54 **Dummy.**

57 A baby's dummy (pacifier) which at one end of the portion held within the baby's mouth and integral with the protection disc, there is provided a clip which is placed on the lower lip of the baby.

DUMMY

The present invention relates to babies' dummies (pacifiers).

The use of dummies commenced years ago and to this date apart from slight changes in configuration and material basically it remained the same for obvious reasons.

It is a well known fact that from time to time the baby rejects the pacifier and starts to cry. Sometime the pacifier just drops out of the baby's mouth, but still the result is the same. It can be really said that there are no means for keeping the pacifier in a baby's mouth or keeping it from falling out.

It is thus the object of the present invention to provide pacifiers with means which will keep the pacifier insides the baby's mouth or which will prevent it from falling out.

According to the invention there is provided a baby's pacifier which at one end of the portion held within the baby's mouth and integral with the protection disc which prevents the swallowing of the pacifier, there is provided a clip in the form of substantially 3/4 (270°) of a ring which clip is placed on the lower lip of the baby and which prevents the dropping out thereof, the said ring shaped clip extending in a plane normal to that of the said disc.

The invention will now be described with reference to the annexed drawings in which:

Fig. 1 is a perspective illustration of a pacifier.

Figs. 2, 3 and 4 are different embodiments of the clip.

Fig. 5 illustrates the manner in which the clip is used.

Figs. 6a and 6b illustrate the use of the pacifier.

Turning first to Fig. 1 a conventional pacifier 1 has a mouth piece 2, a protection disc 3 and gripping handle 4 and the new clip 5.

Figs 2 and 3 illustrate two different types of pacifier provided with two embodiments of clips which for all practical purposes function in the same manner.

As can be seen in Fig. 4 the pacifier is held in one hand of a person while the thumb is pulling back the protection disc 3 which causes the partial ring of the clip to open permitting the entrance of the lower lip of the baby (Fig. 5) into the space defined by the confines of the said clip.

Due to the fact that the clip does not constitute a full ring, no pressure or pain is caused to the baby.

Where technical features mentioned in any claim are followed by reference signs, those refer-

ence signs have been included for the sole purpose of increasing the intelligibility of the claims and accordingly, such reference signs do not have any limiting effect on the scope of each element identified by way of example by such reference signs.

Claims

1. A baby's dummy (pacifier) which at one end of the portion held within the baby's mouth and integral with the protection disc, there is provided a clip which is placed on the lower lip of the baby.

2. A baby's dummy as claimed in claim 1, characterised thereby that the clip is subsequently 3/4 (270°) of a ring.

3. A baby's dummy as claimed in claim 1, characterised thereby that the clip is part of the protection disc.

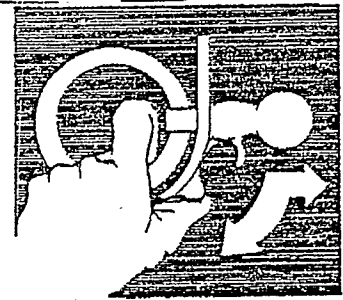

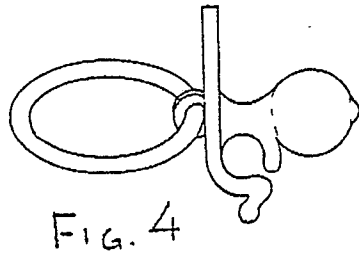

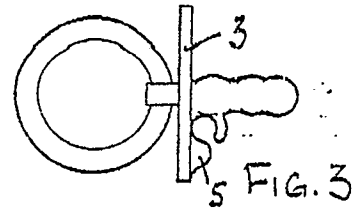

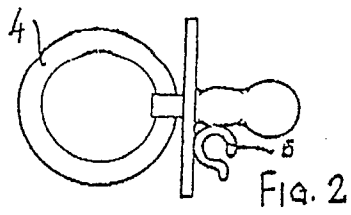

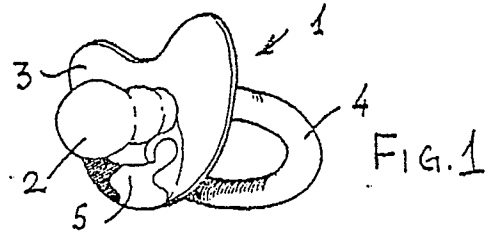

FIG. 6 b

FIG 6a
