide a method for treating gastrin-associated or CCK-B receptor-containing tumors and/or cancers.

An object of the presently disclosed subject matter having been stated  
5 hereinabove, and which is achieved in whole or in part by the compositions and methods disclosed herein, other objects will become evident as the description proceeds when taken in connection with the accompanying Figures as best described herein below.

#### BRIEF DESCRIPTION OF THE DRAWINGS

10 Figure 1 is a schematic of an exemplary experimental strategy for testing the ability of patent applications with or without an immune checkpoint inhibitor to influence growth of a pancreatic cell tumor in mice. In a particular embodiment, subcutaneous tumors were produced by injecting C57BL/6 mice with  $5 \times 10^5$  murine mT3 pancreatic cancer cells (C57BL/6 is syngeneic with mT3 cells) at -1  
15 week before treatment. Groups of 10 mice (40 total) were treated with PAS at t = 0, 1, and 3 weeks and/or an anti-PD-1 antibody (PD1-1 Ab; Bio X cell, West Lebanon, New Hampshire, United States of America) at t = 0, 4, 8, 15, and 21 days. Between treatments, tumor volumes were measured. The study was ended and PBMC were collected from spleens and tumors were excised from the mice  
20 and analyzed.

Figure 2 is a bar graph showing mean tumor weights in grams in mT3-bearing mice following treatment with control (phosphate-buffered saline only; PBS), PAS alone (100  $\mu$ g per administration; PAS100), PD-1 Ab alone (150  $\mu$ g per administration; PD-1), or the combination of PAS (100  $\mu$ g per administration) and PD-1 Ab (150  $\mu$ g per administration; PAS100 + PD-1). NS:  $p \geq 0.05$  (i.e., not  
25 significant); \*  $p < 0.05$  compared to PBS and compared to PAS100; #  $p = 0.0017$  as compared to PD-1. Error bars are  $\pm$  SEM.

Figures 3A and 3B are a series of plots of CD4<sup>-</sup>/CD8<sup>-</sup> and CD4<sup>-</sup>/CD8<sup>-</sup> T<sub>EMRA</sub> cells present in CD3 terminally differentiated T cells after treatment with  
30 PBS, PD-1 Ab alone (150  $\mu$ g per administration; PD1), PAS alone (100  $\mu$ g per administration; PAS), or the combination of PAS (100  $\mu$ g per administration) and PD-1 Ab (150  $\mu$ g per administration; PAS/PD1). Figure 3A shows the percentages of CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup> and CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup> (i.e. T<sub>EMRA</sub>) cells in mice that underwent various treatments. Figure 3B shows the portion of

CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup> cells that were CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup> T<sub>EMRA</sub> cells. The portion of cells was calculated by taking the percentage of CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup> lymphocytes multiplied by the percentage of CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup> T<sub>EMRA</sub> cells in the CD4<sup>-</sup>/CD8<sup>-</sup> lymphocytes /10000 to calculate the portion of CD4<sup>-</sup> /CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup> T<sub>EMRA</sub> cells in the CD3<sup>+</sup> T cell fraction (see Figure 3B). \* p < 0.05; \*\* p < 0.01. Error bars are ± 1 standard deviation.

Figures 4A and 4B are a series of bar graphs summarizing a cytokine activation assay with respect to TNF $\alpha$ , Granzyme B, Perforin, and INF $\gamma$  in various T cell subpopulations without (Figure 4A) and with (Figure 4B) re-stimulation with gastrin after treatment with PAS100. Figure 4A shows that the T cells isolated from the spleens of mice treated with PAS100 were indeed activated. When these same cells were re-stimulated with gastrin in culture for 6 hours (Figure 4B), they were re-stimulated and released even more of each cytokine. Black bars: INF $\gamma$ . Light gray bars: Granzyme B. Dark gray bars: Perforin. Hatched gray bars: TNF $\alpha$ .

Figures 5A and 5B are a series of bar graphs comparing cytokine release with respect to TNF $\alpha$ , Granzyme B, Perforin, and INF $\gamma$  in CD4<sup>-</sup>/CD8<sup>-</sup> (left group in each Figure), CD8<sup>+</sup> (middle group in each Figure), and CD4<sup>+</sup> (right group in each Figure) T cell subpopulations treated with PAS100 monotherapy (Figure 5A) or PAS100 + PD-1 combination therapy (Figure 5B). Activated T lymphocytes released increased cytokines compared to lymphocytes from PBS treated mice. The lymphocytes from the combination treated mice released markedly higher levels of cytokines, suggesting that the combination therapy was better at stimulating activated T cells. TNF $\alpha$  in particular was increased greater than 2-fold with the PAS + PD-1 Ab combination therapy. Black bars: INF $\gamma$ . Light gray bars: Granzyme B. Dark gray bars: Perforin. Hatched gray bars: TNF $\alpha$ .

Figures 6A and 6B show the results of PBS control, PD-1 monotherapy, PAS100 monotherapy, and PAS100 & PD-1 combination therapy on the development of fibrosis in mT3 pancreatic cancer cell tumors in mice. Figure 6A depicts mT3 tumors stained with Masson's Trichrome Stain, which stains collagen blue and provides an indicator of fibrosis. Figure 6B is a bar graph summarizing the results of the staining depicted in Figure 6A. Of note is that whereas the integrated density of the tumors treated with PD-1 monotherapy and PAS100 monotherapy were insignificantly different the negative control PBS treatment, the PAS + PD-1 Ab combination therapy resulted in a decrease in density (and hence

fibrosis) that was statistically significant as compared to PBS alone ( $p < 0.005$ ) and also PAS100 alone ( $p < 0.001$ ). \*\*\*  $p < 0.005$  compared to PBS and  $p < 0.001$  as compared to PAS100. Black bar: PBS. Light gray bar: PD-1 alone. White bar: PAS100 alone. Hatched gray bar: PAS100 + PD-1.

5            Figures 7A and 7B show the results of PBS control, PD-1 monotherapy, PAS100 monotherapy, and PAS100 & PD-1 combination therapy on infiltration of CD8<sup>+</sup> cells into mT3 pancreatic cancer cell tumors in mice. Figure 7A depicts exemplary mT3 tumors stained with an antibody that binds to the CD8 after treatment with PBS, PD-1 Ab (PD-1) monotherapy, PAS100 monotherapy (patent applications), and PAS100 & PD-1 combination therapy on infiltration of CD8<sup>+</sup> cells into mT3 pancreatic cancer cell tumors in mice. Figure 7B is a bar graph summarizing the data exemplified by Figure 7A. Treatment with PD-1 (PD-1 Ab) monotherapy or PAS100 alone resulted in significantly higher levels of CD8<sup>+</sup> cells in tumors ( $p = 0.0019$  and  $p = 0.0026$ , respectively) as compared to the negative control PBS treatment. The PAS + PD-1 Ab combination therapy resulted in even greater levels of CD8<sup>+</sup> cells in tumors when compared to PBS alone ( $p = 4.7 \times 10^{-5}$ ) as well as when compared to PD-1 alone ( $p = 0.042$ ) and when compared to PAS100 alone ( $p = 0.039$ ). PD-1 alone compared to PAS100 alone was not significantly different ( $p > 0.05$ ). \*\* $p = 0.0026$ ; \*\*\* $p = 0.0019$ ; \*\*\*\* $p = 4.7 \times 10^{-5}$  as compared to PBS. Error bars are  $\pm$  SEM.

15            Figures 8A and 8B depict analyses of Foxp3<sup>+</sup> cells in mT3 tumors. Figure 8A depicts exemplary mT3 tumors stained with an antibody that binds to the Foxp3 protein, a marker for T<sub>regs</sub>. Comparison of the fields shows that as compared to PBS (upper left panel), PD-1 monotherapy (upper right panel), or PAS100 monotherapy (lower left panel), PAS100 & PD-1 combination therapy resulted in a decrease in the presence of intratumoral T<sub>regs</sub>, suggesting that PAS100 + PD-1 combination therapy might modify the intratumoral environment to an extent where the intratumoral microenvironment might be characterized by a lower degree of T<sub>reg</sub>-based immunosuppression as compared to either monotherapy alone. Figure 8B is a bar graph summarizing the data exemplified by Figure 8A. As compared to PBS, the number of Foxp3<sup>+</sup> cells in tumors treated with PD-1 monotherapy or PAS100 monotherapy was not significantly different. Tumors treated with PAS100 + PD-1 Ab combination therapy had significantly fewer Foxp3<sup>+</sup> cells than the negative control. \*  $p = 0.038$ . Black bar: PBS. Light

gray bar: PD-1 Ab alone. White bar: PAS100 alone. Hatched gray bar: PAS100 + PD-1 Ab. Error bars are  $\pm$  SEM.

#### DETAILED DESCRIPTION

Headings are included herein for reference and to aid in locating certain sections. These headings are not intended to limit the scope of the concepts described therein under, and these concepts can have applicability in other sections throughout the entire description.

##### I. General Considerations

The presently disclosed subject matter relates in some embodiments to methods and systems for treating human and animal cancers using combinations of treatments that together generate both a humoral immune anti-tumor effect plus a cellular immune anti-tumor effect. More particularly, the presently disclosed subject matter relates in some embodiments to using particular combinations of drugs that: (1) induce immunologic humoral B cell responses that generate antibodies against the tumor and/or circulating tumor growth factor(s); and (2) induce or otherwise enhance immunologic cellular T cell responses directed against the tumor to elicit cytotoxic T lymphocyte responses. More particularly, the presently disclosed subject matter relates in some embodiments to methods and systems for treating human cancers using an anti-gastrin cancer vaccine in combination with a second drug that causes immune checkpoint blockade. Even more particularly, the presently disclosed subject matter relates in some embodiments to treating specific human cancers with one or more cancer vaccines designed to elicit a B cell antibody response to the active form of the growth factor gastrin. As disclosed herein for the first time, in some embodiments anti-gastrin vaccines can result in a human tumor becoming responsive to treatment with an immune checkpoint inhibitor, thus creating an unexpected additive or even synergistic combination therapy effect that enhances overall anti-tumor efficacy.

The presently disclosed subject matter also relates in some embodiments to methods for the treatment of tumors and/or cancers using a combination of methods, which generate both a humoral antibody immune response (a gastrin cancer vaccine) and a cellular T cell immune response (immune checkpoint blockade). In some embodiments, the presently disclosed subject matter relates to compositions and methods that produce novel, unexpected, additive, and/or

synergistic efficacy in treating human and animal gastrointestinal tumors using a novel and unique combination of drug classes which generate both a humoral immune anti-tumor effect plus a cellular immune anti-tumor effect. In some embodiments, the presently disclosed subject matter relates to using specific combinations of drugs that: (1) induce immunologic humoral B cell responses to tumor growth factors and/or circulating tumor growth factors; and (2) cause and/or enhance immunologic cellular T cell responses directed against tumors to elicit cytotoxic T lymphocyte responses. In some embodiments, the presently disclosed subject matter relates to methods and systems for treating human and animal cancers using the presently disclosed combinations of gastrin cancer vaccines and one or more second drugs that causes immune checkpoint blockade. In some embodiments, the presently disclosed subject matter relates to treating specific human cancers with one or more cancer vaccines designed to elicit B cell antibody responses to the active form of the growth factor gastrin, which as disclosed herein unexpectedly also results in the human tumor becoming more responsive to the treatment with an immune checkpoint inhibitor, thus creating an unexpected, additive, or even synergistic combination therapy effect that enhances anti-tumor efficacy. In some embodiments, the presently disclosed subject matter thus relates to using PAS with immune checkpoint inhibitors. In some embodiments, the presently disclosed subject matter relates to using PAS as a cancer vaccine to induce both a humoral and a cellular immune response.

## II. Definitions

The terminology used herein is for the purpose of describing particular embodiments only and is not intended to be limiting of the presently disclosed subject matter.

While the following terms are believed to be well understood by one of ordinary skill in the art, the following definitions are set forth to facilitate explanation of the presently disclosed subject matter.

All technical and scientific terms used herein, unless otherwise defined below, are intended to have the same meaning as commonly understood by one of ordinary skill in the art. References to techniques employed herein are intended to refer to the techniques as commonly understood in the art, including variations on those techniques or substitutions of equivalent techniques that would be apparent to one of skill in the art. While the following terms are believed to be well

understood by one of ordinary skill in the art, the following definitions are set forth to facilitate explanation of the presently disclosed subject matter.

In describing the presently disclosed subject matter, it will be understood that a number of techniques and steps are disclosed. Each of these has individual benefit and each can also be used in conjunction with one or more, or in some cases all, of the other disclosed techniques.

Accordingly, for the sake of clarity, this description will refrain from repeating every possible combination of the individual steps in an unnecessary fashion. Nevertheless, the specification and claims should be read with the understanding that such combinations are entirely within the scope of the presently disclosed and claimed subject matter.

Following long-standing patent law convention, the terms “a”, “an”, and “the” refer to “one or more” when used in this application, including in the claims. For example, the phrase “an inhibitor” refers to one or more inhibitors, including a plurality of the same inhibitor. Similarly, the phrase “at least one”, when employed herein to refer to an entity, refers to, for example, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 35, 40, 45, 50, 75, 100, or more of that entity, including but not limited to whole number values between 1 and 100 and greater than 100.

Unless otherwise indicated, all numbers expressing quantities of ingredients, reaction conditions, and so forth used in the specification and claims are to be understood as being modified in all instances by the term “about”. The term “about”, as used herein when referring to a measurable value such as an amount of mass, weight, time, volume, concentration, or percentage, is meant to encompass variations of in some embodiments  $\pm 20\%$ , in some embodiments  $\pm 10\%$ , in some embodiments  $\pm 5\%$ , in some embodiments  $\pm 1\%$ , in some embodiments  $\pm 0.5\%$ , and in some embodiments  $\pm 0.1\%$  from the specified amount, as such variations are appropriate to perform the disclosed methods and/or employ the disclosed compositions. Accordingly, unless indicated to the contrary, the numerical parameters set forth in this specification and attached claims are approximations that can vary depending upon the desired properties sought to be obtained by the presently disclosed subject matter.

As used herein, the term “and/or” when used in the context of a list of entities, refers to the entities being present singly or in combination. Thus, for

example, the phrase “A, B, C, and/or D” includes A, B, C, and D individually, but also includes any and all combinations and subcombinations of A, B, C, and D.

As used herein, the terms “antibody” and “antibodies” refer to proteins comprising one or more polypeptides substantially encoded by immunoglobulin genes or fragments of immunoglobulin genes. Immunoglobulin genes typically include the kappa ( $\kappa$ ), lambda ( $\lambda$ ), alpha ( $\alpha$ ), gamma ( $\gamma$ ), delta ( $\delta$ ), epsilon ( $\epsilon$ ), and mu ( $\mu$ ) constant region genes, as well as myriad immunoglobulin variable region genes. Light chains are classified as either  $\kappa$  or  $\lambda$ . In mammals, heavy chains are classified as  $\gamma$ ,  $\mu$ ,  $\alpha$ ,  $\delta$ , or  $\epsilon$ , which in turn define the immunoglobulin classes, IgG, IgM, IgA, IgD, and IgE, respectively. Other species have other light and heavy chain genes (e.g., certain avians produced what is referred to as IgY, which is an immunoglobulin type that hens deposit in the yolks of their eggs), which are similarly encompassed by the presently disclosed subject matter. In some embodiments, the term “antibody” refers to an antibody that binds specifically to an epitope that is present on a gastrin gene product, including but not limited to an epitope that is present within an amino acid sequence as set forth in SEQ ID NO: 1 or SEQ ID NO: 2 or SEQ ID NO: 3 or SEQ ID NO: 4.

A typical immunoglobulin (antibody) structural unit is known to comprise a tetramer. Each tetramer is composed of two identical pairs of polypeptide chains, each pair having one “light” chain (average molecular weight of about 25 kilodalton (kDa)) and one “heavy” chain (average molecular weight of about 50-70 kDa). The two identical pairs of polypeptide chains are held together in dimeric form by disulfide bonds that are present within the heavy chain region. The N-terminus of each chain defines a variable region of about 100 to 110 or more amino acids primarily responsible for antigen recognition. The terms variable light chain ( $V_L$ ) and variable heavy chain ( $V_H$ ) refer to these light and heavy chains, respectively.

Antibodies typically exist as intact immunoglobulins or as a number of well-characterized fragments that can be produced by digestion with various peptidases. For example, digestion of an antibody molecule with papain cleaves the antibody at a position N-terminal to the disulfide bonds. This produces three fragments: two identical “Fab” fragments, which have a light chain and the N-terminus of the heavy chain, and an “Fc” fragment that includes the C-terminus of the heavy chains held together by the disulfide bonds. Pepsin, on the other hand,

digests an antibody C-terminal to the disulfide bond in the hinge region to produce a fragment known as the “F(ab)<sub>2</sub>” fragment, which is a dimer of the Fab fragments joined by the disulfide bond. The F(ab)<sub>2</sub> fragment can be reduced under mild conditions to break the disulfide linkage in the hinge region, thereby converting the

5 F(ab)<sub>2</sub> dimer into two Fab’ monomers. The Fab’ monomer is essentially an Fab fragment with part of the hinge region (see e.g., Paul, 1993 for a more detailed description of other antibody fragments). With respect to these various fragments, Fab, F(ab)<sub>2</sub>, and Fab’ fragments include at least one intact antigen binding domain, and thus are capable of binding to antigens.

10 While various antibody fragments are defined in terms of the digestion of an intact antibody, one of skill will appreciate that various of these fragments (including, but not limited to Fab’ fragments) can be synthesized de novo either chemically or by utilizing recombinant DNA methodology. Thus, the term “antibody” as used herein also includes antibody fragments either produced by the

15 modification of whole antibodies or synthesized de novo using recombinant DNA methodologies. In some embodiments, the term “antibody” comprises a fragment that has at least one antigen binding domain.

Antibodies can be polyclonal or monoclonal. As used herein, the term “polyclonal” refers to antibodies that are derived from different antibody-producing

20 cells (e.g., B cells) that are present together in a given collection of antibodies. Exemplary polyclonal antibodies include but are not limited to those antibodies that bind to a particular antigen and that are found in the blood of an animal after that animal has produced an immune response against the antigen. However, it is understood that a polyclonal preparation of antibodies can also be prepared

25 artificially by mixing at least non-identical two antibodies. Thus, polyclonal antibodies typically include different antibodies that are directed against (i.e., binds to) different epitopes (sometimes referred to as an “antigenic determinant” or just “determinant”) of any given antigen.

As used herein, the term “monoclonal” refers to a single antibody species

30 and/or a substantially homogeneous population of a single antibody species. Stated another way, “monoclonal” refers to individual antibodies or populations of individual antibodies in which the antibodies are identical in specificity and affinity except for possible naturally occurring mutations, or post-translational modifications that can be present in minor amounts. Typically, a monoclonal

antibody (mAb) is generated by a single B cell or a progeny cell thereof (although the presently disclosed subject matter also encompasses “monoclonal” antibodies that are produced by molecular biological techniques as described herein). Monoclonal antibodies (mAbs) are highly specific, typically being directed against a single antigenic site. Furthermore, in contrast to polyclonal antibody preparations, a given mAb is typically directed against a single epitope on the antigen.

In addition to their specificity, mAbs can be advantageous for some purposes in that they can be synthesized uncontaminated by other antibodies.

The modifier “monoclonal” is not to be construed as requiring production of the antibody by any particular method, however. For example, in some embodiments, the mAbs of the presently disclosed subject matter are prepared using the hybridoma methodology first described by Kohler et al., 1975, and in some embodiments, are made using recombinant DNA methods in bacterial or eukaryotic animal or plant cells (see e.g., U.S. Patent No. 4,816,567, the entire contents of which are incorporated herein by reference). mAbs can also be isolated from phage antibody libraries using the techniques described in Clackson et al., 1991 and Marks et al., 1991, for example.

The antibodies, fragments, and derivatives of the presently disclosed subject matter can also include chimeric antibodies. As used herein in the context of antibodies, the term “chimeric”, and grammatical variants thereof, refers to antibody derivatives that have constant regions derived substantially or exclusively from antibody constant regions from one species and variable regions derived substantially or exclusively from the sequence of the variable region from another species. A particular kind of chimeric antibody is a “humanized” antibody, in which the antibodies are produced by substituting the complementarity determining regions (CDRs) of, for example, a mouse antibody, for the CDRs of a human antibody (see e.g., PCT International Patent Application Publication No. WO 1992/22653). Thus, in some embodiments, a humanized antibody has constant regions and variable regions other than the CDRs that are derived substantially or exclusively from the corresponding human antibody regions, and CDRs that are derived substantially or exclusively from a mammal other than a human.

The antibodies, fragments, and derivatives of the presently disclosed subject matter can also be single chain antibodies and single chain antibody fragments. Single-chain antibody fragments contain amino acid sequences having at least one of the variable regions and/or CDRs of the whole antibodies described herein but are lacking some or all of the constant domains of those  
5 antibodies. These constant domains are not necessary for antigen binding but constitute a major portion of the structure of whole antibodies.

Single-chain antibody fragments can overcome some of the problems associated with the use of antibodies containing a part or all of a constant domain.

10 For example, single-chain antibody fragments tend to be free of undesired interactions between biological molecules and the heavy-chain constant region, or other unwanted biological activity. Additionally, single-chain antibody fragments are considerably smaller than whole antibodies and can therefore have greater capillary permeability than whole antibodies, allowing single-chain antibody  
15 fragments to localize and bind to target antigen-binding sites more efficiently. Also, antibody fragments can be produced on a relatively large scale in prokaryotic cells, thus facilitating their production. Furthermore, the relatively small size of single-chain antibody fragments makes them less likely to provoke an immune response in a recipient than whole antibodies. The single-chain antibody  
20 fragments of the presently disclosed subject matter include but are not limited to single chain fragment variable (scFv) antibodies and derivatives thereof such as, but not limited to tandem di-scFv, tandem tri-scFv, diabodies, and triabodies, tetrabodies, miniantibodies, and minibodies.

Fv fragments correspond to the variable fragments at the N-termini of  
25 immunoglobulin heavy and light chains. Fv fragments appear to have lower interaction energy of their two chains than Fab fragments. To stabilize the association of the  $V_H$  and  $V_L$  domains, they have been linked with peptides (see Bird et al., 1988; Huston et al., 1988), disulfide bridges (Glockshuber et al., 1990), and "knob in hole" mutations (Zhu et al., 1997). ScFv fragments can be produced  
30 by methods well known to those skilled in the art (see e.g., Whitlow et al., 1991 and Huston et al., 1993).

scFv can be produced in bacterial cells such as *E. coli* or in eukaryotic cells. One potential disadvantage of scFv is the monovalency of the product, which can preclude an increased avidity due to polyvalent binding, and their short

half-life. Attempts to overcome these problems include bivalent (scFv')<sub>2</sub> produced from scFv containing an additional C-terminal cysteine by chemical coupling (Adams et al., 1993; McCartney et al., 1995) or by spontaneous site-specific dimerization of scFv containing an unpaired C-terminal cysteine residue (see  
5 Kipriyanov et al., 1995).

Alternatively, scFv can be forced to form multimers by shortening the peptide linker to 3 to 12 residues to form "diabodies" (see Holliger et al., 1993). Reducing the linker still further can result in scFv trimers ("triabodies"; see Kortt et al., 1997) and tetramers ("tetraabodies"; see Le Gall et al., 1999). Construction of  
10 bivalent scFv molecules can also be achieved by genetic fusion with protein dimerizing motifs to form "miniantibodies" (see Pack et al., 1992) and "minibodies" (see Hu et al., 1996). scFv-scFv tandems ((scFv)<sub>2</sub>) can be produced by linking two scFv units by a third peptide linker (see Kurucz et al., 1995).

Bispecific diabodies can be produced through the non-covalent association  
15 of two single chain fusion products consisting of V<sub>H</sub> domain from one antibody connected by a short linker to the V<sub>L</sub> domain of another antibody (see Kipriyanov et al., 1998). The stability of such bispecific diabodies can be enhanced by the introduction of disulfide bridges or "knob in hole" mutations as described hereinabove or by the formation of single chain diabodies (scDb) wherein two  
20 hybrid scFv fragments are connected through a peptide linker (see Kontermann et al., 1999).

Tetravalent bispecific molecules can be produced, for example, by fusing an scFv fragment to the CH<sub>3</sub> domain of an IgG molecule or to a Fab fragment through the hinge region (see Coloma et al., 1997). Alternatively, tetravalent  
25 bispecific molecules have been created by the fusion of bispecific single chain diabodies (see Alt et al., 1999). Smaller tetravalent bispecific molecules can also be formed by the dimerization of either scFv-scFv tandems with a linker containing a helix-loop-helix motif (DiBi miniantibodies; see Muller et al., 1998) or a single chain molecule comprising four antibody variable domains (V<sub>H</sub> and V<sub>L</sub>) in an  
30 orientation preventing intramolecular pairing (tandem diabody; see Kipriyanov et al., 1999).

Bispecific F(ab')<sub>2</sub> fragments can be created by chemical coupling of Fab' fragments or by heterodimerization through leucine zippers (see Shalaby et al.,

1992; Kostelny et al., 1992). Also available are isolated V<sub>H</sub> and V<sub>L</sub> domains (see U.S. Patent Nos. 6,172,197; 6,248,516; and 6,291,158).

The presently disclosed subject matter also includes functional equivalents of anti-gastrin antibodies. As used herein, the phrase “functional equivalent” as it refers to an antibody refers to a molecule that has binding characteristics that are comparable to those of a given antibody. In some embodiments, chimerized, humanized, and single chain antibodies, as well as fragments thereof, are considered functional equivalents of the corresponding antibodies upon which they are based.

Functional equivalents also include polypeptides with amino acid sequences substantially the same as the amino acid sequence of the variable or hypervariable regions of the antibodies of the presently disclosed subject matter. As used herein with respect to amino acid sequences, the phrase “substantially the same” refers to a sequence with, in some embodiments at least 80%, in some embodiments at least 85%, in some embodiments at least about 90%, in some embodiments at least 91%, in some embodiments at least 92%, in some embodiments at least 93%, in some embodiments at least 94%, in some embodiments at least 95%, in some embodiments at least 96%, in some embodiments at least 97%, in some embodiments at least 98%, and in some embodiments at least about 99% sequence identity to another amino acid sequence, as determined by the FASTA search method in accordance with Pearson & Lipman, 1988. In some embodiments, the percent identity calculation is performed over the full length of the amino acid sequence of an antibody of the presently disclosed subject matter.

Functional equivalents further include fragments of antibodies that have the same or comparable binding characteristics to those of a whole antibody of the presently disclosed subject matter. Such fragments can contain one or both Fab fragments, the F(ab')<sub>2</sub> fragment, the F(ab') fragment, an Fv fragment, or any other fragment that includes at least one antigen binding domain. In some embodiments, the antibody fragments contain all six CDRs of a whole antibody of the presently disclosed subject matter, although fragments containing fewer than all of such regions, such as three, four, or five CDRs, can also be functional equivalents as defined herein. Further, functional equivalents can be or can combine members of any one of the following immunoglobulin classes: IgG, IgM,

IgA, IgD, and IgE, and the subclasses thereof, as well as other subclasses as might be appropriate for non-mammalian subjects (e.g., IgY for chickens and other avian species).

5 Functional equivalents further include peptides that have the same or comparable characteristics to those of a whole protein of the presently disclosed subject matter. Such peptides can contain one or more antigens of the whole protein, which can elicit an immune response in the treated subject.

10 Functional equivalents also include aptamers and other non-antibody molecules, provided that such molecules have the same or comparable binding characteristics to those of a whole antibody of the presently disclosed subject matter.

The term “comprising”, which is synonymous with “including” “containing”, or “characterized by”, is inclusive or open-ended and does not exclude additional, unrecited elements and/or method steps. “Comprising” is a term of art that means  
15 that the named elements and/or steps are present, but that other elements and/or steps can be added and still fall within the scope of the relevant subject matter.

As used herein, the phrase “consisting of” excludes any element, step, or ingredient not specifically recited. It is noted that, when the phrase “consists of” appears in a clause of the body of a claim, rather than immediately following the  
20 preamble, it limits only the element set forth in that clause; other elements are not excluded from the claim as a whole.

As used herein, the phrase “consisting essentially of” limits the scope of the related disclosure or claim to the specified materials and/or steps, plus those that do not materially affect the basic and novel characteristic(s) of the disclosed  
25 and/or claimed subject matter. For example, a pharmaceutical composition can “consist essentially of” a pharmaceutically active agent or a plurality of pharmaceutically active agents, which means that the recited pharmaceutically active agent(s) is/are the only pharmaceutically active agent(s) present in the pharmaceutical composition. It is noted, however, that carriers, excipients, and/or  
30 other inactive agents can and likely would be present in such a pharmaceutical composition and are encompassed within the nature of the phrase “consisting essentially of”.

With respect to the terms “comprising”, “consisting of”, and “consisting essentially of”, where one of these three terms is used herein, the presently

disclosed and claimed subject matter can include the use of either of the other two terms. For example, in some embodiments, the presently disclosed subject matter relates to compositions comprising antibodies. It would be understood by one of ordinary skill in the art after review of the instant disclosure that the presently disclosed subject matter thus encompasses compositions that consist essentially of the antibodies of the presently disclosed subject matter, as well as compositions that consist of the antibodies of the presently disclosed subject matter.

As used herein, the phrase “immune cell” refers to the cells of a mammalian immune system including but not limited to antigen presenting cells, B cells, basophils, cytotoxic T cells, dendritic cells, eosinophils, granulocytes, helper T cells, leukocytes, lymphocytes, macrophages, mast cells, memory cells, monocytes, natural killer cells, neutrophils, phagocytes, plasma cells and T cells.

As used herein, the phrase “immune response” refers to immunities including but not limited to innate immunity, humoral immunity, cellular immunity, immunity, inflammatory response, acquired (adaptive) immunity, autoimmunity, and/or overactive immunity.

As used herein, the phrase “gastrin-associated cancer” is a tumor or cancer or a cell therefrom in which a gastrin gene product acts as a trophic hormone to stimulate tumor and/or cancer cell growth both when exogenously applied to tumor and/or cancer cells and also in vivo through autocrine and paracrine mechanisms. Exemplary gastrin-associated cancers include pancreatic cancer, gastric cancer, gastroesophageal cancer, and colorectal cancer.

The term “polynucleotide” as used herein includes but is not limited to DNA, RNA, complementary DNA (cDNA), messenger RNA (mRNA), ribosomal RNA (rRNA), small hairpin RNA (shRNA), small nuclear RNA (snRNA), short nucleolar RNA (snoRNA), microRNA (miRNA), genomic DNA, synthetic DNA, synthetic RNA, and/or tRNA.

As used herein, the phrases “single chain variable fragment”, “single-chain antibody variable fragments”, and “scFv” antibodies refer to forms of antibodies comprising the variable regions of only the heavy and light chains, connected by a linker peptide.

The term “subject” as used herein refers to a member of any invertebrate or vertebrate species. Accordingly, the term “subject” is intended to encompass in

some embodiments any member of the Kingdom Animalia including, but not limited to the phylum Chordata (e.g., members of Classes Osteichthytes (bony fish), Amphibia (amphibians), Reptilia (reptiles), Aves (birds), and Mammalia (mammals), and all Orders and Families encompassed therein.

5           The compositions and methods of the presently disclosed subject matter are particularly useful for warm-blooded vertebrates. Thus, in some embodiments the presently disclosed subject matter concerns mammals and birds. More particularly provided are compositions and methods derived from and/or for use in mammals such as humans and other primates, as well as those mammals of  
10 importance due to being endangered (such as Siberian tigers), of economic importance (animals raised on farms for consumption by humans) and/or social importance (animals kept as pets or in zoos) to humans, for instance, carnivores other than humans (such as cats and dogs), swine (pigs, hogs, and wild boars), ruminants (such as cattle, oxen, sheep, giraffes, deer, goats, bison, and camels),  
15 rodents (such as mice, rats, and rabbits), marsupials, and horses. Also provided is the use of the disclosed methods and compositions on birds, including those kinds of birds that are endangered, kept in zoos, as well as fowl, and more particularly domesticated fowl, e.g., poultry, such as turkeys, chickens, ducks, geese, guinea fowl, and the like, as they are also of economic importance to humans. Thus, also  
20 provided is the use of the disclosed methods and compositions on livestock, including but not limited to domesticated swine (pigs and hogs), ruminants, horses, poultry, and the like.

As used herein, the terms "T cell" and "T lymphocyte" are interchangeable and used synonymously. Examples include, but are not limited to, naive T cells,  
25 central memory T cells, effector memory T cells, cytotoxic T cells, T regulatory cells, helper T cells and combinations thereof.

As used herein, the phrase "therapeutic agent" refers to an agent that is used to, for example, treat, inhibit, prevent, mitigate the effects of, reduce the severity of, reduce the likelihood of developing, slow the progression of, and/or  
30 cure, a disease or disorder such as but not limited to a gastrin-associated tumor and/or cancer.

The terms "treatment" and "treating" as used herein refer to both therapeutic treatment and prophylactic or preventative measures, wherein the object is to prevent or slow down (lessen) the targeted pathologic condition,

prevent the pathologic condition, pursue or obtain beneficial results, and/or lower the chances of the individual developing a condition, disease, or disorder, even if the treatment is ultimately unsuccessful. Those in need of treatment include those already with the condition as well as those prone to have or predisposed to having  
5 a condition, disease, or disorder, or those in whom the condition is to be prevented.

As used herein, the term "tumor" refers to any neoplastic cell growth and/or proliferation, whether malignant or benign, and all pre-cancerous and cancerous cells and tissues the initiation, progression, growth, maintenance, of metastasis of  
10 which is directly or indirectly influenced by autocrine and/or paracrine action of gastrin. The terms "cancer" and "tumor" are used interchangeably herein and can refer to both primary and metastasized solid tumors and carcinomas of any tissue in a subject, including but not limited to pancreatic cancer, gastric cancer, gastroesophageal cancer, and colorectal cancer (referred to herein collectively as  
15 "gastrin-associated" tumors and/or cancers). As used herein, the terms "cancer and "tumor" are also intended to refer to multicellular tumors as well as individual neoplastic or pre-neoplastic cells. In some embodiments, a cancer or a tumor comprises a cancer or tumor of an epithelial tissue such as, but not limited to a carcinoma. In some embodiments, a tumor is an adenocarcinoma, which in some  
20 embodiments is an adenocarcinoma of the pancreas, liver, stomach, esophagus, colon, or rectum, and/or a metastatic cell derived therefrom. In some embodiments, a tumor and/or a cancer is associated with fibrosis, meaning that as a direct or indirect consequence of the development of the tumor and/or the cancer, one or more regions of fibrosis typically develop in the area of the tumor  
25 and/or the cancer.

All genes, gene names, and gene products disclosed herein are intended to correspond to homologs and/or orthologs from any species for which the compositions and methods disclosed herein are applicable. Thus, the terms include, but are not limited to genes and gene products from humans and mice. It  
30 is understood that when a gene or gene product from a particular species is disclosed, this disclosure is intended to be exemplary only, and is not to be interpreted as a limitation unless the context in which it appears clearly indicates. Thus, for example, for the gastrin gene products presented in GENBANK® biosequence database Accession No: NP\_000796.1, the human amino acid

sequence disclosed is intended to encompass homologous and orthologous gastrin genes and gene products from other animals including, but not limited to other mammals, fish, amphibians, reptiles, and birds. Also encompassed are any and all nucleotide sequences that encode the disclosed amino acid sequences, including but not limited to those disclosed in the corresponding GENBANK®

5 entries (i.e., NP\_000796.1 and NM\_000805.4, respectively).

### III. Development of an Anti-Gastrin Vaccine

A unique approach to tumor-associated antigen-based vaccines has been undertaken by exploiting the involvement of gastrin as a key autocrine and paracrine growth factor for PC and other gastrointestinal cancers. This approach involves neutralizing gastrin's trophic effects through an active humoral immunity against gastrin-17 (G17) with a compound called "Polyclonal Antibody Stimulator" or PAS. PAS comprises a 9-amino acid gastrin epitope derived from the N-terminal sequence of G17 that is identical in mice and humans and conjugated the same to diphtheria toxoid (DT) through a linker molecule. This compound has been formulated in an oil-based adjuvant to create PAS. PAS stimulates the production of specific and high-affinity polyclonal anti-G17 antibodies, whereas DT alone had no effect (Watson et al., 1996). Preclinical studies were performed in several animal models with gastrointestinal (GI) cancer that are gastrin responsive, including colon cancer (Singh et al., 1986; Smith & Solomon, 1988; Upp et al., 1989; Smith et al., 1996b), gastric cancer (Smith et al., 1998a; Watson et al., 1989), lung cancer (Rehfeld et al., 1989), and pancreatic cancer (Smith et al., 1990; Smith et al., 1991; Smith et al., 1995; Segal et al., 2014).

10  
15  
20

In animals, PAS-generated anti-G17 antibodies have been shown to reduce the growth and metastasis of gastrointestinal tumors (Watson et al., 1995; Watson et al., 1996; Watson et al., 1999). Both active immunizations with PAS and passive immunization with PAS-generated anti-G17 antibodies (Watson et al., 1999) have been shown to inhibit tumor growth in animal models of GI cancers (Watson et al., 1998; Watson et al., 1999).

25

A prospective, randomized, double-blind, placebo controlled group sequential trial of PAS for the treatment of advanced pancreatic cancer was conducted in human subjects with advanced pancreatic cancer. The primary objective of this study was to compare the effect of monotherapy PAS to placebo on patient survival. Overall, 65% of patients generated an antibody response to

30

PAS. Subjects in the PAS treated group survived longer than the placebo group (average 150 days vs. 84 days, respectively;  $p = 0.016$ ). However, when patients were stratified based upon whether they generated an immune response to PAS (i.e., PAS responders) or did not generate an immune response (i.e., PAS non-responders), survival was significantly increased ( $p = 0.003$ ) in the responders.

To date, 469 patients with PDAC have been treated with PAS in clinical trials. Approximately 90% of these subjects elicited a protective antibody titer. Pooled data from four of the studies (PC1, PC2, PC3, and PC6; Brett et al., 2002; Gilliam et al., 2012) showed that responder patients had a significant increase in median survival days (191 days) compared with non-responder patients (106 days;  $p = 0.0003$ ). Importantly, none of these patients exhibited any evidence of an autoimmune-type reaction that negatively influenced the normal level and function of gastrin.

PAS is known to elicit a B cell response with generation of neutralizing antibodies to gastrin. However, clinical studies demonstrated that there were also long-term survivors, which suggested that additional mechanisms of anti-tumor immunity could also have been responsible.

#### IV. PAS + Check Point Inhibitor Combination Therapies

##### IV.A. Generally

PAS administration generates a humoral antibody response and a cellular immune response to the onco-fetal protein gastrin, which is inappropriately expressed (i.e., overexpressed) in PDAC. This inappropriate gastrin expression in PDAC causes an autocrine and paracrine growth-promoting effect. PAS administration with its subsequent generation of humoral antibodies to gastrin, will help eliminate this pathological growth-promoting effect. In addition, a PAS-mediated humoral immune response to gastrin will also help reverse the promotion of angiogenesis, circumvention of apoptosis, increase in cell migration, and increase in invasive enzyme expression that are associated with inappropriate gastrin expression (Watson et al., 2006).

PAS comprises 3 subunits. The first subunit is a gastrin epitope, which in some embodiments is a peptide that comprises amino-terminal amino acid residues 1-9 of human G17 with a carboxy-terminal seven (7) amino acid spacer sequence that terminates in a cysteine residue. An exemplary sequence for this first subunit is EGPWLEEEE (SEQ ID NO: 2).

The second subunit of PAS is a linker that covalently links the first subunit to the third subunit. In some embodiments, the linker is a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester (eMCS), although any linker, including non-peptide linkers such as but not limited to polyethylene glycol linkers, could be used for this purpose.

5

The third subunit of PAS is a diphtheria toxoid, which is used as a carrier protein to enhance a humoral response directed against the first subunit (in particular, a humoral response directed against the gastric epitope). It is noted, however, that in some embodiments carrier proteins other than diphtheria toxoid could be employed such as but not limited to tetanus toxoid or bovine serum albumin.

10

In some embodiments, the three subunits are formulated for intramuscular (i.m.) injection, and the formulation has excellent physical, chemical, and pharmaceutical properties. PAS also elicits a B cell response with generation of neutralizing antibodies to gastrin. This is relevant in PDAC, since gastrin increases cellular proliferation, promotes angiogenesis, facilitates circumvention of apoptosis, increases cell migration, increases invasive enzyme expression, and is associated with fibrosis on the PDAC microenvironment. In accordance with some aspects of the presently disclosed subject matter, if the actions of gastrin are blocked, CD8<sup>+</sup> lymphocytes influx into PDAC, rendering it more likely to respond to immune checkpoint therapy (e.g., a T-cell mediated response). As disclosed herein. PAS also elicits a T cell response and CD8<sup>+</sup> cells that produce cytokines in response to gastrin stimulation.

15

20

PAS can be designed as a therapeutic vaccine or immunotherapeutic. PAS-induced humoral antibodies are highly specific and typically characterized by high affinity to G17 and Gly-G17.

25

PAS consistently induced therapeutically efficacious levels of antibodies that are directed against the hormone G17 and its precursor G17-Gly. Twenty-two clinical studies have been completed with a total of 1,542 patients. Importantly, treatment with PAS demonstrated an excellent safety and tolerability profile, and further resulted in a survival benefit in colorectal, gastric, and pancreatic cancer patients. Used as a monotherapy, an exemplary dose and schedule were identified to be 250  $\mu$ g/0.2 ml dosed at 0, 1, and 3 weeks.

30

Taken collectively, the conclusions that can be made from the 22 studies and >1,500 patients treated with PAS are as follows:

- 5 (a) Nonclinical data demonstrated both in vitro and in vivo anti-tumor efficacy of anti-G17 antibodies, with a wide therapeutic index in various cancer models, including human pancreatic cancer models;
- (b) PAS can be administered at very safe and well tolerated doses, and effectively causes a B cell antibody response to gastrin with no adverse reactions and no induction of negative autoimmune effects; and
- 10 (c) Numerous clinical studies have demonstrated a survival benefit across gastrointestinal tumors, including pancreatic cancer, and a correlation between generation of anti-G17 antibody response and improved survival.

However, clinical studies have also demonstrated that there were long term  
15 survivors, which suggested that additional therapeutic benefits also resulted from PAS administration. While not wishing to be bound by any particular theory of operation, it is possible that PAS treatment might have also induced a T cell immune response characterized by activation of cytotoxic T cells and memory cells in these subjects.

20 The use of check point inhibitors in PDAC has been limited, and only modest results have been demonstrated. CTLA-4, PD-1, and PD-L1 inhibitors have been investigated in patients with locally advanced or metastatic PDAC in a number of clinical trials (Royal et al., 2010; Brahmer et al., 2012; Segal et al., 2014). Durvalumab (MEDI 4736) has generated a partial response rate of 8% in a  
25 preliminary analysis that was presented at the American Society of Clinical Oncology in 2014 (Segal et al., 2014).

It is not known why pancreatic tumors have proven to be relatively resistant to monoclonal antibody (mAb)-based immunotherapeutics that target check point inhibitors. The failure of anti-immune checkpoint inhibitor immunotherapeutics  
30 might be related to massive infiltration of immunosuppressive leukocytes, which could actually suppress an anti-tumor immune response. This might be related to expression of the RAS oncogene, which drives an inflammatory program that helps establish immune privilege in the pancreatic tumor microenvironment (Zheng et al., 2013).

#### IV.B. Check-Point Inhibitors Generate a Cellular Cytotoxic T Cell Response

The immune system has the key central role in differentiating between self (i.e., “normal” cells) and “non-self” or “foreign” cells, whether this be bacteria found in infections or altered and/or transformed cells that are typically found in tumors and cancers. With respect to this process, the immune system requires exquisite regulation to “turn off” when it recognizes “self” so it does not mount an autoimmune reaction to normal body cells while also needing to “turn on” when it recognizes foreign and/or transformed cells. In fact, cell transformation is a relatively common event, but the immune system keeps efficient and effective surveillance on this to effectively and efficiently eliminate foreign and/or transformed cells. Tumor formation and cancer are relatively rare events, since it is only on rare occasions that transformed cells develop mechanisms where they can subvert normal immune system checkpoints, resulting in the immune system not recognizing them as transformed, thus avoiding immune attack by, for example, cytotoxic T lymphocyte attachment to the transformed tumor cells.

Programmed cell Death protein 1 (PD-1; also known as CD279) is a cell surface receptor that serves as a checkpoint that is found on the surface of T cells. PD-1 appears to function as an “off switch” so that T cells do not mount a cytotoxic T lymphocyte attack against normal cells in the body. Human PD-1 is produced as a 288 amino acid precursor protein, an exemplary amino acid sequence for which is provided as Accession No. NP\_005009.2 of the GENBANK® biosequence database (encoded by GENBANK® Accession No. NM\_005018.2). The 288 amino acid precursor includes a signal peptide as amino acids 1-20 of GENBANK® Accession No. NP\_005009.2, which is removed to produce the mature peptide (i.e., amino acids 21-288 of GENBANK® Accession No. NP\_005009.2). The amino acid sequences of orthologs of human PD-1 from other species that are present in the GENBANK® biosequence database include, but are not limited to Accession Nos. NP\_032824.1 (*Mus musculus*), NP\_001100397.1 (*Rattus norvegicus*), NP\_001301026.1 (*Canis lupus familiaris*), NP\_001138982.1 (*Felis catus*), NP\_001076975.1 (*Bos taurus*), XP\_004033550.1 (*Gorilla gorilla gorilla*), NP\_001107830.1 (*Macaca mulatta*), NP\_001271065.1 (*Macaca fascicularis*), and XP\_003776178.1 (*Pongo abelii*).

The ligand for the PD-1 receptor is referred to as the Programmed death-ligand 1 (PD-L1). It is also known as CD274 or the B7 homolog 1 (B7-H1). In humans, there are several isoforms of the PD-L1 protein, the largest of which (isoform a) is produced as a 290 amino acid precursor. An exemplary amino acid sequence for a human PD-L1 precursor a protein is provided as Accession No. NP\_054862.1 of the GENBANK® biosequence database (encoded by GENBANK® Accession No. NM\_014143.3). The 290 amino acid precursor includes a signal peptide as amino acids 1-18 of GENBANK® Accession No. NP\_054862.1, which is removed to produce the mature peptide (i.e., amino acids 19-290 of GENBANK® Accession No. NP\_054862.1). The amino acid sequences of orthologs of human PD-L1 from other species that are present in the GENBANK® biosequence database include, but are not limited to Accession Nos. NP\_068693.1 (*Mus musculus*), NP\_001178883.1 (*Rattus norvegicus*), NP\_001278901.1 (*Canis lupus familiaris*), XP\_006939101.1 (*Felis catus*), NP\_001156884.1 (*Bos taurus*), XP\_018889139.1 (*Gorilla gorilla gorilla*), NP\_001077358.1 (*Macaca mulatta*), XP\_015292694.1 (*Macaca fascicularis*), and XP\_009454557.1 (*Pongo troglodytes*).

PD-L1 is found mainly on normal cells, and when a PD-1 expressing T cell binds to a normal cell with PD-L1, it signals to the T cell that this is a normal cell (i.e., “self”) and a cytotoxic T cell response against the (normal) cell is suppressed. Most transformed cells are routinely eliminated since they typically do not express PD-L1, meaning that a PD-1 expressing T cell would not be “shut down” but rather “activated” when encountering such a cell, thereby eliminating that transformed cell. However, on rare occasions, the transformed cell does expresses the PD-L1 ligand, resulting in a shutdown of a T cell response to the transformed cell. Hence, transformed cells that express PD-L1 can evade cytotoxic T cell responses. When this occurs, the unrecognized transformed cell can expand, acquire additional mutations, and grow into a malignant, metastatic tumor.

Inhibition of the PD-1/PD-L1 checkpoint (referred to as “immune checkpoint inhibitors”) can interfere with PD-1/PD-L1 binding, thereby allowing T lymphocytes to recognize tumor and/or cancer cells as non-self, resulting in cytotoxic T lymphocyte response against the tumor and/or cancer cells. This can be accomplished by drugs that either target PD-1 on T cells or PD-L1 on tumor

and/or cancer cells to effectively block PD-1/PD-L1 interactions. Critical to this process are at least two requirements. First, the immune checkpoint inhibitors must get to the site of the tumor and/or cancer to block any interaction between PD-1 and PD-L1. Second, the tumor and/or cancer itself must be accessible to  
5 cytotoxic T cells.

Another checkpoint protein is the cytotoxic T-lymphocyte antigen 4 (CTLA-4; also known as CD152) protein. Like PD-1, CTLA-4 is a cell surface receptor that can downregulate immune responses. T<sub>regs</sub> express CTLA-4, as do activated T cells. When the CTLA-4 receptor binds to CD80 or CD86 present on the surface  
10 of antigen-presenting cells (APCs), like PD-1 it functions as an “off switch” with respect to immune responses.

The human CTLA4-TM isoform is a 223 amino acid precursor protein that has the amino acid sequence set forth in GENBANK® Accession No. NP\_005205.2 (encoded by GENBANK® Accession No. NM\_005214.4). This  
15 protein includes a 35 amino acid signal peptide, that when removed generates the 188 amino acid mature peptide. The amino acid sequences of orthologs of human CTLA-4 from other species that are present in the GENBANK® biosequence database include, but are not limited to Accession Nos. NP\_033973.2 (*Mus musculus*), NP\_113862.1 (*Rattus norvegicus*), NP\_001003106.1 (*Canis lupus familiaris*), NP\_001009236.1 (*Felis catus*), NP\_776722.1 (*Bos taurus*),  
20 XP\_004033133.1 (*Gorilla gorilla gorilla*), XP\_009181095.2 (*Macaca mulatta*), XP\_005574073.1 (*Macaca fascicularis*), and XP\_526000.1 (*Pan troglodytes*).

As such, in some embodiments the presently disclosed subject matter pertains to the administration of PAS with one or more immune check point  
25 inhibitors. More particularly, in some embodiments the presently disclosed subject matter relates to use of immune checkpoint inhibitors that target CTLA-4, PD-1, and/or PD-L1. Exemplary compounds that inhibit these immune checkpoint inhibitors include the following. For CTLA-4: Ipilimumab (YERVOY® brand; Bristol-Myers Squibb, New York, New York) and Tremelimumab (formerly  
30 Ticilimumab; Medimmune, LLC, Gaithersburg, Maryland). For PD-1: Nivolumab (OPDIVO® brand; Bristol-Myers Squibb, New York, New York), Pidilizumab (Medivation, San Francisco, California), Pembrolizumab (KEYTRUDA® brand; Merck & Co., Inc., Kenilworth, New Jersey), MEDI0680 (AMP514; Medimmune, LLC, Gaithersburg, Maryland), and AUNP-12 (Aurigene Discovery Technologies

Limited/Laboratoires Pierre Fabre SA). For PD-L1: BMS-936559/MDX-1105 (Bristol Myers Squibb, New York, New York), Atezolizumab (TECENTRIQ® brand; Genentech/Roche, South San Francisco, California), Durvalumab (MEDI4736; Medimmune, LLC, Gaithersburg, Maryland), and Avelumab (BAVENCIO® brand; 5 EMD Serono, Inc., Rockland, Maryland, and Pfizer Inc., New York, New York).

Evidence strongly suggests there is more commonality rather than divergence related to efficacy and toxicity when one compares the PD-1 and PD-L1 inhibitors. In fact, in cross-trial meta-type analyses, Nivolumab, Pembrolizumab, Avelumab, Atezolizumab, and MDX1105 have been shown to 10 have very similar (but not identical) profiles with respect to toxicity and efficacy. Although affinities and current dosing regimens might differ for the various PD-1 and PD-L1 inhibitors, there is generally a very wide therapeutic window for all. Associated with this broad therapeutic window is the observation that most of these check point inhibitors do not fail in Phase I and many clinical development 15 plans are moving to flat dosing regimens rather than metered dosing.

Although the drugs that target PD-1 and PD-L1 have similar modes of action, efficacy profiles, and toxicity profiles, in general there are some subtle differences between them. Avelumab might have some advantage over other PD-L1 targeted drugs due to capability to complement patent applications-derived B 20 cell responses with an antibody-dependent cell-mediated cytotoxicity (ADCC) response. Avelumab also has a native Fc receptor and therefore can elicit a “normal” ADCC response, whereas Atezolizumab has modifications in the Fc region that might be expected to reduce the ADCC response (at least in humans).

Another difference to note in comparing different PD-1 and PD-L1 targeted 25 drugs is the fact that some are humanized mAbs while others are fully human mAbs. Humanized mAbs might be expected to be characterized by an increased likelihood of inducing “allergic” type reactions compared to fully human mAbs when the humanized mAbs are administered to humans.

## V. Compositions

### V.A. Pharmaceutical Compositions

 30

In some embodiments, the presently disclosed subject matter provides pharmaceutical compositions that in some embodiments can be employed in the methods of the presently disclosed subject matter.

As used herein, a “pharmaceutical composition” refers to a composition that is to be employed as part of a treatment or other method wherein the pharmaceutical composition will be administered to a subject in need thereof. In some embodiments, a subject in need thereof is a subject with a tumor and/or a cancer at least one symptom, characteristic, or consequence of which is expected to be ameliorated at least in part due to a biological activity of the pharmaceutical composition acting directly and/or indirectly on the tumor and/or the cancer and/or a cell associated therewith.

Techniques for preparing pharmaceutical compositions are known in the art, and in some embodiments pharmaceutical compositions are formulated based on the subject to which the pharmaceutical compositions are to be administered. For example, in some embodiments a pharmaceutical composition is formulated for use in a human subject. Thus, in some embodiments a pharmaceutical composition is pharmaceutically acceptable for use in a human.

The pharmaceutical compositions of the presently disclosed subject matter in some embodiments comprise a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor; and an immune checkpoint inhibitor. In some embodiments, the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody. In some embodiments, the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4). In some embodiments, the glutamic acid residue an amino acid position 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier, optionally wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier via a linker, optionally wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.

In some embodiments, the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and

10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

Pharmaceutical compositions of the presently disclosed subject matter that are designed to elicit humoral immune responses can in some embodiments further comprise an adjuvant, optionally an oil-based adjuvant. Exemplary adjuvants include but are not limited to montanide ISA-51 (Seppic, Inc.); QS-21 (Aquila Pharmaceuticals, Inc.); Arlacel A; oleic acid; tetanus helper peptides; GM-CSF; cyclophosphamide; bacillus Calmette-Guerin (BCG); corynebacterium parvum; levamisole, azimezone; isoprinosone; dinitrochlorobenzene (DNCB); keyhole limpet hemocyanins (KLH) including Freund's adjuvant (complete and incomplete); mineral gels; aluminum hydroxide (Alum); lysolecithin; pluronic polyols; polyanions; peptides; oil emulsions; nucleic acids (e.g., dsRNA) dinitrophenol; diphtheria toxin (DT); toll-like receptor (TLR, e.g., TLR3, TLR4, TLR7, TLR8 or TLR9) agonists (e.g., endotoxins such as lipopolysaccharide (LPS); monophosphoryl lipid A (MPL); polyinosinic-polycytidylic acid (poly-ICLC/HILTONOL®; Oncovir, Inc., Washington, DC, United States of America); IMO-2055, glucopyranosyl lipid A (GLA), QS-21 – a saponin extracted from the bark of the Quillaja saponaria tree, also known as the soap bark tree or Soapbark; resiquimod (TLR7/8 agonist), CDX-1401 – a fusion protein consisting of a fully human monoclonal antibody with specificity for the dendritic cell receptor DEC-205 linked to the NY-ESO-1 tumor antigen; Juvaris' Cationic Lipid-DNA Complex; Vaxfectin; and combinations thereof.

The pharmaceutical compositions of the presently disclosed subject matter can in some embodiments comprise an immune checkpoint inhibitor. Immune checkpoint inhibitors are a class of compounds that inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1). In some embodiments, the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

In some embodiments of the presently disclosed pharmaceutical compositions, the first agent comprises an amount of a gastrin peptide

comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGW MDF (SEQ ID NO: 4) effective to induce an anti-gastrin humoral response and the second agent comprises an amount of a checkpoint inhibitor that is effective to induce or enhance a cellular immune response against a gastrin-associated tumor or cancer when administered to a subject who has gastrin-associated tumor or cancer.

In some embodiments of the presently disclosed pharmaceutical compositions, the first agent comprises one or more anti-CCK-B receptor antibodies and is present in the pharmaceutical composition in an amount sufficient to reduce or inhibit gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer when administered to a subject that has a gastrin-associated tumor or cancer.

The pharmaceutical compositions of the presently disclosed subject matter are in some embodiments employed to treat a gastrin-associated tumor and/or cancer. In some embodiments, pharmaceutical compositions of the presently disclosed subject matter are intended to treat pancreatic cancer.

#### V.B. Nucleic Acids

The term "RNA" refers to a molecule comprising at least one ribonucleotide residue. By "ribonucleotide" is meant a nucleotide with a hydroxyl group at the 2' position of a  $\beta$ -D-ribofuranose moiety. The terms encompass double stranded RNA, single stranded RNA, RNAs with both double stranded and single stranded regions, isolated RNA such as partially purified RNA, essentially pure RNA, synthetic RNA, recombinantly produced RNA, as well as altered RNA, or analog RNA, that differs from naturally occurring RNA by the addition, deletion, substitution, and/or alteration of one or more nucleotides. Such alterations can include addition of non-nucleotide material, such as to the end(s) of an siRNA or internally, for example at one or more nucleotides of the RNA. Nucleotides in the RNA molecules of the presently disclosed subject matter can also comprise non-standard nucleotides, such as non-naturally occurring nucleotides or chemically synthesized nucleotides or deoxynucleotides. These altered RNAs can be referred to as analogs or analogs of a naturally occurring RNA.

The terms “small interfering RNA”, “short interfering RNA”, “small hairpin RNA”, “siRNA”, and shRNA are used interchangeably and refer to any nucleic acid molecule capable of mediating RNA interference (RNAi) or gene silencing. See e.g., Bass, Nature 411:428-429, 2001; Elbashir et al., Nature 411:494-498, 5 2001a; and PCT International Publication Nos. WO 00/44895, WO 01/36646, WO 99/32619, WO 00/01846, WO 01/29058, WO 99/07409, and WO 00/44914. In one embodiment, the siRNA comprises a double stranded polynucleotide molecule comprising complementary sense and antisense regions, wherein the antisense region comprises a sequence complementary to a region of a target nucleic acid 10 molecule (for example, a nucleic acid molecule encoding a gastrin gene product). In another embodiment, the siRNA comprises a single stranded polynucleotide having self-complementary sense and antisense regions, wherein the antisense region comprises a sequence complementary to a region of a target nucleic acid molecule. In another embodiment, the siRNA comprises a single stranded 15 polynucleotide having one or more loop structures and a stem comprising self-complementary sense and antisense regions, wherein the antisense region comprises a sequence complementary to a region of a target nucleic acid molecule, and wherein the polynucleotide can be processed either in vivo or in vitro to generate an active siRNA capable of mediating RNAi. As used herein, 20 siRNA molecules need not be limited to those molecules containing only RNA, but further encompass chemically modified nucleotides and non-nucleotides.

The presently disclosed subject matter takes advantage of the ability of short, double stranded RNA molecules to cause the down regulation of cellular genes, a process referred to as RNA interference. As used herein, “RNA 25 interference” refers to a process of sequence-specific post-transcriptional gene silencing mediated by a small interfering RNA (siRNA). See generally Fire et al., Nature 391:806-811, 1998. The process of post-transcriptional gene silencing is thought to be an evolutionarily conserved cellular defense mechanism that has evolved to prevent the expression of foreign genes (Fire, Trends Genet 15:358- 30 363, 1999).

RNAi might have evolved to protect cells and organisms against the production of double stranded RNA (dsRNA) molecules resulting from infection by certain viruses (particularly the double stranded RNA viruses or those viruses for which the life cycle includes a double stranded RNA intermediate) or the random

integration of transposon elements into the host genome via a mechanism that specifically degrades single stranded RNA or viral genomic RNA homologous to the double stranded RNA species.

The presence of long dsRNAs in cells stimulates the activity of the enzyme  
5 Dicer, a ribonuclease III. Dicer catalyzes the degradation of dsRNA into short stretches of dsRNA referred to as small interfering RNAs (siRNA; Bernstein et al., Nature 409:363-366, 2001). The small interfering RNAs that result from Dicer-mediated degradation are typically about 21-23 nucleotides in length and contain about 19 base pair duplexes. After degradation, the siRNA is incorporated into an  
10 endonuclease complex referred to as an RNA-induced silencing complex (RISC). The RISC is capable of mediating cleavage of single stranded RNA present within the cell that is complementary to the antisense strand of the siRNA duplex. According to Elbashir et al., cleavage of the target RNA occurs near the middle of the region of the single stranded RNA that is complementary to the antisense  
15 strand of the siRNA duplex (Elbashir et al., Genes Dev 15:188-200, 2001b).

RNAi has been described in several cell type and organisms. Fire et al., 1998 described RNAi in *C. elegans*. Wianny & Zernicka-Goetz, Nature Cell Biol 2:70-75, 1999 disclose RNAi mediated by dsRNA in mouse embryos. Hammond et al., Nature 404:293-296, 2000 were able to induce RNAi in *Drosophila* cells by  
20 transfecting dsRNA into these cells. Elbashir et al. Nature 411:494-498, 2001a demonstrated the presence of RNAi in cultured mammalian cells including human embryonic kidney and HeLa cells by the introduction of duplexes of synthetic 21 nucleotide RNAs.

Other studies have indicated that a 5'-phosphate on the target-  
25 complementary strand of a siRNA duplex facilitate siRNA activity and that ATP is utilized to maintain the 5'-phosphate moiety on the siRNA (Nykanen et al., Cell 107:309-321, 2001). Other modifications that might be tolerated when introduced into an siRNA molecule include modifications of the sugar-phosphate backbone or the substitution of the nucleoside with at least one of a nitrogen or sulfur  
30 heteroatom (PCT International Publication Nos. WO 00/44914 and WO 01/68836) and certain nucleotide modifications that might inhibit the activation of double stranded RNA-dependent protein kinase (PKR), specifically 2'-amino or 2'-O-methyl nucleotides, and nucleotides containing a 2'-O or 4'-C methylene bridge (Canadian Patent Application No. 2,359,180).

Other references disclosing the use of dsRNA and RNAi include PCT International Publication Nos. WO 01/75164 (in vitro RNAi system using cells from *Drosophila* and the use of specific siRNA molecules for certain functional genomic and certain therapeutic applications); WO 01/36646 (methods for inhibiting the expression of particular genes in mammalian cells using dsRNA molecules); WO 5 99/32619 (methods for introducing dsRNA molecules into cells for use in inhibiting gene expression); WO 01/92513 (methods for mediating gene suppression by using factors that enhance RNAi); WO 02/44321 (synthetic siRNA constructs); WO 00/63364 and WO 01/04313 (methods and compositions for inhibiting the function of polynucleotide sequences); and WO 02/055692 and WO 02/055693 10 (methods for inhibiting gene expression using RNAi).

In some embodiments, the presently disclosed subject matter utilizes RNAi to at least partially inhibit expression of at least one gastrin gene product. Inhibition is preferably at least about 10% of normal expression amounts. In some 15 embodiments, the method comprises introducing an RNA to a target cell in an amount sufficient to inhibit expression of a gastrin gene product, wherein the RNA comprises a ribonucleotide sequence which corresponds to a coding strand of a gene of interest. In some embodiments, the target cell is present in a subject, and the RNA is introduced into the subject.

20 The RNA can have a double-stranded region comprising a first strand comprising a ribonucleotide sequence that corresponds to the coding strand of the gene encoding the target protein (for example, a gastrin gene product) and a second strand comprising a ribonucleotide sequence that is complementary to the first strand. The first strand and the second strand hybridize to each other to form 25 the double-stranded molecule. The double stranded region can be at least 15 basepairs in length, and in some embodiments, between 15 and 50 basepairs in length, and in some embodiments the double stranded region is between 15 and 30 basepairs in length.

In some embodiments, the RNA comprises one strand that forms a double- 30 stranded region by intramolecular self-hybridization, which is preferably complementary over at least 19 bases. In some embodiments, the RNA comprises two separate strands that form a double-stranded region by intermolecular hybridization that is complementary over at least 19 bases.

One skilled in the art will recognize that any number of suitable common techniques can be used to introduce the RNAs into a target cell. In some embodiments, a vector encoding the RNA is introduced to the target cell. For example, the vector encoding the RNA can be transfected into the target cell and the RNA is then transcribed by cellular polymerases.

In some embodiments, a recombinant virus comprising nucleic acid encoding the RNA can be produced. Introducing the RNA into a target cell then comprises infecting the target cell with the recombinant virus. Cellular polymerases transcribe the RNA resulting in expression of the RNA within the target cell. Engineering recombinant viruses is well known to those having ordinary skill in the art. One of skill would readily appreciate the multiple factors involved in selecting the appropriate virus and vector components needed to optimize recombinant virus production for use with the presently disclosed subject matter without the necessity of further detailed discussion herein. As one non-limiting example, a recombinant adenovirus can be engineered comprising DNA encoding an siRNA. The virus can be engineered to be replication deficient such that cells can be infected by the recombinant adenovirus, the siRNA transcribed, and transiently expressed in the infected target cell. Details of recombinant virus production and use can be found in PCT International Patent Application Publication No. WO 2003/006477, herein incorporated by reference in their entireties. Alternatively, a commercial kit for producing recombinant viruses can be used, such as for example, the pSILENCER ADENO 1.0-CMV SYSTEM™ brand virus production kit (Ambion, Austin, Texas, United States of America).

#### V.C. Gene Editing

Downregulation of gene products can also be accomplished using the CRISPR-Cas gene editing system as described in U.S. Patent No. 8,945,839 to Zhang and references cited therein, Al-Attar et al., 2011; Makarova et al., 2011; Le Cong et al., 2013; Seung Woo Cho et al., 2013a, b; Carroll, 2012; Gasiunas et al., 2012; Hale et al., 2012; and Jinek et al., 2012, all of which are incorporated herein by reference in their entireties. In some embodiments, the methods and compositions for use in the CRISPR-Cas gene editing system include nucleic acids that target a gastrin gene sequence, which in some embodiments is a gastrin gene sequence in a tumor and/or a cancer.

### V.D. Formulations

Compositions as described herein comprise in some embodiments a composition that includes a pharmaceutically acceptable carrier. Suitable formulations include aqueous and non-aqueous sterile injection solutions that can contain antioxidants, buffers, bacteriostats, bactericidal antibiotics, and solutes that render the formulation isotonic with the bodily fluids of the intended recipient; and aqueous and non-aqueous sterile suspensions, which can include suspending agents and thickening agents. In some embodiments, a formulation of the presently disclosed subject matter comprises an adjuvant, optionally an oil-based adjuvant.

The compositions used in the methods can take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and can contain formulatory agents such as suspending, stabilizing, and/or dispersing agents. The compositions used in the methods can take forms including, but not limited to perioral, intravenous, intraperitoneal, intramuscular, and intratumoral formulations. Alternatively or in addition, the active ingredient can be in powder form for constitution with a suitable vehicle (e.g., sterile pyrogen-free water) before use.

The formulations can be presented in unit-dose or multi-dose containers, for example sealed ampules and vials, and can be stored in a frozen or freeze-dried (lyophilized) condition requiring only the addition of sterile liquid carrier immediately prior to use.

For oral administration, the compositions can take the form of, for example, tablets or capsules prepared by a conventional technique with pharmaceutically acceptable excipients such as binding agents (e.g., pregelatinized maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g., lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g., magnesium stearate, talc or silica); disintegrants (e.g., potato starch or sodium starch glycollate); or wetting agents (e.g., sodium lauryl sulfate). The tablets can be coated by methods known in the art. For example, a neuroactive steroid can be formulated in combination with hydrochlorothiazide, and as a pH stabilized core having an enteric or delayed-release coating which protects the neuroactive steroid until it reaches the colon.

Liquid preparations for oral administration can take the form of, for example, solutions, syrups or suspensions, or they can be presented as a dry

product for constitution with water or other suitable vehicle before use. Such liquid preparations can be prepared by conventional techniques with pharmaceutically acceptable additives such as suspending agents (e.g., sorbitol syrup, cellulose derivatives or hydrogenated edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g., almond oil, oily esters, ethyl alcohol or fractionated vegetable oils); and preservatives (e.g., methyl or propyl-p-hydroxybenzoates or sorbic acid). The preparations can also contain buffer salts, flavoring, coloring, and sweetening agents as appropriate. Preparations for oral administration can be suitably formulated to give controlled release of the active compound. For buccal administration the compositions can take the form of tablets or lozenges formulated in conventional manner.

The compounds can also be formulated as a preparation for implantation or injection. Thus, for example, the compounds can be formulated with suitable polymeric or hydrophobic materials (e.g., as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives (e.g., as a sparingly soluble salt).

The compounds can also be formulated in oils that are administered as water-in-oil emulsions, oil-in-water emulsions, or water-in-oil-in water emulsions.

The compounds can also be formulated in rectal compositions (e.g., suppositories or retention enemas containing conventional suppository bases such as cocoa butter or other glycerides), creams or lotions, or transdermal patches.

In some embodiments, the presently disclosed subject matter employs a composition that is pharmaceutically acceptable for use in humans. One of ordinary skill in the art understands the nature of those components that can be present in such a composition that is pharmaceutically acceptable for use in humans and also what components should be excluded from compositions that are pharmaceutically acceptable for use in humans.

#### V.E. Doses

As used herein, the phrases "treatment effective amount", "therapeutically effective amount", "treatment amount", and "effective amount" are used interchangeably and refer to an amount of a therapeutic composition sufficient to produce a measurable response (e.g., a biologically or clinically relevant response in a subject being treated). Actual dosage levels of active ingredients in the

pharmaceutical compositions of the presently disclosed subject matter can be varied so as to administer an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular subject. The selected dosage level can depend upon the activity of the therapeutic composition, the route of administration, combination with other drugs or treatments, the severity of the condition being treated, the condition and prior medical history of the subject being treated, etc. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The potency of a therapeutic composition can vary, and therefore a "therapeutically effective amount" can vary. However, one skilled in the art can readily assess the potency and efficacy of a candidate modulator of the presently disclosed subject matter and adjust the therapeutic regimen accordingly.

After review of the disclosure herein of the presently disclosed subject matter, one of ordinary skill in the art can tailor the dosages to an individual subject, taking into account the particular formulation, method of administration to be used with the composition, and other factors. Further calculations of dose can consider subject height and weight, severity and stage of symptoms, and the presence of additional deleterious physical conditions. Such adjustments or variations, as well as evaluation of when and how to make such adjustments or variations, are well known to those of ordinary skill in the art of medicine.

Thus, in some embodiments the term "effective amount" is used herein to refer to an amount of a composition comprising an agent that provides and/or induces a humoral or cellular immune response against a gastrin peptide and or comprising a nucleic acid that inhibits expression of a gastrin gene product, a pharmaceutically acceptable salt thereof, a derivative thereof, or a combination thereof sufficient to produce a measurable anti-tumor and/or anti-cancer biological activity. Actual dosage levels of active ingredients in composition of the presently disclosed subject matter can be varied so as to administer an amount of the active compound(s) that is effective to achieve the desired response for a particular subject and/or application. The selected dosage level can depend upon a variety of factors including the activity of the composition, formulation, route of administration, combination with other drugs or treatments, severity of the condition being treated, and physical condition and prior medical history of the

subject being treated. In some embodiments, a minimal dose is administered, and dose is escalated in the absence of dose-limiting toxicity to a minimally effective amount. Determination and adjustment of an effective dose, as well as evaluation of when and how to make such adjustments, are known to those of ordinary skill  
5 in the art.

For administration of a composition as disclosed herein, conventional methods of extrapolating human dosage based on doses administered to a murine animal model can be carried out using techniques known to one of ordinary skill in the art. Drug doses can also be given in milligrams per square  
10 meter of body surface area because this method rather than body weight achieves a good correlation to certain metabolic and excretory functions. Moreover, body surface area can be used as a common denominator for drug dosage in adults and children as well as in different animal species as described by Freireich et al., 1966. Briefly, to express a mg/kg dose in any given species as the equivalent  
15 mg/m<sup>2</sup> dose, multiply the dose by the appropriate km factor. In an adult human, 100 mg/kg is equivalent to  $100 \text{ mg/kg} \times 37 \text{ kg/m}^2 = 3700 \text{ mg/m}^2$ .

For additional guidance regarding formulations and doses, see U.S. Patent Nos. 5,326,902; 5,234,933; PCT International Publication No. WO 93/25521; Remington et al., 1975; Goodman et al., 1996; Berkow et al., 1997; Speight et al.,  
20 1997; Ebadi, 1998; Duch et al., 1998; Katzung, 2001; Gerbino, 2005.

#### V.F. Routes of Administration

The presently disclosed compositions can be administered to a subject in any form and/or by any route of administration. In some embodiments, the formulation is a sustained release formulation, a controlled release formulation, or  
25 a formulation designed for both sustained and controlled release. As used herein, the term "sustained release" refers to release of an active agent such that an approximately constant amount of an active agent becomes available to the subject over time. The phrase "controlled release" is broader, referring to release of an active agent over time that might or might not be at a constant level.  
30 Particularly, "controlled release" encompasses situations and formulations where the active ingredient is not necessarily released at a constant rate, but can include increasing release over time, decreasing release over time, and/or constant release with one or more periods of increased release, decreased release, or combinations thereof. Thus, while "sustained release" is a form of "controlled

release”, the latter also includes delivery modalities that employ changes in the amount of an active agent that are delivered at different times.

In some embodiments, the sustained release formulation, the controlled release formulation, or the combination thereof is selected from the group consisting of an oral formulation, a peroral formulation, a buccal formulation, an enteral formulation, a pulmonary formulation, a rectal formulation, a vaginal formulation, a nasal formulation, a lingual formulation, a sublingual formulation, an intravenous formulation, an intraarterial formulation, an intracardial formulation, an intramuscular formulation, an intraperitoneal formulation, a transdermal formulation, an intracranial formulation, an intracutaneous formulation, a subcutaneous formulation, an aerosolized formulation, an ocular formulation, an implantable formulation, a depot injection formulation, a transdermal formulation and combinations thereof. In some embodiments, the route of administration is selected from the group consisting of oral, peroral, buccal, enteral, pulmonary, rectal, vaginal, nasal, lingual, sublingual, intravenous, intraarterial, intracardial, intramuscular, intraperitoneal, transdermal, intracranial, intracutaneous, subcutaneous, ocular, via an implant, and via a depot injection. Where applicable, continuous infusion can enhance drug accumulation at a target site (see, e.g., U.S. Patent No. 6,180,082). See also U.S. Patent Nos. 3,598,122; 5,016,652; 5,935,975; 6,106,856; 6,162,459; 6,495,605; and 6,582,724; and U.S. Patent Application Publication No. 2006/0188558 for transdermal formulations and methods of delivery of compositions. In some embodiments, the administering is via a route selected from the group consisting of peroral, intravenous, intraperitoneal, inhalation, and intratumoral.

The particular mode of administration of the compositions of the presently disclosed subject matter used in accordance with the methods disclosed herein can depend on various factors, including but not limited to the formulation employed, the severity of the condition to be treated, whether the active agents in the compositions (e.g., PAS) are intended to act locally or systemically, and mechanisms for metabolism or removal of the active agents following administration.

## VI. Methods and Uses

In some embodiments, the presently disclosed subject matter relates to employing pharmaceutical compositions in the context of various methods and/or

uses related to treating gastrin-associated tumors and/or cancers, producing medicaments for treating gastrin-associated tumors and/or cancers, inhibiting growth of gastrin-associated tumors and/or cancers, inducing and/or enhancing humoral and/or cellular immune responses against gastrin-associated tumors and/or cancers, sensitizing tumors and/or cancers associated with gastrin and/or CCK-B receptor signaling in subjects to inducers of cellular immune responses directed against the tumors and/or cancers, preventing, reducing, and/or eliminating formation of fibrosis associated with tumors and/or cancers, particularly in the context of pancreatic cancer; preventing, reducing, and/or eliminating metastases of gastrin-associated tumors and/or cancers; increasing the number of tumor-infiltrating CD8<sup>+</sup> lymphocytes in tumors and/or cancers; reducing the number of FoxP3<sup>+</sup> inhibitory T-regulatory cells present in tumors and/or cancers; and increasing the number of T<sub>EMRA</sub> cells in subject that respond to gastrin-associated tumors and/or cancers. Each of these methods and/or uses is described in more detail herein below.

#### VI.A. Methods for Treating Gastrin-associated Tumors and/or Cancers

In some embodiments, the presently disclosed subject matter relates to methods for treating gastrin-associated tumors and/or cancers. In some embodiments, the method comprises administering to a subject in need thereof (e.g., a subject with a gastrin-associated tumor and/or cancer) an effective amount of a composition that comprises a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor; and a second agent that induces and/or provides a cellular immune response against the gastrin-associated tumor or cancer. Thus, the presently disclosed methods in some embodiments rely on the use of pharmaceutical compositions that have one or more active agents that together provide two distinct immunotherapeutic activities: providing and/or inducing an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor, and inducing and/or providing a cellular immune response against the gastrin-associated tumor and/or cancer.

With respect to providing and/or inducing an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor, the first agent present in the pharmaceutical compositions of the presently disclosed subject matter is selected from the group consisting of a gastrin peptide designed

to induce an active humoral response against gastrin, and/or an anti-gastrin antibody and/or an anti-CCK-R antibody designed to provide a passive humoral response against gastrin and/or a CCK-B receptor, in some embodiments a CCK-B receptor present on gastrin-associated tumor and/or cancer. While not wishing to be bound by any particular theory of action, the active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor is designed to inhibit, either partially or completely, gastrin signaling in the gastrin-associated tumor and/or cancer via the CCK-B receptor by reducing gastrin binding to the CCK-B receptor by reducing the amount of circulating gastrin present in the subject and/or by interfering with gastrin binding to the CCK-B receptor with neutralizing and/or blocking antibodies.

Thus, in some embodiments the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4), wherein the glutamic acid residue at amino acid position 1 of any of SEQ ID NOs: 1-4 is a pyroglutamate residue. In some embodiments, the gastrin peptide is conjugated to an immunogenic carrier, optionally via a linker, further optionally a linker comprising a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester, in the pharmaceutical composition. Non-limiting examples of immunogenic carriers include diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin. The structure of the first agent is described in more detail herein above, but in some embodiments the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

As would be appreciated by one of ordinary skill in the art upon consideration of this disclosure, in some embodiments the pharmaceutical composition further comprises an adjuvant, optionally an oil-based adjuvant, to enhance the immunogenicity of the gastrin peptide and/or the gastrin peptide conjugate when an active anti-gastrin humoral immune response is desired.

In order to induce a cellular immune response against the gastrin-associated tumor or cancer, the methods of the presently disclosed subject matter

employ pharmaceutical compositions that comprise one or more checkpoint inhibitors. As is known, checkpoint inhibitors inhibit one or more biological activities of target polypeptides that have immune checkpoint activities. Exemplary such polypeptides include cytotoxic T-lymphocyte antigen 4 (CTLA4) polypeptides, programmed cell death-1 receptor (PD-1) polypeptides, and  
5 programmed cell death 1 receptor ligand (PD-L1) polypeptides. In some embodiments, a checkpoint inhibitor comprises an antibody or a small molecule that binds to and/or interferes with interactions between T cells and tumor cells by inhibiting or preventing interactions between PD-1 polypeptides and PD-L1  
10 polypeptides. Exemplary such antibodies and small molecules include but are not limited to Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

The pharmaceutical compositions of the presently disclosed subject matter  
15 can include various amounts of the first and second agents, provided that both humoral and cellular responses are induced and/or provided in the subject, and the amounts of the first and second agents present in the pharmaceutical compositions can be adjusted in order to maximize the effectiveness of the treatment and/or minimize undesirable side effects thereof. However, in some  
20 embodiments a pharmaceutical composition of the presently disclosed subject matter is administered in a dose selected from the group consisting of about 50  $\mu$ g to about 1000  $\mu$ g, about 50  $\mu$ g to about 500  $\mu$ g, about 100  $\mu$ g to about 1000  $\mu$ g, about 200  $\mu$ g to about 1000  $\mu$ g, and about 250  $\mu$ g to about 500  $\mu$ g, and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the  
25 second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.

In some embodiments, a method for treating a gastrin-associated tumor and/or cancer of the presently disclosed subject matter comprises administering to a subject in need thereof a first agent that directly or indirectly inhibits one or more  
30 biological activities of gastrin in the tumor and/or cancer and a second agent comprising a stimulator of a cellular immune response against the tumor and/or the cancer. As such, in some embodiments the first agent directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer by providing and/or inducing a humoral immune response against a gastrin peptide,

optionally wherein the agent is selected from the group consisting of an anti-gastrin antibody and a gastrin peptide that induces production of neutralizing anti-gastrin antibodies in the subject; and/or comprises a nucleic acid that inhibits expression of a gastrin gene product. Nucleic acids that inhibit expression of a gastrin gene product would be understood by one of ordinary skill in the art after  
5 consideration of this disclosure, and examples are discussed herein above.

Anti-gastrin antibodies are known in the art and are described in U.S. Patent Nos. 5,607,676; 5,609,870; 5,622,702; 5,785,970; 5,866,128; and 6,861,510. See also PCT International Patent Application Publication Nos. WO  
10 2003/005955 and WO 2005/095459. The content of each of these U.S. Patents and PCT International Patent Application Publications is incorporated herein in its entirety. In some embodiments, an anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17). In some embodiments, the epitope is present within one or more of the amino acid sequences  
15 EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).

In some embodiments, administration of a pharmaceutical composition of the presently disclosed subject matter to a subject induces a reduction in and/or  
20 prevents the development of fibrosis associated with the pancreatic cancer.

In some embodiments, the presently disclosed treatment methods are designed to inhibit growth and/or survival of a gastrin-associated tumor and/or cancer in a subject. In some embodiments, the presently disclosed methods thus comprise administering to the subject a composition that comprises a first agent  
25 comprising a gastrin immunogen, one or more anti-gastrin antibodies, one or more anti-CCK-B receptor antibodies, or any combination thereof; and a second agent comprising a checkpoint inhibitor.

Thus, in some embodiments the presently disclosed subject matter provides uses of the pharmaceutical compositions disclosed herein for the  
30 preparation of medicaments to treat gastrin-associated tumors and/or cancers as well as uses of the pharmaceutical compositions disclosed herein to treat gastrin-associated tumors and/or cancers.

In some embodiments, the multi-agent pharmaceutical compositions disclosed herein provide enhanced, more efficacious, and/or more successful

treatment of gastrin-associated tumors and/or cancers than would treating a similar subject with the any of the agents individually.

5 VI.B. Methods for Inducing and/or Enhancing Cellular Immune Responses  
Against Gastrin-associated Tumors and/or Cancers

The presently disclosed subject matter also provides methods for inducing and/or enhancing cellular immune responses against gastrin-associated tumors and/or cancers in subject. In some embodiments, the methods comprise administering to a subject that has a gastrin-associated tumor or cancer an effective amount of a composition comprising an agent that reduces or inhibits gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer, thereby inducing and/or enhancing a cellular immune response against the subject's gastrin-associated tumor and/or cancer. As used herein, the phrase "inducing and/or enhancing a cellular immune response against a gastrin-associated tumor and/or cancer" and grammatical variants of refers to a circumstance where as a result of administering to a subject that has a gastrin-associated tumor or cancer an effective amount of a composition comprising an agent that reduces or inhibits gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer, a level of a T cell-based immune response is higher in the subject at a relevant time post-administration than would have been present in the subject in the absence of the treatment. Agents that reduce or inhibit gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer include the agents disclosed herein that can interfere with an interaction of a gastrin peptide and a CCK-B receptor, and include but are not limited to gastrin peptides and/or immunogens, anti-gastrin antibodies, anti-CCK-B receptor antibodies, small molecule inhibitors of gastrin/CCK-B signaling, and combinations thereof.

25 VI.C. Methods for Sensitizing Tumors and/or Cancers to Inducers of  
Cellular Immune Responses

30 In some embodiments, the presently disclosed subject matter also provides methods for sensitizing tumors and/or cancers associated with gastrin and/or CCK-B receptor signaling in a subject to inducers of cellular immune responses directed against the tumors and/or cancers. As used herein, the phrase "sensitizing tumors and/or cancers associated with gastrin and/or CCK-B receptor

signaling in a subject to inducers of cellular immune responses” refers to treatments that result in levels of cellular immune responses in subjects when one or more inducers of a cellular immune response is administered to the subject as compared to levels of cellular immune responses in subjects when one or more  
5 inducers of a cellular immune response is administered to the subject in the absence of the treatment.

In some embodiments, the methods comprise administering to a subject a composition comprising a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide, and a second  
10 agent that induces and/or provides a cellular immune response against the tumor and/or the cancer, or a combination thereof, optionally wherein the first agent and the second agent are individually selected from the group consisting of a gastrin peptide and/or a fragment and/or a derivative thereof that induces a cellular immune response or production of neutralizing anti-gastrin antibodies in the  
15 subject and a neutralizing anti-gastrin antibody and/or a fragment and/or derivative thereof and; and/or a composition comprising a nucleic acid that inhibits expression of a gastrin gene product; and/or a composition comprising an agent that blocks the biological function of gastrin at the CCK-B receptor. In some embodiments, the anti-gastrin antibody is an antibody directed against an epitope  
20 present within gastrin-17 (G17).

Accordingly, in some embodiments the instant methods for sensitizing tumors and/or cancers associated with gastrin and/or CCK-B receptor signaling in a subject to inducers of cellular immune responses comprises administering to the subject a pharmaceutical composition as disclosed herein in order to induce  
25 and/or provide to the subject both an active and/or a passive humoral immune response against a gastrin peptide in the subject as well as to induce and/or provide a cellular immune response against the tumor and/or the cancer.

#### VI.D. Methods for Preventing, Reducing, and/or Eliminating Fibrosis Associated with Tumors and/or Cancers

PC is also characterized by a dense fibrotic environment (Neesse et al.,  
30 2011), which helps promote angiogenesis and creates a physical barrier that could inhibit the penetration of chemotherapeutics and immunotherapeutics to the pancreatic tumor site (Templeton & Brentnall, 2013). Disclosed herein is the unexpected and surprising observation that that with PAS administration,

optionally in combination with one or more immune checkpoint inhibitors, the fibrotic nature that is a hallmark of PC fibrosis can be reduced. While not wishing to be bound by any particular theory of operation, a reduction in fibrosis can facilitate greater penetration of other drugs, including but not limited to macromolecules like checkpoint mAbs. This could explain why check point inhibitors have to date been characterized by very modest efficacy, perhaps due to lack of penetration of the checkpoint mAbs to PDAC cells. Therefore, an aspect of the presently disclosed subject matter is that PAS plus immune checkpoint inhibitors have anti-PDAC-tumor activity separately when given as monotherapy, but when given as a combination therapy as disclosed herein, they have much greater activity.

Novel and innovative drug combinations with diverse but complementary or even synergistic mechanisms of action are provided in accordance with the presently disclosed subject matter to address the inherently fibrotic nature of PDAC and to be beneficial to allow greater access to the tumor environment of large monoclonal antibodies (mAbs), such as but not limited to anti-immune checkpoint inhibitor mAbs. While not wishing to be bound by any particular theory of operation, PAS plus immune checkpoint inhibitors when administered together as part of a combination therapy can provide a synergistic effect to make tumors more accessible to chemotherapeutics and immune checkpoint inhibitor drugs by reducing the fibrosis associated with PDAC, thereby allowing anti-tumor therapeutics to target the interaction of PD-1 and PD-L1 in order to induce a cellular immune response against a gastrin-associated tumor.

Treatment with PAS results in a humoral immunological response (i.e., an antibody response) to the autocrine and paracrine tumor/cancer growth factor gastrin. In so doing, PAS affects the tumor/cancer (e.g., PDAC) phenotype by affecting cell proliferation, apoptosis, angiogenesis, invasion, and metastasis. As disclosed herein, PAS is also effective in decreasing fibrosis associated with PDAC. While not wishing to be bound by any particular theory of operation, this is believed to enhance the ability of large molecules, such as but not limited to immune checkpoint inhibitory mAbs, to gain greater access to the pancreatic tumor site, which in turn would be expected to promote a much greater cellular immune effect. PAS also results in a cellular immune response to gastrin. Thus, disclosed herein are methods for treating tumors and/or cancers by PAS

administration in conjunction with the administration of immune checkpoint inhibitors such as anti-PD-1, anti-PD-L1, and/or anti-CTLA-4 mAbs to address the inherent fibrotic as well as recalcitrant nature of PDAC in resistance to therapeutic agents that need access to the tumor for efficacy.

5           Therefore, in some embodiments the presently disclosed subject matter provides methods for preventing, reducing, and/or eliminating formation of fibrosis associated with a tumor and/or a cancer, optionally pancreatic cancer, by contacting cells of the tumor and/or the cancer with an agent that directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or  
10 cancer. Agents that directly or indirectly inhibit one or more biological activities of gastrin are disclosed herein above, and include agents that provide and/or induce humoral immune responses against gastrin peptides (such as but not limited to anti-gastrin antibodies, and/or fragments and/or derivatives thereof), and gastrin peptides that induce production of neutralizing anti-gastrin antibodies in the  
15 subject; inhibitory nucleic acids that inhibit expression of gastrin gene products; small molecule compounds that block the function of the gastrin hormone, and any combination thereof. In some embodiments, the anti-gastrin antibodies comprise an antibody directed against an epitope present within gastrin-17 (G17), which epitope is in some embodiments present within one or more of the amino  
20 acid sequences EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).

As with other immunogenic forms of gastrin and gastrin peptides disclosed herein, in some embodiments the gastrin peptides are conjugated to an  
25 immunogenic carrier, optionally an immunogenic carrier selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.

In some embodiments, the methods for preventing, reducing, and/or eliminating formation of fibrosis associated with a tumor and/or a cancer, optionally pancreatic cancer further comprise contacting the tumor and/or the  
30 cancer with a second agent comprising a stimulator of a cellular immune response against the tumor and/or the cancer. Exemplary stimulators of cellular immune responses include immune checkpoint inhibitors such as those that inhibit a biological activity of a target polypeptide selected from the group consisting of

cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1), including but not limited to

Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, and Avelumab.

In some embodiments, the tumor and/or cancer for which preventing, reducing, and/or eliminating the formation of fibrosis therein is pancreatic cancer.

VI.E. Methods for Modulating T Cell Subpopulations in Subjects and Tumors Present Therein

As disclosed herein, administration of the pharmaceutical compositions of the presently disclosed subject matter to subjects that have gastrin-associated tumors and/or cancers was observed to modify both the circulating T cell subpopulations present in subjects treated with gastrin-associated tumors and/or cancers as well as the T cell subpopulations present within the tumors and/or cancers per se.

In some embodiments, administration of the pharmaceutical compositions of the presently disclosed subject matter to subjects that have gastrin-associated tumors and/or cancers results in an enhancement of the number of CD8<sup>+</sup> tumor infiltrating lymphocytes (TILs) present in gastrin-associated tumors and/or cancers. It is recognized in the art that that TILs have anti-tumor and anti-cancer activity, and thus increasing the number of TILs in a tumor and/or a cancer can result in greater anti-tumor and/or anti-cancer efficacy of various treatment strategies with either the pharmaceutical compositions of the presently disclosed subject matter alone or in combination with other front-line an/d or secondary treatments.

In some embodiments, administration of the pharmaceutical compositions of the presently disclosed subject matter to subjects that have gastrin-associated tumors and/or cancers results in a reduction in the number of FoxP3<sup>+</sup> inhibitory T-regulatory cells (T<sub>regs</sub>) present in gastrin-associated tumors and/or cancers. It is recognized in the art that that T<sub>regs</sub> have immunosuppressive activity, particularly tumor- and cancer-specific immunosuppressive activity, and thus reducing the number of FoxP3<sup>+</sup> inhibitory T<sub>regs</sub> in a tumor and/or a cancer can result in greater anti-tumor and/or anti-cancer efficacy of various treatment strategies with either

the pharmaceutical compositions of the presently disclosed subject matter alone or in combination with other front-line an/d or secondary treatments. In some embodiments, reducing the number of FoxP3<sup>+</sup> inhibitory T<sub>regs</sub> in a tumor and/or a cancer can result in greater efficacy of front-line chemotherapeutics.

5 In some embodiments, administration of the pharmaceutical compositions of the presently disclosed subject matter to subjects that have gastrin-associated tumors and/or cancers results in an increase in anti-gastrin T<sub>EMRA</sub> cells in the subjects. T<sub>EMRA</sub> cells are effector memory T cells that are found in the peripheral circulation and tissues. T<sub>EMRA</sub> cells appear to have a sentinel activity in that they  
10 might be involved in recognizing metastases. As such, increasing anti-gastrin T<sub>EMRA</sub> cells in subjects could prevent, reduce, and/or eliminate metastasis associated with gastrin-associated tumors and/or cancers. Therefore, in some embodiments the presently disclosed subject matter relates to methods for increasing T<sub>EMRA</sub> cells that recognize gastrin-associated tumor and/or cancer  
15 antigens and cells expressing the same by treating subjects with the pharmaceutical compositions disclosed herein.

Summarily, in some embodiments the presently disclosed subject matter relates to uses of the presently disclosed compositions comprising immune  
20 checkpoint inhibitors and gastrin immunogens to treat gastrin-associated tumors and/or cancers, either alone as a front-line therapy, in combination with other front-line therapies, or in combination with any other therapy that would be appropriate for a subject who has a gastrin-associated tumor and/or cancer.

## VII. Conclusion

The presently disclosed subject matter thus relates in some embodiments  
25 to combination therapies for the treatment of cancer using a combination of methods that individually or together generate both a humoral antibody immune response (using, for example, the gastrin cancer vaccine PAS) and a cellular T cell immune response (using, for example, the gastrin cancer vaccine PAS or an immune checkpoint inhibitor). More particularly, unexpected additive and/or  
30 synergistic efficacies in treating human and animal gastrointestinal tumors using the instantly described combination of drug classes that generate humoral and cellular immune anti-tumor responses in combination with cellular immune anti-tumor effects are described.

More particularly, the presently disclosed subject matter relates in some embodiments to using specific combinations of drugs that (i) induce humoral B cell immune responses to a tumor growth factor or circulating tumor growth factor; and (ii) induce and/or enhance cellular immune responses (i.e., anti-tumor and/or cancer T cell responses) directed against the tumor and/or cancer to elicit a cytotoxic T lymphocyte response.

As such, in some embodiments disclosed herein are methods for treating human and animal tumors and cancers using a combination of a gastrin cancer vaccine in combination with a second drug that overcomes immune checkpoint failure. Thus, in some embodiments the presently disclosed subject matter relates to treating specific human cancers with a cancer vaccine directed at eliciting a B cell and/or antibody immune response and a cellular immune response to the active form of the growth factor gastrin, with the unexpected observation that this vaccine treatment also resulted in making the tumor more responsive to treatment with an immune checkpoint inhibitor, thus creating an unexpected, additive, or even synergistic combination therapeutic effect that enhanced anti-tumor efficacy.

Additionally, the pharmaceutical compositions of the presently disclosed subject matter can be employed for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount of the pharmaceutical composition of any one of claims 1-13 sufficient to enhance the number of CD8+ tumor infiltrating lymphocytes.

The use of claim 104, wherein the administering results in improves survival of the subject, reduced tumor growth, and/or enhanced efficacy of a chemotherapeutic agent and/or an immune checkpoint therapy in the subject as compared to that which would have occurred had the pharmaceutical composition not been administered.

Use of the pharmaceutical composition of any one of claims 1-13 for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount of the pharmaceutical composition of any one of claims 1-13 sufficient to reduce the number of FoxP3+ inhibitory T-regulatory cells.

## EXAMPLES

The following EXAMPLES provide illustrative embodiments. In light of the present disclosure and the general level of skill in the art, those of skill will appreciate that the following EXAMPLES are intended to be exemplary only and that numerous changes, modifications, and alterations can be employed without departing from the scope of the presently disclosed subject matter.

*Materials and Methods for the EXAMPLES*

Cell Line: Murine mT3 pancreatic cancer cells were obtained from the laboratory of Dr. David Tuveson (Cold Spring Harbor Laboratories, Cold Spring Harbor, New York, United States of America; see also Boj et al., 2015). These cells have been shown to express the CCK-B receptor and produce gastrin, and were used as the tumor model. These cells produce tumors in syngeneic C57BL/6 mice (Smith et al., 2018).

Study Design: All animal studies were performed in an ethical fashion under a protocol approved by the Institutional Animal Care and Use Committee (IACUC) of Georgetown University (Washington, D.C., United States of America). Forty male (6 weeks old) C57BL-6 mice were injected with 500,000 cells subcutaneously into the flank. On the 6<sup>th</sup> day after inoculation 100% of the mice had a palpable tumor and were allocated into one of four (4) groups of n = 10 mice each so that the baseline tumor volume was equal in all groups. The Groups were as follows:

1. PBS Control (PBS)
2. PAS 100 µg (PAS100)
3. PD-1 Ab 150 µg (PD-1)
4. PD-1 Ab (150 µg) + PAS 100 µg (PD-1 + PAS100)

One week (7 days) after the mT3 cells were injected, non-control Groups of mice received administration of patent applications and/or PD-1 Ab as follows: if the mice were in a group that was to receive PAS, the PAS was injected starting at the time of randomization (baseline time = 0) as an i.p. injection in 100 µl and again at week 1 and at week 3. PD-1 antibody (Bio X cell, West Lebanon, New Hampshire, United States of America) was given to appropriate mice at a dose of 150 µg i.p. five times during the study at t = 0, 4, 8, 15, and 21 days). Control mice received PBS on the same days that PAS was administered. Tumor volumes were measured weekly by calipers and calculated as  $L \times (w)^2 \times 0.5$ .

Histology: After 31 days of growth the mice were ethically euthanized by CO<sub>2</sub> asphyxiation and cervical dislocation. Mice were weighed, pancreatic tumors were excised, and they were weighed. The tumors were divided and half of the tumor was fixed in 4% paraffin in formaldehyde for histology and half was flash frozen in liquid nitrogen. Tumor-associated fibrosis was assessed with Masson's trichrome staining. Analysis of Masson's trichrome was done by a technician blinded to the treatment using ImageJ image processing and analysis software (developed by Wayne Rasband of the United States National Institutes of Health (NIH), Bethesda, Maryland, United States of America; available through the website of the NIH).

For immunohistochemistry, tumors were sectioned from paraffin embedded blocks (10 µm) and fixed on slides. Tumor sections were stained with either anti-CD8 antibodies (1:75; EBIOSCIENCE™, San Diego, California, United States of America); or anti-Foxp3 antibodies (1:30; EBIOSCIENCE™). Immunoreactive cells were counted manually.

Spleen T-cell isolation. The spleen from each animal was removed, weighed, and placed in a 60 mm dish containing 5 ml RPMI1640 medium. The spleens were mechanically chopped using a razor blade. The medium containing the spleen tissue was filtered through a 100 µm cell strainer to a 50 ml tube and rinsed with medium a few times until the final volume was 40 ml. The spleen tissue was then filtered again using a 40 µm cell strainer to a 50 ml tube, and centrifuged to pellet down the cells at 1500 rpm for 5 minutes at 4°C. The supernatant was removed and the cell pellet resuspended in 40 ml PBS before the cells were repelleted by centrifugation at 1500 rpm for 5 minutes at 4°C. The supernatant was discarded, the cell pellet was resuspended in 3 ml Washing buffer (PBS with 2 mM EDTA and 0.5% bovine serum albumin), and then slowly added on the top of 5 ml Ficoll medium in a 15 ml tube. After centrifugation at 2100 rpm for 20 minutes with deceleration set to zero, the lymphocytes were collected from the white layer between buffer and the Ficoll. The lymphocytes were washed an additional two times, resuspended in medium, and counted.

Flow cytometry. One million lymphocytes were added to a 5 ml clear tube (Catalogue # 352054; BD Falcon, Bedford, Massachusetts, United States of America), volumes were equalized with PBS, and the cells were pelleted at 1500 rpm for 5 minutes. After washing with PBS, 50 µl of pre-diluted ZOMBIE NIR™

brand fixable viability solution (BIOLEGEND®, San Diego, California, United States of America) was added to the cells, which were then incubated at room temperature in the dark for 20 minutes. The cells were washed and then blocked by adding 5 µl Purified Rat Anti-Mouse CD16/CD32 (Mouse BD Fc BLOCK™ brand reagent; BD Biosciences, San Jose, California, United States of America) and incubating for 20 minutes.

The antibodies listed in Table 1 were reacted to the lymphocytes and flow cytometry performed using a FACSARIA™ IIu brand cell sorter (BD Biosciences) with 375 nm, 405 nm, 488 nm and 633 nm laser lines.

For re-stimulation. 1 or 2 million isolated and washed lymphocytes were added to each well of a 6-well plate for two duplicate plates, and the volume was brought to the same for each (2 or 3 ml). Brefeldin A solution (BIOLEGEND®, 1000X Catalogue No. 420601) was added at 1 µl/ml to each well. 1 µM gastrin-14 (Sigma Aldrich Catalogue No. SCP0152, having the amino acid sequence pEGPWLEEEEEAYGW; SEQ ID NO: 5) was added to each well at 1 µl/ml for one plate for a final gastrin concentration of 1 nM. The other duplicate plate was not treated with gastrin-14 and served as a control. The 6-well plates were placed in the cell culture incubator at 37°C for 6 hours. The cells were then removed, washed, and permeabilized using an Intracellular Fixation & Permeabilization

Buffer Set (EBIOSCIENCE™ Catalogue No. 88-8824-00). A cytokine antibody master mix including the four (4) antibodies listed in Table 2 was added (4 antibodies for 8 samples, so 10 µl of each antibody to make the mastermix), and incubated at 4° C overnight.

Flow cytometry was performed to analyze for cytokines in cells that were re-stimulated with gastrin or with PBS. Analysis of flow cytometry data was done using FCSEXPRESS-6 software (De Novo Software, Glendale, California, United States of America).

## EXAMPLE 1

Producing Tumors in Mice

To determine whether PAS treatment induced both a humoral and a cellular immune response and provided a synergistic effect on immune checkpoint antibody therapy, tumors were generated in immune competent mice (e.g., C57BL/6 mice that were syngeneic with murine mT3 pancreatic cancer cells) by introducing  $5 \times 10^5$  murine mT3 pancreatic cancer cells in 0.1 ml PBS subcutaneously into the flank. After allowing for one week for the tumors to become established, mice were treated with PAS and one or more immune checkpoint inhibitors as depicted in Figure 1.

Animals were treated starting one week after mT3 pancreatic cancer cell inoculation as this timeframe ensured that all animals in the study had a palpable subcutaneous tumor, and that treatment did not interfere with tumor initiation. The primary end points were tumor growth and survival. Growth of tumors was measured weekly with calipers and the volumes of the tumors were calculated as

L x W<sup>2</sup> x 0.5. Tumors were excised and examined histologically by immunohistochemistry for immune cells, including but not limited to tumor-infiltrating lymphocytes (TILs), and T Regulatory cells (T<sub>regs</sub>). Tumors were also examined for the presence and extent of fibrosis development typically associated with PDAC. Spleens were removed and T-cells isolated and re-stimulated with gastrin. The cells were labeled with a panel of relevant antibodies for cytokines and characterized by flow cytometry.

Each experiment employed 40 mice (n = 10 per group; see Figure 1), which were implanted with 5 x 10<sup>5</sup> pancreatic murine cancer cells. Groups of immune competent syngeneic mice bearing mT3 murine pancreatic tumors were treated with PBS (negative control), PAS monotherapy (100 µg per administration at 0, 1, 2, and 3 weeks after tumor cell inoculation), an anti-PD-1 antibody (PD1-1 Ab; Bio X cell, West Lebanon, New Hampshire, United States of America) as an immune checkpoint inhibitor (150 µg per administration at 0, 4, 8, 15, and 21 days after the first PAS vaccination), or a combination of both PAS vaccination (100 µg per administration at 0, 1, 2, and 3 weeks after tumor cell inoculation) and the immune checkpoint inhibitor (150 µg per administration at 0, 4, 8, 15, and 21 days after the first PAS vaccination). The immune checkpoint blockade antibody specific for programmed cell death protein 1 (PD1-1 Ab; Bio X cell, West Lebanon, New Hampshire, United States of America) was administered intraperitoneally. The data are summarized in Table 3 below and in Figure 2.

Table 3

Mean Mouse Body Weight in Each Treatment Group

Treatment Group	Mean Weight (g ± SEM)	p value
PBS (negative control)	27.500 ± 0.563	-
PD-1	27.333 ± 0.645	NS
PAS100 alone	27.400 ± 0.499	NS
PD-1 + PAS100	28.000 ± 0.577	NS

NS: not significant

There were no statistical differences in final tumor weights in grams between the PBS control mice and the weights of the tumors from mice in both the PD-1 and PAS100-treated groups. In contrast, the mice treated with the combination of PD-1 and PAS100 had significantly smaller tumors compared to

PBS ( $p = 0.014$ ) and PD-1 controls ( $p = 0.0017$ ). Furthermore, the combination therapy with PD-1 and PAS100 resulted in tumors that were also significantly smaller than PAS100 monotherapy ( $p < 0.05$ ).

## EXAMPLE 2

### Analyses of T<sub>EMRA</sub> CD4<sup>-</sup>/CD8<sup>-</sup> Cells in the CD3 Terminally Differentiated T Cell Subpopulation

5 Tumors were induced in mice as set forth in EXAMPLE 1. T lymphocytes were isolated from spleen peripheral blood mononuclear cells (PBMCs) that were isolated from mice that had been treated with PBS, PD-1 Ab, PAS100, or PAS100 + PD-1 Ab. Various subpopulations of T cells were identified by flow cytometry using the antibodies listed in Table 1. In particular, a first T cell subpopulation was isolated that was CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>, and from this subpopulation a further subpopulation representing T<sub>EMRA</sub> cells that were CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup> was isolated. The percentages and proportions of these various subpopulations present in mice that had been treated with PBS, PD-1 Ab, PAS100, or PAS100 + PD-1 Ab were determined, and the results are presented in Figures 3A and 3B.

Figure 3A shows the percentage of T<sub>EMRA</sub> cells (CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup>) in CD3<sup>+</sup> T cells in mice treated with PBS, PD-1 Ab, PAS100, or PAS100/PD-1. Figure 3B shows the proportion of CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup> cells in each treatment group that were T<sub>EMRA</sub> cells.

The most significant differences among the treatment groups were that PAS100 had lower CD4<sup>-</sup>/CD8<sup>-</sup> T<sub>EMRA</sub> cells than that of PBS, whereas PAS100 + PD-1 treatment resulted in similar CD4<sup>-</sup>/CD8<sup>-</sup> T<sub>EMRA</sub> cells as compared to that of PBS. The portion of T<sub>EMRA</sub> cells (CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup>) in T cells from mice treated with PAS100/PD1 was over 2-fold higher than that from mice treated with PBS or PAS100 alone, suggesting that T<sub>EMRA</sub> cells (CD3<sup>+</sup>/CD4<sup>-</sup>/CD8<sup>-</sup>/CD44<sup>-</sup>/CD62L<sup>-</sup>) were good for defending against and fighting gastrin-associated tumors and cancers.

## EXAMPLE 3

### Cytokine Activation Assay with PAS100

T lymphocytes were isolated from spleen peripheral blood mononuclear cells (PBMCs) that were isolated from mice that had been treated with PAS100. These cells were evaluated by flow cytometry to determine if they were indeed

activated T-cells by cytokine activation to Interferon- $\gamma$  (INFG), Granzyme-B (granzyme), Perforin, and tumor necrosis factor- $\alpha$ (TNFa). The results are provided in Figures 4A and 4B.

Figure 4A shows that the T cells isolated from mice treated with PAS100 were indeed activated. When these same cells were re-stimulated with gastrin in culture for 6 hours (see Figure 4B), they were re-stimulated and released more cytokines, confirming that vaccination with PAS100 stimulated T cells and further that these T cells specifically reacted to gastrin.

#### EXAMPLE 4

##### Comparison of PAS100 to Combination Therapy with PAS & PD-1

T lymphocytes were isolated from spleen PBMC isolated from mice that had been treated with PAS100 or a combination of PAS100 and PD-1. Cells were evaluated by flow cytometry to determine if they were indeed activated T cells by cytokine activation to Interferon- $\gamma$  (INFG), Granzyme-B (granzyme), Perforin, and tumor necrosis factor- $\alpha$ (TNFa). The results are provided in Figures 5A and 5B.

Activated T lymphocytes from mice treated with PAS100 alone released increased cytokines compared to lymphocytes from PBS treated mice (see Figure 5A). The lymphocytes from the combination treated mice, however, released markedly more cytokines (see Figure 5B), suggesting that the combination therapy was better at stimulating activated T cells. TNFa in particular was increased greater than 2-fold with the PAS100 + PD-1 Ab combination therapy as compared to treatment with PAS100 alone (compare Figures 5A and 5B).

#### EXAMPLE 5

##### Analysis of the Effect of PD-1 Monotherapy, PAS100 Monotherapy, and PD-1 + PAS100 Combination Therapy on Fibrosis

Tumors from mice treated with PBS, PD-1 alone, PAS100, or PAS100 + PD-1 were fixed in 4% paraformaldehyde, paraffin embedded, and 8  $\mu$ m sections were cut and mounted. Tissue sections were stained for fibrosis with Masson's trichrome.

Representative sections stained with Masson's trichrome are shown in Figure 6A. Fibrosis quantitative scores were analyzed by a computer program using ImageJ image processing and analysis software, and the results are presented in Figure 6B. Of note is that whereas the integrated density of the

tumors treated with PD-1 monotherapy and PAS100 monotherapy were insignificantly different the negative control PBS treatment, the PAS + PD-1 Ab combination therapy resulted in a decrease in density (and hence fibrosis) that was statistically significant as compared to PBS alone ( $p < 0.005$ ) and also  
5 PAS100 alone ( $p < 0.001$ ).

#### EXAMPLE 6

##### Analysis of the Effect of PD-1 Monotherapy, PAS100 Monotherapy, and PD-1 + PAS100 Combination Therapy on CD8<sup>+</sup> T Cell Infiltration

Tumors were fixed in 4% paraformaldehyde, paraffin embedded, and 8  $\mu$ m  
10 sections were cut and mounted. CD8<sup>+</sup> lymphocytes were stained in the tumor microenvironment with CD8 antibodies (1:75 titer; EBIOSCIENCE™, San Diego, California, U1SA) and CD8<sup>+</sup> cells were manually counted in a blinded fashion. The results are presented in Figures 7A and 7B.

As shown in Figures 7A and 7B, CD8<sup>+</sup> tumor-infiltrating lymphocytes (TILs)  
15 increased with PAS100 and PD-1 alone, but were markedly increased with the combination therapy. The combination PAS100 + PD-1 CD8<sup>+</sup> cells were significantly greater than PD-1 alone ( $p = 0.042$ ) and greater than PAS100 alone ( $p = 0.039$ ).

#### EXAMPLE 7

##### Analysis of the Effect of PD-1 Monotherapy, PAS100 Monotherapy, and PD-1 + PAS100 Combination Therapy on Foxp3<sup>+</sup> T<sub>reg</sub> Infiltration

Tumors were fixed in 4% paraformaldehyde, paraffin embedded, and 8  $\mu$ m  
20 sections were cut and mounted. Tumors were reacted with an anti-Foxp3 antibody (1:30; EBIOSCIENCE™) and immunoreactive cells counted manually using ImageJ software. The results are presented in Figures 8A and 8B.

Figure 8A depicts exemplary mT3 tumors stained with an antibody that binds to the Foxp3 protein, a marker for T<sub>regs</sub>. Comparison of the fields shows that as compared to PBS (upper left panel), PD-1 monotherapy (upper right panel), or PAS100 monotherapy (lower left panel), PAS100 & PD-1 combination therapy  
30 resulted in a decrease in the presence of intratumoral T<sub>regs</sub>, suggesting that PAS100 + PD-1 combination therapy might modify the intratumoral environment to an extent where the intratumoral microenvironment might be characterized by a lower degree of T<sub>reg</sub>-based immunosuppression as compared to either monotherapy alone.

Figure 8B is a bar graph summarizing the data exemplified by Figure 8A. As compared to PBS, the number of Foxp3<sup>+</sup> cells in tumors treated with PD-1 monotherapy or PAS100 monotherapy was not significantly different. Tumors treated with PAS100 + PD-1 combination therapy had significantly fewer Foxp3<sup>+</sup> cells than the negative control.

5

It will be understood that various details of the presently disclosed subject matter may be changed without departing from the scope of the presently disclosed subject matter. Furthermore, the foregoing description is for the purpose of illustration only, and not for the purpose of limitation.

## CLAIMS

What is claimed is:

1. A pharmaceutical composition comprising (i) a first agent that induces and/or provides an active and/or a passive humoral immune response  
5 against a gastrin peptide and/or a CCK-B receptor; and (ii) an immune checkpoint inhibitor.
2. The pharmaceutical composition of claim 1, wherein the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody.
- 10 3. The pharmaceutical composition of claim 2, wherein the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and  
15 EGPWLEEEEEAYGWMD (SEQ ID NO: 4).
4. The pharmaceutical composition of claim 3, wherein the gastrin peptide is conjugated to an immunogenic carrier, optionally via a linker.
5. The pharmaceutical composition of claim 4, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus  
20 toxoid, keyhole limpet hemocyanin, and bovine serum albumin.
6. The pharmaceutical composition of claim 4, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.
7. The pharmaceutical composition of claim 4 or claim 6, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally  
25 wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.
8. The pharmaceutical composition of claim 1, wherein the pharmaceutical composition further comprises an adjuvant, optionally an oil-based adjuvant.
- 30 9. The pharmaceutical composition of claim 1, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).

10. The pharmaceutical composition of claim 1, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.
11. The pharmaceutical composition of claim 1, wherein the gastrin-associated tumor and/or cancer is pancreatic cancer.
12. The pharmaceutical composition of claim 1, wherein the first agent comprises an amount of a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4) effective to induce an anti-gastrin humoral response and the second agent comprises an amount of an immune checkpoint inhibitor that is effective to induce or enhance a cellular immune response against a gastrin-associated tumor or cancer when administered to a subject who has gastrin-associated tumor or cancer.
13. The pharmaceutical composition of claim 1, wherein the first agent comprises one or more anti-CCK-B receptor antibodies and is present in the pharmaceutical composition in an amount sufficient to reduce or inhibit gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer when administered to a subject that has a gastrin-associated tumor or cancer.
14. The pharmaceutical composition of any one of claims 1-13 for use in producing a medicament for treating a gastrin-associated tumor or cancer.
15. The pharmaceutical composition of any one of claims 1-13 for use in treating a gastrin-associated tumor or cancer.
16. A method for treating a gastrin-associated tumor or cancer in a subject, the method comprising administering to the subject an effective amount of a composition that comprises (i) a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide and/or a CCK-B receptor; and (ii) a second agent that induces and/or provides a cellular immune response against the gastrin-associated tumor or cancer.

17. The method of claim 16, wherein the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody.
18. The method of claim 16, wherein the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).
19. The method of claim 18, wherein the gastrin peptide is conjugated to an immunogenic carrier, optionally via a linker.
20. The method of claim 19, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.
21. The method of claim 19, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.
22. The method of claim 19 or claim 21, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.
23. The method of claim 16, wherein the composition further comprises an adjuvant, optionally an oil-based adjuvant.
24. The method of claim 16, wherein the inducer of the cellular immune response against the gastrin-associated tumor or cancer comprises an immune checkpoint inhibitor.
25. The method of claim 24, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).
26. The method of claim 25, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

27. The method of claim 16, wherein the gastrin-associated tumor and/or cancer is pancreatic cancer.
28. The method of claim 27, wherein the composition induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer.
- 5 29. The method of claims 16, wherein the composition is administered in a dose selected from the group consisting of about 50 µg to about 1000 µg, about 50 µg to about 500 µg, about 100 µg to about 1000 µg, about 200 µg to about 1000 µg, and about 250 µg to about 500 µg, and optionally
- 10 wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.
30. A method for treating a gastrin-associated tumor and/or cancer, the method comprising administering to a subject in need thereof a first agent that
- 15 directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer and a second agent comprising a stimulator of a cellular immune response against the tumor and/or the cancer.
31. The method of claim 30, wherein the first agent:
- 20 (i) directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer by providing and/or inducing a humoral immune response against a gastrin peptide, optionally wherein the agent is selected from the group consisting of an anti-gastrin antibody and a gastrin peptide that induces production of neutralizing anti-gastrin antibodies in the subject; and/or
- 25 (ii) comprises a nucleic acid that inhibits expression of a gastrin gene product.
32. The method of claim 31, wherein the anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17).
- 30 33. The method of claim 30, wherein the epitope is present within the amino acid sequence EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), or EGPWLEEEEEAYGWMDF (SEQ ID NO: 4).

34. The method of any one of claims 30-33, wherein the first agent comprises the gastrin peptide conjugated to an immunogenic carrier.
35. The method of claim 34, wherein the gastrin peptide comprises an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).
36. The method of claim 34, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.
37. The method of claim 34, wherein the gastrin peptide is conjugated to the immunogenic carrier via a linker.
38. The method of claim 37, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.
39. The method of claim 37 or claim 38, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.
40. The method of any of claims 30-39, wherein the first agent further comprises an adjuvant, optionally an oil-based adjuvant.
41. The method of any of claims 30-40, wherein the second agent is an immune checkpoint inhibitor.
42. The method of claim 41, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).
43. The method of claim 42, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, and Avelumab.
44. The method of any of claims 30-43, wherein the gastrin-associated tumor and/or cancer is pancreatic cancer.

45. The method of claim 44, wherein the first agent induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer.
46. A method for inhibiting growth of a gastrin-associated tumor and/or cancer in a subject, the method comprising administering to the subject a composition that comprises a first agent comprising a gastrin immunogen, one or more anti-gastrin antibodies, one or more anti-CCK-B receptor antibodies, or any combination thereof; and a second agent comprising an immune checkpoint inhibitor.
47. The method of claim 46, wherein the first agent is selected from the group consisting of a gastrin peptide, an anti-gastrin antibody, and an anti-CCK-R antibody.
48. The method of claim 46, wherein the first agent comprises a gastrin peptide, optionally a gastrin peptide comprising, consisting essentially of, or consisting of an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGW MDF (SEQ ID NO: 4).
49. The method of claim 48, wherein the gastrin peptide is conjugated to an immunogenic carrier, optionally via a linker.
50. The method of claim 49, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.
51. The method of claim 49, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.
52. The method of claim 49 or claim 51, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.
53. The method of claim 46, wherein the composition further comprises an adjuvant, optionally an oil-based adjuvant.
54. The method of claim 46, wherein the inducer of the cellular immune response against the gastrin-associated tumor or cancer comprises an immune checkpoint inhibitor.

55. The method of claim 54, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).
- 5 56. The method of claim 55, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.
- 10 57. The method of claim 46, wherein the gastrin-associated tumor and/or cancer is pancreatic cancer.
58. The method of claim 57, wherein the composition induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer.
- 15 59. The method of claims 46, wherein the composition is administered in a dose selected from the group consisting of about 50  $\mu$ g to about 1000  $\mu$ g, about 50  $\mu$ g to about 500  $\mu$ g, about 100  $\mu$ g to about 1000  $\mu$ g, about 200  $\mu$ g to about 1000  $\mu$ g, and about 250  $\mu$ g to about 500  $\mu$ g, and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.
- 20 60. A method for inducing and/or enhancing a cellular immune response against a gastrin-associated tumor or cancer in a subject, the method comprising administering to a subject that has a gastrin-associated tumor or cancer an effective amount of a composition comprising an agent that reduces or inhibits gastrin signaling via CCK-B receptors present on a gastrin-associated tumor or cancer.
- 25 61. The method of claim 60, wherein the agent comprises a gastrin peptide, an anti-gastrin antibody, an anti-CCK-B receptor antibody, or any combination thereof.
- 30 62. The method of claim 61, wherein the gastrin peptide comprises a gastrin-17 (G17) peptide or an immunogenic fragment thereof.
63. The method of claim 62, wherein the gastrin peptide or the immunogenic fragment thereof comprises, consists essentially of, or consists of an

amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).

5 64. The method of claim 61, wherein the agent comprises a gastrin peptide conjugated to an immunogenic carrier, optionally wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.

10 65. The method of claim 64, wherein the gastrin peptide is conjugated to the immunogenic carrier via a linker, optionally a linker comprising a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.

66. The method of claim 64, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

15 67. The method of claim 60, wherein the composition further comprises an adjuvant, optionally an oil-based adjuvant.

20 68. A method for sensitizing a tumor and/or a cancer associated with gastrin and/or CCK-B receptor signaling in a subject to an inducer of a cellular immune response directed against the tumor and/or cancer, the method comprising administering to the subject a composition comprising:

25 (a) a first agent that induces and/or provides an active and/or a passive humoral immune response against a gastrin peptide, and a second agent that induces and/or provides a cellular immune response against the tumor and/or the cancer, or a combination thereof, optionally wherein the first agent and the second agent are individually selected from the group consisting of a gastrin peptide and/or a fragment and/or a derivative thereof that induces a cellular immune response or production of neutralizing anti-gastrin antibodies in the subject and a neutralizing anti-gastrin antibody and/or a fragment and/or derivative thereof and; and/or

30 (b) a composition comprising a nucleic acid that inhibits expression of a gastrin gene product; and/or

(c) a composition comprising an agent that blocks the biological function of gastrin at the CCK-B receptor.

69. The method of claim 68, wherein the anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17).
70. The method of claim 69, wherein the epitope is present within the amino acid sequence EGPWLEEEEE (SEQ ID NO: 1) or EGPWLEEEEE (SEQ ID NO: 2) or EGPWLEEEEEAY (SEQ ID NO: 3) OR EGPWLEEEEEAYGWMD (SEQ ID NO: 4).
71. The method of any of claims 68-70, wherein the composition comprises the gastrin peptide conjugated to an immunogenic carrier.
72. The method of claim 71, wherein the gastrin peptide comprises an amino acid sequence selected from the group consisting of SEQ ID NO: 1, SEQ ID NO: 2, SEQ ID NO: 3 and SEQ ID NO: 4.
73. The method of claim 71, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.
74. The method of claim 71, wherein the gastrin peptide is conjugated to the immunogenic carrier via a linker.
75. The method of claim 74, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.
76. The method of claim 74 or claim 75, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.
77. The method of any of claims 68-76, wherein the composition further comprises an adjuvant, optionally an oil-based adjuvant.
78. The method of any of claims 68-77, wherein the inducer of the cellular immune response against the gastrin-associated tumor and/or cancer comprises an immune checkpoint inhibitor.
79. The method of claim 78, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).
80. The method of claim 79, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-

936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

81. The method of claim 68, wherein the gastrin-associated tumor and/or cancer is pancreatic cancer.
- 5 82. The method of claim 81, wherein the composition induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer.
83. The method of claim 68, wherein the composition is administered in a dose selected from the group consisting of about 50  $\mu\text{g}$  to about 1000  $\mu\text{g}$ , about 10 50  $\mu\text{g}$  to about 500  $\mu\text{g}$ , about 100  $\mu\text{g}$  to about 1000  $\mu\text{g}$ , about 200  $\mu\text{g}$  to about 1000  $\mu\text{g}$ , and about 250  $\mu\text{g}$  to about 500  $\mu\text{g}$ , and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.
- 15 84. A method for preventing, reducing, and/or eliminating formation of fibrosis associated with a tumor and/or a cancer, the method comprising contacting cells of the tumor and/or the cancer with an agent that directly or indirectly inhibits one or more biological activities of gastrin in the tumor and/or cancer.
- 20 85. The method of claim 84, wherein the agent:
- (i) provides and/or induces a humoral immune response against a gastrin peptide, optionally wherein the agent is selected from the group consisting of an anti-gastrin antibody, and/or a fragment and/or derivative thereof, and a gastrin peptide that 25 induces production of neutralizing anti-gastrin antibodies in the subject; and/or
  - (ii) comprises a nucleic acid that inhibits expression of a gastrin gene product; and/or
  - (iii) comprises a small molecule compound that blocks the 30 function of the gastrin hormone.
86. The method of claim 85, wherein the anti-gastrin antibody is an antibody directed against an epitope present within gastrin-17 (G17).
87. The method of claim 86, wherein the epitope is present within the amino acid sequence EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID

NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), or EGPWLEEEEEAYGWMD (SEQ ID NO: 4).

88. The method of any one of claims 84-87, wherein the agent comprises the gastrin peptide that induces production of neutralizing anti-gastrin antibodies conjugated to an immunogenic carrier.

89. The method of claim 88, wherein the gastrin peptide comprises an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).

90. The method of claim 88, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.

91. The method of claim 88, wherein the gastrin peptide is conjugated to the immunogenic carrier via a linker.

92. The method of claim 91, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.

93. The method of claim 91 or claim 92, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

94. The method of any one of claims 84-93, wherein the agent further comprises an adjuvant, optionally an oil-based adjuvant.

95. The method of any one of claims 84-94, further comprising contacting the tumor and/or the cancer with a second agent comprising a stimulator of a cellular immune response against the tumor and/or the cancer.

96. The method of claim 95, wherein the second agent is an immune checkpoint inhibitor.

97. The method of claim 96, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).

98. The method of claim 97, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-

936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, and Avelumab.

99. The method of any one of claims 84-98, wherein the tumor and/or cancer is pancreatic cancer.
- 5 100. Use of the pharmaceutical composition of any one of claims 1-13 for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount of the pharmaceutical composition of any one of claims 1-13 sufficient to enhance the number of CD4<sup>-</sup>/CD8<sup>-</sup> T<sub>EMRA</sub> cells  
10 in the subject that respond to the gastrin-associated tumor or cancer.
101. Use of the pharmaceutical composition of any one of claims 1-13 for increasing the number of T<sub>EMRA</sub> cells in a subject that respond to a gastrin-associated tumor or cancer.
102. Use of a composition comprising an immune checkpoint inhibitor and a  
15 gastrin immunogen to treat a gastrin-associated tumor or cancer.
103. Use of a composition comprising an immune checkpoint inhibitor and a gastrin immunogen for the preparation of a medicament to treat a gastrin-associated tumor or cancer.
104. Use of the pharmaceutical composition of any one of claims 1-13 for  
20 preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount of the pharmaceutical composition of any one of claims 1-13 sufficient to enhance the number of CD8<sup>+</sup> tumor infiltrating lymphocytes.
- 25 105. The use of claim 104, wherein the administering results in improves survival of the subject, reduced tumor growth, and/or enhanced efficacy of a chemotherapeutic agent and/or an immune checkpoint therapy in the subject as compared to that which would have occurred had the pharmaceutical composition not been administered.
- 30 106. Use of the pharmaceutical composition of any one of claims 1-13 for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer by administering to a subject having a gastrin-associated tumor or cancer an amount of the pharmaceutical composition of any one

of claims 1-13 sufficient to reduce the number of FoxP3<sup>+</sup> inhibitory T-regulatory cells.

**AMENDED CLAIMS****received by the International Bureau on 14 November 2018 (14.11.2018)**What is claimed is:

1. A method for sensitizing a tumor and/or a cancer associated with gastrin signaling in a subject to an inducer of a cellular immune response directed against the tumor and/or cancer, the method comprising administering to the subject a composition comprising a gastrin peptide conjugated to an immunogenic carrier via a linker.

2. The method of claim 1, wherein the gastrin peptide comprises an amino acid sequence selected from the group consisting of SEQ ID NO: 1, SEQ ID NO: 2, SEQ ID NO: 3 and SEQ ID NO: 4.

3. The method of claim 1, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.

4. The method of claim 1, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.

5. The method of claim 4, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

6. The method of claim 1, wherein the composition further comprises an adjuvant, optionally an oil-based adjuvant.

7. The method of claim 1, wherein the inducer of the cellular immune response against the gastrin-associated tumor and/or cancer comprises an immune checkpoint inhibitor.

8. The method of claim 7, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).

9. The method of claim 8, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, Avelumab and Durvalumab.

10. The method of claim 1, wherein the gastrin-associated tumor and/or cancer is pancreatic cancer.

11. The method of claim 10, wherein the composition induces a reduction in and/or prevents the development of fibrosis associated with the pancreatic cancer.

12. The method of claim 1, wherein the composition is administered in a dose selected from the group consisting of about 50 µg to about 1000 µg, about 50 µg to about 500 µg, about 100 µg to about 1000 µg, about 200 µg to about 1000 µg, and about 250 µg to about 500 µg, and optionally wherein the dose is repeated once, twice, or three times, optionally wherein the second dose is administered 1 week after the first dose and the third dose, if administered, is administered 1 or 2 weeks after the second dose.

13. A method for preventing, reducing, and/or eliminating formation of fibrosis associated with a tumor and/or a cancer, the method comprising contacting the tumor and/or the cancer with a first composition comprising a gastrin peptide conjugated to an immunogenic carrier via a linker and a second composition comprising an immune checkpoint inhibitor.

14. The method of claim 13, wherein the gastrin peptide comprises an amino acid sequence selected from the group consisting of EGPWLEEEEE (SEQ ID NO: 1), EGPWLEEEEE (SEQ ID NO: 2), EGPWLEEEEEAY (SEQ ID NO: 3), and EGPWLEEEEEAYGWMD (SEQ ID NO: 4).

15. The method of claim 13, wherein the immunogenic carrier is selected from the group consisting of diphtheria toxoid, tetanus toxoid, keyhole limpet hemocyanin, and bovine serum albumin.

16. The method of claim 13, wherein the linker comprises a  $\epsilon$ -maleimido caproic acid N-hydroxysuccinamide ester.

17. The method of claim 16, wherein the linker and the gastrin peptide are separated by an amino acid spacer, optionally wherein the amino acid spacer is between 1 and 10 amino acids in length, further optionally wherein the amino acid spacer is 7 amino acids in length.

18. The method of claim 13, wherein the first composition further comprises an adjuvant, optionally an oil-based adjuvant.

19. The method of claim 13, wherein the immune checkpoint inhibitor inhibits a biological activity of a target polypeptide selected from the group consisting of cytotoxic T-lymphocyte antigen 4 (CTLA4), programmed cell death-1 receptor (PD-1), and programmed cell death 1 receptor ligand (PD-L1).

20. The method of claim 19, wherein the immune checkpoint inhibitor is selected from the group consisting of Ipilimumab, Tremelimumab, Nivolumab, Pidilizumab, Pembrolizumab, AMP514, AUNP12, BMS-936559/MDX-1105, Atezolizumab, MPDL3280A, RG7446, RO5541267, MEDI4736, and Avelumab.

21. The method of claim 13, wherein the tumor and/or cancer is pancreatic cancer.

22. A method for increasing the number of TEMRA cells that respond to a gastrin-associated tumor or cancer, the method comprising administering to a subject in need thereof an effective amount of a first composition comprising a gastrin peptide conjugated to an immunogenic carrier via a linker and a second composition comprising an immune checkpoint inhibitor, wherein the number of TEMRA cells that respond to the gastrin-associated tumor or cancer is increased.

23. A method for increasing the number of CD8+ tumor infiltrating lymphocytes that respond to the gastrin-associated tumor or cancer in a subject, the method comprising administering to the subject an effective amount of a first composition comprising a gastrin peptide conjugated to an immunogenic carrier via a linker and a second composition comprising an immune checkpoint inhibitor,

whereby the number of CD8+ tumor infiltrating lymphocytes cells that respond to the gastrin-associated tumor or cancer present in the subject is increased.

24. The method of claim 23, wherein the administering results in improves survival of the subject, reduced tumor growth, and/or enhanced efficacy of a chemotherapeutic agent and/or an immune checkpoint therapy in the subject as compared to that which would have occurred had the pharmaceutical composition not been administered.

25. A method for preventing, reducing, and/or eliminating metastasis of a gastrin-associated tumor or cancer in a subject, the method comprising administering to a subject having a gastrin-associated tumor or cancer an effective amount of a first composition comprising a gastrin peptide conjugated to an immunogenic carrier via a linker and a second composition comprising an immune checkpoint inhibitor, wherein the effective amount is sufficient to reduce the number of FoxP3<sup>+</sup> inhibitory T-regulatory cells in the subject.

INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US2018/037737

A. CLASSIFICATION OF SUBJECT MATTER  
IPC(8) - A61K 39/00; A61K 39/395; C07K 14/00 (2018.01)  
CPC - A61K 2039/505; A61K 2039/55516; A61K 2039/575 (2018.08)

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)  
See Search History document

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched  
USPC - 424/174.1; 424/184.1; 424/193.1 (keyword delimited)

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)  
See Search History document

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X -- Y	US 2016/0271239 A1 (BAVARIAN NORDIC A/S) 22 September 2016 (22.09.2016) entire document	1, 2, 8-11, 16, 23-27, 46, 53-57, 102, 103 ----- 3-7, 12, 13, 17-22, 28, 29, 47-52, 58, 59, 68-73, 81-83
X -- Y	US 2003/0091574 A1 (GEVAS et al) 15 May 2003 (15.05.2003) entire document	60-64, 66, 67 ----- 3-7, 12, 13, 17-22, 29-39, 47-52, 59, 65, 70-73, 83-93
Y	US 2016/0228561 A1 (CANSBIO (BEIJING) BIOTECHNOLOGY CO., LTD.) 11 August 2016 (11.08.2016) entire document	6, 21, 37-39, 51, 65, 91-93
Y	WO 2016/196935 A1 (BOSTON BIOMEDICAL, INC.) 08 December 2016 (08.12.2016) entire document	28, 30-39, 58, 68-73, 81-93

Further documents are listed in the continuation of Box C.  See patent family annex.

\* Special categories of cited documents:  
 "A" document defining the general state of the art which is not considered to be of particular relevance  
 "E" earlier application or patent but published on or after the international filing date  
 "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)  
 "O" document referring to an oral disclosure, use, exhibition or other means  
 "P" document published prior to the international filing date but later than the priority date claimed  
 "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention  
 "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone  
 "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art  
 "&" document member of the same patent family

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US2018/037737

## Box No. I Nucleotide and/or amino acid sequence(s) (Continuation of item 1.c of the first sheet)

1. With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international search was carried out on the basis of a sequence listing:

a.  forming part of the international application as filed:

in the form of an Annex C/ST.25 text file.

on paper or in the form of an image file.

b.  furnished together with the international application under PCT Rule 13ter.1(a) for the purposes of international search only in the form of an Annex C/ST.25 text file.

c.  furnished subsequent to the international filing date for the purposes of international search only:

in the form of an Annex C/ST.25 text file (Rule 13ter.1(a)).

on paper or in the form of an image file (Rule 13ter.1(b) and Administrative Instructions, Section 713).

2.  In addition, in the case that more than one version or copy of a sequence listing has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that forming part of the application as filed or does not go beyond the application as filed, as appropriate, were furnished.

3. Additional comments:

SEQ ID NOs: 1-5 were searched.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US2018/037737

**Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

- 1.  Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
- 2.  Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
- 3.  Claims Nos.: 14, 15, 40-45, 77-80, 94-101, 104-106  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

- 1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
- 2.  As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.
- 3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
- 4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- No protest accompanied the payment of additional search fees.
