ACCESSORY FOR BRASSIERES

Dora A. Barg, 4573 N. 30th St.,
Milwaukee, Wis. 53209

Filed July 7, 1967, Ser. No. 651,825
Int. Cl. A41c 3/02
U.S. Cl. 128—513 4 Claims

ABSTRACT OF THE DISCLOSURE

A device for attachment to conventional brassieres having a backing portion formed to conform to the contour of one of the breast portions of a brassiere. The front portion has a conical contour and is attached in a superimposed fashion over the back portion to form a conveying cavity. The front portion has access means such as a zipper therein for providing access to said cavity. The accessory is attached to a brassiere by superimposing the back portion over one of the breast portions of the breast portions of the brassiere.

My invention relates to improvements in brassieres, and more particularly to an accessory adaptable for attachment to a conventional brassiere.

A prime object of my invention is to provide a device of the character described, that is constructed as an accessory of conical contour, that may be applied to a conventional brassiere and become a part thereof.

Still another object of my invention is to construct the device in the form of a conical pocket, sealed at its rear surface and provided with a conventional hookless fastener on its front or outer surface.

A further object of my invention is to provide a device that may be fastened to a standard brassiere in any efficient and convenient manner.

By referring to the drawings and description it will become apparent that the device is adaptable to any existing type of brassiere, and may be attached to the brassiere by means of ribbons, straps, buttons, snaps, or pins. The prime object of the invention being to provide pockets to the brassiere, which pockets are of a form, shape, or contour to fit the brassiere, and fitted with the standard hookless fasteners to permit money, or the like to be inserted therein, for protection during conveying.

Other and further objects of my invention will become more apparent as the description proceeds, when taken in conjunction with the drawings, in which:

FIGURE 1 is a perspective view of the entire device dessigned to a contour to fit over the left portion of a brassiere;

FIGURE 2 is a side view of the device shown in FIGURE 1;

FIGURE 3 is a perspective view of a pair of the units attached to a conventional brassiere shown in phantom;

FIGURE 4 is a similar view of the device as shown in FIGURE 1, equipped with only conventional "snaps" for its attachment; and

FIGURE 5 is a vertical cross-sectional view of the assembled device as a pocket, sealed on its forward face by means of a hookless fastener.

Similar characters of reference indicate corresponding parts throughout the several views, and referring now to

the same, the character **10**, shows the front portion of material, conical in contour, and equipped with a conventional hookless fastener shown as **11**, and having a pliable cover **12** to cover the sliding member **13** (see FIGURE 4), when the fastener is in a closed position.

The front portion **10** has a back portion **14** of material, of the same shape and contour attached to the outer edge of the front portion **10** at **15**, in any convenient and efficient manner, such as by means of sewing, or the like.

If desired a separate band **16** may be sewed to the bottom edge of the front portion **10** to accommodate a strip **17** for supporting a safety pin shown as **18**.

In FIGURE 1, I show a top band **19** for attachment by means of a buckle **20**, onto the shoulder strap **21** of the brassiere **22**, shown in phantom in FIGURE 3.

The device is a separate distinct accessory designed in pairs, and arranged to be applied to the conventional brassiere as shown in phantom in FIGURE 3. The method employed for fastening the device to the brassiere, may be any conventional and practical means, such as snaps **23**, clamps, or pins.

When attached to the brassiere, the device constituting my invention acts as a pocket, opened and closed by the fastener **11** for conveying money, or other valuables, and although I have shown a specific construction, I do not limit myself to the arrangement shown, for many changes may be made without effecting the performance or operativeness of the device, and I reserve the rights to make such changes as I may deem necessary or convenient, witthout departing from the spirit of my invention or the scope of the appended claims.

Having thus described my invention, what I claim and desire to secure by Letters Patent in the United States is:

1. An accessory adaptable for attachment to a conventional brassiere comprising:
   - a back portion that is formed to conform to the contour of one of the breast portions of a brassiere,
   - a front portion having a conical contour and being attached in a superimposed fashion over said back portion to form a conveying cavity therein,
   - said front portion having access means therein for providing access to said cavity, and
   - means for attaching said accessory to a brassiere by superimposing said back portion over one of said breast portions of said brassiere.

2. An accessory, as defined in claim **1**, said access means includes a zipper across said front portion.

3. An accessory, as defined in claim **2**, wherein said back portion is sewed to said brassiere.

4. An accessory, as defined in claim **3**, wherein said accessory has snap means for associating it to said brassiere.
