BACKGROUND

Technical Field

5 The present disclosure relates generally to the field of inhibitors of carbonic anhydrase IX (CAIX) and XII (CAXII), such as aryl sulfonamide compounds, and use of such compounds in treating and/or preventing various human diseases, including those related to CAIX and CAXII, especially in the treatment of cancer related to hypoxia and metastasis, and the depletion of
10 cancer stem cells in mammals.

Description of the Related Art

Hypoxia is a biologically and clinically relevant feature of solid cancers, and its presence has important implications for tumor phenotype, cancer progression, metastasis, and is correlated with poor prognosis in many
15 types of solid tumors (Chaudary and Hill, *Breast Dis.* 2006-2007, 26:55-64; Milani and Harris, *Eur. J. Cancer*, 2008, 44(18):2766-2773). Hypoxia is also associated with resistance of tumors to conventional treatment with radiotherapy and chemotherapy. A hypoxic environment is known to promote epithelial to mesenchymal transition (EMT) of cancer cells, leading to increased
20 metastatic propensity. It also provides a niche environment for cancer stem cells (CSCs), a subset of cancer cells with tumor-initiating properties, including the capacity of self-renewal, and resistance to current anti-cancer therapies (Scheel and Weinberg, *Semin. Cancer Biol.*, 2012, 22(5-6):396-403). Importantly, the inability to effectively eradicate these aggressive,
25 treatment-resistant tumor cells results in recurrence and distant metastasis, the truly deadly aspects of cancer.

The capacity of cancer cells to adapt to the inherently hostile conditions of low oxygen provides a selective advantage compared to normal cells, and supports their expansion and dissemination (Sedlakova *et al.*, *Front.*

Physiol., 2014, 4:400). Adaptation of cancer cells to hypoxia involves activation of the HIF-1 α signaling cascade (Lendhal *et al.*, Nat. Rev. Genet., 2009, 10(12):821-32), culminating in the downstream regulation of several critical cellular processes, including induction of a glycolytic switch (Sedlakova *et al.*,

5 Front. Physiol., 2014, 4:400; Gatenby and Gillies, Nat. Rev. Cancer., 2008, 8(1):56-61; Neri and Supuran, Nat. Rev. Drug Discov., 2011, 10(10):767-77) that leads to increased production of acidic metabolites, including lactic acid, protons, and carbon dioxide (CO₂) (Parks *et al.*, J. Cell Physiol., 2011, 226(2):299-308). To avoid prolonged intracellular acidosis, the presence of

10 which rapidly affects cellular functions vital to cell survival, (Gatenby and Gillies, Nat. Rev. Cancer., 2004, 4(11):891-899; Neri and Supuran, Nat. Rev. Drug Discov., 2011, 10(10):767-77) tumor cells activate a network of proteins and buffer systems that function to maintain pH homeostasis (Gatenby and Gillies, Nat. Rev. Cancer., 2004, 4(11):891-899; Neri and Supuran, Nat. Rev. Drug

15 Discov., 2011, 10(10):767-77; Fang *et al.*, Semin. Cancer Biol., 2008, 18(5):330-7; Gatenby and Gillies, Nat. Rev. Cancer., 2008, 8(1):56-61). The membrane-bound, exofacial carbonic anhydrases, especially tumor-associated CAIX and CAXII, are critical components of this pH regulatory system (Neri and Supuran, Nat. Rev. Drug Discov., 2011, 10(10):767-77; Supuran, Nat. Rev.

20 Drug Discov., 2008, 7(2):168-81; McDonald *et al.*, Oncotarget., 2012, 3(1):84-97).

CAIX is a cell surface, HIF-1 α -inducible metalloenzyme that functions to catalyze the reversible hydration of CO₂ to bicarbonate (HCO₃⁻) and protons (H⁺) (Gatenby and Gillies, Nat. Rev. Cancer., 2008, 8(1):56-61). In

25 hypoxic tumors, CAIX enables the maintenance of pH favorable for cancer cell survival and growth, and simultaneously participates in extracellular acidification, facilitating tumor cell migration, invasion, and metastasis (Swietach *et al.*, J. Biol. Chem., 2009, 284(30):20299-310; Supuran, Nat. Rev. Drug Discov., 2008, 7(2):168-81). Furthermore, suppressing CAIX or inhibiting

30 its activity results in depletion of cancer stem cells and inhibition of EMT.

Therefore, inhibiting CAIX activity interferes with pH regulation, reducing cancer cell survival (especially cancer stem cells), and attenuating invasion, ultimately inhibiting tumor growth and metastasis (Supuran, *Nat. Rev. Drug Discov.*, 2008, 7(2):168-81; Lou *et al.*, *Cancer Res.*, 2011, 71(9):3364-76). CAIX expression is

5 highly restricted in human normal tissue but the overexpression in solid tumors is associated with poor prognosis in many cancers including lung, colon, breast, cervix, bladder, pancreas, ovaries, brain, head and neck, and oral cavity. In addition, clinical studies have revealed a correlation between CAIX expression and metastatic disease (Lou *et al.*, *Cancer Res.*, 2011, 71(9):3364-76;

10 Lancaster *et al.*, *Cancer Res.*, 2001, 61(17):6394-9; Kim *et al.*, *J. Cancer Res. Clin. Oncol.*, 2006, 132(5):302-8; De Schutter *et al.*, *BMC Cancer*, 2005, 5:42; Liao *et al.*, *Gynecol. Oncol.*, 2010, 116(3):452-8.; Garcia *et al.*, *Hum. Pathol.*, 2007, 38(6):830-41).

CAIX is an attractive target for anticancer therapy for several

15 reasons. It is selectively expressed on the extracellular surface of tumor cells and shows highly restricted expression in normal tissue (Supuran, *Nat. Rev. Drug Discov.*, 2008, 7(2):168-81). It is a functional regulator of processes critical for tumor growth and metastasis, including pH regulation, survival, and adhesion/migration. Furthermore, genetic silencing of CAIX in preclinical tumor

20 models *in vivo* has demonstrated the requirement of CAIX for the growth of hypoxic tumors and their metastasis (Chiche *et al.*, *Cancer Res.*, 2009, 69(1):358-368; Lou *et al.*, *Cancer Res.*, 2011, 71(9):3364-76; McIntyre *et al.*, *Clin. Cancer Res.*, 2012, 18(11):3100-11).

Analogous to CAIX, CAXII is a membrane-bound, exofacial

25 carbonic anhydrase that catalyzes the reversible hydration of carbon dioxide (Gatenby and Gillies, *Nat. Rev. Cancer.*, 2004, 4(11):891-899; Wykoff *et al.*, *Am. J. Pathol.*, 2001, 158(3):1011-9). Similar to CAIX, its expression is limited in normal tissue, but it is expressed in many types of human cancer, including pancreatic, colorectal, oral, brain, lung, ovarian, breast, and T-cell lymphoma

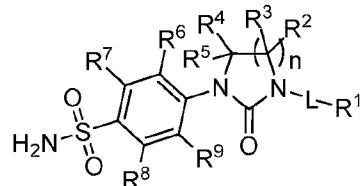

30 and is likely also involved in pH regulation and cancer cell survival (Watson et

al., Br. J. Cancer, 2003, 88(7):1065-70; Wykoff et al., Am. J. Pathol., 2001, 158(3):1011-9; Gondi et al., Cancer Res., 2013, 73(21):6494-503; Ilie et al., Lung Cancer, 2013, 82(1):16-23; Gatenby & Gillies, Nat. Rev. Cancer., 2004, 4(11):891-899). It is noteworthy that co-expression of CAIX and CAXII is 5 evident in some types of cancers, suggesting that a degree of redundancy may exist between CAIX and CAXII in these cases (McIntyre et al., Clin. Cancer Res., 2012, 18(11):3100-11). In cancer types where both isoforms are expressed or where inhibition of CAIX potentially results in partial compensation by CAXII, concurrent selective inhibition of both targets may be necessary.

DETAILED DESCRIPTION OF THE DISCLOSURE

Definitions

Certain chemical groups named herein are preceded by a shorthand notation indicating the total number of carbon atoms that are to be found in the indicated chemical group. For example; C₇-C₁₂alkyl describes an alkyl group, as defined below, having a total of 7 to 12 carbon atoms, and C₄-C₁₂cycloalkylalkyl describes a cycloalkylalkyl group, as defined below, having a total of 4 to 12 carbon atoms. The total number of carbons in the shorthand notation does not include carbons that may exist in substituents of the group described.

Accordingly, as used in the specification and appended claims, unless specified to the contrary, the following terms have the meaning indicated:

"Amino" refers to the $-\text{NH}_2$ radical.

"Cyano" refers to the $-\text{CN}$ radical.

"Nitro" refers to the $-\text{NO}_2$ radical.

"Oxo" refers to the =O substituent.

"Thioxo" refers to the =S substituent.

"Alkyl" refers to a straight or branched hydrocarbon chain radical, when unsubstituted, consisting solely of carbon and hydrogen atoms,

- 5 containing no unsaturation, having from one to twelve carbon atoms, preferably one to eight carbon atoms or one to six carbon atoms, and which is attached to the rest of the molecule by a single bond, e.g., methyl, ethyl, *n*-propyl, 1-methylethyl (*iso*-propyl), *n*-butyl, *n*-pentyl, 1,1-dimethylethyl (*t*-butyl), and the like. Unless stated otherwise specifically in the specification, an alkyl group

Thus, "alkyl" includes unsubstituted and substituted alkyl.

"Alkenyl" refers to a straight or branched hydrocarbon chain

Thus, "alkenyl" includes unsubstituted and

10 substituted alkenyl.

"Alkylene" and "alkylene chain" refer to a straight or branched divalent hydrocarbon chain, linking the rest of the molecule to a radical group, consisting solely of carbon and hydrogen, containing no unsaturation and having from one to twelve carbon atoms, preferably having from one to eight carbons, e.g., methylene, ethylene, propylene, *n*-butylene, and the like. The alkylene chain may be attached to the rest of the molecule and to the radical group through one carbon within the chain or through any two carbons within the chain.

Aryl groups include, but are not limited to groups such as fluorenyl, phenyl and naphthyl. Unless stated otherwise specifically in the specification, the term "aryl" or the prefix "ar-" (such as in "aralkyl") is meant to include aryl radicals optionally substituted by one or

more substituents selected from the group consisting of alkyl, alkenyl, amino, halo, haloalkyl, haloalkenyl, cyano, nitro, aryl, aralkyl, cycloalkyl, cycloalkylalkyl, heterocyclyl, heterocyclylalkyl, heteroaryl, heteroarylalkyl, -

R¹⁶) (where t is 1 to 2), -R¹⁵-S(O)_tOR¹⁶ (where t is 1 to 2), -R¹⁵-S(O)_tR¹⁶ (where
t is 0 to 2), and -R¹⁵-S(O)_tN(R¹⁴)₂ (where t is 1 to 2) where each R¹⁴ is
independently hydrogen, alkyl, haloalkyl, cycloalkyl, cycloalkylalkyl, aryl, aralkyl,

alkyl radical as defined above and R_b is one or more aryl radicals as defined
above, e.g., benzyl, diphenylmethyl and the like. The aryl part of the aralkyl
radical may be optionally substituted as described above for an aryl group. The
alkyl part of the aralkyl radical may be optionally substituted as defined above

When heteroaryl is a substituent of another moiety, the heteroaryl is monovalent, which means that the heteroaryl is connected to the other moiety by a single ring atom. An example of a monovalent heteroaryl can be found in the radical of heteroarylalkyl, in which an alkyl group is substituted with a heteroaryl group. When heteroaryl is a linker,

the heteroaryl is a divalent radical. Thus, "heteroaryl" includes unsubstituted and substituted heteroaryl.

"Prodrugs" refers to a compound that may be converted under physiological conditions or by solvolysis to a biologically active compound of any one of Formulae (I), (Ia) or (II). Thus, the term "prodrug" refers to a metabolic precursor of a compound of any one of Formulae (I), (Ia) or (II) that is pharmaceutically acceptable; the latter is also referred to as a "parent compound." A prodrug may be inactive when administered to a subject in need thereof, but is converted *in vivo* to an active compound, *i.e.*, the parent compound. Prodrugs are typically rapidly transformed *in vivo* to yield the parent compound, for example, by hydrolysis in blood. The prodrug compound often offers advantages of solubility, tissue compatibility or delayed release in a mammalian organism (see, Bundgard, H., *Design of Prodrugs* (1985), pp. 7-9, 21-24, Elsevier, Amsterdam).

The term "prodrug" is also meant to include any covalently bonded carriers which release the active compound of the disclosure *in vivo* when such prodrug is administered to a mammalian subject. Prodrugs of a compound of the disclosure may be prepared by modifying functional groups present in the compound of the any one of Formulae (I), (Ia) or (II) in such a way that the modifications are cleaved, either in routine manipulation or *in vivo*, to the parent compound. Prodrugs include compounds of any one of Formulae (I), (Ia) or (II) wherein a hydroxy, amino or mercapto group is bonded to any group that, when the prodrug is administered to a mammalian subject, cleaves to restore the free hydroxy, free amino or free mercapto group, respectively.

Examples of prodrugs include, but are not limited to, acetate, formate and benzoate, and phosphate derivatives of alcohol or amine functional groups in the compounds of any one of Formulae (I), (Ia) or (II).

"Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

"Mammal" or "mammalian subject" or "subject" includes humans and domestic animals, such as cats, dogs, swine, cattle, sheep, goats, horses, rabbits, and the like.

"Optional" or "optionally" means that the subsequently described event of circumstances may or may not occur, and that the description includes instances where said event or circumstance occurs and instances in which it does not. For example, "optionally substituted aryl" means that the aryl radical may or may not be substituted and that the description includes both substituted aryl radicals and aryl radicals having no substitution.

These salts are prepared from addition of an inorganic base or an organic base to the free acid. Salts derived from inorganic bases include, but are not limited to, the sodium, potassium, lithium, ammonium, calcium, magnesium, iron, zinc, copper, manganese, aluminum salts and the like. Preferred inorganic salts are the ammonium, sodium, potassium, calcium, and magnesium salts. Often crystallizations produce a solvate of the compound of the disclosure. As used herein, the term "solvate" refers to an aggregate that

5 comprises one or more molecules of a compound of the disclosure with one or more molecules of solvent. The solvent may be water, in which case the solvate may be a hydrate. Alternatively, the solvent may be an organic solvent. Thus, the compounds of the present disclosure may exist as a hydrate, including a monohydrate, dihydrate, hemihydrate, sesquihydrate, trihydrate,

10 tetrahydrate and the like, as well as the corresponding solvated forms. The compound of the disclosure may be true solvates, while in other cases, the compound of the disclosure may merely retain adventitious water or be a mixture of water plus some adventitious solvent.

A "pharmaceutical composition" refers to a formulation of a

15 compound of the disclosure and a medium generally accepted in the art for the delivery of the biologically active compound to mammals, e.g., humans. Such a medium includes all pharmaceutically acceptable carriers, diluents or excipients therefor.

"Therapeutically effective amount" refers to that amount of a

20 compound of the disclosure which, when administered to a mammal, preferably a human, is sufficient to effect treatment, as defined below, of a disease or condition in the mammal, preferably a human. The amount of a compound of the disclosure which constitutes a "therapeutically effective amount" will vary depending on the compound, the condition and its severity, and the age of the

25 mammal to be treated, but can be determined routinely by one of ordinary skill in the art having regard to his own knowledge and to this disclosure.

"Treating" or "treatment" as used herein covers the treatment of the disease or condition of interest in a mammal, preferably a human, having the disease or disorder of interest, and includes:

- (i) preventing the disease or condition from occurring in a mammal, in particular, when such mammal is predisposed to the condition but has not yet been diagnosed as having it;
- (ii) inhibiting the disease or condition, *i.e.*, arresting its development; or
- (iii) relieving the disease or condition, *i.e.*, causing regression of the disease or condition.

As used herein, the terms "disease" and "condition" may be used interchangeably or may be different in that the particular malady or condition 10 may not have a known causative agent (so that etiology has not yet been worked out) and it is therefore not yet recognized as a disease but only as an undesirable condition or syndrome, wherein a more or less specific set of symptoms have been identified by clinicians.

The compounds of the disclosure, or their pharmaceutically 15 acceptable salts may contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)- or, as (D)- or (L)- for amino acids. The present disclosure is meant to include all such possible isomers, as well as their racemic and optically pure forms. Optically 20 active (+) and (-), (R)- and (S)-, or (D)- and (L)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques, such as HPLC using a chiral column. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include both *E* 25 and *Z* geometric isomers. Likewise, all tautomeric forms are also intended to be included.

A "stereoisomer" refers to a compound made up of the same atoms bonded by the same bonds but having different three-dimensional structures, which are not interchangeable. The present disclosure contemplates 30 various stereoisomers and mixtures thereof and includes "enantiomers", which

Substitution with heavier isotopes such as deuterium, i.e. ^2H , may afford

15 certain therapeutic advantages resulting from greater metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements and hence may be preferred in some circumstances. Isotopically-enriched compounds of the disclosure can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the

20 accompanying Examples and Preparations Sections using an appropriate isotopically-enriched reagent in place of the non-enriched reagent previously employed.

The chemical naming protocol and structure diagrams used herein employ and rely the chemical naming features as utilized by Chemdraw 25 version 12.0.2.1076 (available from Cambridgesoft Corp., Cambridge, MA).

Utility and Testing of the Compounds of the Disclosure

The present disclosure relates to compounds, pharmaceutical compositions and methods of using the compounds and pharmaceutical compositions for the treatment and/or prevention of diseases and conditions
 20 mediated by the activity of CAIX or CAXII individually or by any combination of them, preferably diseases and conditions related to characterized by angiogenesis and/or cell proliferation and migration, and especially a disease and condition related to cancer, and the like, by administering an effective amount of a compound of the disclosure.

25 The compounds of the disclosure modulate, preferably inhibit, the activity of human CAIX or CAXII individually or by any combination of them.

The general value of the compounds of the disclosure in modulating, especially inhibiting, the activity of CAIX or CAXII individually or by any combination of them can be determined using the assay described below in
 30 Example 29.

The compounds of the instant disclosure are inhibitors of CAIX or CAXII individually or inhibitors of any combination of them and are useful for treating diseases and disorders in humans and other organisms, including all those human diseases and disorders which are the result of abnormal activity of

5 CAIX or CAXII individually or any combination of them or which may be ameliorated by modulation of the activity of CAIX or CAXII individually or any combination of them.

As defined herein, a disease or condition mediated by the abnormal activity of CAIX or CAXII individually or any combination of them is

10 defined as any disease or condition in which the activity of CAIX or CAXII individually or any combination of them is elevated and/or where inhibition of the activity of CAIX or CAXII individually or any combination of them can be demonstrated to bring about symptomatic improvements for the individual so treated. As defined herein, a disease or condition mediated by the abnormal
15 activity of CAIX or CAXII individually or any combination of them includes, but is not limited to, a disease or condition which is, or is related to cancer. For purposes of this disclosure, Diseases and conditions which are alleviated by the modulation of the activity of CAIX or CAXII individually or any combination of them include, but are not limited to, solid tumors, including, but not limited to,
20 breast, renal, endometrial, ovarian, thyroid, and non-small cell lung carcinoma, melanoma, prostate carcinoma, sarcoma, gastric cancer and uveal melanoma; endometriosis, vascular disease/injury including, but not limited to, restenosis, atherosclerosis and thrombosis, psoriasis; visual impairment due to macular degeneration; diabetic retinopathy and retinopathy of prematurity; kidney
25 disease including, but not limited to, glomerulonephritis, diabetic nephropathy and renal transplant rejection, rheumatoid arthritis; osteoarthritis, osteoporosis and cataracts.

In addition to the foregoing, the compounds of the disclosure are useful in treating diseases and conditions which are affected by the following

30 biological processes: Invasion, migration, metastasis, or drug resistance as

15

The compounds of the disclosure may be used or tested for their use in treating endometriosis by, respectively, administering a pharmaceutically effective amount to a subject in need thereof or using the syngenic mouse

20 model of endometriosis (see Somigliana, E. et al., "Endometrial ability to implant in ectopic sites can be prevented by interleukin-12 in a murine model of endometriosis", Hum. Reprod. 1999, 14(12), 2944-2950). The compounds may also be tested for their use in treating endometriosis by using the rat model of endometriosis (see Lebovic, D.I. et al., "Peroxisome proliferator-activated

25 receptor-gamma induces regression of endometrial explants in a rat model of endometriosis", Fertil. Steril., 2004, 82 Suppl 3, 1008-1013).

Typically, a successful inhibitory therapeutic agent of the activity of CAIX or CAXII individually or any combination of them will meet some or all of the following criteria. Oral availability should be at or above 20% Animal

30 model efficacy is less than about 20 mg/Kg, 2 mg/Kg, 1 mg/Kg, or 0.5 mg/Kg

and the target human dose is between 10 and 250 mg/70 Kg, although doses outside of this range may be acceptable. ("mg/Kg" means milligrams of compound per kilogram of body mass of the subject to whom it is being administered). The required dosage should preferably be no more than about 5 once or twice a day or at meal times. The therapeutic index (or ratio of toxic dose to therapeutic dose) should be greater than 10. The IC₅₀ ("Inhibitory Concentration - 50%") is a measure of the amount of compound required to achieve 50% inhibition of the kinase activity, over a specific time period, in a kinase activity assay. Any process for measuring the kinase activity of CAIX or 10 CAXII, preferably human CAIX or CAXII, may be utilized to assay the activity of the compounds useful in the methods of the disclosure in inhibiting said CAIX or CAXII activity. Compounds of the disclosure demonstrate an IC₅₀ in a 15 to 60 minute recombinant human assay of preferably less than 10 μ M, less than 5 μ M, less than 2.5 μ M, less than 1 μ M, less than 750 nM, less than 500 nM, less 15 than 250 nM, less than 100 nM, less than 50 nM, and most preferably less than 20 nM. Compounds of the disclosure may show reversible inhibition or irreversible inhibition and preferably do not inhibit other carbonic anhydrases.

The activities of the compounds of the disclosure as CAIX or CAXII inhibitors were tested using the recombinant human CAIX or CAXII 20 proteins and employing stopped-flow method for which the procedure is known to someone skilled in the art or as described in Example 29. When tested in this assay, compounds of the disclosure had greater than 50% inhibitory activity at 10 μ M concentration of the test compound, preferably greater than 60% inhibitory activity at 10 μ M concentration of the test compound, more preferably 25 greater than 70% inhibitory activity at 10 μ M concentration of the test compound, and even more preferably greater than 80% inhibitory activity at 10 μ M concentration of the test compound, and the most preferably greater than 90% inhibitory activity at 10 μ M concentration of the test compound, thereby demonstrating that the compounds of the disclosure are potent inhibitors of the 30 activity of CAIX and CAXII.

These results provide the basis for analysis of the structure-activity relationship (SAR) between test compounds and the inhibitory activity of CAIX or CAXII. Certain-groups tend to provide more potent inhibitory compounds. SAR analysis is one of the tools those skilled in the art may

5 employ to identify preferred embodiments of the compounds of the disclosure for use as therapeutic agents. Other methods of testing the compounds disclosed herein are also readily available to those skilled in the art. Thus, in addition, the determination of the ability of a compound to inhibit CAIX or CAXII activity may be accomplished *in vivo*. In one such embodiment this is

10 accomplished by administering said chemical agent to an animal afflicted with a certain tumor xenograft model and subsequently detecting a change in tumor growth rate in said animal thereby identifying a therapeutic agent useful in treating the said tumors. In such embodiment, the animal may be a human, such as a human patient afflicted with such a disorder and in need of treatment

15 of said disorder.

In specific embodiments of such *in vivo* processes, said change in CAIX or CAXII activity in said animal is a decrease in activity, preferably wherein said CAIX or CAXII inhibiting agent does not substantially inhibit the biological activity of other carbonic anhydrases.

Pharmaceutical Compositions of the Disclosure and Administration

The present disclosure also relates to pharmaceutical composition containing the compounds of the any one of Formulae (I), (Ia) or (II) disclosed herein. In one embodiment, the present disclosure relates to a composition 10 comprising compounds of any one of Formulae (I), (Ia) or (II) in a pharmaceutically acceptable carrier and in an amount effective to modulate the activity of CAIX or CAXII individually or in any combination of them or to treat diseases related to angiogenesis and/or cell proliferation and migration, and especially cancer and the like when administered to an animal, preferably a 15 mammal, most preferably a human patient. In an embodiment of such composition, the patient has solid tumor expressing CAIX before administration of said compound of the disclosure and the compound of the disclosure is present in an amount effective to modulate or inhibit the over-expression of CAIX.

20 The pharmaceutical compositions useful herein also contain a pharmaceutically acceptable carrier, including any suitable diluent or excipient, which includes any pharmaceutical agent that does not itself induce the production of antibodies harmful to the individual receiving the composition, and which may be administered without undue toxicity. Pharmaceutically 25 acceptable carriers include, but are not limited to, liquids, such as water, saline, glycerol and ethanol, and the like. A thorough discussion of pharmaceutically acceptable carriers, diluents, and other excipients is presented in REMINGTON'S PHARMACEUTICAL SCIENCES (Mack Pub. Co., N.J. current edition).

Those skilled in the art are also familiar with determining administration methods (oral, intravenous, inhalation, sub-cutaneous, etc.), dosage forms, suitable pharmaceutical excipients and other matters relevant to the delivery of the compounds to a subject in need thereof.

5 In an alternative use of the disclosure, the compounds of the disclosure can be used in *in vitro* or *in vivo* studies as exemplary agents for comparative purposes to find other compounds also useful in treatment of, or protection from, the various diseases disclosed herein.

Administration of the compounds of the disclosure, or their
10 pharmaceutically acceptable salts, in pure form or in an appropriate pharmaceutical composition, can be carried out via any of the accepted modes of administration of agents for serving similar utilities. The pharmaceutical compositions of the disclosure can be prepared by combining a compound of the disclosure with an appropriate pharmaceutically acceptable carrier, diluent
15 or excipient, and may be formulated into preparations in solid, semi-solid, liquid or gaseous forms, such as tablets, capsules, powders, granules, ointments, solutions, suppositories, injections, inhalants, gels, microspheres, and aerosols. Typical routes of administering such pharmaceutical compositions include, without limitation, oral, topical, transdermal, inhalation, parenteral, sublingual,
20 buccal, rectal, vaginal, and intranasal. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques. Pharmaceutical compositions of the disclosure are formulated so as to allow the active ingredients contained therein to be bioavailable upon administration of the composition to a patient. Compositions
25 that will be administered to a subject or patient take the form of one or more dosage units, where for example, a tablet may be a single dosage unit, and a container of a compound of the disclosure in aerosol form may hold a plurality of dosage units. Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see Remington: The
30 Science and Practice of Pharmacy, 20th Edition (Philadelphia College of

Pharmacy and Science, 2000). The composition to be administered will, in any event, contain a therapeutically effective amount of a compound of the disclosure, or a pharmaceutically acceptable salt thereof, for treatment of a disease or condition of interest in accordance with the teachings of this

5 disclosure.

A pharmaceutical composition of the disclosure may be in the form of a solid or liquid. In one aspect, the carrier(s) are particulate, so that the compositions are, for example, in tablet or powder form. The carrier(s) may be liquid, with the compositions being, for example, an oral oil, injectable liquid or 10 an aerosol, which is useful in, for example, inhalatory administration.

When intended for oral administration, the pharmaceutical composition is preferably in either solid or liquid form, where semi-solid, semi-liquid, suspension and gel forms are included within the forms considered herein as either solid or liquid.

15 As a solid composition for oral administration, the pharmaceutical composition may be formulated into a powder, granule, compressed tablet, pill, capsule, chewing gum, wafer or the like form. Such a solid composition will typically contain one or more inert diluents or edible carriers. In addition, one or more of the following may be present: binders such as carboxymethylcellulose, 20 ethyl cellulose, microcrystalline cellulose, gum tragacanth or gelatin; excipients such as starch, lactose or dextrins, disintegrating agents such as alginic acid, sodium alginate, Primogel, corn starch and the like; lubricants such as magnesium stearate or Sterotex; glidants such as colloidal silicon dioxide; sweetening agents such as sucrose or saccharin; a flavoring agent such as 25 peppermint, methyl salicylate or orange flavoring; and a coloring agent.

When the pharmaceutical composition is in the form of a capsule, for example, a gelatin capsule, it may contain, in addition to materials of the above type, a liquid carrier such as polyethylene glycol or oil.

30 The pharmaceutical composition may be in the form of a liquid, for example, an elixir, syrup, solution, emulsion or suspension. The liquid may be

for oral administration or for delivery by injection, as two examples. When intended for oral administration, preferred composition contain, in addition to the present compounds, one or more of a sweetening agent, preservatives, dye/colorant and flavor enhancer. In a composition intended to be administered

5 by injection, one or more of a surfactant, preservative, wetting agent, dispersing agent, suspending agent, buffer, stabilizer and isotonic agent may be included.

The liquid pharmaceutical compositions of the disclosure, whether they be solutions, suspensions or other like form, may include one or more of the following adjuvants: sterile diluents such as water for injection, saline

10 solution, preferably physiological saline, Ringer's solution, isotonic sodium chloride, fixed oils such as synthetic mono or diglycerides which may serve as the solvent or suspending medium, polyethylene glycols, glycerin, propylene glycol or other solvents; antibacterial agents such as benzyl alcohol or methyl paraben; antioxidants such as ascorbic acid or sodium bisulfite; chelating

15 agents such as ethylenediaminetetraacetic acid; buffers such as acetates, citrates or phosphates and agents for the adjustment of tonicity such as sodium chloride or dextrose. The parenteral preparation can be enclosed in ampoules, disposable syringes or multiple dose vials made of glass or plastic.

Physiological saline is a preferred adjuvant. An injectable pharmaceutical

20 composition is preferably sterile. A liquid pharmaceutical composition of the disclosure intended for either parenteral or oral administration should contain an amount of a compound of the disclosure such that a suitable dosage will be obtained. Typically, this amount is at least 0.01% of a compound of the disclosure in the composition. When intended for oral administration, this

25 amount may be varied to be between 0.1 and about 70% of the weight of the composition. Preferred oral pharmaceutical compositions contain between about 4% and about 75% of the compound of the disclosure. Preferred pharmaceutical compositions and preparations according to the present disclosure are prepared so that a parenteral dosage unit contains between 0.01

30 to 10% by weight of the compound prior to dilution of the disclosure.

The pharmaceutical composition of the disclosure may be intended for topical administration, in which case the carrier may suitably comprise a solution, emulsion, ointment or gel base. The base, for example, may comprise one or more of the following: petrolatum, lanolin, polyethylene glycols, bee wax, mineral oil, diluents such as water and alcohol, and emulsifiers and stabilizers. Thickening agents may be present in a pharmaceutical composition for topical administration. If intended for transdermal administration, the composition may include a transdermal patch or iontophoresis device. Topical formulations may contain a concentration of the compound of the disclosure from about 0.1 to about 10% w/v (weight per unit volume). The pharmaceutical composition of the disclosure may be intended for rectal administration, in the form, for example, of a suppository, which will melt in the rectum and release the drug. The composition for rectal administration may contain an oleaginous base as a suitable nonirritating excipient. Such bases include, without limitation, lanolin, cocoa butter and polyethylene glycol. The pharmaceutical composition of the disclosure may include various materials, which modify the physical form of a solid or liquid dosage unit. For example, the composition may include materials that form a coating shell around the active ingredients. The materials that form the coating shell are typically inert, and may be selected from, for example, sugar, shellac, and other enteric coating agents. Alternatively, the active ingredients may be encased in a gelatin capsule.

The pharmaceutical composition of the disclosure in solid or liquid form may include an agent that binds to the compound of the disclosure and thereby assists in the delivery of the compound. Suitable agents that may act in this capacity include a monoclonal or polyclonal antibody, a protein or a liposome. The pharmaceutical composition of the disclosure may consist of dosage units that can be administered as an aerosol. The term aerosol is used to denote a variety of systems ranging from those of colloidal nature to systems consisting of pressurized packages. Delivery may be by a liquefied or

compressed gas or by a suitable pump system that dispenses the active ingredients. Aerosols of compounds of the disclosure may be delivered in single phase, bi-phasic, or tri-phasic systems in order to deliver the active ingredient(s). Delivery of the aerosol includes the necessary container,

5 activators, valves, subcontainers, and the like, which together may form a kit. One of ordinary skill in the art, without undue experimentation may determine preferred aerosols. The pharmaceutical compositions of the disclosure may be prepared by methodology well known in the pharmaceutical art. For example, a pharmaceutical composition intended to be administered by injection can be

10 prepared by combining a compound of the disclosure with sterile, distilled water so as to form a solution. A surfactant may be added to facilitate the formation of a homogeneous solution or suspension. Surfactants are compounds that non-covalently interact with the compound of the disclosure so as to facilitate dissolution or homogeneous suspension of the compound in the aqueous

15 delivery system.

The compounds of the disclosure, or their pharmaceutically acceptable salts, are administered in a therapeutically effective amount, which will vary depending upon a variety of factors including the activity of the specific compound employed; the metabolic stability and length of action of the

20 compound; the age, body weight, general health, sex, and diet of the patient; the mode and time of administration; the rate of excretion; the drug combination; the severity of the particular disorder or condition; and the subject undergoing therapy. Generally, a therapeutically effective daily dose is (for a 70 kg mammal) from about 0.001 mg/kg (i.e., 0.7 mg) to about 100 mg/kg (i.e., 7.0

25 gm); preferably a therapeutically effective dose is (for a 70 kg mammal) from about 0.01 mg/kg (i.e., 7 mg) to about 50 mg/kg (i.e., 3.5 g); more preferably a therapeutically effective dose is (for a 70 kg mammal) from about 1 mg/kg (i.e., 70 mg) to about 25 mg/kg (i.e., 1.75 g).

Compounds of any one of Formulae (I), (Ia) or (II), or

30 pharmaceutically acceptable derivatives thereof, may also be administered

simultaneously with, prior to, or after administration of one or more other therapeutic agents. Such combination therapy includes administration of a single pharmaceutical dosage formulation which contains a compound of the disclosure and one or more additional active agents, as well as administration

5 of the compound of the disclosure and each active agent in its own separate pharmaceutical dosage formulation. For example, a compound of the disclosure and the other active agent can be administered to the patient together in a single oral dosage composition such as a tablet or capsule, or each agent administered in separate oral dosage formulations. Where separate dosage

10 formulations are used, the compounds of the disclosure and one or more additional active agents can be administered at essentially the same time, i.e., concurrently, or at separately staggered times, i.e., sequentially; combination therapy is understood to include all these regimens.

Isotopic Enrichment of Compounds

15 Isotopic enrichment is a process by which the relative abundance of the isotopes of a given element are altered, thus producing a form of the element that has been enriched in one particular isotope and depleted in its other isotopic forms. Isotopic enrichment of a drug are used for the following applications: reducing or eliminating unwanted metabolites; increasing the half-life of the parent drug; decreasing the number of doses needed to achieve a desired effect; decreasing the amount of a dose necessary to achieve a desired effect; increasing the formation of active metabolites, if any are formed; and/or decreasing the production of deleterious metabolites in specific tissues and/or create a more effective drug and/or a safer drug for combination therapy,

20

25 whether the combination therapy is intentional or not.

Replacement of an atom for one of its isotopes often will result in a change in the reaction rate of a chemical reaction. This phenomenon is known as the Kinetic Isotope Effect. For example, if a C-H bond is broken during a rate-determining step in a chemical reaction (i.e. the step with the

30 highest transition state energy), substitution of a deuterium for that hydrogen

will cause a decrease in the reaction rate and the process will slow down. This phenomenon is known as the Deuterium Kinetic Isotope Effect (Foster *et. al.*, *Adv. Drug Res.*, 1985, 14, 1-36; Kushner *et. al.*, *Can. J. Physiol. Pharmacol.*, 1999, 77, 79-88).

5 Improvement of metabolism, pharmacokinetics, pharmacodynamics, and toxicity profiles of pharmaceuticals by isotopic enrichment such as deuteration has been demonstrated by the following examples: Lijinsky *et. al.*, *J. Nat. Cancer Inst.*, 1982, 69, 1127-1133; Gately *et. al.*, *J. Nucl. Med.*, 1986, 27, 388-394; Gordon *et. al.*, *Drug Metab. Dispos.*, 10 1987, 15, 589-594; Mangold *et. al.*, *Mutation Res.*, 1994, 308, 33-42; Zello *et. al.*, *Metabolism*, 1994, 43, 487-491; Wade D., *Chem. Biol. Interact.*, 1999, 117, 191-217.

EXAMPLE 29

ASSESSMENT OF CARBONIC ANHYDRASE INHIBITORY ACTIVITY

An Applied Photophysics stopped-flow instrument was used for

5 assaying the CA-catalyzed CO₂ hydration activity. Phenol red (at 0.2 mM) was used as indicator, working at the absorbance maximum of 557 nm, with 20 mM Hepes (pH 7.4) and 20 mM NaBF₄ (for maintaining constant the ionic strength), following the initial rates of the CA-catalyzed CO₂ hydration reaction for 10-100 seconds. The CO₂ concentrations ranged from 1.7 to 17 mM for the

10 determination of the kinetic parameters and inhibition constants. For each inhibitor, at least six traces of the initial 5-10% of the reaction were used for determining the initial velocity. The uncatalyzed rates were determined in the same manner and subtracted from the total observed rates. Stock solutions of inhibitor (10 mM) were prepared in distilled-deionized water, and dilutions up to

15 0.01 nM were done thereafter with distilled-deionized water. Inhibitor and enzyme solutions were pre-incubated together for 15 minutes at room temperature prior to assay in order to allow for the formation of the E-I complex. The inhibition constants were obtained by nonlinear least-squares methods using PRISM 3, whereas the kinetic parameters for the uninhibited enzymes

20 were from Lineweaver-Burk plots, and represent the mean from at least three different determinations.

The following table summarizes the inhibitory activity on CAIX and CAXII of the compounds of the disclosure. “+” represents the K_i is > 100 μM; “++” represents the 100 nM < K_i < 10 nM; and “+++” represents the K_i < 10 nM.

EXAMPLE 30

CELL CULTURE AND HYPOXIC EXPOSURE

The acquisition, generation and culture of the luciferase

5 expressing mouse breast cancer cell lines 4T1, 66cl4 and 67NR, and the human breast cancer cell lines MDA-231 and MDA-231 LM2-4 have been described previously (Lou et al, (2008) Dev Dyn 237:2755-2768; Lou et al, (2011) Cancer Res, 71:3364-3376. For culture in hypoxia, cells were

maintained in 1% O₂ and 5% CO₂ balanced with N₂ at 37 °C in a humidified incubator in a sealed anaerobic workstation.

EXAMPLE 31

GENERATION OF STABLE CELLS

5 shRNAmir vectors targeting mouse CAIX and a non-silencing sequence (Open Biosystems) were transfected into 90% confluent cells using LipofectAMINEPLUS™ (Invitrogen Life Technologies) according to the manufacturer's instructions. Due to the previous utilization of puromycin, transfected cells were selected using hygromycin. Stable shCAIX clones were
10 derived by limited dilution cloning. For (re-)introduction of CAIX into cells, human CAIX was transfected into 4T1 cells following the same procedure and Zeocin was used for selection.

EXAMPLE 32

MEASUREMENT OF EXTRACELLULAR pH

15 Cells were plated at appropriate density (1 x 10⁴ cells/cm² for 4T1 cells and its transfected derivatives, 2 x 10⁴ cells/cm² for 66cl4 cells, 1 x 10⁴ cells/cm² for 67NR cells and its transfected derivatives) in 60 mm dishes and allowed to recover overnight. A standard volume of 3 ml of fresh media/dish was then added and cells were incubated in normoxia (air + 5% CO₂) or
20 hypoxia (1% O₂ and 5% CO₂ balanced with nitrogen) for 72 h. Care was taken to ensure that cultures grown in normoxia and hypoxia were at similar confluence and contained similar cell numbers at the time of medium collection. Collected spent media was maintained at 37 °C and pH was measured immediately using a digital pH meter. Cell counts were performed to ensure that
25 cell numbers for a given cell line were comparable in both environmental conditions. Cells were harvested on ice for qRT-PCR and Western blot analysis.

EXAMPLE 33

CELL PROLIFERATION ASSAY

Cell growth was measured using an MTT cell proliferation kit (Roche Applied Science) according to the manufacturer's instructions. In brief, 5 cells were plated in 96-well plates at a density of 5×10^3 cells/cm² and allowed to recover overnight. Parallel samples were then incubated in normoxia and hypoxia for 48 to 72 h prior to performing the assay.

EXAMPLE 34

3D MATRIGEL INVASION ASSAY

10 A 3D "on-top" matrigel culture assay was performed as described previously (Lee et al, (2007) Nat Methods 4:359-365). Briefly, MDA-231 LM2-4 Luc+ cells (1.5×10^4 cells/cm²) were re-suspended in 100 μ l/well growth media containing 2x the final concentration of inhibitor and plated into 8-well chamber slides pre-coated with matrigel. Cells were allowed to attach for 45 minutes 15 with side-to-side agitation every 10-15 minutes to prevent clumping of cells in the center of the well. An additional 100 μ l/well media containing 10% matrigel was added to the cells and cultures were incubated in hypoxia for 4 days. Images were acquired and cultures were fixed for TUNEL using the "whole culture fixation" methodology outlined in Lee et al, (2007) Nat Methods 4:359-20 365.

EXAMPLE 35

SYNGENEIC ORTHOTOPIC TUMORS AND SPONTANEOUS METASTASIS

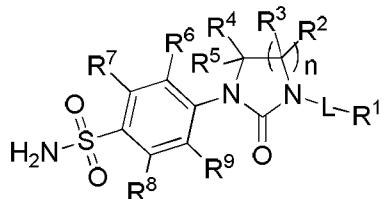

4T1 cells (1×10^6) or 67NR cells (2×10^6) were orthotopically implanted into the fourth mammary fat pad of 7-9 week-old female BALB/c mice 25 as described previously (Lou et al, (2011) Cancer Res 71:3364-3376; Lou et al, (2008) Dev Dyn 237:2755-2768). Injection of cell numbers of this magnitude is standard for propagation of these tumors, and is well below that used in other models of tumor growth (Erler, JT. Bennewith, KL,.. Icolau, M. Nature 440:

1222-1226). Primary tumor growth rates were calculated from caliper measurements using the modified ellipsoid formula ($L \times W^2/2$). Tumor formation and metastasis progression was monitored and quantified using bioluminescent imaging as previously described (Ebos et al., (2009) Cancer 5 Cell 15:232-239.;Lou et al., (2008) Dev Dyn 237:2755-2768).

From the foregoing it will be appreciated that, although specific embodiments of the disclosure have been described herein for purposes of illustration, various modifications may be made without deviating from the 10 spirit and scope of the disclosure. Accordingly, the disclosure is not limited except as by the appended claims.
