(54) **Security device, particularly for doors or window closure elements**

(57) A security device (1), particularly for doors or window closure elements, comprising a series of links (2, 2a, 2b, 2c) arranged side by side and mutually articulated and adapted to be wrapped around a roller (3) that can rotate and be blocked selectively. The roller (3) can rotate about its own axis to move a door or window closure element (4) that in turn can be rigidly associated with an end link (2a) of the series of links (2, 2a, 2b, 2c). When the roller (3) is blocked, the links (2) interposed

between the end link (2a) and an adjustment link (2b) connected to the roller (3) are arranged, following an unwanted lifting of the door or window closure element (4), in a configuration for blocking by geometric interference and friction of the translational motion thereof. The security device (1) comprises means (5) for selective coupling of the roller (3) to one of a plurality of links (2, 2a, 2b, 2c), the link (2, 2a, 2b, 2c) chosen for coupling forming the adjustment link (2b).

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 09 17 3327

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
