(54) Title: DISK DISPENSING AND RETRIEVAL SYSTEM WITH AUTOMATED QUALITY CONTROL AND INTERNET USAGE FEEDBACK

(57) Abstract: A kiosk (200) dispenses and receives recorded optical disk media (214) using an interconnected (107) system central server computer (300) through an Internet Service Provider (401). The system central server (300) contains databases and processing, and is connected to a credit verification system (410). The central databases collect inventory administration information and customer data from the kiosks (200) including credit card and email addresses (105). The central server (300) maintains databases that are used for remote inventory control and administration of the kiosk network. A kiosk (200) has the capability to identify a recorded disk (214) for automated restocking and may also perform quality assessment (800) of a recorded disk (214). A kiosk (200) may also provide publishing-on-demand or act as a portal for remotely served advertisements.
For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.
DISK DISPENSING AND RETRIEVAL SYSTEM WITH AUTOMATED QUALITY
CONTROL AND INTERNET USAGE FEEDBACK

RELATED APPLICATIONS

5 This application is a non-provisional continuation of pending U.S. provisional
application serial number 60/135,854, and 60/143,601, each of which is hereby
incorporated by reference.

FIELD OF THE INVENTION

This invention relates to a method and apparatus for dispensing recorded
10 optical disks employing computers and software. More particularly, this invention
relates to a method and apparatus for providing automated retail distribution of
recorded optical disks. Still more particularly, this invention relates to a method and
apparatus for providing a freestanding distribution and retrieval system for recorded
optical disks, which is linked to a central server computer using the Internet.

PROBLEM

One method commonly used for distribution of recorded media is a retail
15 outlet. A retail outlet may sell or rent recorded media. A large inventory is common
at a retail location, and staff is required for sales, rentals and restocking. A building
is required to house inventory and to provide a retail location. A computer system is
usually employed to track inventory of rentals and sales. A retail outlet for recorded
media is very expensive to construct and operate. Because of these factors, there
is considerable overhead required to run a rental or sales business for recorded
media.

Another method of media distribution is a limited scale operation. A
20 convenience store might offer a limited selection of items for sale or rent. However,
staff is still needed for sales, rentals and restocking. A significant limitation of the
retail distribution model for disks is the overhead required to operate a business.

One way that retailers have sought to reduce costs is through electronic
25 commerce (EC). Providing an Internet-connected website for customer interaction
is quickly becoming a new business model. A system of distribution using EC can
significantly reduce overhead associated with retail locations. In this type of
business model a central warehouse or warehouses ship an order submitted via the
Internet through the mail or using a private courier. The cost of operating a retail
location is avoided with this business model. However, a strictly Internet-based
distribution system often has significant liabilities. One disadvantage is that a customer must wait for an order to be shipped from a warehouse location. Another disadvantage is that stock may not be available at the time the order is processed. If stock is unavailable, an order may be placed on back-order or the order may be canceled. Another significant disadvantage of an Internet-based distribution system is the impracticality for media rental. The rental business is one of immediacy; a customer will rent an item that is available immediately, but may not rent if it is not available immediately. A customer is much less likely to rent an item that is shipped after ordering, requiring days for delivery. In addition, once a customer is finished with a rented item it must be return-shipped to the distribution location.

An advantage of an Internet-based distribution, however, is that a customer may set up an account, pay electronically, and provide invaluable information to a retailer, wholesaler or the media industry. What is needed is an Internet-based distribution system that allows a customer instant distribution or retrieval of media that does not require a retail outlet with the attendant staff and other costs of doing business. In addition, there is a need to provide automated services for payment and quality assurance such that a distribution system is simple and inexpensive to construct and maintain.

**SOLUTION**

The above and other problems are solved and an advance in the art is made by provision of a method and product for Internet-based automated distribution and collection of recorded disks.

A first advantage of the invention is the ability to provide automated distribution of recorded disks. A standalone fully automated kiosk serves as a distribution point for an integrated system of automated distribution linked via the Internet. The kiosk is a simple and inexpensive mechanical system providing storage and dispensing of disks. A carousel or shuttle system provides access to multiple media selections within the kiosk. Multiple kiosks may be connected to the system via the Internet for simultaneous use by users at different locations.

A user interacts with the system via a touch screen. The system software guides each customer through the process using HTML linked pages connected to a database. A selection is entered on the touch screen to choose one or more items for rental or sale. The selections are added to a "shopping cart," or a
temporary database represented on the display, that is approved by the customer. A credit or debit card or other membership information may be entered using a magnetic strip card reader or other device that imports the data to a verification module. Approval or denial of credit is accomplished via a local database, and/or a connection to the system central server computer, and/or a connection to banking services. If the credit or debit is approved, the ongoing transaction is attached to a customer, approval for the price of the disk is entered, and a dispensing system is activated. A database then queries software for the requested item location. A carousel or shuttle system manipulates the media until it is aligned with the dispensing/retrieving slot. A door mechanism is activated to open, and a mechanism is activated to push the recorded disk partially out of the slot to make it available for hand retrieval by the customer.

A second advantage of the present invention is the ability to reduce expense by emailing transaction information to a customer. During the disk dispensing operation, an option to receive an e-mailed receipt is given. The option contains a touch-screen keyboard pop-up for the purpose of entering email address characters and other data. A consumer enters an email address via the touch screen keyboard. Receipts may include transactional information as well as advertising and links to specific web-sites. All receipts are given by e-mail reducing the expense of a kiosk since a hard-copy receipt printer is not required. Additionally, the system acquires e-mail addresses from customers allowing post transaction interaction while the consumer is on line.

A third advantage of the present invention is the ability to receive media back to the system. The customer activates a return process by selecting “Return” from a touch screen menu or by presenting the disk to the system bar-code reader or optical sensor. The carousel or shuttle system positions to accept a disk at the opening. An initial sensor detects if the recorded disk belongs to the system and activates a door mechanism to allow placement of the recorded disk in the opening. If the recorded disk does not register as a system disk, the door mechanism will not allow the disk to enter the opening. Once registered, the individual code associated with each item is entered into the database and the position in the carousel or shuttle is stored. An open transaction is closed when the item is returned and logged in the database or sold. The location of each item is stored in the database upon insertion through the return slot. Recorded disks are stored raw
or in containers specific to the system. This may include certain lock and key
structures on the system and on the containers that enable early identification of
the item. Item-specific identifiers may be present on the container, on the item, or
on both to further verify the identity of the individual items.

A fourth advantage of the present invention is an error detection system.
Quality scanning software can accomplish a playable/not playable decision via
interaction with the error correction code on individual optical media. Product to be
dispensed can be assured of quality after an automated analysis. The scanning
may be performed using a media specific drive, in concert with automated
transporting to and from the drive within the storage system. The error system first
identifies every file in the file tree structure. It then traps errors in the file tree
structure if a file cannot be opened. Next, the error system opens each file, reads
the first block of each file, reads subsequent blocks of each file, trapping errors on
each block. The block size is adjustable, the number of blocks read is adjustable
and the number of blocks skipped is adjustable. The error system stores block data
in a database. The error system totals successful and unsuccessful block reads.
The error testing system allows an algorithm to determine the integrity of the media,
and to generate disk imperfection data toward tracking the degradation of disk
quality over successive rentals.

The error-testing algorithm runs on readily available personal computer
hardware. Once an error is found, the system determines a number of contiguous
blocks affected. Based on the number of bad blocks and the number of contiguous
bad blocks, the system determines a probable level of media integrity on a multi-
point scale. The system then compares the file tree found and errors found against
test results for perfect disk and previous test results for the same disk. If a "bad
media identifier" is indicated, the "bad media" tag is associated with the database
entry, the disk is not made available for re-rental or sale and notification is made at
the central server that the disk is available for removal. A mechanism is preferably
incorporated into system media cases that when toggled allows the system to
identify a disk that the customer deemed to be damaged or in need of attention.
Additionally, an attached or stand-alone polishing system that has payment
elements common to the invention system can take a disk, resurface the read side,
and return the disk. This may include a grinding system and/or a buffing system
and may be Internet connected, or linked to the system kiosk.
A fifth advantage of the present invention is the ability to provide on-demand publishing for automated distribution. The system will be linked to a central server computer for the transfer of data in multiple directions. Multiple individual systems can be linked via a network, and data may be transferred to a kiosk site or group of sites, recorded on disk and distributed for rental or sale in an automated process.

A sixth advantage of the present invention is a circular bar code for the purpose of identifying disks inserted into the kiosk system from any orientation. The “ringcode” consists of concentric circles separated in dark and light bands with relative distances recognized by standard line scanners.

The ringcodes are created by reducing a standard barcode to a single point width cross-section. This produces a single straight line of dots that are spaced to the original barcode. The line is then pivoted around a prescribed center radius to produce a group of concentric circles spaced to the original barcode. A standard line scanner will view a simple straight cross-section as it passes through the center of the ring. This gives the scanner two attempts at reading the entire code on the coded object; once on either side of the center as the reader passes over the center of the code.

A seventh advantage of the present invention is the universal kiosk element of the system. The kiosk system may be shipped via standard shipping methods such as UPS. This capability, in combination with Hot-Swappable Kiosks, and low cost manufacturing allows rapid Remove and Replace (R&R) maintenance as needed. Additional units can be stocked on site specifically for maintenance and replacement or can be shipped quickly to provide locations with optimal ongoing performance.

The kiosk may be designed to utilize a quick-mount wall frame system. This capability addresses the maintenance of public use terminals, allowing anyone with keyed access to remove the system from the wall mount bracket for repair or replacement. This reduces maintenance costs by speeding installation and provides plug-and-play instant connectivity requiring no special tools, training or connections. Additionally, the kiosk system is totally portable, and can be mounted by one person on a wall or in a wall. Wireless devices that allow connection to the Internet without phone or data lines present will allow interactive kiosk units to be placed in unwired locations.
An eighth advantage of the present invention is automatic restocking of the kiosk system. Customers return the media to the system. A single-touch selection or bar-code-activated initiation of the system starts the process. The kiosk system then rotates the carousel into the appropriate alignment of the opening to the selected inventory slot. Once in the appropriate alignment, and upon recognition of the system-specific barcode, the door opens for acceptance of a cased recorded disk. As the case passes through, the door mechanism pivots to decline additional insertions until the system is ready. The location information is stored in the computer, restocking information is downloaded to the central server and the disk is then available for subsequent rental or sale.

**BRIEF DESCRIPTION OF THE DRAWINGS**

FIG. 1 illustrates the disk distribution system of the invention;

FIG. 2 is a block diagram of a system kiosk;

FIG. 3 illustrates a system central server computer;

FIG. 4 is a block diagram data exchange within the distribution system;

FIG. 5 is a flowchart of a system transaction;

FIG. 6 is a block diagram of an exemplary computer system;

FIG. 7 is a depiction of a ringcode for recorded disks;

FIG. 8 a flowchart of an error detection process for recorded disks;

FIG. 9 is an exemplary front-view of a preferred embodiment of a kiosk;

FIG. 10 is an exemplary side-view of the kiosk of FIG. 9;

FIG. 11 is an exemplary front-view of a second preferred embodiment of a kiosk;

FIG. 12 is an exemplary side-view of the kiosk of FIG 11;

FIG. 13 is an exemplary top-view of the kiosk of FIGS. 11 and 12;

FIG. 14 is an exemplary front-view of a preferred embodiment of a disk-shuttle system;

FIG. 15 is an exemplary side-view of the disk-shuttle system of FIG 14;

FIG. 16 is an exemplary top-view of the disk-shuttle system of FIGS 14 and 15;

FIG. 17 is a depiction of a test result for an error correction system;

**DETAILED DESCRIPTION OF THE INVENTION**

In the following detailed description of the present invention, a method and product for Internet-based automated disk distribution and retrieval, specific details are set forth in order to provide a thorough understanding of the present invention. It will be obvious, however, to a person skilled in the art that the present invention
may be practiced without these specific details.

**System Overview**

The integrated disk distribution system is centered on combining instant physical access to recorded disk media with the convenience of Internet based e-commerce. The system is designed to support Digital Versatile Disk (DVD) players, and other optically recorded disk systems.

An Internet-connected central server computer integrates customers, suppliers, employees, kiosks, owners, and the video industry in a "Hub and Spoke" system that is fully automated and interactive, providing real time business-to-consumer and business-to-business capabilities.

The system kiosks are a critical piece of the Hub and Spoke network system. For the purpose of the following discussion "kiosk" may be used interchangeably with Automated Dispensing or Retrieval System (ADRS). The kiosks act as the brick and mortar spokes, providing a faster, more convenient way for customers to obtain and return DVD videos or other disks. Each kiosk is a self-service unit that combines mechanical dispensing systems, Internet connectivity and a touch screen monitor for customer interaction. The compact nature of the DVD format allows up to 1000 disks to be stocked in a kiosk like the system shown in Figure 9. The kiosk’s small space requirement allows placement in high-traffic locations that are more convenient than traditional retail locations. Internet connectivity allows customers to have the choice of shopping online or on-site or to access a variety of real-time services. Additionally, smaller low-cost units holding fewer disks, but with the same interactive capabilities allow placement in a multitude of convenience-based locations in both floor mount and wall mount configurations. The kiosks present significant reductions in labor and real estate costs compared to traditional video rental outlets.

Each kiosk is a self-service unit that uses a computer, Internet connectivity, and a touch screen monitor for customer interaction. The small physical footprint of the kiosk enables it to be placed in a variety of locations. The kiosks can operate 24 hours a day, 7 days a week, providing instant electronic access to products. The kiosks are fully automated providing customer service through the Internet; and on-site staffing is not required to support customer needs. The system web site provides 24-hour access to on-line customer support. It also provides access to specific kiosk inventory, movie trailers and reviews, customer inquiries, special
orders, regular individually tailored e-mailed updates, and overall service. The integrated remote kiosk monitoring system allows low cost inventory management, tailored marketing promotions, operations planning, and system diagnosis.

In the preferred embodiment, the kiosks are physically designed to meet American Disabilities Act (ADA) specifications so that they may be placed in public facilities. The kiosks also preferably meet other regulatory requirements of public transportation facilities, universities, and office buildings.

The system central server supports a World Wide Web site. The central server includes promotional drivers and accessory services that route through the system website in conjunction with the kiosks. Customers may use the Internet to query a specific kiosk for availability or to purchase new and used media, register for e-mailed updates, or participate in various targeted programs.

The integrated system allows fast transactions. A simple and easy to use title search process minimizes shopping time and allows rapid transactions. Transaction times from walk-up to walk-away can be less than 60 seconds and average 2.5 minutes. Return of media is also simple, as the disks only need to be re-inserted into the dispensing/retrieval mechanism. Upon the return of a disk at a kiosk, the internal computer reads individual identification information from the disk and restocks it automatically.

The system uses standardized components. The standard design of the kiosk components minimizes manufacturing costs and simplifies maintenance. Standardized automated kiosks allow placement of the system kiosks in non-customary locations providing the appropriate service to the target customer and ease of maintenance.

The system allows remote price changes and can also gather up-to-the minute product availability and customer data. Thin-client computing technology keeps hardware costs low and speeds up application deployment by centralizing management, and enhancing security. E-mailed receipts generated from the kiosks through the central server allow ongoing access to customers after the completion of the transaction.

Recorded disk pricing may be determined on a kiosk-by-kiosk basis based on local market conditions. Pricing also varies depending on market elasticity; for example, premiums may be placed on DVD videos available in airport terminals. Differentiated pricing can be used for newer releases vs. older releases. In
addition, rental terms and promotions may vary based on kiosk locations and the time of week, and can be adjusted remotely on demand.

**Operational Overview**

At the kiosk, a graphical user interface (GUI) utilizing a touch screen display provides a user-friendly interface even to consumers lacking computer experience. Once a touch screen is activated, a computer in the kiosk generates a touch-selectable list of available media: movie genres such as *Action*, *Drama*, *Romance*, and *Comedy*, for example. By touching on one of the genres, a selection of associated titles and/or a promotional picture may appear on the screen. Touching an image causes basic information to be displayed about that media such as cost and rating, along with an option to rent or purchase the media. When selection of media is complete, a credit, debit card, or other membership ID is requested to execute the transaction and then the disk is dispensed to a customer.

Return of rental media is similar; a customer may select "Return" on a touch screen, and then insert a disk into an opening in the kiosk. An optical scanner first verifies that the disk belongs to the system before accepting a disk. Upon return, a disk may be evaluated for damage by a media diagnostic system. Damaged rental stock, scratched or warped disks for example, are identified and quarantined. This provides a means to track inventory quality and when and who damaged a disk. Depending on the extent of the damage a customer may be assessed a fee.

Internet connectivity and a dynamic customer database provide product promotion capabilities and consumer access. Product information and promotions may be tailored to each location's demographics and additionally to each kiosk's rental and sell-through history. Advertising is available on a kiosk screen and on associated monitors such as overhead plasma displays. Advertising on the kiosk screen provides a mechanism to promote specific marketing initiatives as well as additional local and global advertising. A loyalty program encourages and rewards repeat customers by offering special discounts or services while conducting transactions. The system website allows consumers to search for kiosks and to query a specific kiosk for available content. The website also carries updated lists of used media for sale at discounted prices at individual kiosks. A customer may reserve and pay for a DVD stocked at a specific kiosk from the website, then pick up the DVD within a specified time period at the specific kiosk. Once a customer
enters e-mail information at the kiosk or at the website, that customer is eligible to receive frequent tailored e-mailed updates from the central server on current promotions.

Additional products potentially distributed through the kiosks include a variety of other disk-based media such as books on disk, DVD music videos, DVD-ROM, DVD video games, DVD-Audio, SA-CDs and CDs. The modularity of the system allows for easy adoption of additional disk-based content distribution.

**Detailed Description of System Elements**

Some portions of the following detailed description are presented in terms of procedures, logic blocks, processing steps, computer program code and other symbolic representations of data operations within a computer memory. A procedure, logic block, process, etc., is a self-consistent sequence of steps or instructions leading to a desired result. The steps are those requiring physical manipulations of physical quantities.

A practitioner will recognize that all of these and similar terms are to be associated with the appropriate physical quantities and are merely convenient labels applied to these quantities. Unless specifically stated, terms such as “processing,” “computing,” “calculating,” “determining,” “displaying,” refer to the action and processes of a computer system or similar electronic computing device.

Figure 6 illustrates a computer system 612. In general, computer system 612 used by the preferred embodiment of the present invention comprises a bus system 600 for communicating information between system components. A central processing unit 601 for processing information and instructions is coupled to bus system 600. A processing unit may be a processor a microprocessor or any group or combination of processors or microprocessors. A random-access memory 602 for storing information and instructions for the central processor 601 is coupled to bus system 600. A read-only memory 603 for storing static information and instructions for the processor 601 is coupled to bus system 600. A data storage device 604, such as a magnetic or other disk drive, for storing information and instructions is coupled to bus system 600. A display device 605 for displaying information to the computer user is coupled to bus system 600. An alphanumeric input device 606, including alphanumeric and function keys, for communicating information and command selections to the central processor 601, is coupled to bus system 600. A cursor control device 607 for communicating user input information
and command selections to the central processor 601 is coupled to bus system 600. And, a signal-generating device 608 for communicating data or signals between devices external to system 612 and processor 601 is coupled to bus system 600.

The display device 605 of Figure 6 utilized with computer system 612 is suitable for displaying graphic images and alphanumeric characters. A cursor control device 607 is known in the art to include a trackball, mouse, joystick, or special keys on an alphanumeric input device 606. A cursor control device 607 inputs cursor movement of a given direction or manner of displacement. The cursor control device 607 also may be directed and/or activated via input from the keyboard using special keys and key sequence commands. Alternatively, the cursor may be directed and/or activated via input from a number of specially adapted cursor directing devices or may be integrated with a display device 605.

Figure 1 illustrates a preferred embodiment of an optical disk distribution system 100. Generally, system 100 distributes recorded optical media in disk form; for example a Digital Versatile Disk (DVD), or a Compact Disc (CD). A disk, recorded disk, or recorded optical media are hereafter used to refer to a recorded optical disk media. The system 100 integrates one or more kiosks 101 with a server system 103 through a virtual network 107. The server system 103 is connected to the Internet 104 for direct linking to individual email accounts 105 and 105'. The server system 103 supports a World Wide Web page set 108 for general access by customers using the Internet. Generally, access to system web page set 108 supported by server 103 is through an Internet Service Provider (ISP) that provides an Internet connection for a personal computer 106. The kiosk 101 has a display 106 for viewing and entering information. The kiosk 101 dispenses and receives disks 102, via an opening on the front.

Figure 2 illustrates a preferred embodiment of a system kiosk 200. The system kiosk 200 is a self-contained unit dispensing system that contains computer devices and mechanical devices. A central processing unit 201 is operably connected to a system bus 250. System bus 250 may be a single bus or a series of busses for communicating data or signals between various devices and central processing unit 201. A memory device for storing instructions 202 is operably connected to system bus 250. A data storage device for storing data, or containing databases and/or other instructions, is connected to system bus 250. A display
device having alphanumeric input capability 204 is operably connected to system bus 250. Alternatively, system kiosk 200 may contain computer system 612 for controlling system functions. If computer system 612 is contained in system kiosk 200, then bus 600 is operably connected to or replaces system bus 250. A magnetic card reader 211 for reading magnetically imprinted cards is operably connected to system bus 250. Any device suitable for uniquely identifying a customer such as a retinal scanning device, a smart-card reader or finger-print scanner for example, may be substituted for magnetic card reader 211 when appropriate. An optical reader for reading bar-type codes 205 is operably connected to system bus 250. A disk shuttle assembly for accessing and storing disk media 206 is operably connected to system bus 250. A media storage unit 207 for storing optical media 214 is contained in kiosk 200. Shuttle system 206 may be contained in, or integrated with, media storage unit 207 for accessing optical media 214. A kicker device 208 for dispensing or receiving optical disk media 214 is operably connected to system bus 250. An optional audio device 212 for providing kiosk sound capability may be connected to system bus 250. An optional DVD-Ram or DVD-ROM drive 214 for reading data from, or writing data to, optical media may be operably connected to system bus 250.

An optional error detection system 209 for detecting damaged optical disc media may be internal to or external to system kiosk 200. When error detection system 209 is internal to system kiosk 200, error detection system 209 is operably connected to system bus 250, and DVD-RAM or DVD-ROM drive 213 is operably connected to system bus 250.

In a preferred embodiment of the invention a system for polishing damaged optical media may be internal to kiosk 200 or may be a linked freestanding unit external to kiosk 200 but preferably shares power and functionality. If a polishing system is provided with a kiosk 200, shuttle 206 may be used to move optical media to or from kiosk 200. In a preferred embodiment kiosk processor 201 may be utilized to control functions of a polishing mechanism. A polishing system for optical media is known in the art and is not depicted in Figure 2.

Figure 3 is an illustration of a preferred embodiment of a central server computer 300. The system central server computer 300 may also be computer system 612. System server 300 provides command and control and collects and delivers data to system kiosk 200. Server computer 300 has a central processing
unit 301 that is operably connected to server system bus 350. A memory device capable of storing instructions 302 is operably connected to server system bus 350. A database 303 for storing data is operably connected to system bus 350. A communication device capable of transmitting and receiving data or html 304 is operably connected to system server bus 350. An optional second communication device for exchanging data for commercial transactions 305 may be operably connected to server system bus 350.

Figure 4 depicts a preferred embodiment of the system data transfer mechanism 400. Mechanism 400 is, for example, item 107 of Fig. 1. A virtual network connection, item 107 Fig. 1, provides data exchange between a kiosk 200 of Fig. 2, and server computer 300 of Fig. 3. The kiosk-server virtual network system 107 can be a local network system or a remote network system that may utilize an html-based data exchange, e.g. an intranet or extranet. The exchange of data in html format includes an html request 425 and an html page 435. Both the kiosk 200 of Fig. 2, and the server computer 300 of Fig. 3, may request and receive data using the html protocol, allowing a two-way data-exchange system. The use of the html protocol allows an Internet browser to be a system interface, and additionally allows the system to be administered by an Application Service Provider (ASP) using the Internet. Application Service Providers (ASP) provide software applications across the Internet by basing resident software on a central server that is accessed using an Internet browser. The use of ASP's is desirable where the functionality of a network is desired, but the use of a private server-system is impossible or impractical. An Internet Service Provider (ISP) 401 may also be an ASP. An ISP provides a connection to the Internet to individual computer users.

Exchange of data using virtual network 107 of Fig. 1, is accomplished in a secure manner using methods of data encryption and decryption known in the art. Secure transfer of data through an ISP provides a virtual private network connection. An additional data exchange may occur on a dedicated private network connection for banking services, or alternatively using a virtual network as in item 107 of Fig. 1. Server 300 of Fig. 3 may obtain credit or debit or other membership authorization using information received from a customer. A credit authorization request 412 is transmitted from server 300 of Fig. 3, to a bankcard verification service 410, which generally is a secure server computer. After receiving credit authorization request 412, bank-card verification service 410 processes credit
authorization request 412, and transmits a response 411 to server computer 300 of Fig. 3. Response 411 is conveyed to kiosk 200 of Fig. 2 through virtual network 107 of Fig. 1.

Figure 5 illustrates a preferred embodiment of a diskdispensing transaction process 500. Process 500 begins with a request to dispense a media selection from kiosk 200 of Fig. 2, in step 501. Information including, for example, creditcard number or email address is next received from a customer to kiosk 200 in step 502. Kiosk 200 then securely transmits data received in step 502 to ISP 401 of Fig. 4, in step 503. Data securely transmitted in step 503 is received to ISP 401 in step 504. Data received to ISP 401 in step 540 is securely transmitted to system server 300 of Fig. 3, in step 505. Data securely transmitted to system server 300 in step 505 in next received to system server 300 in step 506. System server 300 next securely transmits debit authorization request data to a credit verification server in step 507. System server 300 next securely receives credit authorization data from a credit verification service in step 508. System server 300 next securely transmits authorization data received in step 508 to ISP 401 in step 509. In step 510 system server 300 transmits to ISP 401 an e-mail receipt for a debit transaction occurring in steps 507 and 508 for an e-mail address supplied in step 501. In step 511 data transmitted by system server 300 in step 509 and step 510 is received by ISP 401. Step 509 and step 510 may occur simultaneously in one step or sequentially in different steps. In step 512 ISP 401 securely transmits to kiosk 200 authorization to dispense requested media received from system server 300 in step 511. In step 513 ISP 401 transmits email receipt data received from system server 300 in step 511 to an email address received in step 501. In step 514 kiosk 200 securely receives authorization to dispense media transmitted from ISP 401 in step 512. In step 515 kiosk 200 dispenses requested media to a customer.

In a preferred embodiment of the invention, shown in Fig. 7, an optical ringcode 701 uniquely identifies each recorded disk 700. Generally an optical disk is comprised of a sandwich of polycarbonate and a reflective surface. A region between the media outside diameter 705, and the center region 704 may be used for a label region 702. On a single-sided media the label region 702 which is positioned upon the reflective surface may contain printed information. On a dual-sided media nothing may be printed in the label region 702. A center region 704 exists between the label region 702 and the center hole 703. The center region
704 may contain printed information on both single-sided and double-sided optical media. A standard barcode system has been established and is known in the art. For recorded disk 700 a radial optical code 701 is achieved by rotating a section of a standard barcode around a fixed position located at disk 700's true center. The resulting "ringcode" 701 is a series of concentric circles that may be scanned from any radial position of the disk 700. In the preferred embodiment of the invention a standard optical reader 205 may be used to identify the recorded disk. In another preferred embodiment of the invention the label region 702 of a single-sided disk may be used for a ringcode 701. In another preferred embodiment of the invention, the ringcode 701, may be detectable by a non-standard barcode reader operating at a non-visible frequency in infra-red or ultra-violet, for example. A ring-code 701 may therefore be transparent or may be opaque, allowing a greater degree of security for proprietary identification features or codes.

In a preferred embodiment of the invention an error media error-detection system may optionally be incorporated into kiosk 200 of Fig. 2. Error detection process 800 is depicted in Figure 8. Error detection process 800, within kiosk 200, is generally a sequential instruction set for directing a computer 612 or a processor. In step 801 a disk error detection system, item 209 of Fig. 2, is initiated. Error detection process 800 can be initiated as in step 801 automatically by kiosk system 200 or by system server 300 or by manual selection. In step 802 a recorded disk, item 214 of Fig. 2 for example, is shuttled to a disk drive mechanism, item 213 of Fig. 2 for example, for reading data. In step 803 data is read from a disk shuttled to a disk drive 213 in step 802. Data read from disk 214 in step 803 is analyzed by an algorithm in step 804 to detect data errors. If no errors are detected in step 804 then step 805 occurs and system kiosk 200 is signaled that no error was detected. In step 806 a disk with no detected data errors is shuttled to kiosk 200's media storage unit, item 207 of Fig. 2. Next, in step 807 system kiosk 200 updates a database to indicate that the error free disk is available. If a data error is detected in step 804, step 808 occurs and an error tag is generated. In step 809 kiosk 200 is signaled of an error tag attaching to the disk. In step 810 the error tagged disk is shuttled to segregated area for damaged disks within media storage unit 207. Alternatively, in step 810 a database may be updated to indicate that the disk is not available.
Figure 9 is an exemplary front-view embodiment of a kiosk 200 of Fig. 2. A kiosk housing 900 forms an enclosure. A computer 901 is included inside housing 900. Computer 901 may be computer 612 of Fig. 6, or one or more components illustrated in Fig. 2, such as CPU 201. Stereo speakers 912, for audio are positioned on the front of housing 900. A touch screen display 904 is positioned on the front of housing 900. A dispense/return opening 940 is positioned on the front of housing 900. A credit-card magnetic reader 911 is positioned on the front of housing 900. A disk inventory system 907 is included internal to housing 900. A transfer mechanism/controller 906 is included in housing 900. Transfer mechanism 906 may be shuttle/carousel 206 of Fig. 2, or as illustrated in Figures 14-16. A sleeve dispenser 930 is positioned on the front of housing 900, for dispensing protective coverings for media. Sleeve dispenser 930 may be a mechanical device or a holding area for sleeves that requires manual extraction by a kiosk user.

Figure 10 is an exemplary side-view embodiment of a kiosk 200 of Fig. 2, as shown in Fig. 9. A housing 1000 is identical to housing 900 of Fig. 9.

Figure 11 is an exemplary front-view of a second kiosk 200 of Fig. 2. A bulkhead 1100 forms a base upon which components may be mounted. Stereo speakers 1112 are mounted on bulkhead 1100. A touch-screen display 1104 is mounted on bulkhead 1100. A carousel 1107, for storing media is mounted on bulkhead 1100. A carousel drive 1106 is mounted on bulkhead 1100 for driving carousel 1107. A debit/credit magnetic card reader 1111 is mounted on bulkhead 1100. A dispense/return door mechanism 1108 is mounted on bulkhead 1100. A dispense/return door drive 1120 is mounted on bulkhead 1100 to operate dispense/return mechanism 1108. A dispense/return guide and case scanner 1105 is mounted on bulkhead 1100. Dispense/return guide 1105 may have an integrated optical scanning unit for identifying media before allowing media to be received to a kiosk.

Figure 12 is an exemplary side view of a second kiosk 200 of Fig. 2, as illustrated in Fig. 11. A bulkhead 1200 forms a base upon which components may be mounted. Bulkhead 1200 is identical to bulkhead 1100 of Fig. 11. A dispense/return door 1240 is attached to bulkhead 1200. A media case/disk ID scanner 1205 is mounted on bulkhead 1200. Media case/disk scanner 1205 is identical to dispense/return guide and case scanner 1105 of Fig. 11.
Figure 13 is an exemplary top view of a second kiosk 200 of Fig. 2, as shown in Figs. 11 and 12. A bulkhead 1300 forms a base upon which components may be mounted. Bulkhead 1300 is identical to bulkhead 1100 of Fig. 11 and bulkhead 1200 of Fig. 12. A dispense/return mechanism 1308 is mounted on bulkhead 1300. Dispense/return mechanism 1308 is identical to dispense/return door mechanism 1108 of Fig. 11. A keyed or unkeyed case 1330 is mounted on bulkhead 1300.

Figure 14 is an exemplary front-view embodiment of a shuttle/carousel system for shuttling a recorded disk as in 206 of Fig. 2 and 906 of Fig. 9. A rack-mount plate 1410 forms a base upon which components may be mounted. A transfer mechanism base 1425 forms a base for transfer mechanism components. Transfer mechanism base 1425 attaches to rack-mount 1410. A disk grip 1422 is mounted on base 1425. A transfer gearbox 1423 is mounted on transfer mechanism base 1425. An end-of-travel sensor 1424 is attached to transfer mechanism base 1425. An input/output motor 1426 is attached to transfer mechanism base 1425. An input/output shaft 1427 is attached to transfer mechanism base 1425 and operably coupled to input/output motor 1426. A clamp motor 1429 is attached to transfer mechanism base 1425.

Figure 15 is an exemplary side-view embodiment of a shuttle/carousel system for shuttling a recorded disk as in Fig. 14. A rack-mount plate 1510 forms a base upon which components may be mounted. A transfer mechanism base 1525 forms a base for transfer mechanism components. An input/output faceplate 1528 is attached to transfer mechanism base 1525. A disk clamp 1534 for holding a recorded disk is attached to transfer mechanism base 1525. An arm-at-input sensor 1532 for detecting positional orientation is attached to transfer mechanism base 1525. An arm-at-transfer sensor 1533 for indicating positional orientation is attached to transfer mechanism base 1525. A disk support 1530 for supporting a recorded disk is attached to transfer mechanism base 1525.

Figure 16 is an exemplary top-view embodiment of a shuttle/carousel system for shuttling a recorded disk as in Figs. 14 and 15. A rack-mount plate 1610 forms a base upon which components may be mounted. A transfer mechanism base 1625 forms a base for transfer mechanism components. A disk transfer arm 1635 is attached to rack-mount plate 1610. A grip arm 1611 for gripping a recorded disk is attached to disk transfer arm 1635. A disk transport arm 1613 for transporting a
recorded disk is operably attached to disk transfer arm 1635. A disk support/sensor 1612 is operably attached to disk transport arm 1613. An unclamp sensor 1614 is operably attached to disk transport arm 1613. An arm-clear sensor 1615 is operably attached to disk transport arm 1613. A first disk-clear pin sensor 1616 is operably attached to transfer mechanism base 1625. A disk stop pin 1617 is attached to transfer mechanism base 1625. A second disk-clear pin sensor 1618 is attached to transfer mechanism base 1625. A disk input sensor 1619 is attached to transfer mechanism base 1625. An interconnect PCBA for circuitry is attached to transfer mechanism base 1625. A transfer motor 1621 is mounted on rack mount plate 1610 and operably attached to disk transfer arm 1635.

Figure 17 depicts a graphical display of a test file result derived from the following computer code instructions when sequentially performed by a computer such as computer 612 of Fig. 6.

The following data table corresponds to the graphical display result of Fig. 17, and results from the following computer code instructions being sequentially performed by a computer such as computer 612 of Fig. 6. The table indicates information about a test-subject optical media and results of a testing algorithm that evaluates media integrity by reading error-correction data from an optical disk.

The above is a description of a method and system for Internet-based automated disk distribution and retrieval. It is expected that others will design alternative methods and systems for Internet-based disk distribution using stand-alone automated kiosks as set forth in the claims below either literally of through the Doctrine of Equivalents.

25
What is claimed is:

1. A system (100) for dispensing optical storage media (214) from a kiosk (200) remote from a system server (300) and communicatively connected (107) to said system server (300), said system (100) comprising:

   a first processor (201) in said kiosk (200);

   a first set of instructions for directing said first processor to:

   receive a request for an optical storage media (214) and billing information from a user (502),

   transmit said billing information to said system server for confirmation (502),

   receive said confirmation of billing from said central server (514), and

   dispense said requested optical storage media (214) to said user (515);

   a first media (203) readable by said first processor (201) for storing said first set of instructions;

   a second processor (301) in said system server (300);

   a second set of instructions for directing said second processor (301) to:

   receive said billing information (506) from said first processor (201),

   perform a credit verification routine (507) on a credit account in said billing information,

   transmit said confirmation (509) to said first processor (201) responsive to a verification of credit account, and

   transmit an electronic receipt (510) for said transaction to a user specified address in said billing information; and

   a second media (302) readable by said second processor (301) for storing said second set of instructions.

2. The system of claim 1 wherein said first set of instructions further comprise:

   instructions for directing said first processor (201) to:

   read data from one of said optical storage media (214) stored
in said kiosk (200); and
display said data on a display (204) in said kiosk (200).

3. The system of claim 1 wherein said first set of instructions further comprise:

   instructions for directing said first processor (201) to:
   receive a returned optical media (214) from a user,
   identify said returned optical media (214), and
   transmit identity of said returned optical media (214) to
   said system server (300).

4. The system of claim 3 further comprising:

   an optical reading device (205).

5. The system of claim 4 wherein said first set of instructions further comprise:

   instructions for directing said first processor (201) to:
   read (803) said returned optical media (214), and
   detect an error (804) in data stored on said
   returned media (214).

6. The system of claim 5 wherein said first set of instructions further comprise:

   generating a recording (808) indicating said optical storage
   media (214) contains an error responsive to detection of said error
   (804).

7. The system of claim 3 wherein said first set of instructions further comprise:

   instructions for directing said first processing unit (201) to:
   receive a signal from said user that said returned optical
   media (214) contains an error.

8. The system of claim 7 wherein said signal is read from a flag on a
   casing that is returned with said returned optical media.

9. The system of claim 1 further comprising:

   a plurality of optical storage media (214) each storing data for a
   particular program;
   a storage unit (207) in said kiosk (200) for storing said plurality
   of optical storage media; and
wherein said first instructions further comprise instructions for maintaining an inventory of said plurality of optical storage media (214) stored in said storage unit (207).

10. The system of claim 9 wherein said first instructions further comprise:

5 instructions for directing said first processor (201) to:

removing a one of said optical storage media (214) from said inventory responsive to dispensing (515) said one of said plurality of optical storage media (214).

11. The system of claim 9 wherein said first instructions further comprise:

10 instructions for directing said first processor to:

add a one of said plurality of said optical storage media (214) to said inventory response to receiving said one of said plurality of optical storage media (214) from said user.

12. The system of claim 9 wherein said first instructions further comprise:

transmitting an update of said inventory to said second processor (301) responsive to said first processor (201) updating said inventory.

13. The system of claim 1 further comprising:

a media polishing mechanism associated with said kiosk (200).

14. The system of claim 13 further comprising:

an optical reading mechanism (213) in said kiosk (200); and wherein said first set of instructions further comprise instructions for directing said first processor (201) to:

read (803) said optical storage media (214),

perform an error checking routine (804) on said optical storage media (214), and

generate an indicia of an error (808) on said optical storage media (214) responsive to detecting an error (804) in said optical storage media (214).

15. The system of claim 14 wherein said first set of instructions further comprise:

instructions directing said first processor (201) to:

display a warning to insert said optical storage media (214) into said media polishing mechanism.
16. The system of claim 14 wherein said first set of instructions further comprise:
   instructions for directing said first processor (201) to insert said optical storage media (214) in said polishing mechanism responsive to said indica of said error.

17. The system of claim 16 wherein said first instructions further comprise:
   perform said error checking routine (804) responsive to said optical storage media (214) being polished.

18. The system of claim 1 wherein said second set of instructions further comprise:
   instructions for directing said second processor (201) to:
   open a transaction responsive to receiving said billing information from said first processing unit (201).

19. The system of claim 18 wherein said second set of instructions further comprise:
   instructions for directing said second processor (301) to:
   receive a message indicating said optical storage media (214) has been returned to said kiosk (200), and
   close said transaction responsive to receiving said message.

20. The system of claim 1 wherein said second set of instructions further comprise:
   instructions for directing said second processor (301) to:
   maintain an inventory database of optical storage media (214) in said kiosk (200).

21. The system of claim 20 wherein said second set of instructions further comprise:
   instructions for directing said second processor (301) to:
   provide access to said inventory database to a third processing unit.

22. The system of claim 1 wherein user specified address is an e-mail address.
23. The system of claim 1 wherein said second set of instructions further comprise:

   instructions for directing said second processing unit (301) to
   maintain a user profile of users.

24. The system of claim 23 wherein said instructions for directing said second set of instructions further comprise:

   instructions for directing said second processor (301) to:
   record each said optical storage media (214) said
   user requests.

25. The system of claim 24 wherein said second set of instructions further comprise:

   instructions for directing said second processor (301) to:
   read said user profile,
   determine which type of optical storage media
   (214) said user prefers, and
   transmit advertisements for optical storage media
   (214) of types said user prefers to said kiosk (200).

26. The system of claim 1 further comprising:

   an internet service provider (401);

   a third processor (601) in said internet service provider (401);

   a third set of instructions for directing said third processor (601) to
   transmit messages between said first processor (201) and said second
   processor (301);

   a third storage media (604) readable by said third processor (601) for
   storing said third set of instructions;

   wherein said first set of instructions include instructions for directing
   said first processor (201) to insert data for said second processor (301) in
   messages, transmit said messages to said third processor (601), receive
   messages from said third processor (601), and read data from said
   received messages; and

   wherein said second set of instructions include instructions for
   directing said second processor (301) to insert data for said first processor
   (201) into said messages, transmit said message to said third processor
(601), to receive said messages from said third processor (601), and remove data from said messages.

27. The system of claim 1 further comprising:

   an media identification reader (205) in said kiosk (200) that is operable to detect an identification marking on said optical storage media (214).

28. The system of claim 27 wherein said first set of instructions include:

   instructions for directing said first processor (201) to:

   read said identification marking on said optical storage media using said media identification reader, and

   identify said optical storage media (214).

29. The system of claim 28 wherein said first set of instructions further comprise:

   instructions for directing said first processor (201) to:

   maintain a record of a position of said optical storage media (214) in said kiosk (200) based upon said identification of said optical recorded media.

30. The system of 27 wherein said identification marking on said optical storage media (214) includes a concentric marking around a center of said optical storage media (214).

31. The system of claim 30 wherein said concentric marking is a bar code (701).

32. The system of claim 31 wherein said media identification reader (205) is a bar code scanner.

33. The system of claim 1 further comprising:

   an optical writing system (213) that writes optical data to said optical storage media (214);

   wherein said first set of instructions include instructions for directing said first processor (201) to:

   transmit a request for data to store on said optical storage media (214) to said second processor (301), receive said data from said second processor (301), and write said data to said optical storage media (214); and

   wherein said second set of instructions include
instructions for directing said second processor (301) to:
receive said request for said data,
retrieve said data, and
transmit said data to said first processor (201).

34. The system of claim 1 wherein said receipt includes advertisements.
35. The system of claim 33 wherein said advertisements are promotions
for optical media (214) available at said kiosk (200).
36. The system of claim 1 wherein said receipt includes a link to a file
maintained on an Internet server (612).
37. The system of claim 36 wherein said file is a home page (108).
38. The system of claim 37 wherein said home page (108) includes
information about promotions offered by said system.
39. The system of claim 1 further comprising:
a casing dispenser (930) that dispensing a casing (1330) for
said optical storage media (214) to said user.
40. The system of claim 39 wherein said casing comprises:
a storage compartment for said disk;
a pre-metered stamp to allow said casing to be mailed; and
a preprinted address.
41. The system of claim 39 wherein said casing further includes:
an identifier.
42. The system of claim 41 wherein said kiosk (200) further comprises:
a retrieval slot (1105) configured to receive a casing (1330);
a reader proximate said retrieval slot (1205); and
wherein said first set of instructions include instructions for
directing said first processor (201) to:
read said identifier from said casing (1330),
determine whether said optical storage media (214) in said
casing (1330) belongs to said system, and
opening said retrieval slot (1105) responsive to a determination
that said optical storage media (214) belongs to said system.

43. A method for dispensing optical storage media (214) from a kiosk
(200) remote from a system server (300) and communicatively
connected (107) to said system server (300), said method comprising the steps of:

receiving a request (501) for an optical storage media (214) and billing information from a user at said kiosk (200);

transmitting said billing information (503) to said system server (300) for confirmation;

receiving said billing information (506) in said system server (300);

performing a credit verification routine (507) on a credit account in said billing information with said system server (300);

transmitting said confirmation (510) from said system server (300) to said kiosk (200) responsive to a verification of credit account (508);

transmitting an electronic receipt (510) for said transaction to a user specified address received in said billing information;

receiving said confirmation (514) of billing from said central server (300) in said kiosk (200); and

dispensing (515) said requested optical storage media (214) to said user.

44. The method of claim 43 further comprising the steps of:

reading data (803) from said optical storage media (214) stored in said kiosk (200); and

displaying said data on a display (204) in said kiosk (200).

45. The method of claim 43 further comprising the steps of:

receiving a returned optical storage media (214) from a user in said kiosk (200);

identifying said returned optical storage media (214); and

transmitting an identity of said returned optical storage media (214) to said system server (300).

46. The method of claim 45 further comprising the steps of:

reading data (803) from said returned optical storage media (214) in said kiosk (200); and

detecting an error (804) in data stored on said returned optical storage media (214).
47. The method of claim 46 further comprising the step of:
    generating a recording (808) indicating said optical storage media
    (214) contains an error responsive to detection (804) of said error.

48. The method of claim 45 further comprising the steps of:
    receiving a signal from said user that said returned optical storage
    media (214) contains an error.

49. The method of claim 48 further comprising the step of:
    reading said signal from a flag on a casing that is returned with said
    returned optical storage media (214).

50. The method of claim 43 further comprising the step of:
    storing a plurality of optical storage media (214) in said kiosk
    (200) wherein each of said plurality of optical storage media (214)
    stores data for a particular program; and
    maintaining an inventory of said plurality of optical storage
    media (214) stored in kiosk (200).

51. The method of claim 50 further comprising the step of:
    removing a one of said optical storage media (214) from said
    inventory responsive to dispensing said one of said plurality of optical
    storage media (214).

52. The method of claim 50 further comprising the steps of:
    adding a one of said plurality of said optical storage media
    (214) to said inventory responsive to receiving said one of said plurality
    of optical storage media (214) in said kiosk (200) from said user.

53. The method of claim 50 further comprising the step of:
    transmitting an update of said inventory to said system server
    responsive to said kiosk (200) updating said inventory.

54. The system of claim 43 further comprising the step of:
    providing a media polishing mechanism associated with said
    kiosk (200).

55. The system of claim 54 further comprising the step of:
    reading (803) said optical storage media (214);
    performing an error checking routine (804) on said optical
    storage media (214); and
    generating an indicia of an error (808) on said optical storage
media (214) responsive to detecting an error (804) in said optical storage media (214).

56. The method of claim 55 further comprising the step of:
   displaying a warning to insert said optical storage media (214)
   into said optical polishing media.

57. The method of claim 55 further comprising the step of:
   inserting said optical storage media (214) in said polishing
   mechanism responsive to said indicia of said error.

58. The method of claim 57 further comprising the step of:
   performing said error checking routine (804) responsive to said
   optical storage media (214) being polished.

59. The method of claim 43 further comprising the steps of:
   opening a transaction record in said system server (300)
   responsive to receiving said billing information (506).

60. The method of claim 59 further comprising the steps of:
   transmitting a message from said kiosk (200) to said central
   server (300) responsive to receiving said optical storage media (214)
   in said kiosk (200) wherein said message indicates said optical
   storage media (214) has been returned to said kiosk (200);
   receiving a message indicating said optical storage media
   (214) has been returned to said kiosk (200), and
   closing said transaction record responsive to receiving said
   message.

61. The method of claim 43 further comprising the step of:
   maintaining an inventory database of optical storage media
   (214) in said kiosk (200) at said system server (300).

62. The method of claim 61 further comprising the step of:
   providing access to said inventory database to a user via an
   Internet connection (108).

63. The method of claim 43 wherein user specified address is an e-mail
   address (105).

64. The method of claim 43 further comprising the step of:
   maintaining a user profile of said user in said system server
   (300).
65. The method of claim 64 further comprising the step of:
   recording each said optical storage media (214) said user
   requests in said user profile.

66. The method of claim 66 further comprising the steps of:
   reading said user profile;
   determining which type of optical storage media (214) said
   user prefers;
   transmitting advertisements for optical storage media (214) of
   types said users prefer to said kiosk (200); and
   displaying said advertisements at said kiosk (200).

67. The method of 43 claim further comprising the steps of:
   generating messages containing information for said system
   server (300) in said kiosk (200);
   transmitting said messages to Internet service provider (401);
   transmitting said messages from said Internet service provider
   (401) to said system server (300);
   receiving said messages in said system server (300); and
   reading data from said received messages in said system
   server (300).

68. The method of claim 43 further comprising the steps of:
   transmitting messages containing data for said kiosk (200)
   from said system server to an Internet service provider (401);
   receiving said messages in said Internet service provider (401);
   transmitting said messages from said Internet service provider
   (401) to said kiosk (200); and
   removing data from said messages in said kiosk (200).

69. The method of claim 43 further comprising the step of:
   reading an identification marking on said optical storage media
   (214) using a media identification reader (205) in said kiosk (200); and
   identifying said optical storage media (214).

70. The method of claim 69 further comprising the step of:
   maintaining a record of a position of said optical storage media
(214) in said kiosk (200) based upon said identification of said optical storage media (214).

71. The method of 70 wherein said step of reading said identification marking on said optical storage media (214) includes:

reading a concentric marking around a center of said optical storage media (214).

72. The method of claim 71 wherein step of reading said concentric marking includes:

reading a bar code (701) printed concentrically around said optical storage media (214) with a bar code scanner in said kiosk (200).

73. The method of claim 43 further comprising the step of:

transmitting a request (425) for data to said system server (300) from said kiosk (200);

receiving said data in said kiosk (200) from said system server (300); and

writing said data to said optical storage media (214).

74. The method of claim 73 further comprising the steps of:

receiving said request for said data from said kiosk (200) in said system server (300);

retrieving said data; and

transmitting (435) said data from said system server (300) to said kiosk (200).

75. The method of claim 43 wherein said receipt includes advertisements.

76. The method of claim 43 wherein said advertisements are promotions for optical storage media (214) available at said kiosk (200).

77. The method of claim 43 wherein said receipt includes a link to a file maintained on an Internet server (612).

78. The method of claim 77 wherein said file is a home page (108).

79. The method of claim 78 wherein said home page (108) includes information about promotions offered by said system.

80. The method of claim 43 further comprising the step of:

dispensing a casing (1330) for said optical storage media (214) to said user.

81. The method of claim 80 further comprising the step of:
stamping said casing (1330) with pre-metered postage to allow
said casing (1330) to be mailed; and
printing a postal address on said casing (1330).

82. The method of claim 80 further comprising the step of:
including an identifier on said casing.

83. The method of claim 82 further comprising the steps of:
reading said identifier from said casing (1330),
determining whether said optical storage media (214) in said
casing (1330) belongs to said system, and
opening a retrieval slot (1105) configured to receive said
casing (1330) responsive to a determination that said optical storage
media (214) belongs to said system.

SUBSTITUTE SHEET (RULE 28)
FIG. 8

1. Initiate error detection routine
2. Shuttle a disk to an optical drive
3. Read data from disk
4. Is a data error detected?
   - Yes: Create an error tag
     - Alert kiosk system of tag
     - Shuttle disk to a segregated holding area
   - No: Alert kiosk system no errors found
     - Shuttle disk to kiosk storage
     - Update database in kiosk system

FIG. 17
INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER
IPCG(7) :G06F 13/00
US CL. :705/1, 14, 22, 28, 401
According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED
Minimum documentation searched (classification system followed by classification symbols)
U.S. : 705/1, 14, 22, 28, 401

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

[X] Further documents are listed in the continuation of Box C. [ ] See patent family annex.

* Special categories of cited documents

**A** document defining the general state of the art which is not considered to be of particular relevance

**E** earlier document published on or after the international filing date

**L** document which may throw doubts on priority claims or which is cited to establish the publication date of another citation or other special reason (as specified)

**O** document referring to an oral disclosure, use, exhibition or other means

**P** document published prior to the international filing date but later than the priority date claimed

*"* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"X" document member of the same patent family

Date of the actual completion of the international search: 21 AUGUST 2000
Date of mailing of the international search report: 06 SEP 2000
