For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.

SYNERGISTIC COMBINATION

The invention relates to the combined administration of PDE inhibitors and β1 adrenoceptor agonists for the treatment of respiratory tract disorders.
Synergistic combination

Field of application of the invention

The invention relates to the combination of certain known active compounds for therapeutic purposes.

The substances used in the combination according to the invention are known active compounds from the PDE inhibitors class and active compounds from the β₂ adrenoceptor agonists class. Their combined use in the sense according to the invention for therapeutic purposes has not yet been described in the prior art.

Description of the invention

It is the object of the present invention to make available respiratory tract therapeutics which fulfill the following conditions:

- Good antiinflammatory action
- Marked broncho-relaxation and -dilatation
- Good oral availability, at least with respect to the PDE inhibitor
- Minor side effects
- Good suitability for long-term therapy
- Favorable influence on bronchial hyperreactivity.

It has now been found that the combined use of a PDE inhibitor which can be used as a respiratory tract therapeutic and of a β₂ adrenoceptor agonist outstandingly fulfills the abovementioned conditions.

The invention thus relates to the combined use of a PDE inhibitor which can be used as a respiratory tract therapeutic and a β₂ adrenoceptor agonist in the treatment of respiratory tract disorders.

PDE inhibitors which can be used as respiratory tract therapeutics in the sense of the present invention are those compounds which slow the breakdown of cyclic AMP (cAMP) or cyclic GMP (cGMP) by inhibition of the phosphodiesterases, which can lead to a relative increase in the intracellular concentration of cAMP or cGMP.

Exemplary PDE inhibitors are shown on the following pages with the aid of their formulae:
Rofiumilast
No hydrogen atoms are indicated in the above formulae. -O is accordingly -OH, -N is NH₂. Methyl groups, e.g. on the oxygen atoms, are indicated by lines.

The compounds preferred from the group of the abovementioned PDE inhibitors are arofylline, cipamfylline, D-4418, filaminast, ibudilast, laprafylline, ORG-20241, picamilast, rolipram, SB-207499, tibanolast and V-11294A. The compounds particularly preferred are BYK-33043 and in particular roflumilast.

β₂ adrenoceptor agonists which may particularly be mentioned are those selectively acting substances which only have a slight cardiac action and therefore are also employed in therapy, in particular in the oral therapy of respiratory tract disorders. β₂ adrenoceptor agonists which may be mentioned are, for example: AR-C68397AA, broxaterol, CHF-1035,
HOKU-81, ibuterol, KUL-1248, soterenol, meluadrine, TA-2005, tiaramide, salbutamol, levosalbutamol, tulobuterol, terbutaline, carbuterol, pirbuterol, reproterol, clenbuterol, fenoterol, hexoprenaline, orciprenaline, isoprenaline, formoterol, salmeterol, rimiterol, procaterol, bambuterol, bitolterol and mabuterol. The orally readily available β₂ adrenoceptor agonists such as clenbuterol, orciprenaline, salbutamol, terbutaline, tulobuterol, bambuterol and reproterol are preferred. Particularly preferred are the so-called long acting β₂ adrenoceptor agonists, such as salmeterol.

The PDE inhibitors and the β₂ adrenoceptor agonists can be present as such or in chemically bonded form. It is understood hereby that the active compounds mentioned can also be present, for example, in the form of their pharmacologically tolerable salts and/or as solvates (e.g. hydrates), and/or in the form of their N-oxides etc. Suitable pharmacologically tolerable salts here are in particular water-soluble and water-insoluble acid addition salts with acids such as, for example, hydrochloric acid, hydrobromic acid, phosphoric acid, nitric acid, sulfuric acid, acetic acid, citric acid, D-glucosonic acid, benzoic acid, 2-(4-hydroxybenzoyl)-benzoic acid, butyric acid, sulfosalicylic acid, maleic acid, lauric acid, malic acid, fumaric acid, succinic acid, oxalic acid, tartaric acid, embonic acid, stearic acid, toluenesulfonic acid, methanesulfonic acid or 1-hydroxy-2-naphthoic acid, the acids being employed in salt preparation – depending on whether it is a mono- or polybasic acid and depending on which salt is desired – in an equimolar quantitative ratio or one differing therefrom. Furthermore, the active compounds mentioned can also be present as pure enantiomers or as enantiomer mixtures in any mixing ratio.

Respiratory tract disorders which may be mentioned are in particular allergen- and inflammation-induced bronchial disorders (bronchitis, obstructive bronchitis, spastic bronchitis, allergic bronchitis, allergic asthma, bronchial asthma, COPD), which can be treated by the combination according to the invention also in the sense of a long-term therapy (if desired with appropriate adjustment of the dose of the individual components to the needs at the time, for example needs subject to seasonally related variations).

"Combined use" or "combination" within the meaning of the present invention is to be understood as meaning that the individual components can be administered simultaneously (in the form of a combination medicament), more or less simultaneously (from separate pack units) or in succession (directly in succession or else alternatively at a relatively large time interval) in a manner which is known per se and customary.

Within the meaning of the present invention, "use" is preferably understood as meaning the oral administration of both active compounds. If only the PDE inhibitor is administered orally, "use" with respect to the β₂ adrenoceptor agonist is understood in particular as meaning
topical application in inhalatory form. For this, the $\beta_2$ adrenoceptor agonist is preferably administered by inhalation in the form of an aerosol, the aerosol particles of solid, liquid or mixed composition having a diameter of 0.5 to 10 $\mu$m, advantageously of 2 to 6 $\mu$m.

Aerosol generation can be carried out, for example, by pressure-driven jet atomizers or ultrasonic atomizers, but advantageously by propellant-driven metered aerosols or propellant-free administration of micronized active compounds from inhalation capsules.

The active compounds are dosed in an order of magnitude customary for the individual dose, it more likely being possible, on account of the individual actions, which are mutually positively influencing and reinforcing, to reduce the respective doses on the combined administration of the active compounds compared with the norm. Customarily, the $\beta_2$ adrenoceptor agonist (depending on potency) is administered in a dose of, for example, 0.002 to 2.0 mg per day on administration by inhalation.

Depending on the inhaler system used, in addition to the active compounds the administration forms additionally contain the required excipients, such as, for example, propellants (e.g. Frigen in the case of metered aerosols), surface-active substances, emulsifiers, stabilizers, preservatives, flavorings, fillers (e.g. lactose in the case of powder inhalers) or, if appropriate, further active compounds.

For the purposes of inhalation, a large number of apparatuses are available with which aerosols of optimum particle size can be generated and administered, using an inhalation technique which is as right as possible for the patient. In addition to the use of adaptors (spacers, expanders) and pear-shaped containers (e.g. Nebulator®, Volumatic®), and automatic devices emitting a puffer spray (Autohaler®), for metered aerosols, in particular in the case of powder inhalers, a number of technical solutions are available (e.g. Diskhaler®, Rotadisk®, Turbohaler® or the inhaler described in European Patent Application EP 0 505 321), using which an optimal administration of active compound can be achieved.

In the case of the oral administration of the $\beta_2$ adrenoceptor agonists together with the PDE inhibitor, which is the preferred administration form, the $\beta_2$ adrenoceptor agonist is administered in a daily dose of, for example, 0.05 to 60 mg. For the PDE inhibitors, it is possible in the case of oral administration to vary the doses – depending on the active compound – within a wide range, it being possible, as bounds, to start from a dose of 1 - 2000 $\mu$g/kg of body weight. In the case of the administration of the preferred PDE inhibitor roflumilast, the dose is in the range from 2 - 20 $\mu$g/kg of body weight.

The PDE inhibitors to be administered orally are formulated – if appropriate together with the $\beta_2$ adrenoceptor agonists – to give medicaments according to processes known per se and
familiar to the person skilled in the art. The pharmacologically active compounds are employed as medicaments, preferably in combination with suitable pharmaceutical excipients or vehicles, in the form of tablets, coated tablets, capsules, emulsions, suspensions or solutions, the active compound content advantageously being between 0.1 and 95% and, by the appropriate choice of the excipients and vehicles, it being possible to achieve a pharmaceutical administration form precisely tailored to the active compound(s) and/or to the desired onset of action (e.g. a sustained-release form or an enteric form). Particularly worthy of mention within the meaning of the combined, oral administration of both active compounds according to the invention are oral administration forms, e.g. tablets or capsules, in which one part of the β₂ adrenoceptor agonist and the PDE inhibitor is present in non sustained-release form and a further, preferably larger part, of the β₂ adrenoceptor agonist is present in sustained-release form.

The person skilled in the art is familiar on the basis of his/her expert knowledge with which excipients or vehicles are suitable for the desired pharmaceutical formulations. In addition to solvents, gel-forming agents, tablet excipients and other active compound carriers, it is possible to use, for example, antioxidants, dispersants, emulsifiers, antifoams, flavor corrigents, preservatives, solubilizers, colorants or permeation promoters and complexing agents (e.g. cyclodextrins).
Pharmacology

Model
Late Inflammatory Airway Reaction in the Ovalbumin-sensitized/-challenged Brown-Norway Rat
Anti-inflammatory activity of Roflumilast, Pumafentrine (BYK-33043), and Salmeterol was determined in ovalbumin (OVA)-sensitized and OVA-challenged Brown Norway rats. Sensitization was done by simultaneous injection of Bordetella pertussis suspension i.p. and OVA/AHG suspension s.c. on day 1, 14 and 21. 28 days after start of sensitization, conscious Brown-Norway rats were challenged by inhalation of the aerosolized OVA solution for 1 h (~20 ml/h). Non-challenged, only sensitized animals were used as baseline control. The drugs (thoroughly mixed with lactose) or the placebo control (lactose) were administered intratracheally (i.t.) as dry powders 1 h before OVA-challenge. 48h later, OVA-challenged or non-challenged animals were anaesthetized and bronchoalveolar lavage (BAL) was performed using 3x4 ml BAL buffer per animal. The number of total cells and eosinophils in the BAL fluid, and the concentration of protein in the cell-free BAL fluid were determined. Drug-induced relative changes were calculated and statistically analyzed by the Jonckheere Terpstra test.

Summary
The PDE inhibitors Roflumilast (PDE4 inhibitor) and Pumafentrine (PDE3>4 inhibitor) administered at doses of 0.3 µmol/kg and 3 µmol/kg i.t., respectively, did not show any significant effects on cell infiltration and protein accumulation. The negative values obtained (trend: amplification of inflammation) fall into the range of biological variability of the model and therefore, no significance must be attached to these data.
In contrast, the long-acting β2-adrenergic receptor agonist Salmeterol given at a dose of 3 μmol/kg i.t exhibited inhibitory effects on total cell and eosinophil influx into alveolar space and protein levels in BAL fluid. However, the data failed to reach significance.

Co-administration of the PDE inhibitor Roflumilast or Pumafentrine with Salmeterol resulted in synergistic effects compared to administration of every compound alone, i.e. both PDE inhibitors combined with the β2 agonist displayed a significant inhibition of eosinophilia and reduction of protein concentration in the BAL fluid. The combination of the PDE3/4 inhibitor Pumafentrine and Salmeterol was more efficacious on all parameters measured (difference was not significant), and additionally, showed a significant effect on inhibition of total cell influx into the alveolar space.
Patent claims

1. A medicament comprising a PDE inhibitor, which is to be administered orally, from the PDE4 or PDE3/4 inhibitors group combined with a β₂ adrenoceptor agonist in fixed or free combination.

2. The medicament as claimed in claim 1, which is a fixed oral combination.

3. The medicament as claimed in claim 1 or 2 for use in the therapeutic treatment of respiratory tract disorders.

4. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is a compound selected from the group consisting of arofylline, cipamfylline, D-4418, filaminast, ibudilast, lapraffylline, ORG-20241, piclamilast, rolipram, SB-207499, tibenelast and V-11294A or a salt thereof.

5. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is roflumilast, its salt and/or its N-oxide.

6. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is BYK-33043, its salt and/or its N-oxide.

7. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is roflumilast, its salt and/or its N-oxide and the β₂ adrenoceptor agonist is salmeterol or a salt thereof.

8. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is BYK-33043, its salt and/or its N-oxide and the β₂ adrenoceptor agonist is salmeterol or a salt thereof.

9. The medicament as claimed in claim 1 or 2, wherein the β₂ adrenoceptor agonist is clenbuterol, orciprenaline, salbutamol, terbutaline, tulobuterol, bambuterol or reproterol or a salt thereof.

10. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is arofylline, cipamfylline, D-4418, filaminast, ibudilast, lapraffylline, ORG-20241, piclamilast, rolipram, SB-207499, tibenelast or V-11294A or a salt thereof, and the β₂ adrenoceptor agonist is clenbuterol, orciprenaline, salbutamol, terbutaline, tulobuterol, bambuterol or reproterol or a salt thereof.
11. The medicament as claimed in claim 1 or 2, wherein the PDE inhibitor is roflumilast or BYK-33043, their salts and/or their N-oxides and the \( \beta_2 \) adrenoceptor agonist is clenbuterol, orciprenaline, salbutamol, terbutaline, tulobuterol, bambuterol or reproterol or a salt thereof.

12. The use of a PDE inhibitor, which is to be administered orally, from the PDE4- or PDE3/4 inhibitors group in the combined use with a \( \beta_2 \) adrenoceptor agonist in the therapeutic treatment of respiratory tract disorders.
