Title: COLORED PEROXIDE AND POLYESTER FORMULATIONS

Abstract: Disclosed herein is a composition comprising: A) at least one dye; and B) at least one additional component selected from the group consisting of: 1) unsaturated polyester resins; and 2) organic peroxide initiators; wherein the dye is compatible with any organic peroxide present and is selected from the group consisting of antraquinone derivatives, pyrazaline derivatives, and mixtures thereof.
COLORED PEROXIDE AND POLYESTER FORMULATIONS

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to the hardening of unsaturated polyester resins using organic peroxide initiators in the presence of dyes.

2. Description of Related Art

Pigments based on metal oxides are known coloring agents for peroxides; however, they are predominantly used with solid peroxides (such as benzoyl peroxide, lauroyl peroxide, etc.) Their liquid organic peroxide formulations have a very limited shelf-life. In addition, a wide variety of phenylenediamine dyes were disclosed in the patent literature as effective coloring agents for solid peroxides (benzoyl peroxide, cyclohexanone peroxide, decanoyl peroxide). Their limited applications for liquid organic peroxide products could be explained by their mutual incompatibility, which results in active oxygen content losses and degradation of the peroxides. Most of the commercially available dyes for both liquid and solid organic peroxides are red. There are also examples of yellow dyes suitable for organic peroxides; however, very often yellow-colored peroxides are not distinctively different from the undyed material.

The following advantages are realized when colored formulations are used:

1. Organic peroxides used in external mixing resin/peroxide spray guns are often dyed as a visual aid to help the operator confirm an adequate flow out of the peroxide nozzle.

2. The presence of a peroxide and uniformity of mixing the resin with the peroxide is indicated by observing the color distribution therein.
3. The coloration in most instances causes the polymerization product to become slightly pigmented with a pre-selected color.

4. Having pigmented peroxides of several colors permits different colors to be offered for different products (or their grades), thereby helping to prevent their inadvertent misuse.

U.S. Patent No. 3,181,991 organic peroxides such as benzoyl peroxide to which a coloration has been imparted by means of incorporating a relatively small proportion of a pigment with the peroxide. The pigmentation material is an organic or inorganic compound having a distinct color and is inert with respect to organic peroxides.

U.S. Patent No. 3,182,026 discloses the combination of pigmented peroxide compositions with certain substances in order to make the total composition substantially permanently homogeneous and prevent them from physically separating into their component parts during storage or use. Preferably, the compositions comprise an intermixture of an organic peroxide, a compatible pigment therefor, and an activated gel in an amount sufficient to cause the composition to be permanently homogeneous.

U.S. Patent No. 3,390,121 discloses achieving uniform blending of a curing catalyst in the curing of polyester resins by including a color indicating compound in the polyester using curing composition. The compositions include as the indicator a diphenylamine compound having at least one additional resonating group, i.e. a bivalent sulfur, a bivalent amino or a monovalent amino group, which in the presence of a peroxide curing catalyst gives a fugitive color which disappears during the curing.
U.S. Patent No. 4,164,492 discloses a method for determining the degree of cure of polyester and epoxy resins which includes the steps of adding a catalyst, containing a pigment, to the resin; mixing the two components to provide a visually uniform distribution of the catalyst and pigment throughout the resin; and, depositing the mixture in a desired position for curing. The pigment can also be added directly to the resin rather than the catalyst. Additionally, in either alternative, at the completion of the curing the color imparted by the pigment has substantially disappeared from the cured product as though no pigment had been employed. Also disclosed is a benzoyl peroxide paste composition, for curing polyester resins, having a pigment the color of which substantially disappears from the cured product.

U.S. Patent No. 4,232,136 discloses a process for the controlled hardening of unsaturated polyester resins at temperatures of -5° C to +150° C using an organic peroxide initiator. According to the process of the invention an organic dyestuff of a specific given formula is admixed with the polyester resin and/or the organic peroxide in an amount of 0.001 to 0.05% by weight, calculated for the weight of the polyester resin. It is said that the composition and homogeneity of the polyester resin/additive mixtures can be observed easily and the progress of cross-linking can be monitored visually through characteristic colors and color changes, respectively.

U.S. Patent Nos. 4,370,428 and 4,460,719 disclose polyester and hardener compositions that have incorporated therein pigments of Toluidine Red Y and Parachlor R to enable the user to determine when mixing is uniform and when the cure has been completed.

U.S. Patent No. 4,522,963 discloses a process for monitored cross-linking of unsaturated polyester resins in the presence of a metal-ion-containing accelerator and an
organic peroxide initiator, complemented by promotor in some cases. The cross-linking is
carried out in the presence of one of the compounds from the group consisting of alizarin,
sodium alizarinesulfonate, 3-nitroalizarin, chinizarine, or purpurin, where the substituents are
H atoms or OH, NO₂, SO₃H, or SO₃Na groups with the restriction that at least one of them
should be other than H, which is present in a ratio of from 0.005 to 0.5, preferably 0.01 to 0.1
percent (mass/mass), compared to the mass of the polyester resin, and cross-linking is trailed
by the color change in the system. It is said that all of the chemical-technological processes
involved in the processing of unsaturated polyester resins can thus be monitored visually.

The disclosures of the foregoing are incorporated herein by reference in their entirety.

Notwithstanding the foregoing, a need still remains for new multicolor dyes
compatible with organic peroxides used for curing unsaturated polyester resins, especially
liquid peroxides, such as ketone peroxides, hydroperoxides, peroxyketals,
peroxydicarbonates, and peroxyesters.

**SUMMARY OF THE INVENTION**

The present invention is directed to the curing of unsaturated polyester resins in the
presence of an organic peroxide and a dye compatible with the organic peroxide, wherein the
dye is selected from the group consisting of anthraquinone derivatives, pyrazolone
derivatives, and mixtures thereof.

More specifically, the present invention is directed to a composition comprising:

A) at least one dye; and

B) at least one additional component selected from the group consisting of:

1) unsaturated polyester resins; and

2) organic peroxide initiators;
wherein the dye is compatible with any organic peroxide present and is selected from the group consisting of anthraquinone derivatives, pyrazalone derivatives, and mixtures thereof.

In a preferred embodiment, the present invention is directed to a composition comprising:

A) at least one dye; and

B) at least one additional component selected from the group consisting of:

1) unsaturated polyester resins; and

2) organic peroxide initiators;

wherein the dye is compatible with any organic peroxide present and is selected from the group consisting of:

1) anthraquinone derivatives of the structure:

\[
\begin{array}{c}
R_3 \\
\text{O} \\
\text{O} \\
R_2 \\
R_1
\end{array}
\]

wherein \( R_1, R_2, \) and \( R_3 \) are independently selected from the group consisting of hydrogen, alkyl, and

\[
\begin{array}{c}
R_4 \\
R_7 \\
R_6 \\
R_5
\end{array}
\]
wherein \( R_7 \) is -NH, -NH-R\(_9\), or -S, \( R_8 \) is alkyene, and \( R_4, R_5, R_6 \) are independently selected from the group consisting of hydrogen, alkyl, and halogen, provided that at least one of \( R_1, R_2, \) and \( R_3 \) is

![Chemical structure](Image 1)

2) pyrazolone derivatives of the structure:

![Chemical structure](Image 2)

wherein

\( R_9 \) is hydrogen or -NH-R\(_{11}\),

\( R_{10} \) and \( R_{11} \) are independently selected from the group consisting of alkyl, aryl, and aralkyl, and

\( R_{12} \) is an aryl group; and

3) mixtures thereof.
In another aspect, the present invention is directed to an improvement in a process for curing unsaturated polyester resins with organic peroxide initiators, wherein the improvement comprises combining an unsaturated polyester resin, an organic peroxide initiator, and a dye that is compatible with the organic peroxide and is selected from the group consisting of anthraquinone derivatives, pyrazalone derivatives, and mixtures thereof.

In another preferred embodiment, the present invention is directed to an improvement in a process for curing unsaturated polyester resins with organic peroxide initiators, wherein the improvement comprises combining an unsaturated polyester resin, an organic peroxide initiator, and a dye that is compatible with the organic peroxide and is selected from the group consisting of:

A) anthraquinone derivatives of the structure:

\[
\begin{array}{c}
\text{R}_1 \\
\text{O} \\
\text{R}_2 \\
\text{O} \\
\end{array}
\]

wherein \(\text{R}_1, \text{R}_2, \) and \(\text{R}_3\) are independently selected from the group consisting of hydrogen, alkyl, and

\[
\begin{array}{c}
\text{R}_4 \\
\text{R}_5 \\
\text{R}_6 \\
\text{R}_7 \\
\end{array}
\]
wherein \( R_7 \) is \(-\text{NH}, -\text{NH-R}_9, \text{or} -\text{S} \), \( R_9 \) is alkylene, and \( R_{d3}, R_{s3}, \text{and} R_6 \) are independently selected from the group consisting of hydrogen, alkyl, and halogen, provided that at least one of \( R_1, R_2, \text{and} R_3 \) is

\[
\begin{tikzpicture}
  
  \node at (0,0) (A) {\text{R}_7};
  \node at (0.5,0.5) (B) {\text{R}_4};
  \node at (0.5,-0.5) (C) {\text{R}_5};
  \node at (-0.5,-0.5) (D) {\text{R}_6};

  \draw (A) edge (B)
  \draw (B) edge (C)
  \draw (C) edge (D)
  \draw (D) edge (A);
\end{tikzpicture}
\]

B) pyrazolone derivatives of the structure:

\[
\begin{tikzpicture}
  \node at (0,0) (A) {$\text{R}_{10}$};
  \node at (0.7,0) (B) {$\text{R}_9$};
  \node at (0.7,-1) (C) {$\text{N}$};
  \node at (0.1,-1) (D) {$\text{N}$};
  \node at (0,0.6) (E) {$\text{R}_{12}$};

  \draw (A) edge (B)
  \draw (B) edge (C)
  \draw (C) edge (D)
  \draw (D) edge (E)
  \draw (E) edge (A);
\end{tikzpicture}
\]

wherein

\( \text{R}_9 \) is hydrogen or \(-\text{NH-R}_{11} \),

\( \text{R}_{10} \) and \( \text{R}_{11} \) are independently selected from the group consisting of alkyl, aryl, and aralkyl, and

\( \text{R}_{12} \) is an aryl group; and

C) mixtures thereof.
DESCRIPTION OF THE PREFERRED EMBODIMENTS

The compositions of the present invention preferably comprise:

A) at least one dye; and

B) at least one additional component selected from the group consisting of:
   1) unsaturated polyester resins; and
   2) organic peroxide initiators;

wherein the dye is compatible with any organic peroxide present and is selected from the group consisting of:

   1) anthraquinone derivatives of the structure:

   \[
   \begin{align*}
   &\text{R}_3 \quad \text{O} \\
   &\text{R}_2 \\
   &\text{R}_1 \\
   &\text{O} \\
   &\text{R}_4 \\
   &\text{R}_7 \\
   &\text{R}_6 \\
   &\text{R}_5
   \end{align*}
   \]

wherein \( R_1, R_2, \) and \( R_3 \) are independently selected from the group consisting of hydrogen, alkyl, and
wherein R₂ is -NH, -NH-R₆, or -S, R₆ is alkyene, and R₄, R₅, and R₆ are independently selected from the group consisting of hydrogen, alkyl, and halogen, provided that at least one of R₁, R₂, and R₃ is

![Chemical Structure](image)

2) pyrazolone derivatives of the structure:

![Pyrazolone Structure](image)

wherein

R₉ is hydrogen or -NH-R₁₁,

R₁₀ and R₁₁ are independently selected from the group consisting of alkyl, aryl, and aralkyl, and

R₁₂ is an aryl group; and

3) mixtures thereof.
Where any of R₁, R₂, or R₃ in the above formulae are alkyl, they are preferably lower alkyl, more preferably lower alkyl of from 1 to 5 carbon atoms, i.e., methyl, ethyl, propyl, butyl, pentyl, and isomers thereof, e.g., isopropyl, tert-butyl, neopentyl, and the like. Where two of R₁, R₂, and R₃ are alkyl, they may be the same or different.

Similarly, where R₄, R₅, and/or R₆ are alkyl, they are preferably lower alkyl, more preferably lower alkyl of from 1 to 5 carbon atoms, as described above. Again, where two or more of R₄, R₅, and R₆ are alkyl, they may be the same or different.

Where R₄, R₅, and/or R₆ are halogen, they are preferably chloro, bromo, or iodo, more preferably bromo. Where two or more of R₄, R₅, and R₆ are halogen, they may be the same or different; preferably, they will be the same.

When present in the above formulae, R₇ is alkyne, preferably lower alkyne, more preferably lower alkyne of from 1 to 5 carbon atoms, i.e., methylene, ethylene, propylene, butylene, pentylene, and isomers thereof, e.g., isopropylene, tert-butylene, neopentylene, and the like. As employed herein, the term "alkyne" is intended to mean an alkyl group having an additional hydrogen removed to provide two bonding sites on the moiety, e.g., -CH₂-, -CH₂CH₂-, and so on.

Where R₁₀ and/or R₁₁ are alkyl, they are preferably lower alkyl, more preferably lower alkyl of from 1 to 5 carbon atoms, as described above. Again, where both R₁₀ and R₁₁ are alkyl, they may be the same or different.

Where R₁₀ and/or R₁₁ are aryl, it is preferred that they, as well as R₁₂, which is always aryl, be aromatic groups having from 6 to 10 ring carbon atoms, such as, phenyl or naphthyl. Phenyl groups are preferred. These aryl groups can, if desired, have substituents attached thereto. Naturally, such substituents will normally be chosen from those that impart no
substantial detriment to the dyeing properties of the pyrazolone, for example, alkyl groups. Where two or more of \( R_{10}, R_{11}, \) and \( R_{12} \) are aryl, they may be the same or different.

\( R_{10} \) and/or \( R_{11} \) can also be aralkyl, i.e., an aryl-substituted alkyl, such as, for example, benzyl, where, again, the phenyl ring may, if desired, be substituted with innocuous moieties.

Examples of the most suitable dyes for pigmenting organic peroxides used for curing unsaturated polyester resins in accordance with the present invention are listed below in Table 1.

These dyes can be successfully used for coloring any peroxide catalyst that can be used for the polymerization of an unsaturated polyester resin. These catalysts are organic peroxides that are generally used industrially and include ketone peroxides, such as, methyl ethyl ketone peroxide, methyl isobutyl ketone peroxide, cyclohexanone peroxide, and the like; hydroperoxides, such as, cumene hydroperoxide, t-butyl hydroperoxide, and the like; diacyl peroxides, such as, benzoyl peroxide, lauroyl peroxide, and the like; peroxycetals, such as, 1,1-di(t-butyl peroxy)cyclohexane, 1,1-di(t-butyl peroxy)3,3,5-trimethylcyclohexane, and the like; peroxysters, such as, t-butyl peroxybenzoate, t-butyl peroxo 2-ethyl hexanoate, and the like; peroxydicarbonates, such as, bis(4-t-butyl cyclohexyl) peroxydicarbonate) and the like; and mixtures of the foregoing used for curing unsaturated polyester resins.

It should be understood that, in accordance with the present invention, the order of addition is not critical, for example,

1. the dye can be combined with the organic peroxide and then this combination can be combined with the polyester, or

2. the dye can be combined with the polyester and then this combination can be combined with the organic peroxide.

Colored formulations can, for example, be made by dissolving solid dyes in liquid organic peroxides or by adding solutions of the dyes (solid or liquid) to the organic peroxides.

The dyes are added at levels ranging from about 0.001 to about 10 wt.% based on the weight of the peroxide to be employed, preferably about 0.01 to about 2 wt.%, and, more preferably, from about 0.1 to about 0.5 wt.%. 

13
The term "polyester resin" as used herein refers to the product of a mixture of one or more unsaturated polyesters with one or more unsaturated compounds that can be cross-linked. Unsaturated polyesters are produced by esterifying a saturated or unsaturated dicarboxylic acids or the corresponding anhydrides with saturated or unsaturated polyfunctional alcohols. Examples of these acids are maleic, fumaric, phthalic, itaconic acid and the like. These acids can be partially replaced by one or more saturated dicarboxylic acids. Examples of these are adipic, sebacic, or succinic acid, and the like. Examples of the polyfunctional alcohols that may be used individually or in blends of two or more are ethylene glycol, diethylene glycol, propylene glycol, triethylene glycol and the like. The unsaturated polyester obtained by reacting the above is then dissolved in a reactive monomer, such as, styrene, acrylic compounds, divinyl benzene, or diallylphthalate.

The advantages and the important features of the present invention will be more apparent from the following examples.

**EXAMPLES**

The stability of the colored organic peroxide formulations was tested with the Displacement Test, Active Oxygen, and Color Absorbency analytical methods. Methyl ethyl ketone peroxide (MEKP) product (Hi Point 90, supplied by Crompton Corporation) was used for testing as representing one of the most reactive organic peroxides. Also, colored formulations of t-butyl peroxybenzoate (Esperox 10), 80% solution of 1,1-di(t-butyl peroxy) cyclohexane in butyl benzyl phthalate (USP 400P) and cumene hydroperoxide (CHP 158) supplied by Crompton Corporation were tested representing peroxysterers, peroxylketals, and hydroperoxides, respectively.
Displacement Test

The Displacement Test is an accelerated aging test to determine if a product will develop gas pressure in the commercial package as it ages. A 10 ml sample is sealed in a 14 ml vial that is fitted with a dip tube that leads from the vial to a 12 ml graduated tube. The vial with the sample is placed in a 55° C dry bath and the amount of liquid displaced by the gas pressure developed in the vial is recorded over an eight hour period. The testing time was extended to a forty-eight hour period in order to ensure a longer term stability of the compositions. The results are shown in Table 2.

Active Oxygen Method

The Active Oxygen Method determines the relative concentration of peroxo groups in formulations. Each peroxo group is considered to contain one active oxygen atom. A 0.3 g sample of the ketone peroxide is dissolved in a solution of glacial acetic acid, water, and excess potassium iodide to produce a very dark reddish-brown iodine color. The iodine produced is determined by reducing it back to colorless iodine with a standardized 0.1 N sodium thiosulfate solution. The analysis was conducted right after the colored compositions were prepared and three months later to ensure peroxide stability within this period. The results are shown in Table 3.

Color Absorbency

The Color Absorbency was measured to ensure dye stability in peroxide. A Hach DR2000 spectrophotometer was used for the color analysis. The samples to be analyzed were diluted 1:50 by volume with the colorless product and analyzed at various wavelengths for absorbency. The optimum wavelength for the absorbency measurements was achieved by scanning the wavelength spectra and plotting absorbency vs. wavelength. Yellow and green
samples were measured at 395 nm; blue and violet samples were measured at 625 and 560 nm, respectively. The analysis was conducted right after the formulations were prepared and three months later. The results are shown in Table 4.

The performance of the colored organic peroxide compositions in curing unsaturated polyester resins was analyzed in the Gel Test Method.

Gel Time Test

A Randolph Gel Time Tester, Model 100, was used to determine the gel time for a peroxide in a standard polyester resin. A 2.0 g sample of peroxide was added to 130 g of resin to gel the resin within 25-30 minutes at 25° C. The results are shown in Table 5.

Example 1
Coloring Organic Peroxides

A quantity of 0.3 g of Morplast Blue 2R was dissolved in 100 g of Hi Point 90. The sample exhibited a blue color of 0.779 color absorbency that did not change substantially over a period of three months. (0.760, 2.4% change). The dye did not affect the stability of the peroxide. The change in the Active Oxygen content was as little as 0.8% over a period of three months. A quantity of 1.5 ml was displaced over eight hours at 55° C when the sample was analyzed by the Displacement Test. The dye did not substantially affect the curing characteristics of the peroxide. After being stored for three months, the colored organic peroxide composition gelled the standard unsaturated polyester resin within 25.96 minutes, which is within the expected variation for the non-colored peroxide.

Other examples related to Hi Point 90 (ketone peroxide) are included in Tables 3, 4, and 5. Examples related to other classes of organic peroxide (Displacement Test data) such as peroxyketal, peroxyester, and hydroperoxide are included in Table 6.
Example 2
Coloring Unsaturated Polyester Resins

A general-purpose cobalt promoted unsaturated polyester resin, made up of 90% di-cyclopentadiene (DCPD) resin and 10% orthophthalic resin was used for testing. A dye (either Pylakrome Blue or Pylakrome Green) was added at 0.05-0.1 wt.% and mixed with the resin, and a colored resin composition was obtained. Based on visual observations, the color did not fade within seven days of the test at ambient temperature.

In view of the many changes and modifications that can be made without departing from principles underlying the invention, reference should be made to the appended claims for an understanding of the scope of the protection to be afforded the invention.
CLAIMS

What is claimed is:

1. A composition comprising:
   A) at least one dye; and
   B) at least one additional component selected from the group consisting of:
      1) unsaturated polyester resins; and
      2) organic peroxide initiators;

   wherein the dye is compatible with any organic peroxide present and is selected from the
   group consisting of anthraquinone derivatives, pyrazalone derivatives, and mixtures thereof.

2. The composition of claim 1 wherein the peroxide is selected from the group
   consisting of ketone peroxides, hydroperoxides, diacyl peroxides, peroxyketals, peroxyesters,
   peroxydicarbonates, and mixtures of the foregoing.

3. The composition of claim 2 wherein the peroxide is selected from the group
   consisting of methyl ethyl ketone peroxide, methyl isobutyl ketone peroxide, cyclohexanone
   peroxide, cumene hydroperoxide, t-butyl hydroperoxide, benzoyl peroxide, lauroyl peroxide,
   1,1-di(t-butyl peroxy)cyclohexane, 1,1-di(t-butyl peroxy)3,3,5-trimethylcyclohexane, t-butyl
   peroxybenzoate, t-butyl peroxy 2-ethyl hexanoate, bis(4-t-butyl cyclohexyl)
   peroxydicarbonate) and mixtures of the foregoing.
4. The composition of claim 1 wherein the dye does not impart substantial instability to
the peroxide, does not substantially fade during the shelf life of the peroxide, and does not
substantially affect the performance of the peroxide in curing polyester resins.

5. The composition of claim 1 wherein the dye is selected from the group consisting of
9,10-anthracenedione-1,4-bis (2-bromo-4,6-dimethylphenyl) amino;
9,10-anthracenedione-1,4{(2,6-dibromo-4- methyl phenyl) amino};
9,10-anthracenedione-1,4-bis (phenylthio); 9,10-anthracenedione-1,8-bis(methylphenyl)
amino; 9,10-anthracenedione-1,4-bis(alkylphenyl) amino; Pylakrome Blue LX-9704;
Pylakrome Yellow LX - 10124; 1-phenyl-3-methyl-4-(alkylphenylazo)-5- pyrazalone, and
Pylakrome Green LX - 10908.

6. A composition comprising an organic peroxide, a polyester resin, and a dye
compatible with said organic peroxide, wherein said dye is selected from the group consisting
of anthraquinone derivatives, pyrazolone derivatives, and mixtures thereof.

7. The composition of Claim 6 wherein the dye is added at a level ranging from about
0.001 to about 10 wt.% based on the weight of the peroxide.

8. The composition of claim 6 wherein the peroxide is selected from the group
consisting of ketone peroxides, hydroperoxides, diacyl peroxides, peroxyketals, peroxyesters,
peroxydicarbonates, and mixtures of the foregoing.
9. The composition of claim 8 wherein the peroxide is selected from the group consisting of methyl ethyl ketone peroxide, methyl isobutyl ketone peroxide, cyclohexanone peroxide, cumene hydroperoxide, t-butyl hydroperoxide, benzoyl peroxide, lauroyl peroxide, 1,1-di(t-butyl peroxy)cyclohexane, 1,1-di(t-butyl peroxy)3,3,5-trimethylcyclohexane, t-butyl peroxybenzoate, t-butyl peroxy 2-ethyl hexanoate, bis(4-t-butyl cyclohexyl peroxydicycarbonate) and mixtures of the foregoing.

10. The composition of claim 6 wherein the dye is selected from the group consisting of 9,10-anthracenedione-1,4-bis (2-bromo-4,6-dimethylphenyl) amino;
9,10-anthracenedione-1,4(2,6-dibromo-4-methyl phenyl) amino};
9,10-anthracenedione-1,4-bis (phenylthio); 9,10-anthracenedione-1,8-bis(methylphenyl) amino; 9,10-anthracenedione-1,4-bis(alkylphenyl) amino; Pylakrome Blue LX-9704; Pylakrome Yellow LX - 10124; 1-phenyl-3-methyl-4-(alkylphenylazo)-5- pyrazalone, and Pylakrome Green LX - 10908.

11. A composition comprising:

A) at least one dye; and

B) at least one additional component selected from the group consisting of:

1) unsaturated polyester resins; and

2) organic peroxide initiators;

wherein the dye is compatible with any organic peroxide present and is selected from the group consisting of:
1) **anthraquinone derivatives of the structure:**

![Anthraquinone Structure]

wherein $R_1$, $R_2$, and $R_3$ are independently selected from the group consisting of hydrogen, alkyl, and

![Additional Structure]

wherein $R_7$ is $\text{-NH}$, $\text{-NH-R_5}$, or $\text{-S}$, $R_6$ is alkylene, and $R_4$, $R_5$, and $R_6$ are independently selected from the group consisting of hydrogen, alkyl, and halogen, provided that at least one of $R_1$, $R_2$, and $R_3$ is

![Additional Structure]
2) pyrazolone derivatives of the structure:

\[
\begin{array}{c}
R_9 \\
N \\
N \\
R_{10} \quad N \quad R_{12} \\
\end{array}
\]

wherein

R₉ is hydrogen or -NH-R₁₁,

R₁₀ and R₁₁ are independently selected from the group consisting of alkyl, aryl, and aralkyl,

and

R₁₂ is an aryl group; and

3) mixtures thereof.

12. The composition of claim 11 wherein the peroxide is selected from the group consisting of ketone peroxides, hydroperoxides, diacyl peroxides, peroxyketals, peroxyesters, peroxydicarbonates, and mixtures of the foregoing.

13. The composition of claim 12 wherein the peroxide is selected from the group consisting of methyl ethyl ketone peroxide, methyl isobutyl ketone peroxide, cyclohexanone peroxide, cumene hydroperoxide, t-butyl hydroperoxide, benzoyl peroxide, lauroyl peroxide, 1,1-di(t-butyl peroxy)cyclohexane, 1,1-di(t-butyl peroxy)3,3,5-trimethylcyclohexane, t-butyl peroxybenzoate, t-butyl peroxy 2-ethyl hexanoate, bis(4-t-butyl cyclohexyl) peroxydicarbonate) and mixtures of the foregoing.
14. The composition of claim 11 wherein the dye is selected from the group consisting of
9,10-anthracenedione-1,4-bis (2-bromo-4,6-dimethylphenyl) amino;
9,10-anthracenedione-1,4{(2,6-dibromo-4- methyl phenyl) amino};
9,10-anthracenedione-1,4-bis (phenylthio); 9,10-anthracenedione-1,8-bis(methylphenyl)
amino; 9,10-anthracenedione-1,4-bis(alkylphenyl) amino; Pylakrome Blue LX-9704;
Pylakrome Yellow LX - 10124; 1-phenyl-3-methyl-4-(alkylphenylazo)-5- pyrazalone, and
Pylakrome Green LX - 10908.

15. In a process for curing unsaturated polyester resins with organic peroxide initiators,
the improvement that comprises combining an unsaturated polyester resin, an organic
peroxide initiator, and a dye that is compatible with the organic peroxide and is selected from
the group consisting of anthraquinone derivatives, pyrazalone derivatives, and mixtures
thereof.

16. The process of Claim 15 wherein the dye is added at a level ranging from about 0.001
to about 10 wt.% based on the weight of the peroxide.

17. The process of claim 15 wherein the peroxide is selected from the group consisting of
ketone peroxides, hydroperoxides, diacyl peroxides, peroxyketals, peroxysterers,
peroxydicarbonates, and mixtures of the foregoing.

18. The process of claim 17 wherein the peroxide is selected from the group consisting of
methyl ethyl ketone peroxide, methyl isobutyl ketone peroxide, cyclohexanone peroxide,
cumene hydroperoxide, t-butyl hydroperoxide, benzoyl peroxide, lauroyl peroxide,
1,1-di(t-butyl peroxy)cyclohexane, 1,1-di(t-butyl peroxy)3,3,5-trimethylcyclohexane, t-butyl peroxybenzoate, t-butyl peroxy 2-ethyl hexanoate, bis(4-t-butyl cyclohexyl) peroxydicarbonate) and mixtures of the foregoing.

19. The process of claim 15 wherein the dye is selected from the group consisting of
9,10-anthracenedione-1,4-bis (2-bromo-4,6-dimethylphenyl) amino;
9,10-anthracenedione-1,4-{(2,6-dibromo-4-methyl phenyl) amino};
9,10-anthracenedione-1,4-bis (phenylthio); 9,10-anthracenedione-1,8-bis(methylphenyl) amino; 9,10-anthracenedione-1,4-bis(alkylphenyl) amino; Pylakrome Blue LX-9704; Pylakrome Yellow LX - 10124; 1-phenyl-3-methyl-4-(alkylphenylazo)-5-pyrazalone, and Pylakrome Green LX - 10908.

20. In a process for curing unsaturated polyester resins with organic peroxide initiators, the improvement that comprises combining an unsaturated polyester resin, an organic peroxide initiator, and a dye that is compatible with the organic peroxide and is selected from the group consisting of:

A) anthraquinone derivatives of the structure:

```
  R3
  O   R2
  /    |
 /     |
 /     O
 /     |
 /   R1
```

27
wherein $R_1$, $R_2$, and $R_3$ are independently selected from the group consisting of hydrogen, alkyl, and

\[ \text{wherein } R_7 \text{ is } -NH, -NH-R_8, \text{ or } -S, R_8 \text{ is alkylene, and } R_4, R_5, \text{ and } R_6 \text{ are independently selected from the group consisting of hydrogen, alkyl, and halogen,}
\]

provided that at least one of $R_1$, $R_2$, and $R_3$ is

B) pyrazolone derivatives of the structure:

\[ \text{wherein } \]
$R_9$ is hydrogen or -NH-$R_{11}$.

$R_{10}$ and $R_{11}$ are independently selected from the group consisting of alkyl, aryl, and aralkyl, and

$R_{12}$ is an aryl group; and

C) mixtures thereof.

21. The process of Claim 20 wherein the dye is added at a level ranging from about 0.001 to about 10 wt.% based on the weight of the peroxide.

22. The process of claim 20 wherein the peroxide is selected from the group consisting of ketone peroxides, hydroperoxides, diacyl peroxides, peroxyketals, peroxyesters, peroxydicarbonates, and mixtures of the foregoing.

23. The process of claim 22 wherein the peroxide is selected from the group consisting of methyl ethyl ketone peroxide, methyl isobutyl ketone peroxide, cyclohexanone peroxide, cumene hydroperoxide, t-butyl hydroperoxide, benzoyl peroxide, lauroyl peroxide, 1,1-di(t-butyl peroxy)cyclohexane, 1,1-di(t-butyl peroxy)3,3,5-trimethylcyclohexane, t-butyl peroxybenzoate, t-butyl peroxy 2-ethyl hexanoate, bis(4-t-butyl cyclohexyl) peroxydicarbonate) and mixtures of the foregoing.

24. The process of claim 20 wherein the dye is selected from the group consisting of 9,10-anthracenedione-1,4-bis (2-bromo-4,6-dimethylphenyl) amino;

9,10-anthracenedione-1,4-{(2,6-dibromo-4- methyl phenyl) amino}
9,10-anthracenedione-1,4-bis (phenylthio); 9,10-anthracenedione-1,8-bis (methylphenyl) amino; 9,10-anthracenedione-1,4-bis (alkylphenyl) amino; Pylakrome Blue LX-9704; Pylakrome Yellow LX - 10124; 1-phenyl-3-methyl-4-(alkylphenylazo)-5- pyrazalone, and Pylakrome Green LX - 10908.
