AXL INHIBITORS FOR USE IN COMBINATION THERAPY FOR PREVENTING,
TREATING OR MANAGING METASTATIC CANCER

FIELD OF THE INVENTION

This invention is directed to combination therapies for the prevention, treatment, or
5 management of metastatic cancer in a patient having cancer or a patient having other
proliferative diseases or disorders.

BACKGROUND OF THE INVENTION

All of the protein kinases that have been identified to date in the human genome
share a highly conserved catalytic domain of around 300 aa. This domain folds into a bi-
10 lobed structure in which resides ATP-binding and catalytic sites. The complexity of
protein kinase regulation allows many potential mechanisms of inhibition including
competition with activating ligands, modulation of positive and negative regulators,
interference with protein dimerization, and allosteric or competitive inhibition at the
substrate or ATP binding sites.

15 Axl (also known as UFO, ARK, and Tyro7; nucleotide accession numbers
NM_021913 and NM_001699; protein accession numbers NP_068713 and NP_001690) is
a receptor protein tyrosine kinase (RTK) that comprises a C-terminal extracellular
ligand-binding domain and N-terminal cytoplasmic region containing the catalytic domain.
The extracellular domain of Axl has a unique structure that juxtaposes immunoglobulin and
20 fibronectin Type III repeats and is reminiscent of the structure of neural cell adhesion
molecules. Axl and its two close relatives, Mer /Nyk and Sky (Tyro3 / Rse / Dtk),
collectively known as the Tyro3 family of RTK's, all bind and are stimulated to varying
degrees by the same ligand, Gas6 (growth arrest specific-6), a ~76kDa secreted protein
with significant homology to the coagulation cascade regulator, Protein S. In addition to
25 binding to ligands, the Axl extracellular domain has been shown to undergo homophilic
interactions that mediate cell aggregation, suggesting that one important function of Axl
may be to mediate cell-cell adhesion.

Axl is predominantly expressed in the vasculature in both endothelial cells (EC's)
and vascular smooth muscle cells (VSMC's) and in cells of the myeloid lineage and is also
30 detected in breast epithelial cells, chondrocytes, Sertoli cells and neurons. Several

functions including protection from apoptosis induced by serum starvation, TNF- α or the viral protein E1A, as well as migration and cell differentiation have been ascribed to Axl signaling in cell culture. However, Axl-/- mice exhibit no overt developmental phenotype and the physiological function of Axl *in vivo* is not clearly established in the literature.

5 Angiogenesis (the formation of new blood vessels) is limited to functions such as wound healing and the female reproductive cycle in healthy adults. This physiological process has been co-opted by tumors, thus securing an adequate blood supply that feeds tumor growth and facilitates metastasis. Deregulated angiogenesis also a feature of many other diseases (for example, psoriasis, rheumatoid arthritis, endometriosis and blindness 10 due to age-related macular degeneration (AMD), retinopathy of prematurity and diabetes) and often contributes to the progression or pathology of the condition.

15 The overexpression of Axl and/or its ligand has also been reported in a wide variety of solid tumor types including, but not limited to, breast, renal, endometrial, ovarian, thyroid, non-small cell lung carcinoma, and uveal melanoma as well as in myeloid leukemia's. Furthermore, it possesses transforming activity in NIH3T3 and 32D cells. It has been demonstrated that loss of Axl expression in tumor cells blocks the growth of solid human neoplasms in an *in vivo* MDA-MB-231 breast carcinoma xenograft model. Taken together, these data suggest Axl signaling can independently regulate EC angiogenesis and tumor growth and thus represents a novel target class for tumor therapeutic development.

20 The expression of Axl and Gas6 proteins is upregulated in a variety of other disease states including endometriosis, vascular injury and kidney disease and Axl signaling is functionally implicated in the latter two indications. Axl - Gas6 signaling amplifies platelet responses and is implicated in thrombus formation. Axl may thus potentially represent a therapeutic target for a number of diverse pathological conditions including solid tumors, 25 including, but not limited to, breast, renal, endometrial, ovarian, thyroid, non-small cell lung carcinoma and uveal melanoma; liquid tumors, including but not limited to, leukemias (particularly myeloid leukemias) and lymphomas; endometriosis, vascular disease / injury (including but not limited to restenosis, atherosclerosis and thrombosis), psoriasis; visual impairment due to macular degeneration; diabetic retinopathy and retinopathy of prematurity; kidney disease (including but not limited to glomerulonephritis, diabetic nephropathy and renal transplant rejection), rheumatoid arthritis; osteoporosis, osteoarthritis and cataracts.

SUMMARY OF THE INVENTION

15 This invention is directed to combination therapies that provide better therapeutic profiles than current single agent therapies or other combination therapies utilizing Axl inhibitors. Encompassed by the invention are combination therapies, of one or more AXL inhibitors with one or more chemotherapeutic agents, that have at least an additive potency or at least an additive therapeutic effect. Preferably, the invention is directed to 20 combination therapies where the therapeutic efficacy is greater than additive, *e.g.*, a synergy exists between an AXL inhibitor and one or more chemotherapeutic agents when co-administered. Preferably, such combination therapies also reduce or avoid unwanted or adverse effects. In certain embodiments, the combination therapies of the invention provide an improved overall therapy relative to the administration of the therapeutic agents 25 by themselves. In certain embodiments, doses of existing chemotherapeutic agents can be reduced or administered less frequently in using the combination therapies of the invention, thereby increasing patient compliance, improving therapy and reducing unwanted or adverse effects.

Accordingly, this invention is directed to combination therapies designed to 30 prevent, treat or manage cancer, preferably metastatic cancer, in a patient, wherein the combination therapies comprise administering an Axl inhibitor to the patient in need thereof in combination with one or more chemotherapeutic agents. In particular, this

invention provides methods of preventing, treating or managing cancer, preferably metastatic cancer, in a patient comprising administering to the patient in need thereof a therapeutically or prophylactically effective amount of an Axl inhibitor in combination with the administration of a therapeutically or prophylactically effective amount of one or 5 more chemotherapeutic agents.

25 "Patient" means a mammal who has been diagnosed as having cancer and/or metastatic cancer, or who is predisposed to having metastatic cancer due to having cancer.

"Mammal" means any vertebrate of the class *Mammalia*. Humans and domestic animals, such as cats, dogs, swine, cattle, sheep, goats, horses, rabbits, and the like are a particular focus. Preferably, for purposes of this invention, the mammal is a primate (e.g., 30 monkey, baboon, chimpanzee and human), and more preferably, the mammal is a human.

"Optional" or "optionally" means that the subsequently described event or circumstances may or may not occur, and that the description includes instances where said event or circumstance occurs and instances in which it does not. For example, "optionally

substituted aryl" means that the aryl radical may or may not be substituted and that the description includes both substituted aryl radicals and aryl radicals having no substitution. However, when a first functional group is described as "optionally substituted," and in turn, substituents on the first functional group are also "optionally substituted" and so forth, for 5 the purposes of this invention, such iterations for a radical to be optionally substituted are limited to three. Thus, groups described as substituents on the third iteration are not themselves optionally substituted. For example, if an R group herein is defined as being "optionally substituted aryl" (the first iteration) and the optional substituents for the "optionally substituted aryl" include "optionally substituted heteroaryl" (the second 10 iteration) and the optional substituents for the "optionally substituted heteroaryl" include "optionally substituted cycloalkyl" (the third iteration), the optional substituents on the cycloalkyl can not be optionally substituted.

Further, a prophylactically effective amount with respect to with respect to an Axl inhibitor of the combination therapies of the invention means that 15 amount of an Axl inhibitor in combination with other chemotherapeutic agents, that provides a prophylactic benefit in the prevention of metastatic cancer. The compounds of formula (I), or their pharmaceutically acceptable salts, may contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute

stereochemistry, as (R)- or (S)- or, as (D)- or (L)- for amino acids. The present invention is meant to include all such possible isomers, as well as their racemic and optically pure forms. Optically active (+) and (-), (R)- and (S)-, or (D)- and (L)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques, such as 5 HPLC using a chiral column. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include both E and Z geometric isomers. Likewise, all tautomeric forms are also intended to be included.

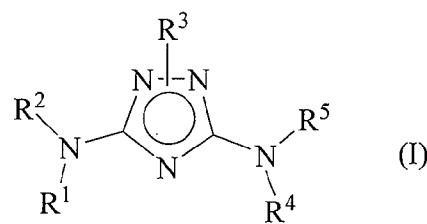

A "stereoisomer" refers to a compound made up of the same atoms bonded by the 10 same bonds but having different three-dimensional structures, which are not interchangeable. The present invention contemplates various stereoisomers and mixtures thereof and includes "enantiomers", which refers to two stereoisomers whose molecules are nonsuperimposeable mirror images of one another.

A "tautomer" refers to a proton shift from one atom of a molecule to another atom 15 of the same molecule. The present invention includes tautomers of any said compounds.

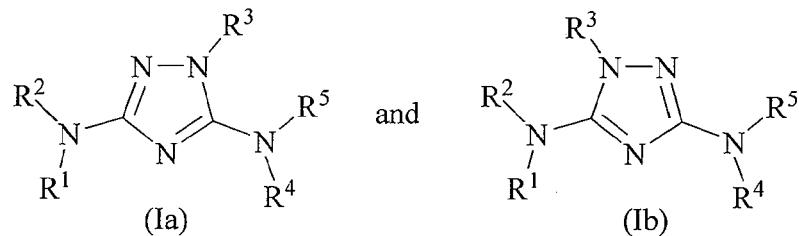

"Atropisomers" are stereoisomers resulting from hindered rotation about single bonds where the barrier to rotation is high enough to allow for the isolation of the conformers (Eliel, E. L.; Wilen, S. H. *Stereochemistry of Organic Compounds*; Wiley & Sons: New York, 1994; Chapter 14). Atropisomerism is significant because it introduces 20 an element of chirality in the absence of stereogenic atoms. The invention is meant to encompass atropisomers, for example in cases of limited rotation around the single bonds emanating from the core triazole structure, atropisomers are also possible and are also specifically included in the compounds of the invention.

The chemical naming protocol and structure diagrams used herein are a modified 25 form of the I.U.P.A.C. nomenclature system wherein the compounds of formula (I) are named herein as derivatives of the central core structure, *i.e.*, the triazole structure. For complex chemical names employed herein, a substituent group is named before the group to which it attaches. For example, cyclopropylethyl comprises an ethyl backbone with cyclopropyl substituent. In chemical structure diagrams, all bonds are identified, except for 30 some carbon atoms, which are assumed to be bonded to sufficient hydrogen atoms to complete the valency.

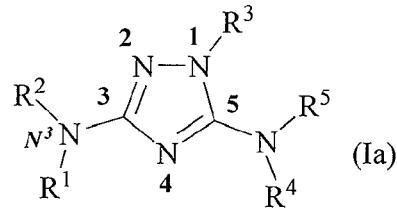

For purposes of this invention, the depiction of the bond attaching the R³ substituent to the parent triazole moiety in formula (I), as shown below:

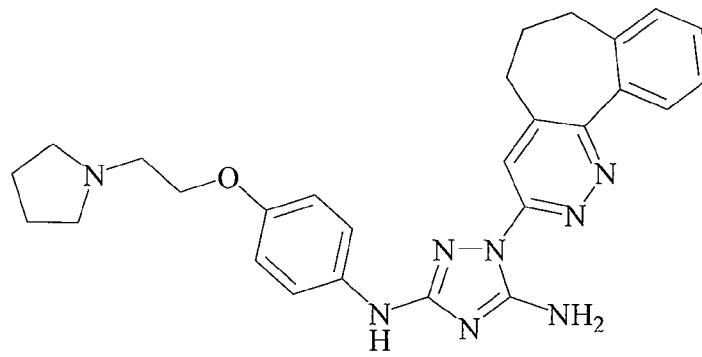

is intended to include only the two regioisomers shown below, *i.e.*, compounds of formula (Ia) and (Ib):

5 The numbering system of the ring atoms in compounds of formula (Ia) is shown below:

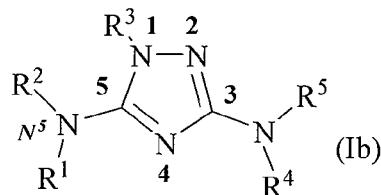

For example, a compound of formula (Ia) wherein R¹, R⁴ and R⁵ are each hydrogen, R² is 4-(2-(pyrrolidin-1-yl)ethoxy)phenyl and R³ is 6,7-dihydro-5H-benzo[6,7]cyclohepta[1,2-c]pyridazin-3-yl; *i.e.*, a compound of the following formula:

is named herein as 1-(6,7-dihydro-5H-benzo[6,7]cyclohepta[1,2-c]pyridazin-3-yl)-N³-(4-(2-(pyrrolidin-1-yl)ethoxy)phenyl)-1H-1,2,4-triazole-3,5-diamine.

The numbering system of the ring atoms in compounds of formula (Ib) is shown

below:

Compounds of formula (Ib) are similarly named herein.

15 Specific embodiments of the invention are described in more detail in the following sections.

UTILITY AND TESTING OF THE COMBINATION THERAPIES OF THE INVENTION

In the combination therapies of the invention, an Axl inhibitor, preferably a 20 compound of formula (I), as set forth in the Summary of the Invention, is used as an active ingredient in combination with one or more chemotherapeutic agents in the prevention, treatment or management of one or more cancers, preferably metastatic cancers.

Preferably, such combination therapies of the present invention will exert greater than 25 additive effects, *i.e.*, synergistic effects, as the mechanisms of action employed for the Axl inhibitor and the one or more chemotherapeutic agents may be different and each may act independently of one another. Accordingly, as used herein "combination therapy" refers to the administration of an Axl inhibitor, preferably a compound of formula (I) as set forth above in the Summary of the Invention, in combination with the administration of one or more chemotherapeutic agents for the prevention, treatment and management of one or more cancers, preferably metastatic cancer. Unless the context makes clear otherwise, 30 "combination therapy" may include simultaneous or sequential administration of the Axl inhibitor and the one or more chemotherapeutic agents, in any order, such as administering the Axl inhibitor at the same time as the administration of the one or more

chemotherapeutic agents, before the administration of the one or more chemotherapeutic agents or after the administration of the one or more chemotherapeutic agents. Unless the context makes clear otherwise, "combination therapy" may include the administration of dosage forms of an Axl inhibitor combined with the dosage forms of one or more chemotherapeutic agents. Unless the context makes clear otherwise, "combination therapy" may include different routes of administration for the Axl inhibitor and for the one or more chemotherapeutic agent. Dosage forms, routes of administration and pharmaceutical compositions include, but are not limited to, those described herein.

The oncogenic receptor tyrosine kinase, Axl, was recently identified, using a retroviral-based functional genetic screening protocol, as a regulator of haptotactic migration, which is a key event in angiogenesis. Inhibition of Axl by RNAi-mediated silencing blocked endothelial cell migration, proliferation and *in vitro* tube formation. These observations, which were disclosed at the American Association Cancer Research General Meeting, April 16-20, 2005, Anaheim, California, and The 7th Annual Symposium on Anti-Angiogenic Agents, February 10-13, 2005, San Diego, California; (*Requirement for The Receptor Tyrosine Kinase Axl in Angiogenesis and Tumor Growth*, Holland, S.J. Powell, M.J., Franci, C., Chan, E., Friera, A.M., Atchison, R., Xu, W., McLaughlin, J., Swift, S.E., Pali, E., Yam, G., Wong, S., Xu, X., Hu, Y., Lasaga, J., Shen, M., Yu, S., Daniel, R., Hitoshi, Y., Bogenberger, J., Nor, J.E., Payan, D.G and Lorens, J.B), were substantiated by an *in vivo* study which demonstrated that stable, shRNAi-mediated Axl knockdown impaired formation of functional human blood vessels in a mouse model of human angiogenesis. These observations were published in a peer reviewed journal (Holland SJ, Powell MJ, Franci C, Chan EW, Friera AM, Atchison RE, McLaughlin J, Swift SE, Pali ES, Yam G, Wong S, Lasaga J, Shen MR, Yu S, Xu W, Hitoshi Y, Bogenberger J, Nor JE, Payan DG, Lorens JB. "Multiple roles for the receptor tyrosine kinase axl in tumor formation", *Cancer Res.* (2005) Vol. 65, pp 9294-303. These observations are also disclosed in U.S. Published Patent Application 2005/0118604 and European Patent Application 1 563 094, the disclosures of which are incorporated in full by reference. Axl signaling, therefore, impacts multiple functions required for neovascularization *in vitro*, and regulates angiogenesis *in vivo*. Regulation of these pro-angiogenic processes required the catalytic activity of Axl. Thus, Axl-mediated angiogenic stimulation would be amenable to modulation by a small molecule inhibitor of Axl catalytic activity.

Accordingly, Axl inhibitors contemplated for use in the combination therapies of the invention are disclosed in U.S. Published Patent Application No. 20070213375, U.S. Published Patent Application No. 20080153815, U.S. Published Patent Application No. 20080188454, U.S. Published Patent Application No. 20080176847, U.S. Published Patent Application No. 20080188455, U.S. Published Patent Application No. 20080182862, U.S. Published Patent Application No. 20080188474, U.S. Published Patent Application No. 20080117789, U.S. Published Patent Application No. 20090111816, PCT Published Patent Application No. WO 2007/0030680, PCT Published Patent Application No. WO 2008/045978, PCT Published Patent Application No. WO 2008/083353, PCT Published Patent Application No. WO 2008/0083357, PCT Published Patent Application No. WO 2008/083367, PCT Published Patent Application No. WO 2008/083354, PCT Published Patent Application No. WO 2008/083356, PCT Published Patent Application No. WO 2008/080134, and PCT Published Patent Application No. WO 2009/054864, the disclosures of which are incorporated in full by reference herein in their entireties. The Axl inhibitors disclosed in PCT Published Patent Application No. WO 2008/083367 are particularly preferred for use in the combination therapies of the invention.

The compounds of formula (I), as set forth above in the Summary of the Invention, are small molecule inhibitors of Axl catalytic activity, and are therefore useful in treating diseases and conditions which are associated with Axl catalytic activity, including those diseases and conditions which are characterized by angiogenesis and/or cell proliferation. In particular, the compounds of formula (I) are useful in treating diseases and conditions which are alleviated by the modulation of Axl activity. Diseases and conditions which are alleviated by the "modulation of Axl activity" includes diseases and conditions which are alleviated by a decrease in Axl activity and diseases and conditions which are alleviated by an increase in Axl activity. Preferably such diseases and conditions are alleviated by a decrease in Axl activity (*i.e.*, inhibition of Axl activity). Diseases and conditions which are alleviated by the modulation of Axl activity include, but are not limited to, solid cancer tumors, including, but not limited to, breast, renal, endometrial, ovarian, thyroid, and non-small cell lung carcinoma, melanoma, prostate carcinoma, sarcoma, gastric cancer and uveal melanoma; liquid tumors, including but not limited to, leukemias (particularly myeloid leukemias) and lymphomas; endometriosis, vascular disease / injury (including but not limited to restenosis, atherosclerosis and thrombosis), psoriasis; visual impairment due to macular degeneration; diabetic retinopathy and retinopathy of prematurity; kidney

disease (including but not limited to glomerulonephritis, diabetic nephropathy and renal transplant rejection), rheumatoid arthritis; osteoarthritis, osteoporosis and cataracts.

In addition to the foregoing, the compounds of formula (I) are useful in treating diseases and conditions which are affected by the following biological processes: Invasion, 5 migration, metastasis, or drug resistance as manifested in cancer; stem cell biology as manifested in cancer; invasion, migration, adhesion, or angiogenesis as manifested in endometriosis; vascular remodeling as manifested in cardiovascular disease, hypertension or vascular injury; bone homeostasis as manifested in osteoporosis or osteoarthritis; viral infection as manifested, for example, in ebola virus infection; or differentiation as 10 manifested in obesity. The compounds of formula (I) may also be used to modulate inflammatory processes by treating sepsis, acting as vaccine adjuvants, and/or potentiating the immune response in immuno-compromised patients.

In a preferred embodiment, the compounds of formula (I) are useful in preventing, treating and managing cancers, preferably metastatic cancers.

5 These and other chemotherapeutic agents useful in treating cancer are described in the "Commonly Used Antineoplastic Drugs", *The Merck Manuals Online Medical Library For HealthCare Professionals* at www.mercksource.com and *Goodman and Gilman's The Pharmacological Basis of Therapeutics*, 10th Edition, Hardman, J.G. and Limbird, L.E. eds., pg. 1381-1287, McGraw Hill, (1996), the disclosures of which both of which are
10 incorporated by reference herein.

In some embodiments, a compound of formula (I), or a pharmaceutically acceptable salt thereof, can be used in the combination therapies of the invention with a second kinase inhibitor that targets an oncogenic kinase different from Axl. Examples include inhibitors of kinases associated with cell proliferative disorders such as, but not limited to the
15 inhibitors of the kinases, Aurora-A, AKT, CDK1/cyclinB, CDK2/cyclinA, CDK3/cyclinE, CDK5/p35, CDK6/cyclinD3, CDK7/cyclinH/MAT1, CHK1, CHK2, EGFR, c-RAF, RAS, cSRC, Yes, Fyn, Lck, Fes, Lyn, Bmx, FGFR3, GSK3 α ., GSK3 β , P13, IGF-1R, MAPK2, MAPKAP-K2, JNK, MEK1, p70S6K, PAK2, PDGFR α , PDGFR β , PDK1, PKA, PKC ϵ , PKC, PKD2, VEGF, PRAK, PRK2, RET, ROCK-II, Rsk1, Rsk2, Rsk3, and SGK.

20 In some embodiments, the second kinase inhibitor is an inhibitor of Abl kinase. For example, chronic myelogenous leukemia is a myeloid neoplasm characterized by malignant proliferation of leukemic stem cells in the bone marrow. The majority of chronic myelogenous leukemia is associated with a cytogenetic abnormality defined by a reciprocal translocation t(9;22)(q34;q11). This chromosomal aberration results in generation of a
25 BCR/ABL fusion protein with activated kinase activity. Inhibitors of the fusion protein kinase activity are effective in treating chronic myelogenous leukemia although resistant forms may develop upon continued treatment. Use of a compound of formula (I), or a pharmaceutically acceptable salt thereof, in combination of Abl kinase inhibitors may lessen the chances of resistant cells by targeting a cellular process different than that
30 targeted by the kinase inhibitor alone. An exemplary Abl kinase inhibitor is 2-phenylaminopyrimidine, also known as imatinib mesylate and GLEEVEC®. Thus, in some embodiments, a compound of formula (I), or a pharmaceutically acceptable salt thereof, can be used in combination with the Abl kinase inhibitor 2-phenylaminopyrimidine and its

derivatives. In other embodiments, the Abl kinase inhibitor may be pyridol[2-3-d]pyrimidine and its derivatives, which was originally identified as inhibitors of Src kinase. In yet further embodiments, the Abl kinase inhibitor is tyrophostins and its derivatives (e.g., adaphostin) which affects the association of the kinase with its substrates. Other Abl kinase inhibitors useful in the combination therapies of the present invention will be apparent to the skilled artisan.

5 In one embodiment of the combination therapies of the invention, the Axl inhibitor utilized therein works by the same mechanism as the one or more chemotherapeutic agents utilized therein. In another embodiment of the combination therapies of the invention, the Axl inhibitor utilized therein works by a different mechanism than the one or more chemotherapeutic agents utilized therein.

10 The combination therapies of the invention are useful in preventing, treating or managing one or more cancers, preferably metastatic cancers. Whether metastases develop from a primary tumor depends on the complex 15 interaction of many tumor cell factors, including the type of primary tumor, the degree of maturity (differentiation) of the primary tumor cells, the location of the primary tumor and how long the primary tumor has been present, as well as other incompletely understood factors.

The treatment of metastatic cancer depends on where the primary tumor is located. 20 When breast cancer spreads to the lungs, for example, it remains a breast cancer and the treatment is determined by the metastatic cancer origin within the breast, not by the fact that it is now in the lung. About 5 percent of the time, metastatic cancer is discovered but the primary tumor cannot be identified. The treatment of these metastatic cancers is dictated by their location rather than their origin. Metastatic cancers are named by the 25 tissue of the original tumor (if known). For example, a breast cancer that has spread to the brain is called metastatic breast cancer to the brain.

Metastases spread in three ways: by local extension from the tumor to the surrounding tissues, through the bloodstream to distant sites or through the lymphatic system to neighboring or distant lymph nodes. Each kind of cancer may have a typical 30 route of spread.

Tissues which are particularly susceptible to metastatic cancer are the brain, liver, bone and lung, although all tissues of the body may be affected. Any cancer may spread to the brain, although the most common to do so are lung and breast cancer. The most

common cancer to metastasize to the liver is colon or other gastrointestinal cancer. The most common cancers to spread to the bones are prostate, lung and breast cancer. Metastases to the lung are common for many types of cancer.

In a preferred embodiment of the invention, the specific property of metastasis is 5 targeted using the combination therapies described herein. In some embodiments, an Axl inhibitor, preferably a compound of formula (I) as set forth above in the Summary of the Invention, in combination with one or more chemotherapeutic agents, can be used to treat metastasis arising from a primary tumor in various tissues of the body, including, but not limited to, primary tumors of the bone, breast, respiratory tract, brain, reproductive organs, 10 digestive tract, urinary tract (*e.g.*, bladder), eye, liver, skin, head, neck, thyroid, parathyroid, and metastatic forms thereof. In one embodiment, the metastasis to be treated by the combination therapies of the invention is lung and/or liver metastasis arising from a primary tumor of the breast.

It is to be understood that the descriptions of proliferative disorders is not limited to the conditions described above, but encompasses other disorders characterized by uncontrolled growth and malignancy. It is further understood that proliferative disorders

include various metastatic forms of the primary tumor and cancer types described herein. The combination therapies of the invention may be tested for effectiveness against these disorders, particularly various metastatic forms of the primary tumor, and a therapeutically effective regimen established. Effectiveness, as further described below, includes

5 reduction or remission of the metastatic tumors, decreases in the rate of cell proliferation, or cytostatic or cytotoxic effect on metastatic cancer cell growth.

The antiproliferative effect of a combination therapy of the invention may be assessed by administering the active ingredients of the combination therapy to a cultured tumor cell line. In the context of an *in vitro* assay, administration of an active ingredient

10 may be simply achieved by contacting the cells in culture with the active ingredient in amounts effective to inhibit cell proliferation. Alternatively, the antiproliferative effect of a combination therapy of the invention may be assessed by administering the active ingredients of the combination therapy to an animal in an approved *in vivo* model for cell proliferation.

15 Examples of tumor cell lines derived from human tumors and available for use in the *in vivo* studies include, but are not limited to, leukemia cell lines (*e.g.*, CCRF-CEM, HL-60(TB), K-562, MOLT-4, RPM1-8226, SR, P388 and P388/ADR); non-small cell lung cancer cell lines (*e.g.*, A549/ATCC, EKVVX, HOP-62, HOP-92, NCI-H226, NCI-H23, NCI-H322M, NCI-H460, NCI-H522 and LXFL 529); small cell lung cancer cell lines

10 **PHARMACEUTICAL COMPOSITIONS, DOSAGES AND ADMINISTRATION OF THE COMBINATION THERAPIES OF THE INVENTION**

15 Pharmaceutical compositions of Axl inhibitors and other chemotherapeutic agents used in the combination therapies of the invention are known or can be prepared according to methods known to one skilled in the art. For example, methods of preparing and formulating pharmaceutical compositions of the Axl inhibitors of formula (I), as set forth above in the Summary of the invention, are disclosed in PCT Published Patent Application No. 2008/083367, which is incorporated in full herein in its entirety, as well as methods of administration.

20 In general, the amount of an Axl inhibitor, preferably a compound of formula (I), as set forth in the Summary of the Invention, or the amount of one or more chemotherapeutic agents which will be effective in the treatment, prevention or management of metastatic cancer in the combination therapies of the invention can be determined by standard research techniques. For example, the dosage amount of each active ingredient in a combination therapy of the invention which will be effective in the treatment, prevention or 25 management of metastatic cancer can be determined by administering the combination therapy to an animal model such as the ones described herein or by one known to one skilled in the art. In addition, *in vivo* assays may optionally be employed to help identify optimal dosage ranges of each active ingredient in a combination therapy of the invention.

30 Selection of the preferred prophylactically or therapeutically effective dose of an active ingredient used in the combination therapies of the invention can be determined (e.g., by clinical trials) by a skilled artisan based upon the consideration of several factors, including the activity of the specific compound employed; the metabolic stability and

length of action of the compound; the age, body weight, general health, sex, and diet of the patient; the mode and time of administration; the rate of excretion; the drug combination; and the severity of the metastatic cancer.

5 The precise dose of either the Axl inhibitor or the one or more chemotherapeutic agents used in the combination therapies of the invention will also depend on the route of administration and the seriousness of the metastatic cancer and should be decided according to the judgment of the medical practitioner and each patient's circumstances. Effective doses may be extrapolated from dose-response curves derived from in vitro or animal model test systems.

10 For example, a therapeutically effective daily dose for an Axl inhibitor, *i.e.*, a compound of formula (I), as set forth above in the Summary of the Invention, is (for a 70 kg mammal) from about 0.001 mg/kg (*i.e.*, 0.07 mg) to about 100 mg/kg (*i.e.*, 7.0 gm); preferably a therapeutically effective dose is (for a 70 kg mammal) from about 0.01 mg/kg (*i.e.*, 0.7 mg) to about 50 mg/kg (*i.e.*, 3.5 gm); more preferably a therapeutically effective dose is (for a 70 kg mammal) from about 1 mg/kg (*i.e.*, 70 mg) to about 25 mg/kg (*i.e.*, 1.75 gm).

15 Dosages, routes of administration and recommended usage of the chemotherapeutic agents used in the combination therapies of the invention are known in the art and often described in such literature as the *Physician's Desk Reference* (current edition). In addition, typical doses of certain known chemotherapeutic agents are provided in U.S. Patent 7,351,729, the relevant section of which is incorporated in full by reference herein.

20 Preferably, the invention provides for any method of administering lower doses of the one or more chemotherapeutic agents used in the combination therapies of the invention than previously known to be effective for the prevention, treatment and management of metastatic cancer. Even more preferably, lower doses of the one or more chemotherapeutic agents are administered in the combination therapies of the invention with lower doses of the Axl inhibitor.

25 In the combination therapies of the invention, an Axl inhibitor is administered simultaneously with, prior to, or after administration of one or more other chemotherapeutic agents, as described herein, by the same route of administration or by different routes. Such combination therapy includes administration of a single pharmaceutical dosage formulation which contains an Axl inhibitor and one or more additional chemotherapeutic agents, as well as administration of the Axl inhibitor and each

chemotherapeutic agent in its own separate pharmaceutical dosage formulation. For example, the Axl inhibitor and the other one or more chemotherapeutic agents can be administered to the patient together in a single oral dosage composition such as a tablet or capsule, or each agent can be administered in separate oral dosage formulations. Where 5 separate dosage formulations are used, the Axl inhibitor and the one or more chemotherapeutic agents can be administered to the patient at essentially the same time, *i.e.*, concurrently, or at separately staggered times, *i.e.*, sequentially. All such combinations of administration are encompassed by the combination therapies of the invention.

In certain embodiments of the combination therapies of the invention, the Axl 10 inhibitor is administered to a patient, preferably a human, concurrently with one or more chemotherapeutic agents useful for the treatment of cancer. The term "concurrently" is not limited to the administration of the active ingredients (*i.e.*, the Axl inhibitor and the one or more chemotherapeutic agents) at exactly the same time, but rather it is meant that the Axl inhibitor and the other chemotherapeutic agent are administered to a patient in a sequence 15 and within a time interval such that the Axl inhibitor can act together with the other chemotherapeutic agent to provide an increased benefit than if they were administered otherwise. For example, each active ingredient of the combination therapies of the invention may be administered at the same time or sequentially in any order at different points in time; however, if not administered at the same time, they should be administered 20 sufficiently close in time so as to provide the desired therapeutic or prophylactic effect. Each active ingredient can be administered separately, in any appropriate form and by any suitable route. In various embodiments, the active ingredients are administered less than 1 hour apart, at about 1 hour apart, at about 1 hour to about 2 hours apart, at about 2 hours to about 3 hours apart, at about 3 hours to about 4 hours apart, at about 4 hours to about 5 25 hours apart, at about 5 hours to about 6 hours apart, at about 6 hours to about 7 hours apart, at about 7 hours to about 8 hours apart, at about 8 hours to about 9 hours apart, at about 9 hours to about 10 hours apart, at about 10 hours to about 11 hours apart, at about 11 hours to about 12 hours apart, no more than 24 hours apart or no more than 48 hours apart. In preferred embodiments, two or more active ingredients are administered within the same 30 patient visit.

In other embodiments, the active ingredients are administered at about 2 to 4 days apart, at about 4 to 6 days apart, at about 1 week part, at about 1 to 2 weeks apart, or more than 2 weeks apart. In preferred embodiments, the active ingredients are administered in a

time frame where both active ingredients are still prophylactically and therapeutically active. One skilled in the art would be able to determine such a time frame by determining the half life of the administered active ingredients.

In certain embodiments, the active ingredients of the invention are cyclically administered to a patient. Cycling therapy involves the administration of a first active ingredient, such as the Axl inhibitor, for a period of time, followed by the administration of the second and/or third active ingredient for a period of time and repeating this sequential administration. Cycling therapy can reduce the development of resistance to one or more of the therapies, avoid or reduce the side effects of one of the therapies, and/or improves the efficacy of the treatment.

In certain embodiments, the active ingredients are administered in a cycle of less than about 3 weeks, about once every two weeks, about once every 10 days or about once every week. One cycle can comprise the administration of an active ingredient by infusion over about 90 minutes every cycle, about 1 hour every cycle, about 45 minutes every cycle. Each cycle can comprise at least 1 week of rest, at least 2 weeks of rest, at least 3 weeks of rest. The number of cycles administered is from about 1 to about 12 cycles, more typically from about 2 to about 10 cycles, and more typically from about 2 to about 8 cycles.

In yet other embodiments, the active ingredients of the combination therapies of the invention are administered in metronomic dosing regimens, either by continuous infusion or frequent administration without extended rest periods. Such metronomic administration can involve dosing at constant intervals without rest periods. Typically the chemotherapeutic agents, in particular cytotoxic agents, are used at lower doses. Such dosing regimens encompass the chronic daily administration of relatively low doses for extended periods of time. In one embodiment, the use of lower doses of the chemotherapeutic agent can minimize toxic side effects and eliminate rest periods. In certain embodiments, the active ingredients are administered by chronic low-dose or continuous infusion ranging from about 24 hours to about 2 days, to about 1 week, to about 2 weeks, to about 3 weeks to about 1 month to about 2 months, to about 3 months, to about 4 months, to about 5 months, to about 6 months. The scheduling of such dose regimens can be optimized by the skilled oncologist.

In other embodiments, the active ingredients are administered concurrently to a patient such that doses of the chemotherapeutic agent are administered separately yet within a time interval such that the Axl inhibitor can work together with the

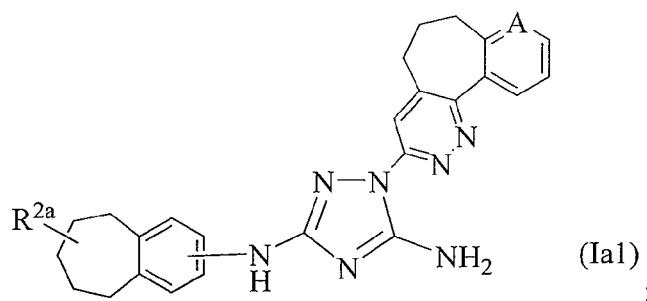

chemotherapeutic agent. For example, the chemotherapeutic agent may be administered one time per week and the Axl inhibitor may be administered every day. In other words, the dosing regimens for the active ingredients are carried out concurrently even if the active ingredients are not administered simultaneously or within the same patient visit.

5 In a preferred embodiment, the Axl inhibitor is administered every day to the patient and the one or more chemotherapeutic agent is administered once a week.

10 It is understood that one of ordinary skill in the art would be able to make the compounds of formula (Ia1) by methods similar to the methods described herein or by methods known to one of ordinary skill in the art. It is also understood that one of ordinary skill in the art would be able to make in a similar manner as described below other compounds of formula (Ia1) and the compounds of formula (Ib1), as set forth above in the 15 Embodiments section, not specifically illustrated below by using the appropriate starting components and modifying the parameters of the synthesis as needed.

It is also understood that in the following Reaction Schemes and throughout this description, combinations of substituents and/or variables of the depicted formulae are permissible only if such contributions result in stable compounds.

20 It will also be appreciated by those skilled in the art that in the processes described below the functional groups of intermediate compounds may need to be protected by suitable protecting groups. Such functional groups include hydroxy, amino, mercapto and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl or diarylalkylsilyl (for example, *t*-butyldimethylsilyl, *t*-butyldiphenylsilyl or trimethylsilyl), 25 tetrahydropyranyl, benzyl, and the like. Suitable protecting groups for amino, amidino and guanidino include benzyl, *t*-butoxycarbonyl, benzyloxycarbonyl, and the like. Suitable protecting groups for mercapto include -C(O)-R" (where R" is alkyl, aryl or arylalkyl), *p*-methoxybenzyl, trityl and the like. Suitable protecting groups for carboxylic acids include alkyl, aryl or arylalkyl esters.

30 Protecting groups may be added or removed in accordance with standard techniques, which are known to one of ordinary skill in the art and as described herein.

The use of protecting groups is described in detail in Greene, T.W. and P.G.M. Wuts, *Greene's Protective Groups in Organic Synthesis* (1999), 3rd Ed., Wiley. As one of

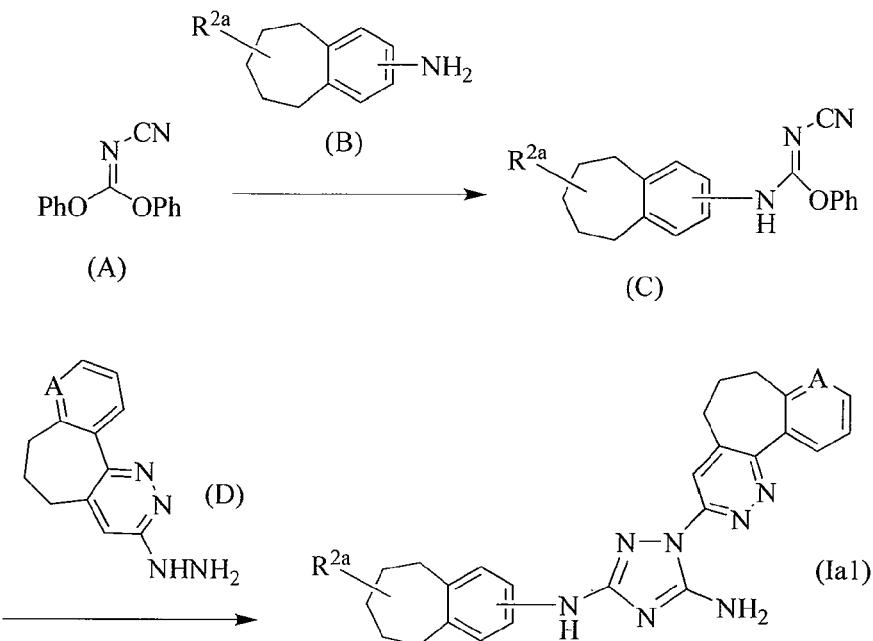

skill in the art would appreciate, the protecting group may also be a polymer resin such as, but not limited to, a Wang resin, Rink resin or a 2-chlorotriyl-chloride resin.

It will also be appreciated by those skilled in the art, although such protected derivatives of compounds of this invention may not possess pharmacological activity as such, they may be administered to a mammal and thereafter metabolized in the body to form compounds of the invention which are pharmacologically active. Such derivatives may therefore be described as "prodrugs".

In general, starting components may be obtained from sources such as Sigma Aldrich, Lancaster Synthesis, Inc., Maybridge, Matrix Scientific, TCI, and Fluorochem USA, etc. or synthesized according to sources known to those skilled in the art (see, for example, Advanced Organic Chemistry: Reactions, Mechanisms, and Structure, 5th edition (Wiley, December 2000)) or prepared as described in this invention. ^1H NMR spectra were recorded in CDCl_3 , $\text{DMSO-}d_6$, CD_3OD , Acetone- d_6 with trimethylsilane (TMS) as internal reference using Gemini 300 MHz instrument. Reagents and solvents were purchased from commercial sources and used without further purification. Flash column chromatography was conducted using silica gel (230-400 mesh) under a positive pressure of nitrogen. Waters LCMS instruments were used for recording LCMS spectra for purity and mass determinations. Deionized water was used to dilute the reactions and wash the products. Brine used was prepared by dissolving sodium chloride into deionized water to saturation point.

Compounds of formula (Ia1), as described above, are generally prepared as illustrated below in Reaction Scheme 1 where A and R^{2a} are as described above for the compounds of formula (Ia1) and Ph is a phenyl group:

REACTION SCHEME 1

Compounds of formula (A), formula (B) and formula (D) are commercially available or can be prepared by methods known to one skilled in the art or by methods disclosed herein.

In general, compounds of formula (Ia1) are prepared, as set forth by Reaction Scheme 1, by first treating diphenyl cyanocarbonimidate (A) (where the phenyl groups therein may be replaced with other suitable groups or suitably substituted groups known to one skilled in the art) (1.1 equiv) with an equivalent amount of an aniline of formula (B) in an polar solvent, including, but not limited to, isopropyl alcohol, at ambient temperatures overnight. The diarylisourea product of formula (C) generally precipitates and isolation can be accomplished via filtration, washing with an appropriate solvent, and drying. Hydrazine hydrate of formula (D) (2 equivalents) is added to a slurry of the compound of formula (C) in an alcohol or other appropriate solvent. Generally, the ring formation reaction occurs at ambient temperature and the product triazole of formula (Ia1) can be isolated by standard isolation techniques.

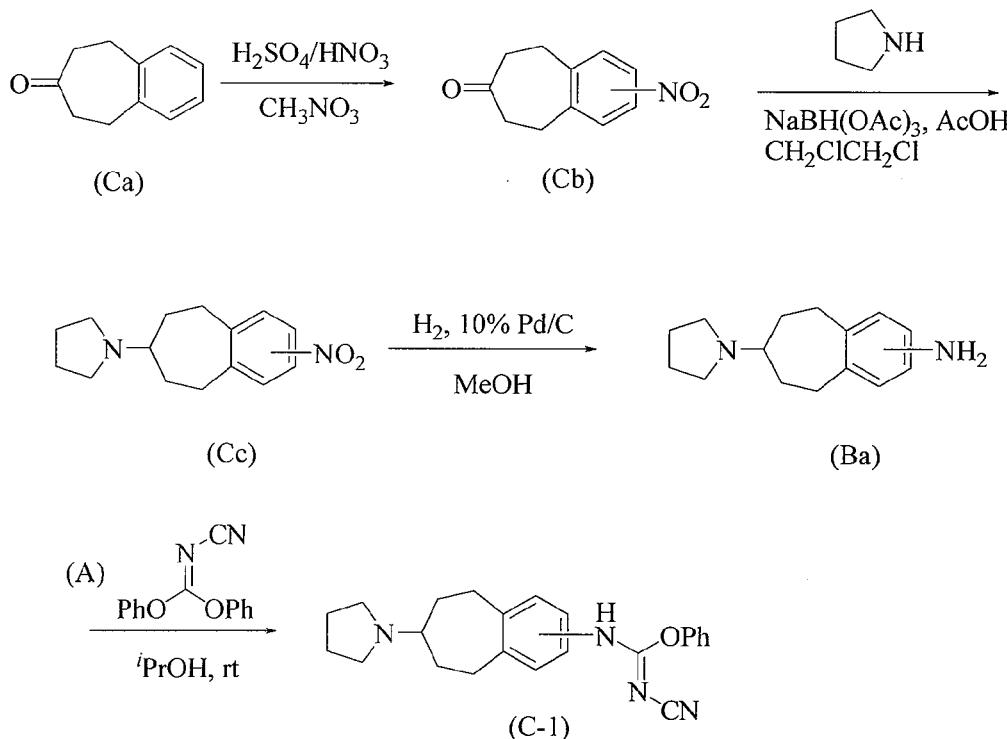

Compounds of formula (Ib1), as set forth above in the Embodiments section, can be prepared using the synthetic route outlined in Reaction Scheme 1 in varying amounts depending on the steric and electronic nature of the starting materials as well as the particular reaction conditions employed. In some instances, compounds of formula (Ib1) are isolated as minor isomers along with compounds of formula (Ia1) as major isomers,

e.g., during column chromatography as described herein.

Compounds of formula (C-1) are compounds of formula (C), as set forth above in Reaction Scheme 1, where R^{2a} is pyrrolidin-1-yl. They can be prepared according to the method described below in relation to Reaction Scheme 2:

5

REACTION SCHEME 2

Compounds of formula (Ca) and formula (A) are commercially available or can be prepared according to methods described herein or known to one skilled in the art.

Compounds of formula (Ba) are compounds of formula (B), as set forth above in Reaction Scheme 1.

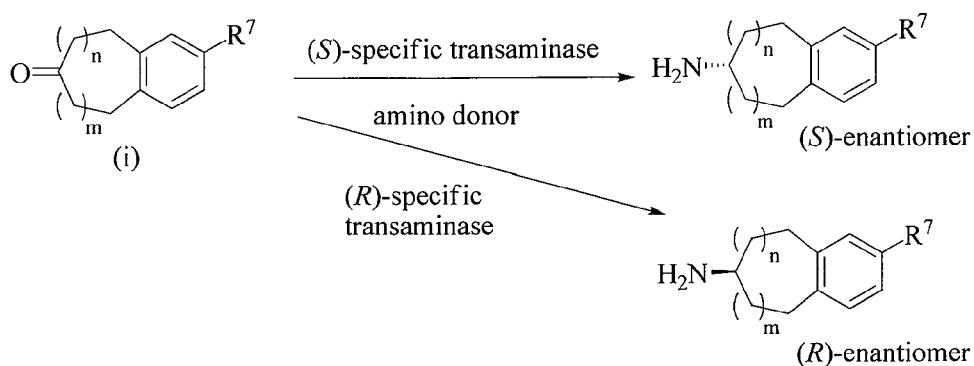

In general, compounds of formula (C-1) are prepared, for example, as set forth above in Reaction Scheme 2, by nitration of the benzo[7]annulene of formula (Ca) to form the nitro compound of formula (Cb). Reductive amination of the keto group in the ketone of formula (Cb) yields the pyrrolidine-substituted compound of formula (Cc). Reduction of the nitro group of the pyrrolidine-substituted compound of formula (Cc), for example, by catalytic hydrogenation, gives the aniline of formula (Ba). Reaction of the aniline of formula (Ba) with diphenyl cyanocarbonimidate of formula (A) yields the compound of formula (C-1). Compounds of formula (C-1) are enantiomeric. The enantiomers of

compound (C-1), and similar compounds of the invention, can be isolated, for example, by chiral phase HPLC.

5 Stereoselective amination of certain cyclic ketones, such as the compounds of formula (Cb) as set forth above, can be very challenging or impossible. Accordingly, the following describes one method of making compounds of formula (Ia1) and (Ib1) using transaminases to produce enantiomerically pure primary amines from cyclic ketones, particularly from cyclic ketones fused to a substituted aromatic ring.

10 Transaminases (also known as amino transferases) are enzymes that catalyze a transamination reaction between an amino-donor molecule (such as an amine or amino acid) and an amino-acceptor molecule (such as a ketone or an α -keto acid). Specifically, enzymatic transamination involves removing the amino group from the amino-donor molecule (leaving behind a carbonyl group) and transferring the amino group to the amino-acceptor molecule (or α -keto acid) by converting the ketone moiety therein to an amine (or an amino acid). A description of transaminases and their use in stereo-selective synthesis 15 can be found in "Transminations. Enzyme Catalysis in Organic Synthesis (2nd Edition) (2002)", by J. David Rozzell and Andreas S. Bommarius, pp. 873-893, which is incorporated in full by reference herein.

20 Transaminases are particularly suitable for the enzymatic synthesis of chiral amines from the corresponding ketone precursors. Commercially available transaminases can be used to achieve a chiral enzymatic amination of a desired starting material in the preparation of the compounds of the invention. In particular, a ketone of the following formula (i) where n and m are the same and are 0, 1 or 2 and R is nitro, halo or $-C(O)OR^{12a}$ (where R^{12a} is as described above for the compounds of formula (Ia1)) can be converted under suitable conditions to the corresponding (S)-enantiomer and (R)-enantiomer wherein 25 the carbon to which the amino group is attached is either in the (S) or the (R) configuration, respectively, by utilizing a (S)-specific transaminase and an amino donor molecule, such as L-alanine, or a (R)-specific transaminase and an amino donor molecule, such as L-alanine, as shown below:

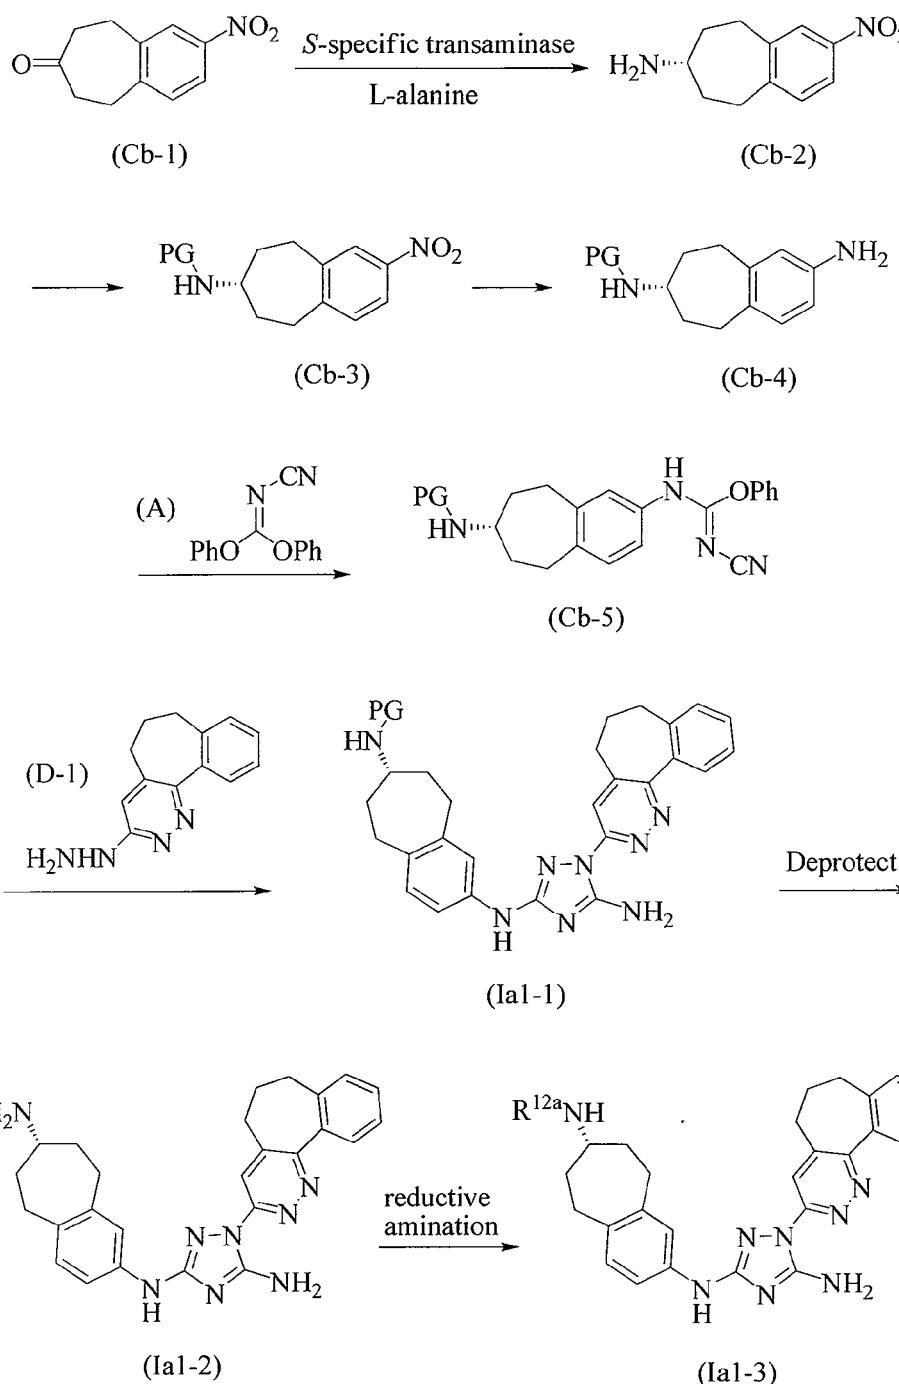

One of ordinary skill in the art would appreciate that the amino group on the (S)-enantiomer and the (R)-enantiomer can be further functionalized by standard procedures known to one skilled in the art. For example, treatment of the above (S)-5 enantiomer with 1,4-dibromobutane under the appropriate alkylation conditions will result in the amino group being converted to a 1-pyrrolidinyl group without racemization of the chiral center. Alternatively, treatment of the above (S)-enantiomer with an appropriate acylating agent will result in the amino group being acylated accordingly, and so forth.

Utilizing the appropriate transaminase to convert the cyclic ketone of formula (i) 10 into the appropriate enantiomer, the appropriate enantiomer can be isolated in greater than 80% ee and preferably greater than 90% ee.

The following Reaction 3, where the compound of formula (Cb-1) is a compound of formula (i) as described above and PG represents a nitrogen protecting group, illustrates a method of preparing a chiral compound of formula (Ia1) utilizing a transaminase as 15 described above:

REACTION SCHEME 3

Compounds of formula (Cb-1) are commercially available, or can be prepared by methods known to one skilled in the art. Compounds of formula (D-1) can be prepared according to methods known to one skilled in the art or by methods disclosed herein. The (S)-specific transaminase is commercially available from Codexis. Preferably the (S)-specific transaminase is ATA-103 from Codexis.

In general, compounds of formula (Ia1-1) are prepared by the method disclosed above in Reaction Scheme 3 by first converting the ketone of formula (Cb-1) into the chiral compound of formula (Cb-2) wherein the amino group from an amino donor molecule, preferably L-alanine, is transferred to the ketone of formula (Cb-1) through an enzymatic 5 transamination reaction under suitable conditions. In particular, the ketone of formula (Cb-1) is treated with a excess molar amount of an amino donor molecule in the the presence of a catalytic amount of a transaminase, preferably a (S)-specific transaminase, and a stoichiometric or excess stoichiometric amount of a pyruvate reductase mixture that reduces (deactivates) the 2-keto acid side product, thereby driving the reaction into the 10 desired direction. Preferably the pyruvate reductase mixture is PRM-102 from Codexix. The reaction is conducted at ambient temperature, at a pH of between about 7.5 and about 8.0, and for a period of time of between about 24 hours and about 6 days, preferably for about 4 days. The chiral compound of formula (Cb-2) is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

15 Alternatively, the transamination reaction can be driven to completion by coupling the reaction to a second reaction that consumes the 2-keto acid by-product in an essentially irreversible step, as described in more detail in "Transminations. Enzyme Catalysis in Organic Synthesis (2nd Edition) (2002)", by J. David Rozzell and Andreas S. Bommarius, pp. 873-893.

20 The amino group of the chiral compound of formula (Cb-2) is then protected by standard nitrogen protecting procedures to yield the compound of formula (Cb-3), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art. The compound of formula (Cb-3) is then treated to standard reducing conditions, such as treatment with H₂/Pd, to produce the corresponding aniline compound of formula 25 (Cb-4), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art. The compound of formula (Cb-4) is then treated with diphenyl cyanocarbonimidate of formula (A) to produce the compound of formula (Cb-5), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

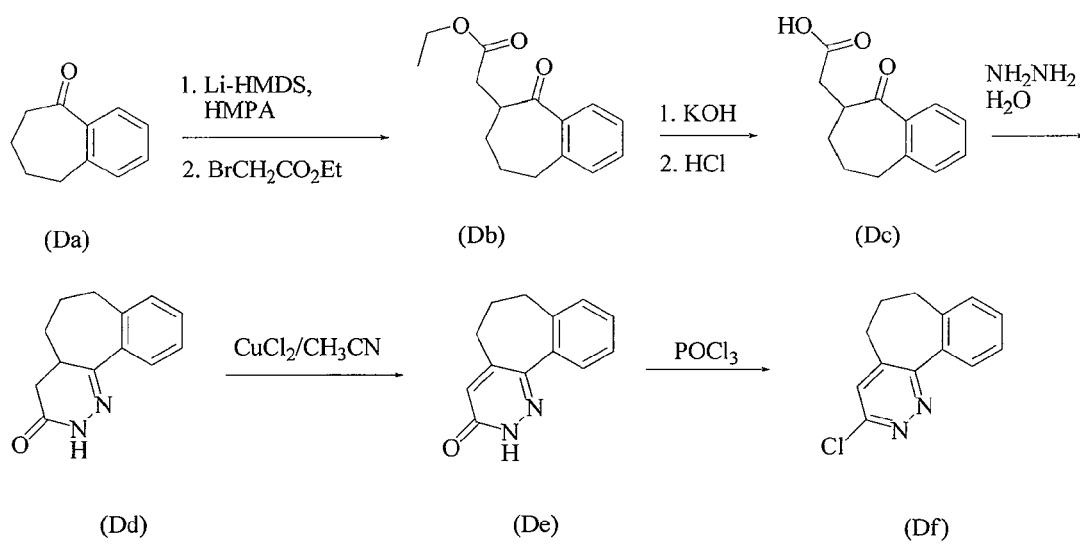

30 The compound of (Cb-5) is then treated with a compound of formula (D-1) in the presence of an aprotic solvent, preferably toluene, at a temperature of between about 80 °C and about 100 °C for a period of time of between about 12 hours and about 36 hours, preferably for about 24 hours, to yield a compound of formula (Ia1-1), which is isolated

from the reaction mixture by standard isolation techniques known to one skilled in the art. Compound of formula (Ia1-1) is a compound of formula (Ia1), as set forth above.

The protecting group on the compound of formula (Ia1-1) can be removed under standard deprotecting conditions known to one skilled in the art, such as acid hydrolysis, to 5 produce a compound of formula (Ia1-2), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art. The compound of formula (Ia1-2) can be further treated with the appropriate aldehyde or ketone under standard reductive amination conditions to yield a compound of formula (Ia1-3), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

10 Compounds of formula (D-1) utilized in Reaction Scheme 3 above are compounds of formula (D), as shown above in Reaction Scheme 1, where A is =C(H)-. Compounds of formula (D-1) can be prepared according to the method disclosed below in Reaction Scheme 4:

REACTION SCHEME 4

15

Compounds of formula (Da) are commercially available or can be prepared by methods known to one skilled in the art or by methods disclosed herein.

In general, compounds of formula (D-1) are prepared, as set forth above in Reaction Scheme 3, by first dissolving the compound of formula (Da) (1.0 equiv) in an anhydrous 20 aprotic polar solvent or mixture of such solvents, for example, tetrahydrofuran with hexamethylphosphoramide (HMPA) (1.2 equiv). The resulting solution is stirred at ambient temperature for about 10 minutes and then cooled to a temperature of between

about -10 °C and about 5 °C, preferably at 0 °C. A strong base, lithium bis(trimethylsilyl)amide (Li-HMDS) (1.1 equiv), is then added dropwise to the stirred mixture over a period of time of between about 20 minutes and 40 minutes, preferably over 30 minutes, while maintaining the temperature of the resulting mixture at between about -5 °C and about 5 °C, preferably at 0 °C. Ethyl bromoacetate (2.5 equiv) is then added to the resulting anion of (Da) and the resulting mixture is stirred for additional period of time of between about 5 minutes and 15 minutes, preferably for about about 10 minutes, and then allowed to warm to ambient temperature and stirred at ambient temperature for a period of time of between about 30 minutes and 3 hours, preferably for about 2 hours. The 10 compound of formula (Db) is then isolated from the reaction mixture by standard isolation techniques known to one skilled in the art, such as solvent evaporation and purification by flash column chromatography.

15 The compound of formula (Db) is then treated under basic hydrolysis conditions to form the compound of formula (Dc), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

The compound of formula (Dc) (1.0 equiv) is then treated with hydrazine hydrate (1.25 equiv) in the presence of a polar protic solvent, such as ethanol, to yield the compound of formula (Dd), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

20 A mixture of the compound of formula (Dd) (1.0 equiv) and anhydrous copper(II) chloride (2.0 equiv) is then refluxed in acetonitrile to yield the unsaturated compound of formula (De), which is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

25 A mixture of the compound of formula (De) and phosphoryl chloride, is refluxed for a period of time of between about 1 hour and 3 hours, preferably for about 2 hours to aromatize and chlorinate the ring containing the N-N linkage. After cooling to ambient temperature, the compound of formula (Df) is isolated from the reaction mixture by standard isolation techniques known to one skilled in the art.

30 A mixture of the compound of formula (Df) (1.0 equiv) and anhydrous hydrazine (19.8 equiv) in a protic solvent, such as ethanol, is refluxed for a period time of between about 4 hours and 24 hours, preferably for about 16 hours. After cooling to ambient temperature, water is added to the mixture and the compound of formula (D-1) is then isolated from the reaction mixture by standard isolation techniques known to one skilled in

the art.

All compounds of the invention which exist in free base or acid form can be converted to their pharmaceutically acceptable salts by treatment with the appropriate inorganic or organic base or acid by methods known to one of ordinary skill in the art.

5 Salts of the compounds of the invention can be converted to their free base or acid form by standard techniques known to one skilled in the art.

25 SYNTHETIC PREPARATION 13

Synthesis of Phenyl *N*'-cyano-*N*-(7-(*t*-butoxycarbonylamino)-6,7,8,9-tetrahydro-5*H*-benzo[7]annulene-2-yl)carbamimidate (Cb-5)

Finely ground 2-Nitro-8,9-dihydro-5*H*-benzo[7]annulen-7(6*H*)-one(8.00 g, 39.0 mmol) and L-alanine (34.7 g, 390 mmol) were added to the reaction buffer (1000 mL,

Codexis/BioCatalytics). The mixture was stirred vigorously for about 20 min in order to obtain a uniform suspension (bright-yellow in color). The pyruvate reductase mix (40.0 g, PRM-102, Codexis/BioCatalytics) and the transaminase (0.85 g, ~10.6 wt %, ATA-103) were added. The pH of the reaction mixture was ~7. Stirring was continued at a slow 5 pace; the pH was checked once a day and, if necessary, adjusted to pH 7.0-7.5 using 1M NaOH. During the course of the reaction the color of the mixture changed to a yellow-orange color. After 6 days HPLC analysis showed 99% conversion. The reaction was worked up by adding sat. NaHCO₃ solution (200 mL) and CHCl₃ (600 mL). This mixture was stirred vigorously to ensure complete transfer of the product into the organic phase.

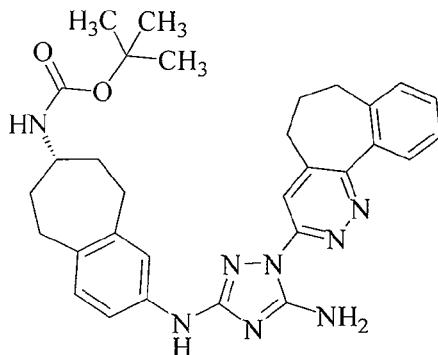

10 After stirring overnight two layers had formed and the organic layer contained large amounts of a gel-like solid. The organic layer was separated and filtered through a large glass frit (medium) to remove the gel-like solid. The aqueous phase was extracted three times with DCM. The combined organic layers were filtered through MgSO₄ and the solvents were evaporated to give the desired amine, (7*S*)-2-nitro-7-amino-7,8,9-trihydro-15 5*H*-benzo[7]annulene (7.27 g, 91%, dark-red oil).

The single enantiomer was then BOC-protected, the nitro group reduced by treatment with H₂/Pd and the primary aniline treated with diphenyl cyanocarboimidate (slight excess) in 20 mL of *isopropanol* with stirring at ambient temperature overnight. The solid was filtered, washed with *isopropanol* and ether and dried to give phenyl (7*S*)-*N*'-20 cyano-*N*-(7-amino-6,7,8,9-tetrahydro-5*H*-benzo[7]annulene-2-yl)carbamimidate, as a white solid in high yield (from the single enantiomer via transamination).

25

Phenyl *N'*-cyano-*N*-(7-(*t*-butoxycarbonylamino)-6,7,8,9-tetrahydro-5*H*-benzo[7]annulene-2-yl)carbamimidate (2.00 g, 4.75 mmol) and 3-hydrazino-6,7-dihydro-5*H*-benzo[6,7]cyclohepta[1,2-*c*]pyridazine (1.08 g, 4.75 mmol) were mixed in dry toluene (40 ml). The suspension was heated to 90 °C and stirred for 24 h. The clear solution was 5 allowed to cool to ambient temperature and the toluene was evaporated using a rotavapor. The crude product was then checked by HPLC and TLC. Column chromatography on silica gel using CHCl₃ and 5% NH₃ (2M in MeOH) afforded some clean fractions of product which gave 367 mg (14%) of the desired product, 1-(6,7-dihydro-5*H*-benzo[6,7]cyclohepta[1,2-*c*]pyridazin-3-yl)-*N*³-(7-(*t*-butoxycarbonylamino)-6,7,8,9-tetrahydro-5*H*-benzo[7]annulene-2-yl)-1*H*-1,2,4-triazole-3,5-diamine. The impure 10 fractions were further purified by reverse phase HPLC to yield another 515 mg (20%) of the desired product, ¹H NMR (DMSO-d₆, 300 MHz) 9.04 (s, 1H, NH), 7.92 (s, 1H), 7.86 (s, 2H), 7.69 (m, 1H), 7.43 (m, 3H), 7.34 (m, 1H), 7.23 (m, 1H), 6.96 (d, 1H), 6.83 (d, 1H), 3.49 (m, 1H), 2.72-2.39 (m, 8H), 2.22 (m, 2H), 2.07 (s, 1H), 1.92 (m, 2H), 1.38 (s, 9H), 15 1.17 (m, 2H) ppm; trifluoroacetic acid salt MS (ES) 553.24 (M+H), 551.42 (M-H).

BIOLOGICAL EXAMPLES

The following biological examples are provided by way of illustration, not limitation. In the following biological examples, 1-(6,7-dihydro-5H-benzo[6,7]cyclohepta[1,2-c]pyridazin-3-yl)-N³-((7-(S)-pyrrolidin-1-yl)-6,7,8,9-tetrahydro-5H-benzo[7]annulene-2-yl)-1H-1,2,4-triazole-3,5-diamine, which is a compound of formula (I), as set forth above in the Summary of the Invention, and which is designated in the following examples and Figures 1-8 as "Compound A" or "Cpd A" or "Cmpd A", was

assayed for its ability to prevent, treat or manage metastatic cancer, either alone or in combination with another chemotherapeutic agent.

BIOLOGICAL EXAMPLE 1

Efficacy of Compound A in Preventing Lung and Liver Metastasis of a Primary Tumor in 5 Breast Tissue

Using a variation of the mouse 4T1 breast tumor model, as described in *Current Protocols in Immunology* (2000), 20.2.1-20.2.16, Compound A was assayed to determine its ability to prevent, treat or manage metastatic cancer in BALB/c mice.

Formulations

10 Vehicle: 0.5% HPMC / 0.1% Tween.

Compound A: Preformulated dosing solutions in vehicle for 25 mg/kg, 40 mg/kg and 75 mg/kg for oral administration.

Cisplatin (Reference Control): Diluted in sterile saline for 1.2 mg/kg, 2.4 mg/kg and 75 mg/kg for intravenous administration.

15 Zometa: Diluted in sterile saline as per clinical formulation for subcutaneous administration.

Protocol

Eighty-eight BALB/c mice were inoculated with 5×10^5 4T1 tumor cells (ATCC) orthotopically into the third mammary fat pad. On Day 0 of the study (2 days post-

20 inoculation), 80 mice were randomized into 8 groups (10 mice per group). Dose administration began on Day 0 and continued for 21 days (3 weeks). Compound A was administered twice a day, Cisplatin was administered once a week, and Zometa was administered three times weekly. Tumor measurements were performed three times per week, starting when tumors were palpable (approximately 3x3 mm). Body weight measurements were taken three times per week at the same time each day. Tumor and body weight measurements for all mice were measured prior to dose administration.

25 On Day 21 of the treatment, mice were euthanized and the lungs exposed and the numbers of surface lung metastases were counted. The size of each metastasis was measured using a caliper in one dimension and categorized as follows:

30 Small: Less than 2mm

Medium: Greater or equal to 2mm

Large: Greater or equal to 3mm

The lungs and livers from all mice were excised and placed in PLP fixative and stained for micrometastasis quantification.

Results

5 The results of this assay with respect to the effect of Compound A on the total number of macroscopic lung metastases are shown in FIGURE 1.

The results of this assay with respect to the effect of Compound A on the number of medium lung metastases are shown in FIGURE 2. The difference between the effect of Compound A at 45 mg/kg and the vehicle was significant ($p < 0.05$, Mann-Whitney Test). The difference between the effect of cisplatin at 4 mg/kg and the vehicle was significant 10 ($p < 0.001$, Mann-Whitney Test).

The results of this assay with respect to the effect of Compound A on the number of 15 large lung metastases are shown in FIGURE 3. The difference between the effect of Compound A at 25 mg/kg and the vehicle was significant ($p < 0.05$, Mann-Whitney Test). The difference between the effect of Cisplatin at 1.2 mg/kg and 2.4 mg/kg and the vehicle was significant ($p < 0.05$, Mann-Whitney Test).

The results of this assay with respect to the effect of Compound A on the incidence 20 of liver micrometastases are shown in FIGURE 4. The difference between the effect of Compound A at 25 mg/kg, 45 mg/kg and 75 mg/kg and the vehicle was significant ($p < 0.05$, Mann-Whitney Test). The difference between the effect of Cisplatin at 2.4 mg/kg and 4 mg/kg and the effect of Cisplatin at 1.2 mg/kg was significant ($p < 0.05$, Mann-Whitney Test). The difference between the effect of Compound A at 45 mg/kg and 75 mg/kg and the effect of Compound A at 25 mg/kg was significant ($p < 0.05$, Mann-Whitney Test). The difference between the effect of Zometa at 0.1 mg/kg and the vehicle was significant ($p < 0.05$, Mann-Whitney Test).

BIOLOGICAL EXAMPLE 2

Efficacy of Compound A in combination with Cisplatin in Preventing Lung and Liver Metastasis of a Primary Tumor in Breast Tissue

Using a variation of the mouse 4T1 breast tumor model, as described in *Current Protocols in Immunology* (2000), 20.2.1-20.2.16, Compound A in combination with 30 Cisplatin was assayed to determine the efficacy of the combination therapy to prevent, treat or manage metastatic cancer in BALB/c mice.

Formulations

Vehicle: 0.5% HPMC / 0.1% Tween.

Compound A: Preformulated dosing solutions in vehicle for 7 mg/kg and 21 mg/kg for oral administration.

5 Cisplatin: Diluted in sterile saline for 1.2 mg/kg (suboptimal clinical formulation) for intravenous administration.

Protocol

Sixty-six BALB/c mice were inoculated with 5×10^5 4T1 tumor cells (ATCC) orthotopically into the third mammary fat pad. On Day 0 of the study (2 days post-

10 inoculation), 60 mice were randomized into 6 groups (10 mice per group). Dose administration began on Day 0 and continued for 21 days (3 weeks). Compound A was administered twice a day, Cisplatin was administered once a week, and Zometa was administered three times weekly. Tumor measurements were performed three times per week, starting when tumors were palpable (approximately 3x3mm). Body weight

15 measurements were taken three times per week at the same time each day. Tumor and body weight measurements for all mice were measured prior to dose administration.

On Day 21 of the treatment, mice were euthanized and the lungs exposed and the number of surface lung metastases were counted. The size of each metastasis was measured using a caliper in one dimension and categorized as follows:

20 Small: Less than 2mm

Medium: Greater or equal to 2mm

Large: Greater or equal to 3mm

The lungs and livers from all mice were excised and placed in PLP fixative and stained for micrometastasis quantification.

25 Results

The results of this assay with respect to the effect of the combination therapy of Compound A and Cisplatin on the size of the primary tumor is shown in FIGURE 5.

The results of this assay with respect to the effect of the combination therapy of Compound A and Cisplatin on the incidence of liver micrometastases is shown in FIGURE 30 6. The difference between the effect of both combination therapies (Compound A at 7 mg/kg or 21 mg/kg and Cisplatin at 1.2 mg/kg) and the effect of the vehicle alone or the active ingredients (Cisplatin or Compound A) alone was significant ($p < 0.05$, Mann-Whitney Test).

The results of this assay with respect to the effect of the combination therapy of Compound A and Cisplatin on reducing the number of large lung metastases is shown in FIGURE 7. The difference between the effect of Compound A at 21 mg/kg and 7 mg/kg and vehicle was significant ($p < 0.01$, Mann-Whitney Test). The difference between the 5 effect of Cisplatin at 1.2 mg/kg and vehicle was significant ($p < 0.05$, Mann-Whitney Test).
