(54) Title: AUCTION WITH INTEREST RATE BIDDING

(57) Abstract: A method, apparatus, and system are provided for declining auction with interest rate bidding. According to one embodiment, an interest rate may be set for a transacted financial instrument, and information regarding the financial instrument and an interest rate at which the financial instrument is offered are published via a computer network. Offers from respective bidders to transact the financial instrument may be received, via the computer network, being expressed as offered interest rates at which the bidders are willing to transact the financial instrument. On the termination of a bid receiving process, whether at least one of the offers satisfies transaction criteria, as defined by a seller of the financial instrument, may be determined. If it is determined that at least one of the offers satisfies the transaction criteria, then at least one of the offers may be identified as an accepted offer.

AUCTION WITH INTEREST RATE BIDDING

BACKGROUND OF THE INVENTION

5

Field of the Invention

Embodiments of the present invention generally relate to technical field of commerce automation and, in one exemplary embodiment, to auctioning with interest rate bidding.

Description of Related Art

10

The Internet and the World Wide Web ("Web") have changed the landscape of information delivery and affected numerous faculties of life, including electronic commerce and entertainment. One area that has benefited from this technological development is the ability for individuals to sell products over the Internet.

15

Auctions conducted across the Internet have become a very popular method of selling goods and services (items). In a typical ascending price auction, once a seller has submitted a request to sell an item, the item becomes available for bidding, with the bidding to close typically at some predetermined time (e.g., at noon, 3 days later). Potential buyers are able to view a description and possibly

20 an image of the item, and submit one or more bids for the item. The potential buyer that submitted the highest bid on the item at the end of the auction wins the auction and is typically contractually obligated to purchase the item for the amount bid.

25

In a typical declining price auction, the price (e.g., dollar amount) for an item is lowered as potential buyers continue to bid on the item for a predetermined amount of time. The price is typically lowered in predetermined increments depending on certain events, such as passage of time or number of bids received. However, even with declining price auctions in which the dollar amount of the item is incrementally lowered, the goal of the seller remains the same, i.e., to sell

30 the item for the highest price possible.

A number of technical challenges exist with respect to the automation of declining auctions between parties in a network-based commerce facility. For

example, conventional declining auction technologies are at least limited in types of items that are offered for sale and types of compensation received for those items. Such technological challenges also limit the performance of declining auctions and confine them to only particular types and ways of trading, resulting
5 further in lack of creativity and limited goals for trading on part of the participants (e.g., sellers and buyers).

SUMMARY OF THE INVENTION

A method, apparatus, and system are provided for declining auction with interest rate bidding. According to one embodiment, an interest rate may be set
10 for a transacted financial instrument, and information regarding the financial instrument and an interest rate at which the financial instrument is offered are published via a computer network. Offers from respective bidders to transact the financial instrument may be received, via the computer network, being expressed as offered interest rates at which the bidders are willing to transact the financial
15 instrument. On the termination of a bid receiving process, whether at least one of the offers satisfies transaction criteria, as defined by a seller of the financial instrument, may be determined. If it is determined that at least one of the offers satisfies the transaction criteria, then at least one of the offers may be identified as an accepted offer.

20 BRIEF DESCRIPTION OF THE DRAWINGS

The appended claims set forth the embodiments of the present invention with particularity. The embodiments of the present invention, together with its advantages, may be best understood from the following detailed description taken in conjunction with the accompanying drawings of which:

25 **Figure 1** is a block diagram illustrating an embodiment of a computer system;

Figure 2 is a block diagram illustrating an embodiment of a network;

Figure 3 is a block diagram illustrating an embodiment of marketplace and payment applications;

Figure 4 is a block diagram illustrating an embodiment of a high-level entity-relationship;

Figure 5 is a block diagram illustrating an embodiment of an auction with interest rate bidding;

5 **Figure 6** is a flow diagram illustrating an embodiment of a process for an auction with interest rate bidding;

Figure 7 is a flow diagram illustrating an embodiment of a process for a declining auction with interest rate bidding;

10 **Figure 8** is a flow diagram illustrating an embodiment of a process for an ascending auction with interest rate bidding; and

Figure 9 is a block diagram illustrating an embodiment of auction architecture.

DETAILED DESCRIPTION

15 A method, apparatus, and system are provided for declining auction with interest rate bidding. According to one embodiment, an interest rate may be set for a transacted financial instrument, and information regarding the financial instrument and an interest rate at which the financial instrument is offered are published via a computer network. Offers from respective bidders to transact the financial instrument may be received, via the computer network, being expressed
20 as offered interest rates at which the bidders are willing to transact the financial instrument. On the termination of a bid receiving process, whether at least one of the offers satisfies transaction criteria, as defined by a seller of the financial instrument, may be determined. If it is determined that at least one of the offers satisfies the transaction criteria, then at least one of the offers may be identified
25 as an accepted offer.

The information concerning the financial instrument may be published from a server computer to a client computer via the computer network. The information regarding the financial instrument may be received from the seller of the financial instrument. Furthermore, the offers may be received from the

respective bidders at the server computer from respective client computers operated by the bidders.

According to one embodiment, the bid receiving process may include a declining auction including reducing the published interest rate at which the financial instrument may be offered for sale during the bid receiving process. The reducing of the published interest rate may be performed automatically by the server computer in response to, for example, bidding activity, lack of bidding activity, and/or receipt of a lower interest rate that is lower than the published interest rate. Furthermore, the published interest rate may be reduced to be equal to the lower interest rate.

Similarly, the bidding process may also include an ascending auction including increasing the published interest rate at which the financial instrument may be offered for sale during the bid receiving process. The ascension of the published may be performed automatically by the server computer in response to, for example, bidding activity, lack of bidding activity, and/or receipt of a higher interest rate that is higher than the published interest rate. Furthermore, the published interest rate may be increased to be equal to the higher interest rate.

The financial instrument may include one or more interest-paying (IP) financial instruments or one or more interest-receiving (IR) financial instruments. An IP financial instrument may refer to a financial instrument for which the seller pays interest to the buyer of the IP financial instrument, while an IR financial instrument may refer to a financial instrument for which the seller receives interest from the buyer of the IR financial instrument.

The interest rate may include a reserve interest rate having a maximum interest rate and/or a minimum interest rate. The maximum interest rate may refer to the highest interest rate that the seller is willing to pay to the buyer for an IP financial instrument, and the minimum interest rate may refer to the lowest interest rate that the seller is willing to accept from the buyer for an IR financial instrument.

In the following description, for purposes of explanation, numerous specific details such as logic implementations, opcodes, resource partitioning, resource sharing, and resource duplication implementations, types and interrelationships of system components, and logic partitioning/integration choices may be set forth
5 in order to provide a more thorough understanding of various embodiments of the present invention. It will be evident, however, to one skilled in the art that the embodiments of the present invention may be practiced without these specific details, based on the disclosure provided. Those of ordinary skill in the art, with the included descriptions, will be able to implement appropriate
10 functionality without undue experimentation.

Various embodiments of the present invention will be described below. The various embodiments may be performed by hardware components or may be embodied in machine-executable instructions, which may be used to cause a general-purpose or special-purpose processor or a machine or logic circuits
15 programmed with the instructions to perform the various embodiments. Alternatively, the various embodiments may be performed by a combination of hardware and software.

Various embodiments of the present invention may be provided as a computer program product, which may include a machine-readable medium
20 having stored thereon instructions, which may be used to program a computer (or other electronic devices) to perform a process according to various embodiments of the present invention. The machine-readable medium may include, but is not limited to, floppy diskette, optical disk, compact disk-read-only memory (CD-ROM), magneto-optical disk, read-only memory (ROM) random access memory
25 (RAM), erasable programmable read-only memory (EPROM), electrically erasable programmable read-only memory (EEPROM), magnetic or optical card, flash memory, or another type of media/machine-readable medium suitable for storing electronic instructions. Moreover, various embodiments of the present invention may also be downloaded as a computer program product, wherein the
30 program may be transferred from a remote computer to a requesting computer by

way of data signals embodied in a carrier wave or other propagation medium via a communication link (e.g., a modem or network connection).

Figure 1 is a block diagram illustrating an embodiment of a computer system. As illustrated, the computer system (system) 100 may include an exemplary machine within which a set of instructions, for causing the machine to perform any one or more of the methodologies discussed herein, may be executed. The system 100 may operate as a standalone device or may be connected (e.g., networked) to other machines or systems. In a networked deployment, the system 100 may operate in the capacity of a server or a client machine in server-client network environment, or as a peer machine in a peer-to-peer (or distributed) network environment. The system 100 may be a server computer, a client computer, a personal computer (PC), a tablet PC, a set-top box (STB), a Personal Digital Assistant (PDA), a cellular telephone, a web appliance, a network router, switch or bridge, or any machine capable of executing a set of instructions (sequential or otherwise) that specify actions to be taken by that machine. Further, while only a single system 100 is illustrated, the term “machine” or “system” shall also be taken to include any collection of systems or machines that individually or jointly may execute a set (or multiple sets) of instructions to perform any one or more of the methodologies discussed herein.

The computer system 100 may include a processor 102 (e.g., a central processing unit (CPU) a graphics processing unit (GPU) or both), a main memory (memory) 104 and a static memory 106, which communicate with each other via a bus 108. The computer system 100 may further include a video display unit 310 (e.g., a liquid crystal display (LCD) or a cathode ray tube (CRT)). The computer system 100 also includes an alphanumeric input device 112 (e.g., a keyboard), a cursor control device 114 (e.g., a mouse), a disk drive unit 116, a signal generation device 118 (e.g., a speaker) and a network interface device 120 to connect the system 100 with other systems or machines via a network (e.g., the Internet) 126.

The processor 102 may include multiple processors including one or more multi-threaded processors having multiple threads or logical processors, and may be capable of processing multiple instruction sequences concurrently using its multiple threads. The processor 102 may further include one or more
5 microprocessors, microcontrollers, field programmable gate arrays (FPGA), application specific integrated circuits (ASIC), central processing units (CPU), programmable logic devices (PLD), and similar devices that access instructions from system storage (e.g., main memory 104), decode them, and execute those instructions by performing arithmetic and logical operations. The processor 102
10 may also include one or more internal caches (not shown).

The bus 108 may also be known as the host bus or the front side bus, and may be used to couple the processors 302 with the system interface. Bus 108 may also be coupled with a control bus, an address bus, and/or a data bus (not shown). The control bus, the address bus, and the data bus may be multidrop bi-
15 directional buses, e.g., connected to three or more bus agents, as opposed to a point-to-point bus, which may be connected only between two bus agents.

The memory 104 may include a dynamic storage device, a random access memory (RAM), or other storage device coupled with the bus 108 for storing information and instructions 124 to be executed by the processor 102. Memory
20 104 also may be used for storing temporary variables or other intermediate information during execution of instructions 124 by the processors 124. The static memory 106 may include a read only memory (ROM) and/or other static storage device coupled with the processor 102 via the bus 108 for storing static information and instructions for the processor 102.

Memory 104 may include a wide variety of memory devices including read-
25 only memory (ROM), erasable programmable read-only memory (EPROM), electrically erasable programmable read-only memory (EEPROM), random access memory (RAM), non-volatile random access memory (NVRAM), cache memory, flash memory, and other memory devices. Memory 216 may also
30 include one or more hard disks, floppy disks, ZIP disks, compact disks (e.g., CD-

ROM), digital versatile/video disks (DVD), magnetic random access memory (MRAM) devices, and other system-readable media that store instructions and/or data. The memory 104 may store program modules such as routines, programs, objects, images, data structures, program data, and other program modules that perform particular tasks or implement particular abstract data types that facilitate system use.

The network interface device 120 may include a modem, a network interface card, or other well-known interface devices, such as those used for coupling with Ethernet, token ring, or other types of physical attachment for purposes of providing a communication link to support a local or wide area network 126, for example. Stated differently, the system 100 may be coupled with a number of clients and/or servers via a conventional network infrastructure 126, such as a company's Intranet and/or the Internet, for example.

The disk drive unit 116 may include a machine-readable medium 122 on which may be stored one or more sets of instructions (e.g., software 124) embodying any one or more of the methodologies or functions described herein. The software 124 may also reside, completely or at least partially, within the main memory 104 and/or within the processor 102 during execution thereof by the computer system 100, the main memory 104 and the processor 102 also constituting machine-readable media. The software 124 may further be transmitted or received over a network 126 via the network interface device 120.

While the machine-readable medium 122 is illustrated in an exemplary embodiment to be a single medium, the term "machine-readable medium" should be taken to include a single medium or multiple media (e.g., a centralized or distributed database, and/or associated caches and servers) that store the one or more sets of instructions. The term "machine-readable medium" shall also be taken to include any medium that is capable of storing, encoding or carrying a set of instructions for execution by the machine of the system 100 and that causes the machine to perform any one or more of the methodologies of the present invention. The term "machine-readable medium" shall accordingly be taken to

include, but not be limited to, solid-state memories, optical and magnetic media, and carrier wave signals.

It is appreciated that a lesser or more equipped computer system than the example described above may be desirable for certain implementations.

5 Therefore, the configuration of system 100 may vary from implementation to implementation depending upon numerous factors, such as price constraints, performance requirements, technological improvements, and/or other circumstances.

It should be noted that, while the embodiments described herein may be
10 performed under the control of a programmed processor, such as the processor 102, in alternative embodiments, the embodiments may be fully or partially implemented by any programmable or hardcoded logic, such as field programmable gate arrays (FPGAs), TTL logic, or application specific integrated circuits (ASICs). Additionally, the embodiments of the present invention may be
15 performed by any combination of programmed general-purpose computer components and/or custom hardware components. Therefore, nothing disclosed herein should be construed as limiting the various embodiments of the present invention to a particular embodiment wherein the recited embodiments may be performed by a specific combination of hardware components.

20 **Figure 2** is a block diagram illustrating an embodiment of a network. As illustrated, the network or architecture (architecture) 200 may include a commerce platform, such as a network-based marketplace or trading platform 202, to provide server-side functionality, via a network 126 (e.g., the Internet) to one or more clients, such as client machines 210-212. As illustrated, for
25 example, a web client 206 (e.g., a browser, such as the Internet Explorer or the Netscape Navigator), and a programmatic client 208 may execute on their respective client machines 210 and 212.

Turning specifically to the network-based marketplace 202, an application program interface (API) server 214 and a web server 216 may be coupled to, and
30 provide programmatic and web interfaces respectively to, one or more

application servers 218. The application servers 218 may host one or more marketplace applications 220 and payment applications 222. Furthermore, the application servers 28 may be coupled to one or more databases servers 224 to facilitate access to one or more databases 226.

5 The marketplace applications 220 may provide a number of marketplace functions and services to users that access the marketplace 202. The payment applications 222 likewise may provide a number of payment services and functions to users. The payment applications 222 may allow users to quantify for, and accumulate, value (e.g., in a commercial currency, such as the U.S.
10 dollar, or a proprietary currency, such as "points") in accounts, and then to redeem the accumulated value for products (e.g., goods or services) that are made available via the marketplace applications 220. While the marketplace and payment applications 220 and 222, as illustrated, both form part of the network-based marketplace 202, it will be appreciated that, in alternative embodiments of
15 the present invention, the payment applications 222 may form part of a payment service that is separate and distinct from the marketplace 202.

Further, while the architecture 200, as illustrated, may employ a client-server architecture, embodiments of the present invention are not limited to this architecture 200, and may equally well find application in a distributed, or peer-
20 to-peer, architectures. The various marketplace and payment applications 220 and 222 may also be implemented as standalone software programs, which do not necessarily have networking capabilities.

The web client 206, it will be appreciated, may access the various marketplace and payment applications 220 and 222 via the web interface
25 supported by the web server 216. Similarly, the programmatic client 206 may access the various services and functions provided by the marketplace and payment applications 220 and 222 via the programmatic interface provided by the API server 214. The programmatic client 208 may, for example, be a seller application (e.g., the TurboLister application developed by eBay Inc., of San
30 Jose, California) to enable sellers to author and manage listings on the

marketplace 202 in an off-line manner, and to perform batch-mode communications between the programmatic client 208 and the network-based marketplace 202.

Figure 3 is a block diagram illustrating an embodiment of marketplace and payment applications. Multiple marketplace and payment applications 220-222 may be provided as part of the network-based marketplace or trading platform 202, as illustrated and described with respect to Figure 2. The network-based marketplace 202 may provide a number of listing and price-setting mechanisms whereby a seller may list goods or services for sale, a buyer may express interest in or indicate a desire to purchase such goods or services, and a price may be set for a transaction pertaining to the goods or services. To this end, the marketplace applications 220 may include one or more auction applications 302 to support auction-format listing and price setting mechanisms (e.g., English, Dutch, Vickrey, Chinese, Double, Ascending, Reverse and Declining auctions etc.). The various auction applications 302 may also provide a number of features in support of such auction-format listings, such as a reserve price feature whereby a seller may specify a reserve price in connection with a listing and a proxy-bidding feature whereby a bidder may invoke automated proxy bidding.

One or more of the auction applications 302 may include one or more declining auction applications and/or one or more ascending auction applications. A declining auction application may provide a dynamic processing mechanism for the trading of interest-paying financial instruments (e.g., bonds, notes, and certificate of deposits (CD)) for which a buyer receives interest from the seller. For interest-paying financial instruments, the price (in currency) may remain constant and the compensation for buying a particular financial instrument may include interest rate. For example, a financial institution or an individual (seller) may want to sell a \$1000 bond to a buyer for an interest rate that is lower than the maximum interest rate that the seller is willing to pay to the buyer. Potential buyers may bid on the bond in terms of interest rates that they are willing to accept. The seller may then sell the bond to the buyer who bids the

lowest interest rate. An ascending auction application may provide a dynamic processing mechanism for trading of interest-receiving financial instruments (e.g., mortgage loans, personal loans, and credit cards) for which a buyer pays interest to the seller.

5 One or more fixed-price applications 304 may support fixed-price listing formats (e.g., the traditional classified advertisement-type listing or a catalogue listing) and buyout-type listings. Specifically, buyout-type listings (e.g., including the Buy-It-Now (BIN) technology developed by eBay Inc., of San Jose, California) may be offered in conjunction with an auction-format (or other
10 dynamic pricing format) listing, and allow a buyer to purchase goods or services, which are also being offered for sale via an auction, for a fixed-price that is typically higher than the starting price of the auction.

Similarly, one or more fixed-interest applications 334 may support providing fixed-interest listing formats and buy-out listings. Using, again, the BIN
15 technology as an example, a buyer may purchase a financial instrument, which may also be offered for sale via an auction, at a fixed interest rate. The fixed-interest rate may be higher or lower than the starting interest rate offered at the auction depending on the nature of the financial instrument. For example, a CD
20 may be sold for a lower fixed-interest rate than the starting interest rate offered at the auction, while a credit card may be sold at a higher fixed-interest rate than the starting interest rate offered at the auction.

One or more publishing applications 336 may be used to publish the information relating to auctions, such as the declining price auction. For example, in an embodiment where the financial instruments are offered for sale
25 over the Internet, the publishing applications 336 may format information about the financial instruments in a web page and provide that web page over the Internet to potential buyers. The publishing applications 336 may also update the current offer price (e.g., \$100) or interest rate (e.g., 10%), as necessary, when the current offer price or interest rate is changed using the auction applications 302.

The store applications 306 may allow sellers to group their listings within a “virtual” store (e.g., a virtual bank), which may be branded and otherwise personalized by and for the sellers. Such a virtual store may also offer promotions, incentives and features that are specific and personalized to a
5 relevant seller.

One or more reputation applications 308 may allow parties that transact utilizing the network-based marketplace 202 to establish, build and maintain reputations, which may be made available and published to potential trading partners. Consider that where, for example, the network-based marketplace 202
10 may support a person-to-person trading, users may have no history or other reference information whereby the trustworthiness and credibility of potential trading partners may be assessed. The reputation applications 308 may allow a user, for example through feedback provided by other transaction partners, to establish a reputation within the network-based marketplace 202 over time.
15 Other potential trading partners may then reference such a reputation for the purposes of assessing credibility and trustworthiness.

The personalization applications 310 may allow users of the marketplace 202 to personalize various aspects of their interactions with the marketplace 202. For example a user may, utilizing an appropriate personalization application 310,
20 may create a personalized reference page at which information regarding transactions to which the user is (or has been) a party may be viewed. Further, the personalization applications 310 may enable a user to personalize listings and other aspects of their interactions with the marketplace 202 and other parties.

The network-based marketplace 202 may support a number of marketplaces
25 that are customized, for example, for specific geographic regions. For example, a version of the marketplace 202 may be customized for the United Kingdom, whereas another version of the marketplace 202 may be customized for the United States of America. Each of these versions may operate as an independent marketplace, or may be customized (or internationalized) presentations of a
30 common underlying marketplace.

The navigation of the network based-marketplace 202 may be facilitated by one or more navigation applications 314. For example, a search application may enable key word searches of listings published via the marketplace 202. A browse application may allow users to browse various categories, catalogues, or inventory data structures according to which listings may be classified within the network-based marketplace 202. Various other navigation applications 314 may be provided to supplement the search and browsing applications.

In order to make listings, available via the network-based marketplace 202, as visually informing and attractive as possible, the marketplace applications 220 may include, according to one embodiment, one or more imaging applications 316 utilizing which users may upload images for inclusion within listings. The imaging applications 316 may also operate to incorporate images within viewed listings. The imaging applications 316 may also support one or more promotional features, such as image galleries that are presented to potential buyers. For example, sellers may pay an additional fee to have an image included within a gallery of images for promoted items.

One or more listing creation applications 318 may allow sellers conveniently to author listings pertaining to goods or services that they wish to transact via the network-based marketplace 202, and listing management applications 320 may allow sellers to manage such listings. Specifically, where a particular seller has authored and/or published a large number of listings, the management of such listings may present a challenge. The listing management applications 320 provide a number of features (e.g., auto-relisting, inventory level monitors, etc.) to assist the seller in managing such listings. One or more post-listing management applications 322 may also assist sellers with a number of activities that typically occur post-listing. For example, upon completion of an auction facilitated by one or more auction applications 302, a seller may wish to leave feedback regarding a particular buyer. To this end, a post-listing management application 322 may provide an interface to one or more reputation applications 308, so as to allow the seller conveniently to provide feedback regarding

multiple buyers to the reputation applications 308. Goods and services may also include financial instruments, such as CDs, notes, credit cards, bank accounts, mortgages, bonds, etc.

5 The dispute resolution applications 324 provide mechanisms whereby disputes arising between transacting parties may be resolved. For example, the dispute resolution applications 324 may provide guided procedures whereby the parties are guided through a number of procedures in an attempt to settle a dispute. In the event that the dispute cannot be settled via the guided procedures, according to one embodiment, the dispute may be escalated to a third party
10 mediator or arbitrator.

A number of fraud prevention applications 326 may implement various fraud detection and prevention mechanisms to reduce the occurrence of fraud within the network-based marketplace 202.

15 The messaging applications 328 may be responsible for the generation and delivery of messages to users of the network-based marketplace 202. Such messages, for example, may advise users regarding the status of listings at the network-based marketplace 202 (e.g., providing “outbid” notices to bidders during an auction process or to provide promotional and merchandising information to users).

20 The merchandising applications 330 may support various merchandising functions that are made available to sellers to enable sellers to increase sales via the network-based marketplace 202. The merchandising applications 330 may also operate the various merchandising features that may be invoked by sellers, and may monitor and track the success of merchandising strategies employed by
25 sellers.

The network-based marketplace 202 itself, or one or more parties that transact via the network-based marketplace 202 may operate loyalty programs that are supported by one or more loyalty/promotions applications 332. For example, a buyer may earn loyalty or promotions points for each transaction

established and/or concluded with a particular seller, and may be offered a reward for which accumulated loyalty points can be redeemed.

Figure 4 is a block diagram illustrating an embodiment of a high-level entity-relationship. As illustrated, according to one embodiment, various tables 400 may be maintained within the databases 226 (see Figure 2), and utilized by and support the marketplace and payment applications 220 and 222 (see Figures 2 and 3). A user table 402 may contain a record for each registered user of the network-based marketplace 202, and may include identifier, address and financial instrument information pertaining to each such registered user. A user may, it will be appreciated, operate as a seller, a buyer, or both, within the network-based marketplace 202. In one exemplary embodiment of the present invention, a buyer may be a user that has accumulated value (e.g., commercial or proprietary currency or interest rate), and is then able to exchange the accumulated value for items (e.g., goods, services, and financial instruments) that are offered for sale by the network-based marketplace 202.

The tables 400 may also include an items table 404 in which may be maintained item records for the items that are available to be, or have been, transacted via the network-based marketplace 202. Each item record within the items table 404 may furthermore be linked to one or more user records within the user table 402, so as to associate a seller and one or more actual or potential buyers with each item record.

A transaction table 406 may contain a record for each transaction (e.g., a purchase transaction) pertaining to items for which records may exist within the items table 404. An order table 408 may be populated with order records, each order record may be associated with an order. Each order, in turn, may be with respect to one or more transactions for which records may exist within the transactions table 406.

The bid records maintained within a bids table 410 may each relate to a bid received at the network-based marketplace 202 in connection with an auction-format listing supported by an auction application 302. An interest rate table 422

may contain information relating to interest rates at they relate to the items (e.g., financial instruments) on sale. For example, the interest rate table 422 may include the start offer interest rate, increments at which the interest rate may be declined, and the reserve interest rate (e.g. maximum and minimum interest

5 rates) corresponding to each of the items. The interest rate table 422 may include overlapping information from other tables, such as the bids table 410, items table 404, and history table 414. A history table 414 may maintain a history of transactions to which a user has been a party.

One or more attributes tables 416 may record attribute information pertaining

10 to items for which records may exist within the items table 404. A feedback table 412 may be utilized by one or more reputation applications 308 to construct and maintain reputation information concerning users. Considering only a single example of such an attribute, the attributes tables 416 may indicate a currency or interest rate attribute associated with a particular item, identifying the currency

15 or interest rate for the relevant item as specified by a seller. The tables 400 illustrated here, and the like, may be included in the databases 226 and/or may be, directly or indirectly, coupled with each other. Furthermore, depending on various embodiments of the present invention, not all the tables 400 may be needed and conversely, additional tables, not illustrated here, may be added, as

20 necessitated.

Figure 5 is a block diagram illustrating an embodiment of an auction with interest rate bidding. According to one embodiment, one or more sellers 502 including financial institutions (e.g., banks, lenders, mutual fund companies, investment companies, and brokers) may publish one or more items including

25 financial instruments (e.g., bonds, certificate of deposits (CDs), savings and money market accounts, home mortgages, automobile loans, personal loans, student loans, and credit cards) for sale using an ascending auction or a declining auction with interest rate bidding 504 over a network 126 (e.g., Internet). The publication of the items for sale may be performed using a website for the users

30 510 to access via a web browser (e.g., Internet Explorer and Netscape Navigator)

using a Uniform Resource Locator (URL) 508 (e.g.,
http://www.financialinstrumentsauction.com).

The seller 502 may publish, for example, a \$1000 bond in a declining auction with an initial offer interest rate (initial interest rate) of, for example, 10%. The
5 price of the bond (e.g., \$1000), however, may remain constant regardless of the initial interest rate and subsequent biddings of the interest rate by the buyer 510, and the final interest rate at which the bond may be sold. The initial interest rate may be set by the seller 502 for the users 510 to start bidding on the item. The initial interest rate may be set automatically depending on various factors, such
10 as item types, history of the time, time allowed for the declining auction, market rates, and reserve interest rate.

The reserve interest rate for the item may refer to the maximum interest rate and/or minimum interest rate for the item as set by the seller depending on the type of item. For example, the reserve interest rate for a bond may be the
15 maximum interest rate (e.g., 6%) that the seller 502 is willing to pay; on the other hand, the reserve interest rate for a mortgage loan may be the minimum interest rate (e.g., 5%) that the seller 502 is willing to accept. Stated differently, for interest-paying items (e.g., items on which the seller 502 is expected to pay interest (e.g., bonds, CDs, savings and money market accounts)), the seller 502
20 may set a maximum interest rate that the seller 502 is willing to pay and above which the seller 502 may not sell the item. Furthermore, for interest-paying items, a declining auction may be used.

For interest-receiving items (e.g., items on which the buyer 510 is expected to pay interest (e.g., home mortgages, automobile loans, personal loans, student
25 loans, and credit cards)), the seller 502 may set a minimum interest rate that the seller 502 is willing to accept and under which the seller 502 may not sell the item. The determination of the reserve interest rate of items may also depend on other factors, such as item types, history of the time, time allowed for the declining auction, market rates, and initial offer interest rate (initial interest rate).

In contrast with the interest-paying items, for interest-receiving items, an ascending auction may be used.

The buyers 510 may continue to bid on the items until a bid is accepted or a triggering event, such as end of the predetermined time period for the auction, occurs. The initial interest rate may be reduced by the seller, or automatically reduced responsive to bid values received from potential buyers. The lowering of the initial interest rate, however, may be performed in predetermined increments or according to the bids received. For example, the initial interest rate of 10% for the bond may be reduced by 1% after every 2 hours of declining auction until it reaches .01%. The initial interest rate may be reduced according to the bids received; for example, a bid of 9.5% may reduce the initial interest rate to 9.5% and later, a bid of 8.75% may reduce the initial interest rate to 8.75%. The interest rate (initial or reserve interest rate) may not reach 0% and the minimum increment for reducing or bidding the interest rate may be .01%. In an ascending auction, the seller may accept the bid with the highest interest rate that is also greater than the minimum interest rate. In a declining auction, the seller may accept the bid with the lowest interest rate that is also lower than the maximum interest rate.

The seller 502 may not be limited to a financial institution and may include individuals and other parties, and the buyer 510 may not be limited to an individual and may include financial institutions and other parties. Also, it is anticipated, the seller 502 and buyer 510 may include any combination of individuals, parties, and financial institutions just as the items for sale may include any variety and combination of financial instruments.

Figure 6 is a flow diagram illustrating an embodiment of a process of an auction with interest rate bidding. According to one embodiment, an initial offer interest rate (initial interest rate) and a reserve interest rate (e.g., maximum interest rate or minimum interest rate) may be set for an item for sale on the declining auction by a seller at processing block 602. The item may then be published along with the initial interest rate by the seller over a network (e.g.,

Internet) for users to access at processing block 604. The users may access the publication of the item using a web page via an Internet browser using a Uniform Resource Locator (URL). The users may also use the web page to bid on the item and such bids are received at processing block 606. The bidding by the users may be performed using various interest rates (e.g., 6.25%, 4.00%, and 2.90%). The interest rates bid by the users may be entered as free-form numbers, or may be interest rates that are presented to the user in a drop-down menu, from which the user may then select an interest rate.

A predetermined time period may be set for auctioning of the item. The predetermined time period may be set at the beginning of the auction, or may be set during the auction if, for example, the item is not very popular with the users. The time period may not be set and the item may be on the auction until it is sold. In an embodiment where the time period is set for the auction of the item, at decision block 608, the remaining time in the auction is determined. If no time is left, the auction may end at processing block 610. However, if there is some time left, the auction may continue with the lowering of the initial interest rate according to predetermined increments, or according to the received bids at processing block 612.

At decision block 614, according to one embodiment, the received bids are evaluated for satisfying the initial interest rate and reserve interest rate criteria. If any of the bids meet the criteria of initial interest rate and reserve interest rate as set forth by, for example, the seller, the best of those bids may be accepted at processing block 616. For example, in case of an interest-paying item (e.g., bond), the bid with the lowest interest rate (e.g., closest to zero) may be accepted using a declining auction, and in case of an interest-receiving item (e.g., home mortgage loan), the bid with the highest interest rate may be accepted using an ascending auction. In the case of multiple items for sale, multiple bids may be received corresponding to each of the multiple items. Furthermore, if only one bid satisfies the criteria of the initial interest rate and the reserve interest rate, that one bid may be accepted.

If none of the bids received satisfy the criteria of the initial interest rate and the reserve interest rate, whether more bids are received may be determined at decision block 618. If the more bids are received, the auction using interest rate bidding may end at processing block 610.

5 **Figure 7** is a flow diagram illustrating an embodiment of a process of a declining auction with interest rate bidding. According to one embodiment, the seller may set or assign an initial offer interest rate (initial interest rate) to an item to sell the item using a declining auction with interest rate bidding at processing block 702. The item may include an interest-paying (IP) item
10 including a financial instrument on which the seller of the financial instrument is expected to pay interest to the buyer. Examples of IP items may include bonds, certificates of deposit (CDs), interest-bearing checking accounts, savings accounts, money market accounts, savings plans, and the like. Given that the seller is expected to pay the interest, according to one embodiment, the seller
15 may set or assign a reserve interest rate including a maximum interest rate (maximum rate) to the IP item at processing block 704. The maximum rate may refer to the maximum rate of interest that the seller is willing to pay on the IP item. Stated differently, the seller may reject any bids that are above the maximum rate and may accept the lowest bid, such as the one closest to 0%.

20 The seller may publish the IP item at the initial interest rate for the buyers to bid at processing block 706. The initial interest rate for the IP item may be published, but the maximum rate may remain confidential. For example, the seller may publish a \$1000 bond for sale at the initial interest rate of 10% to start bidding, but may keep confidential the maximum rate of 6% that the seller is
25 willing to pay. At the processing block 708, according to one embodiment, the buyers may begin to bid on the IP item. Using the published initial interest rate of 10%, the buyers may start bidding at 10% and may bid as low as 0.01%, in minimum increments of 0.01%. For example, one or more buyers may bid 8.25%, 6.23%, 3.90%, and 2.76% for the bond, during which the price of the
30 bond (e.g., \$1000) may not change. One buyer may place one or more bids.

A predetermined time period may be assigned to the declining auction, which means the declining auction may automatically expire after a certain time period has ended and no acceptable bid has yet been received for the IP item.

According to another embodiment, no predetermined time period may be assigned to the declining auction, and the auction may remain open until the item is sold or other triggering event has occurred, such as change in financial markets, political situation, or laws concerning the IP item or declining auction, and the like. At decision block 710, time left of the predetermined time period is determined. If the time period has expired, the declining auction may expire at processing block 712. If the time period has not yet expired, the declining auction may continue with the lowering of the initial interest rate at processing block 714.

The initial interest rate for the IP item may be lowered in various increments based on various factors, such as time or bids received. For example, the initial interest rate of 10% for the bond may be reduced by an increment of 0.1% after every hour, reducing the rate of 10% to 9.70% after three hours. On the other hand, the initial interest rate may be reduced according to the bids received. For example, the initial interest rate of 10% may be reduced from the highest to the lowest bid received, such as from 10% to 8.25% to 6.23% to 3.90% and then to 2.76%. If a lower bid (e.g., 3.90%) is received before a higher bid (e.g., 6.23%), the initial interest rate may remain at 3.90%, and may not be increased to 6.23%.

The bids received may then be compared to the initial interest rate to determine whether any of the bids qualify for further consideration at decision block 716. If the bid rate (e.g., 12.5%) is higher than the initial interest rate (e.g., 10%), the bid for the IP item (e.g., bond) may be rejected at processing block 718. Bids with interest rates lower than the initial interest rate may then be compared with the maximum rate to determine whether any of those bids qualify for further consideration at decision block 720. If the bid rate (e.g., 8.25% and 6.23%) is higher than the maximum rate (e.g., 6%), the bid for the IP item (e.g.,

bond) may be rejected at processing block 718, and the declining auction continues with receiving bids at processing block 708.

Before accepting any of the bids (e.g., 3.90% and 2.76%) having lower interest rate than the maximum rate (e.g., 6%) for the IP item (e.g., bond),
5 whether more bids have been received is determined at decision block 722. If additional bids have been received, the process of evaluating and analyzing those and other bids may continue at decision block 710. If no more bids received, the lowest bid (e.g., 2.76%) may be accepted at processing block 724. With the acceptance of the lowest (or best) bid, the declining auction with interest rate
10 bidding may end at processing block 712.

Accepting the lowest bid may mean the seller may pay the accepted bid interest rate to the buyer of the IP item. Continuing with the bond example, the seller may pay 2.76% to the buyer for the \$1000 bond that the buyer purchased with the accepted bid.

15 **Figure 8** is a flow diagram m illustrating an embodiment of a process of an ascending auction with interest rate bidding. According to one embodiment, the seller may set or assign an initial offer interest rate (initial interest rate) to an item to sell the item using an ascending auction with interest rate bidding at processing block 802. The item may include an interest-receiving (IR) item
20 including a financial instrument on which the seller of the financial instrument is expected to receive interest from the buyer. Examples of IR items may include home mortgages, automobile loans, personal loans, student loans, credit cards, and the like. Given that the seller is expected to receive the interest, the seller may set or assign a reserve interest rate including a minimum interest rate
25 (minimum rate) to the IR item at processing block 804. The minimum rate may refer to the minimum rate of interest that the seller is willing to receive on the IR item. Stated differently, the seller may reject any bids that are below the minimum rate.

The seller may publish the IR item at the initial interest rate for the buyers to
30 bid at processing block 806. The initial interest rate for the IR item may be

published, but the minimum rate may remain confidential. For example, the seller may publish a credit card for sale at the initial interest rate of 7% to start bidding, but may keep confidential the minimum rate of 10% that the seller is willing to accept. At the processing block 808, the buyers may begin to bid on the IR item. Using the published initial interest rate of 7%, the buyers may start bidding at 7% and may bid in minimum increments of 0.01%. For example, one or more buyers may bid 18.25%, 16.23%, 8.90%, and 7.76% for the credit card. Also, one buyer may place one or more bids.

A predetermined time period may be assigned to the ascending auction, which means the ascending auction may automatically expire after a certain time period has ended and no acceptable bid has yet been received for the IR item. According to another embodiment, no predetermined time period may be assigned to the declining auction, and the auction may remain open until the item is sold or other triggering event has occurred, such as change in financial markets, political situation, or laws concerning the IR item or ascending auctions, and the like. At decision block 810, time left of the predetermined time period is determined. If the time period has expired, the ascending auction may expire at processing block 812. If the time period has not yet expired, the ascending auction may continue.

The seller, according to one embodiment, may have the option of lowering the minimum rate, in various increments, depending on the bids received to accommodate more bids or, according to another embodiment, may choose not to lower the minimum rate and reject all bids that are for interest rate lower than the minimum rate. The bids received with interest rates lower than the initial interest rate may then be compared with the minimum rate to determine whether any of those bids qualify for further consideration at decision block 814. If the bid interest rate (e.g., 8.90% and 7.76%) is lower than the minimum rate (e.g., 10%), and even though it is higher than the initial rate (e.g., 7%), such bid for the IR item (e.g., credit card) may be rejected at processing block 816, and the ascending auction continues with the receiving of bids at processing block 808.

Before accepting any of the bids (e.g., 18.25% and 16.23%) having higher interest rate than the minimum rate (e.g., 10%) for the IR item (e.g., credit cards), whether more bids have been received is determined at decision block 818. If additional bids have been received, the process of evaluating and
5 analyzing those and other bids may continue at decision block 810. If no more bids are received, the highest bid (e.g., 18.25%) may be accepted at processing block 820. With the acceptance of the highest (or best) bid, the ascending auction with interest rate bidding may end at processing block 812.

Accepting the highest bid may mean that the seller has received and accepted
10 a bid interest rate from a buyer of the IR item that satisfies the seller's criteria for selling the IR item. Continuing with the credit card example, the buyer may pay 18.25% to the seller for, for example, carrying a balance on the credit card that the buyer purchased with the accepted bid.

Figure 9 is a block diagram illustrating an embodiment of auction
15 architecture. According to one embodiment, the auction architecture 900, as illustrate here, may include any variety and combinations of one or more client computers and/or one or more server computers directly or indirectly coupled with each other over a network 126 (e.g., the Internet). The auction architecture 900 may also include any number of components and/or elements also directly or
20 indirectly connected with each other and with the one or more client computers and/or one or more server computers over the network 126.

According to one embodiment, an auction, including an ascending auction or a declining acution, may be performed using one or more auction applications 302 as illustrated and described with reference to Figure 3. The one or more
25 auction applications 302 may include one or more ascending an/or declining auction applications 902 to perform various embodiments of the auction. The one or more ascending and/or declining auction applications 902 may further include one or more ascending and/or declining auction interest rate applications 904 to perform various embodiments of the ascending and declining auctions
30 including auctions using interest rate biddings. The various auction applications

302, 902-904 may be used to facilitate a processor, such as the processor 102 of Figure 1, to perform the embodiments of the present application.

The auction applications 302, 902-904 may, directly or indirectly, interface or be coupled with one or more databases, such as the databases 226 of Figure 2.

5 The one or more databases 226 may include an interest rate table 422 and a history table 414. The interest rate table 422 may be used to store information relating to interest rates of a particular item. The information may include various interest rates associated with a number of items, such as initial offer interest rate, reserve interest rate including maximum interest rate and/or
10 minimum interest rate, and interest rates bid by various buyers or a particular item, and the like. Various items may include various financial instruments including interest-receiving (IR) items and interest-paying (IP) items. IR items may refer to those financial instruments on which the seller is expected to receive interest from the buyer upon purchase of an IR item. IP items may refer
15 to those financial instruments on which the seller is expected to pay interest to the buyer upon purchase of an IP item.

The history table 414 may include historical information about various items, as described above, that have been sold or offered for sale using the declining auction with interest rate bidding. Furthermore, the history table 414 may
20 contain information regarding various registered users of the declining auction. The registered users may or may not have participated in a declining auction and/or purchased an item. For example, a declining auction interest rate application 904 may query the interest rate table 422 and the history table 414 to determine whether items similar to the one currently on sale have been sold and
25 the interest rate at which they were sold using the declining auction with interest rate bidding. Such information may be used by the declining auction interest rate application 904 to, for example, either automatically list the initial interest rate and/or reserve interest rate for the item or allow the seller to extract the collected information to determine the initial interest rate and/or reserve
30 interest rate.

The publishing application 336 may perform embodiments including processes relating to publishing the information with regard to the declining auction. For example, in an embodiment where an item may be offered for sale over the Internet 126, the publishing application 336 may format information
5 about the item on a web page and have that web page available over the Internet 126 to potential buyers. Furthermore, the publishing application 336 may also update the current initial interest rate as the current initial interest rate may change by the declining auction applications 902-904.

For simplicity, a single auction is used and illustrated as an example.
10 However, embodiments of the present invention provide for a plurality of auctions, including ascending auctions and declining auctions, to take place sequentially and/or simultaneously. A plurality of auctions may be conducted on the same or different server computers and even on different processors within the same server computer. Furthermore, a single auction or a plurality of
15 auctions may be performed in the same or different processors, and threads, etc. Moreover, any combination of software, hardware, firmware, etc., may be used to perform various embodiments of the present invention. Embodiments of the present invention may also provide for programming the functionality required for performing the various embodiments using any programming technology,
20 paradigm, and/or language that exist today or may be developed in the future, including, but not limited to parallel programming, object-oriented technology, distributed processing, multi-processing, Java, C, C++, and assembly language, and the like.

It should be appreciated that reference throughout this specification to “one
25 embodiment” or “an embodiment” means that a particular feature, structure or characteristic described in connection with the embodiment is included in at least one embodiment of the present invention. Therefore, it is emphasized and should be appreciated that two or more references to “an embodiment” or “one embodiment” or “an alternative embodiment” in various portions of this
30 specification are not necessarily all referring to the same embodiment.

Furthermore, the particular features, structures or characteristics may be combined as suitable in one or more embodiments of the invention.

Similarly, it should be appreciated that in the foregoing description of exemplary embodiments of the invention, various features of the invention are sometimes grouped together in a single embodiment, figure, or description
5 thereof for the purpose of streamlining the disclosure aiding in the understanding of one or more of the various inventive aspects. This method of disclosure, however, is not to be interpreted as reflecting an intention that the claimed invention requires more features than are expressly recited in each claim.
10 Rather, as the following claims reflect, inventive aspects lie in less than all features of a single foregoing disclosed embodiment. Thus, the claims following the detailed description are hereby expressly incorporated into this detailed description, with each claim standing on its own as a separate embodiment of this invention.

CLAIMS

What is claimed is:

1. A method to set an interest rate for a transacted financial instrument, the
5 method characterized by:
publishing, via a computer network, information regarding the financial
instrument and an interest rate at which the financial instrument is
offered;
receiving, via the computer network, offers from respective bidders to
10 transact the financial instrument, the offers being expressed as
offered interest rates at which the bidders are willing to transact
the financial instrument;
on the termination of a bid receiving process, determining whether at
least one of the offers satisfies transaction criteria, defined by a
15 seller of the financial instrument; and
if it is determined that at least one of the offers satisfies the transaction
criteria, identifying the at least one of the offers as an accepted
offer.
- 20 2. The method of claim 1, wherein the information concerning the financial
instrument is published from a server computer to a client computer via
the computer network.
3. The method of claim 1, further characterized by receiving the information
25 regarding the financial instrument from the seller.
4. The method of claim 1, wherein the information regarding the financial
instrument includes one or more of the following: price of the financial
instrument, details about the financial instrument, maximum or minimum

term of the financial instrument, and benefits of purchasing the financial instrument.

5. The method of claim 1, wherein the offers are received from the
5 respective bidders at the server computer from respective client
computers operated by the bidders.
6. The method of claim 1, wherein the bid receiving process is a declining
10 auction, the method characterized by reducing the published interest rate
at which the financial instrument is offered for sale during the bid
receiving process.
7. The method of claim 6, wherein the reducing of the published interest
15 rate is performed automatically by the server computer responsive to at
least one of bidding activity and lack of bidding activity.
8. The method of claim 7, wherein the reducing of the published interest
20 rate is performed by the server computer responsive to receipt of a lower
interest rate that is lower than the published interest rate.
9. The method of claim 8, wherein the published interest rate is reduced to
be equal to the lower interest rate.
10. The method of claim 1, wherein the bid receiving process is an ascending
25 auction, the method including increasing the published interest rate at
which the financial instrument is offered for sale during the bid receiving
process.

11. The method of claim 10, wherein the ascension of the published interest rate is performed automatically by the server computer responsive to at least one of bidding activity and lack of bidding activity.
- 5 12. The method of claim 11, wherein the ascension of the published interest rates is performed by the server computer responsive to receipt of a higher interest rate that is higher than the published interest rate.
- 10 13. The method of claim 12, wherein the published interest rate is increased to be equal to the higher interest rate.
14. The method of claim 1, wherein the financial instrument comprises at least one of the following:
an interest-paying (IP) financial instrument including one or more of the
15 following: a bond, a certificate of deposit, an interest-bearing checking account, a savings account, and a money market account; and
an interest-receiving (IR) financial instrument including one or more of
the following: a home mortgage loan, an automobile loan, a
20 personal loan, a student loan, and a credit card.
15. The method of claim 1, wherein the interest rate set by the seller for the transacted financial instrument comprises at one of the following:
a maximum interest rate having a highest interest rate that the seller is
25 willing to pay to a buyer for the IP financial instrument; and
a minimum interest rate having a lowest interest rate that the seller is willing to accept from the buyer for the IR financial instrument.

16. A system characterized by:
a first storage medium;
a first computer, coupled with the first storage medium, to publish
information regarding a financial instrument and an interest rate at
5 which the financial instrument is offered, the first computer to
publish the information at a request from a second computer via a
computer network; and
the second computer, coupled with the first computer and a second
storage medium, to
10 receive offers from respective bidders to transact the financial
instrument, the offers being expressed as offered interest
rates at which the bidders are willing to transact the
financial instrument, wherein the second computer to
receive the offers from respective computers operated by
15 the bidders,
on the termination of a bid receiving process, determine whether
at least one of the offers satisfies transaction criteria,
defined by a seller of the financial instrument, and
if it is determined that at least one of the offers satisfies the transaction
20 criteria, identifying the at least one of the offers as an accepted
offer.
17. The system of claim 16, wherein the first computer includes a client
computer, and the second computer includes a server computer in a
25 client-server architecture.
18. The system of claim 16, wherein the first computer includes a server
computer, and the second computer includes another server computer in a
peer-peer architecture.

30

19. The system of claim 16, wherein the respective computers operated by the bidders include one or more client computers.
20. The system of claim 16, wherein the computer network includes a single network or a plurality of networks including at least one of the following: a wide area network, a local area network, an intranet, and the Internet.
21. The system of claim 16, wherein the first computer and the second computer each comprises one or more processors including at least one of the following: one or more microprocessors, one or more microcontrollers, one or more field programmable gate arrays (FPGA), one or more application specific integrated circuits (ASIC), one or more central processing units (CPU), and one or more programmable logic devices (PLD).
22. A machine-readable medium having stored thereon data representing sets of instructions which, when executed by a machine, cause the machine to: publish, via a computer network, information regarding the financial instrument and an interest rate at which the financial instrument is offered; receive, via the computer network, offers from respective bidders to transact the financial instrument, the offers being expressed as offered interest rates at which the bidders are willing to transact the financial instrument; on the termination of a bid receiving process, determine whether at least one of the offers satisfies transaction criteria, defined by a seller of the financial instrument; and if it is determined that at least one of the offers satisfies the transaction criteria, identify the at least one of the offers as an accepted offer.
