Title: CORNER SHELF SYSTEM

Abstract: A shelf system for corner walls where the shelf members are supported against two perpendicularly disposed walls without showing any mounting elements. The shelf member includes at least two contiguous sides defining edges of a predetermined thickness and perpendicular to each other. Tongue members extend for the sides and are receivable within cooperative wall cavities for a snug mechanical engagement. Adhesive is applied to the sides to immobilize the shelf member and thus enhance the structured integrity of the system.
I. TITLE: CORNER SHELF SYSTEM

II. TECHNICAL FIELD

The present invention relates to a corner shelf system, and more particularly, to such a system that conceals its supporting members.

III. BACKGROUND ART

Several designs for a corner shelf system have been designed in the past. None of them, however, includes a shelf member with a peripheral edge including tongues that penetrates the corner surfaces to which the shelf member is mounted.

Applicant believes that the closest reference corresponds to U.S. Patent No. 6,591,762 issued to the inventor on July 15, 2003 for a corner_shelf assembly. However, it differs from the present invention because it requires the use of casing members and the tongue members need to be slid horizontally. The present invention, on the other hand, secures the shelf member in place by using a strong adhesive that binds the peripheral edge to the corner walls' surfaces, preventing its movement, which the tongue members snuggly fit within cooperating openings in the walls' surfaces to support most of the vertical load.

Other patents describing the closest subject matter provide for a number of more or less complicated features that fail to solve the problem in an efficient and economical way. None of these patents or any other references known to applicant suggest the novel features of the present invention.
IV. SUMMARY OF THE INVENTION

It is one of the main objects of the present invention to provide a corner shelf system that conceals its supporting mechanisms.

It is another object of this invention to provide a corner shelf system that is strong enough to support objects.

It is still another object of the present invention to provide a corner shelf system that can be readily mounted to and in the walls of a corner.

It is yet another object of this invention to provide such a system that is inexpensive to manufacture and maintain while retaining its effectiveness.

Further objects of the invention will be brought out in the following part of the specification, wherein detailed description is for the purpose of fully disclosing the invention without placing limitations thereon.

V. BRIEF DESCRIPTION OF THE DRAWINGS

With the above and other related objects in view, the invention consists in the details of construction and combination of parts as will be more fully understood from the following description, when read in conjunction with the accompanying drawings in which:

Figure 1 represents an isometric view of a shelf system incorporating the present invention, as the shelf is being installed.
Figure IA is an elevational view showing the application of adhesive 60 along the edge of shelf member 40.

Figure 2 shows an isometric view of the shelf system installed.

Figure 2A shows the relationship between the width "a" and length "b".

Figure 3 is a representation of an elevation cross-section of a tongue member inserted inside a cavity.

Figure 4 is a representation of an elevational cross-section of a tongue member, with a step, inserted inside a cavity.

Figure 4A is a detail elevational view of step 28 shown in figure 4.

VI. DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring now to the drawings, where the present invention is generally referred to with numeral 10, it can be observed that it basically includes corner wall 20 with cavities 30, 30', shelf member 40 with tongue members 50, 50' snugly insertable inside cavities 30, 30', and adhesive 60 applied to edges 42 and 44 of member 40, as it can be seen in figures 1 and 2.

Figure 1 shows shelf member 40 as it is being mounted, with tongue members 50 being lined up with cavities 30. Cavities 30 on wall 22 may be slightly longer than cavities 30' in wall 24 so that tongue member 50 can be first inserted inside cavity 30. Subsequently, tongue members 50' will be pushed through openings 32 and into cavities 30' for a snug fit. Either cavity
30 or cavity 30', or both, need to be slightly longer than the width of tongue member 50 and/or 50'. Figure 2A shows the relationship between the width "a" and length "b" of tongue member 50 or 50' (or both) and cavities 30 or 30' (or both).

As seen in figures 3 and 4, tongue member 50 penetrates through opening 32 into cavity 30 on one side of wall 22 for a snug fit. Adhesive 60 is applied to the edges of shelf member 40 that are brought in contact with wall 22 and 24. Adhesive 60 can be an acrylic adhesive caulking or equivalent that immobilizes shelf member 40 counteracting any shear forces; vertically (from the load) and horizontally (to prevent lateral movements that would disengage tongue member 50).

Shelf member 40 has, in the preferred embodiment, a substantial uniform thickness. Tongue members 50 and 50', in another preferred embodiment, may have a slightly smaller thickness so that step 28 is defined. Step 28 can be defined with the upper side and/or underside. Figure 4 shows step 28 on the upper side. The object is to position step 28 so that it covers the upper portion of opening 32 of cavity 30 as seen in figure 4A.

The foregoing description conveys the best understanding of the objectives and advantages of the present invention. Different embodiments may be made of the inventive concept of this invention. It is to be understood that all matter disclosed herein is to be interpreted merely as illustrative, and not in a limiting sense.
VII. INDUSTRIAL APPLICABILITY

It is apparent from the previous paragraphs that an improvement of the type for such a corner shelf system is quite desirable for its ability to conceal its supporting members.
VIII. CLAIMS

What is claimed is:

1. A shelf system for corner walls, comprising:

   A) a substantially flat shelf member having at least two contiguous sides defining first and second edges of a predetermined thickness and perpendicular to each other, said first edge including at least one tongue member that extends outwardly a predetermined distance and said second edge including at least two tongue members that extend outwardly a predetermined distance;

   B) a corner wall having first and second walls perpendicular to each other and said first and second walls including each a cooperatively located cavity for each of said at least one tongue member; said cavity including an opening through which said at least one tongue member passes and is snuggly received within said cavity; and

   C) adhesive means applied to said first and second edges for rigid affixation of said first and second edge to said first and second walls, respectively, upon contact so that said shelf member is capable of supporting loads of predetermined magnitude without showing detracting supporting elements.

2. The system set forth in claim 1 wherein said at least one tongue member has a slightly smaller thickness than said first and second
edges thereby defining a step between said shelf member and said
tongue member, said step curving in abutting contact with the wall
adjacent to said cavity thereby concealing the latter.

3. The system set forth in claim 2 wherein said first and second edges
include, each, two tongue members.

4. The system set forth in claim 3 wherein said adhesive means is
applied to said tongue member.
