Description

[0001] The present invention relates to novel CXCR7 receptor modulators of formula (I) and their use as pharmaceuticals. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing one or more compounds of formula (I), and their use as CXCR7 receptor modulators. The invention further relates to the compounds of formula (I) and their use as pharmaceuticals in combination with one or more therapeutic agents and / or radiotherapy in the treatment of cancers, especially in the treatment of malignant glioma, in particular glioblastoma multiforme.

[0002] Chemokine receptors are a group of G-protein coupled receptors (GPCRs) that bind peptidic chemokine ligands with high affinity. The predominant function of chemokine receptors is to guide leukocyte trafficking to lymphoid organs and tissues under resting conditions as well as during inflammation, but a role for certain chemokine receptors on non-hematopoietic cells and their progenitors has also been recognized.

[0003] Signaling networks and metabolic profiles of cancer cells differ in a microenvironment dependent manner. This is a major reason for lack of therapeutic response of tumors at certain organ sites and of tumor metastases in comparison to primary tumors. CXCL12 (alias stromal cell-derived factor 1, SDF-1; alias Pre-B cell growth stimulating factor, PBSF), a stroma-derived chemo-attractant, exerts anti-apoptotic effects, displays pro-angiogenic properties and plays a key role in seeding circulating tumor cells to metastatic sites. CXCL12 binds and activates two receptors, CXCR7 (alias ACKR3, alias RDC1, alias CMKOR1, alias GPR159) and CXCR4 (alias Fusin, alias Leukocyte-derived seven-transmembrane-domain receptor; LESTR, alias D2S201E, alias seven-transmembrane-segment receptor, alias HM89, alias lipopolysaccharide-associated protein 3; lap3, alias LPS-associated protein 3).

[0004] The expression of the CXCL12 receptor CXCR7 correlates with diseases progression in cancer (among others in hormone refractory prostate cancer, in renal cell carcinoma, cervical cancer, papillary thyroid carcinoma, bladder cancer, Ewing's sarcoma, colorectal cancers, lung cancer, meningiomas, MALT lymphoma and in tumors in the brain). CXCR7 is also expressed in hepatocellular carcinoma, breast cancer, osteosarcoma, leukemia, gallbladder cancers, alveolar rhabdomyosarcoma, myeloma, non-small cell lung cancer, oral cancers and pancreas cancer (for review see Sun et al.; CXCL12/CXCR4/CXCR7 Chemokine Axis and Cancer Progression; Cancer Metastasis Rev. 2010, 29(4), 709-722).

[0005] CXCR7 silencing and targeting have been shown to reduce tumor growth in experimental disease models as single agents, or in combination with cytotoxic therapies [Wang et al.; The role of CXCR7/RDC1 as a chemokine Receptor for CXCL12/SDF-1 in prostate cancer; Journal of Biochemical Chemistry 2008, 293(7), 4283-4294; Ebsworth et al.; The effect of the CXCR7 inhibitor CCX662 on survival in the ENU rat model of glioblastoma; J Clin Oncol 2012, 30, (suppl; abstr e13580); Zheng et al.; Chemokine receptor CXCR7 regulates the invasion, angiogenesis and tumor growth of human hepatocellular carcinoma cells; Journal of Experimental and Clinical Cancer Research. 2010, 29: 31; Miao et al.; CXCR7 (RDC1) promotes breast and lung tumor growth in vivo and is expressed on tumor associated vasculature; PNAS 2007, 104(40), 15735-15740; Burns et al.; A novel chemokine receptor for SDF-1 and I-TAC involved in cell survival, cell adhesion, and tumor development; Journal of Experimental Medicine 2006, 203(9), 2201-2213; Walters et al.; "Inhibition of CXCR7 extends survival following irradiation of brain tumours in mice and rats", British Journal of Cancer (2014), 1-10 | doi: 10.1038/bjc.2013.830], including among others hepatocellular carcinoma, Kaposi's sarcoma, T cell leukemia, lymphoma, lung carcinomas, breast cancer, rhabdomyosarcoma, prostate cancer, pancreatic cancer and glioblastoma; to alter tumor-associated blood vessels; to reduce tumor cell seeding; to reduce rheumatoid arthritis clinical scores; to decrease the clinical severity of experimental autoimmune encephalomyelitis; to attenuate chronic hypoxia induced pulmonary hypertension, to induce anxiolytic-like behaviour, to trigger an angiocrine response to initiate liver regeneration and resolve fibrosis, and to improve beneficial effects of mesenchymal stem cells based therapies for renal ischemia/reperfusion injury [Cruz-Orengo et al.; CXCR7 influences leukocyte entry into the CNS parenchyma by controlling abluminal CXCL12 abundance during autoimmunity; Journal of Experimental Medicine 2011, 208(2), 327-339; Sartina et al.; Antagonism of CXCR7 attenuates chronic hypoxia-induced pulmonary hypertension; Pediatric Research 2012, 71(6), 682-688; Watanabe et al.; Pathogenic role of CXCR7 in rheumatoid arthritis; Arthritis and Rheumatism 2010, 62(11), 3211-3220; Ding et al, Divergent angiocrine signals from vascular niche balance liver regeneration and fibrosis; Nature 2014; 505(7481):97-102; Ikeda et al, Modulation of Circadian Glucocorticoid Oscillation via Adrenal Opioid-CXCR7 Signaling Alters Emotional Behavior; Cell 2013, 155(6):1323-36].

[0006] Recent studies have provided increasing evidence that activation of the CXCL12 pathway is a potential mechanism of tumor resistance to both conventional therapies and biological agents via multiple complementary actions: (i) by directly promoting cancer cell survival, invasion, and the cancer stem and/or tumor-initiating cell phenotype; (ii) by recruiting "distal stroma" (i.e., myeloid bone marrow-derived cells) to indirectly facilitate tumor recurrence and metastasis; and (iii) by promoting angiogenesis directly or in a paracrine manner. Duda DG et al (Clin Cancer Res; 2011, 17(8); 2074-80) recently discussed preclinical and clinical data that support the potential use of anti-CXCL12 agents including CXCR7 modulators as sensitizers to currently available therapies in cancer treatments.

[0007] Specifically, the potential role of CXCR7 in brain tumors, malignant glioma and in glioblastoma multiforme is

known from the literature. Modulators of the CXCL12 pathway including CXCR7 modulators have been mentioned as potential therapeutic agents for treating brain cancer in combination with chemotherapeutic agents or radiotherapy. For example, Hattermann et al (Cancer research, 2010, 70 (8):3299-3308) teach that CXCL12 "stimulation prevented camp-

5 tothecin- and temozolomide-induced apoptosis and that a CXCR7 antagonist reduced the antiapoptotic effect of CXCL12". The authors concluded that "CXCR7 is a functional receptor for CXCL12 in astrocytomas/glioblastomas and mediates resistance to drug-induced apoptosis". Furthermore, Hattermann et al (Oncology reports, 27: 1348-1352, 2012) teach that "CXCL12 abrogates the antiproliferative effect of temozolomide". The authors also teach that this effect could be almost completely abolished by a CXCR7 specific antagonist, "indicating that the anti-apoptotic effect of CXCL12 is

10 mainly mediated via CXCR7". Ebsworth et al (Neuro Oncol (2013) 15 (suppl 3):iii37-iii61. ET-023) teach that a CXCR7 antagonist significantly prolongs survival when administered in combination with radiotherapy in a rat model of glioblastoma. This finding is supported by other studies (e.g. Ebsworth et al (J Clin Oncol 30, 2012, suppl; abstr e13580; Walters et al.; British Journal of Cancer 2014, 1-10 | doi: 10.1038/bjc.2013.830) disclosing that *in vivo* inhibition of CXCR7 in concert with radiotherapy results in a significant extension of survival time in another rat model of glioblastoma. In addition, Liu SC et al (Neuro-Oncology 2014; 16(1):21-28) teach that inhibition of CXCL12 after irradiation inhibits tumor

15 recurrence in autochthonous brain tumors in rats. Liu SC et al (Neuro Oncol (2013) 15 (suppl 3):iii189-iii190. RB-002. doi: 10.1093/neuonc/not188) also teach that inhibition of CXCL12 in a brain metastasis model after irradiation produced a marked inhibition of tumor growth and prolongation of lifespan compared to irradiation alone. Calatozzolo C et al (Cancer Biology and Therapy 2011, 11:2, 1-12) teach in *in vitro* experiments that CXCR7 antagonists showed complete inhibition of glioma proliferation.

20 **[0008]** CXCR7 is also reported to be expressed in brain metastases (Salmaggi et al, Cancer Biology and therapy 2009, 8:17, 1-7). The authors concluded that the CXCL12/CXCR4/CXCR7 pathway could be an interesting target for further researches investigating the role of these molecules in invasion and proliferation of metastatic cells.

[0009] Furthermore, CXCL12 depletion sensitizes cancer cells to chemotherapy *in vivo* and CXCL12 treatment blocks colonic carcinoma metastasis. CXCR7 is also a receptor for CXCL11 (alias small inducible cytokine subfamily b, member

25 11; scyb11, alias interferon-gamma-inducible protein 9; ip9, alias small inducible cytokine subfamily b, member 9b; scyb9b) and therefore modulators of CXCR7 activity can also be used in indications with CXCL11-associated pathology. CXCR7 functions also as a receptor for the opioid peptide BAM22 and its related peptides (peptide E, peptides BAM12, BAM14, BAM18) and therefore modulators of CXCR7 activity possibly may also be used in indications with opioid peptides associated pathologies (Ikeda et al Cell 155, 1323-1336, December 5, 2013). CXCR7 has also been shown to

30 function as a scavenger receptor for CXCL12. Thus, CXCR7 targeting has been shown to alter CXCL12 local concentration leading to a deregulation of the CXCL12 concentration gradient. The biological properties of CXCR7 modulators thus include, but are not limited to, any physiological function and/or cellular function linked and / or controlled by CXCL12 (Duda et al.; CXCL12 (SDF1alpha)-CXCR4/CXCR7 pathway inhibition: an emerging sensitizer for anticancer therapies?; Clin. Cancer Res. 2011 17(8) 2074-2080; Naumann et al.; CXCR7 function as a scavenger for CXCL12 and CXCL11; Plos One 2010, 5(2) e9175).

35 **[0010]** CXCR7 modulation (using small molecules antagonizing CXCL12 binding on CXCR7, or anti-CXCR7 antibodies, or RNA interference techniques to silence CXCR7 expression), CXCL12 modulation of activity/expression, or CXCR7 expression is, thus, associated with diseases and disorders including cancer, notably carcinomas, leukemias, adenocarcinomas, malignant gliomas, glioblastoma multiforme, brain metastases, multiple myelomas, renal clear cell carcinoma, prostate cancer, pancreatic adenocarcinoma, melanoma, metastatic melanoma, rhabdomyosarcoma, hepatocellular carcinoma, colon tumors, breast cancer, non-small cell lung cancer, oral tumors, adult T-cell leukemia, gallbladder cancer, brain tumors, esophageal cancer, Ewing's sarcoma, bladder cancer, meningiomas, lymphoma, viral-induced tumors, Burkitt's lymphoma, Hodgkin's lymphoma, MALT lymphoma, papillary thyroid carcinoma, cervical cancer, osteosarcoma, lymphoproliferative disease, Kaposi's sarcoma, and choriocarcinoma; primary intra-ocular B-cell lymphoma;

40 inflammation; multiple sclerosis; renal allograft rejection; rheumatoid arthritis; auto-immune encephalomyelitis; demyelinating diseases; systemic lupus erythematosus; osteoarthritis; pulmonary vascular diseases; acute renal failure; ischemia; acute coronary syndrome; inflammatory bowel disease; injured central nervous system; HSCs transplantation; cerebral ischemia; hypertension; pulmonary hypertension; Shiga-toxin-associated hemolytic uremic syndrome; pre-eclampsia; chronic rhinosinusitis; HIV / AIDS; atherosclerosis; acute lung injury; asthma; liver fibrosis, cirrhosis; stress-related disorders; proliferative diabetic retinopathy; West Nile virus encephalitis; vascular injury; pulmonary fibrosis; diseases involving opioid peptides; and diseases involving CXCR7 and/or CXCL12 and/or CXCL11 mediated metastasis, chemotaxis, cell adhesion, trans-endothelial migration, cell proliferation and/or survival.

[0011] WO2009/076404 discloses certain carboxamide compounds comprising a bicyclic ring, which are antagonists of the chemokine CCR2 receptor. WO1999/042456 and WO2002/046164 disclose certain tetrahydroisoquinoline compounds which are active as positive AMPA receptor modulators, respectively, as estrogen receptor- β ligands. JP 2002 371042 discloses certain diamine compounds as CXCR4 antagonists; WO2008/051547 discloses fused bicyclic derivatives of 2,4-diaminopyrimidine as ALK and C-MET inhibitors; WO2009/080725 discloses certain oxadiazole derivatives as S1P modulators; and US 2005/192272 disclose benzodiazepine derivatives as CXCR4 inhibitors.

[0017] Where the plural form is used for compounds, salts, pharmaceutical compositions, diseases and the like, this is intended to mean also a single compound, salt, or the like.

[0018] Any reference to compounds of formula (I) according to embodiments 1) to 28) is to be understood as referring also to the salts (and especially the pharmaceutically acceptable salts) of such compounds, as appropriate and expedient.

[0019] The term "pharmaceutically acceptable salts" refers to salts that retain the desired biological activity of the subject compound and exhibit minimal undesired toxicological effects. Such salts include inorganic or organic acid and/or base addition salts depending on the presence of basic and/or acidic groups in the subject compound. For reference see for example "Handbook of Pharmaceutical Salts. Properties, Selection and Use.", P. Heinrich Stahl, Camille G. Wermuth (Eds.), Wiley-VCH, 2008; and "Pharmaceutical Salts and Co-crystals", Johan Wouters and Luc Quéré (Eds.), RSC Publishing, 2012.

[0020] Definitions provided herein are intended to apply uniformly to the compounds of formula (I), as defined in any one of embodiments 1) to 26), and, *mutatis mutandis*, throughout the description and the claims unless an otherwise expressly set out definition provides a broader or narrower definition. It is well understood that a definition or preferred definition of a term defines and may replace the respective term independently of (and in combination with) any definition or preferred definition of any or all other terms as defined herein.

Examples of (C_{1-5}) alkyl groups as used for R^{10} are methyl, ethyl, propyl, isopropyl, isobutyl, *tert*-butyl, and 2,2-dimethyl-propyl; preferred are methyl and ethyl.

[0023] Examples of substituted (C_{2-5}) alkyl groups as used for R^4 are 2-methoxy-ethyl, 2-hydroxy-ethyl, 2-hydroxy-propyl, 2-hydroxy-2-methyl-propyl, 3-hydroxy-3-methyl-butyl, and 2-hydroxy-3-methoxy-propyl; especially 2-hydroxy-3-methoxy-propyl and 2-hydroxy-2-methyl-propyl. Preferred are (C_{2-4}) alkyl groups mono-substituted with hydroxy, such as especially 2-hydroxy-2-methyl-propyl.

[0024] The term " (C_{x-y}) alkylene-", used alone or in combination, refers to bivalently bound alkyl group as defined before containing x to y carbon atoms. Preferably, the points of attachment of a (C_{1-y}) alkylene group are in 1,1-diyl, in 1,2-diyl, or in 1,3-diyl arrangement. Preferably, the points of attachment of a (C_{2-y}) alkylene group are in 1,2-diyl or in 1,3-diyl arrangement. For the linker L^2 , examples of (C_{1-3}) alkylene- groups are methylene, ethylene, ethane-1,1-diyl, and propylene. For the substituent (C_{2-4}) alkylene- NR^6R^7 as used for R^4 examples of (C_{2-4}) alkylene- groups are notably ethylene and propylene, preferred is ethylene.

[0045] The compounds of formula (I) according to embodiments 1) to 28) and their pharmaceutically acceptable salts can be used as medicaments, e.g. in the form of pharmaceutical compositions for enteral (such especially oral) or parenteral administration (including topical application or inhalation).

[0046] The production of the pharmaceutical compositions can be effected in a manner which will be familiar to any person skilled in the art (see for example Remington, The Science and Practice of Pharmacy, 21st Edition (2005), Part 5, "Pharmaceutical Manufacturing" [published by Lippincott Williams & Wilkins]) by bringing the described compounds of formula (I) or their pharmaceutically acceptable salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

[0047] The present invention also relates to compounds of the formula (I) for use in a method for the prevention or treatment of a disease or disorder mentioned herein comprising administering to a subject a pharmaceutically active

amount of a compound of formula (I) according to embodiments 1) to 28).

[0048] In a preferred embodiment of the invention, the administered amount is comprised between 1 mg and 1000 mg per day, particularly between 5 mg and 500 mg per day, more particularly between 25 mg and 400 mg per day, especially between 50 mg and 200 mg per day.

[0049] Whenever the word "between" is used to describe a numerical range, it is to be understood that the end points of the indicated range are explicitly included in the range. For example: if a temperature range is described to be between 40 °C and 80 °C, this means that the end points 40 °C and 80 °C are included in the range; or if a variable is defined as being an integer between 1 and 4, this means that the variable is the integer 1, 2, 3, or 4.

[0050] Unless used regarding temperatures, the term "about" placed before a numerical value "X" refers in the current application to an interval extending from X minus 10% of X to X plus 10% of X, and preferably to an interval extending from X minus 5% of X to X plus 5% of X. In the particular case of temperatures, the term "about" placed before a temperature "Y" refers in the current application to an interval extending from the temperature Y minus 10 °C to Y plus 10 °C, and preferably to an interval extending from Y minus 5 °C to Y plus 5 °C.

[0051] For avoidance of any doubt, if compounds are described as useful for the prevention or treatment of certain diseases, such compounds are likewise suitable for use in the preparation of a medicament for the prevention or treatment of said diseases.

In a sub-embodiment, such a further particular disease or disorder relating to the CXCR7 receptor or its ligands is especially pulmonary hypertension.

[0058] The compounds of formula (I) according to any one of embodiments 1) to 28) are in particular useful as therapeutic agents for the prevention or treatment of a cancer. They can be used as single therapeutic agents or in combination with one or more chemotherapy agents and / or radiotherapy and / or targeted therapy. In a sub-embodiment, when a compound of formula (I) is used for the prevention or treatment of a cancer in combination with one or more chemotherapy agents and / or radiotherapy, such cancer is especially a malignant glioma, in particular a glioblastoma multiforme. Such combined treatment may be effected simultaneously, separately, or over a period of time.

[0059] The invention, thus, also relates to pharmaceutical compositions comprising a pharmaceutically acceptable carrier material, and:

- a compound of formula (I) according to any one of embodiments 1) to 28);
- and one or more cytotoxic chemotherapy agents.

[0060] The invention, thus, further relates to a kit comprising

- a pharmaceutical composition, said composition comprising a pharmaceutically acceptable carrier material, and:
 - a compound of formula (I) according to any one of embodiments 1) to 28);
- and instructions how to use said pharmaceutical composition for the prevention or the treatment of a cancer (especially of a malignant glioma, in particular of a glioblastoma multiforme), in combination with chemotherapy and / or radiotherapy and / or targeted therapy.

[0061] The terms "radiotherapy" or "radiation therapy" or "radiation oncology", refer to the medical use of ionizing radiation in the prevention (adjuvant therapy) and / or treatment of cancer; including external and internal radiotherapy.

[0062] The term "targeted therapy" refers to the prevention (adjuvant therapy) and / or treatment of cancer with one or more anti-neoplastic agents such as small molecules or antibodies which attack specific types of cancer cells with less harm to normal cells. Some targeted therapies block the action of certain enzymes, proteins, or other molecules involved in the growth and spread of cancer cells. Other types of targeted therapies help the immune system kill cancer cells (immunotherapies); or deliver toxic substances directly to cancer cells and kill them.

[0063] The term "chemotherapy" refers to the treatment of cancer with one or more cytotoxic anti-neoplastic agents ("cytotoxic chemotherapy agents"). Chemotherapy is often used in conjunction with other cancer treatments, such as radiation therapy or surgery. The term especially refers to conventional chemotherapeutic agents which act by killing cells that divide rapidly, one of the main properties of most cancer cells. Chemotherapy may use one drug at a time (single-agent chemotherapy) or several drugs at once (combination chemotherapy or polychemotherapy). Chemotherapy using drugs that convert to cytotoxic activity only upon light exposure is called photochemotherapy or photodynamic therapy.

[0064] The term "cytotoxic chemotherapy agent" or "chemotherapy agent" as used herein refers to an active anti-neoplastic agent inducing apoptosis or necrotic cell death. When used in combination with the compounds of formula (I), the term especially refers to conventional cytotoxic chemotherapy agents such as:

- a) alkylating agents (for example mechlorethamine, chlorambucil, cyclophosphamide, ifosfamide, streptozocin, carmustine, lomustine, melphalan, busulfan, dacarbazine, temozolomide, thiopeta or altretamine);
- b) platinum drugs (for example cisplatin, carboplatin or oxaliplatin);
- c) antimetabolite drugs (for example 5-fluorouracil, capecitabine, 6-mercaptopurine, methotrexate, gemcitabine,

cytarabine, fludarabine or pemetrexed);

d) anti-tumor antibiotics (for example daunorubicin, doxorubicin, epirubicin, idarubicin, actinomycin-D, bleomycin, mitomycin-C or mitoxantrone);

e) mitotic inhibitors (for example paclitaxel, docetaxel, ixabepilone, vinblastine, vincristine, vinorelbine, vindesine or estramustine); or

f) topoisomerase inhibitors (for example etoposide, teniposide, topotecan, irinotecan, diflomotecan or elomotecan).

[0065] When used in combination with the compounds of formula (I), preferred cytotoxic chemotherapy agents are the above-mentioned alkylating agents (notably mechlorethamine, chlorambucil, cyclophosphamide, ifosfamide, streptozocin, carmustine, lomustine, melphalan, busulfan, dacarbazine, 3-methyl-(1H-1,2,4-triazen-1-yl)imidazole-4-carboxamide (MTIC) and prodrugs thereof such as especially temozolomide, thiotepa, altretamine; or pharmaceutically acceptable salts of these compounds; in particular temozolomide); and mitotic inhibitors (notably paclitaxel, docetaxel, ixabepilone, vinblastine, vincristine, vinorelbine, vindesine, estramustine; or pharmaceutically acceptable salts of these compounds; in particular paclitaxel). Most preferred cytotoxic chemotherapy agents to be used in combination with the compounds of formula (I) are those routinely used in the treatment of glioblastoma multiforme, in particular temozolomide. Equally preferred is radiotherapy.

[0066] Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms.

a) Combined modality chemotherapy is the use of drugs with other cancer treatments, such as radiation therapy or surgery.

b) Induction chemotherapy is the first line treatment of cancer with a chemotherapeutic drug. This type of chemotherapy is used for curative intent.

c) Consolidation chemotherapy is the given after remission in order to prolong the overall disease free time and improve overall survival. The drug that is administered is the same as the drug that achieved remission.

d) Intensification chemotherapy is identical to consolidation chemotherapy but a different drug than the induction chemotherapy is used.

e) Combination chemotherapy involves treating a patient with a number of different drugs simultaneously. The drugs differ in their mechanism and side effects. The biggest advantage is minimising the chances of resistance developing to any one agent. Also, the drugs can often be used at lower doses, reducing toxicity.

f) Neoadjuvant chemotherapy is given prior to a local treatment such as surgery, and is designed to shrink the primary tumor. It is also given to cancers with a high risk of micrometastatic disease.

g) Adjuvant chemotherapy is given after a local treatment (radiotherapy or surgery). It can be used when there is little evidence of cancer present, but there is risk of recurrence. It is also useful in killing any cancerous cells that have spread to other parts of the body. These micrometastases can be treated with adjuvant chemotherapy and can reduce relapse rates caused by these disseminated cells.

h) Maintenance chemotherapy is a repeated low-dose treatment to prolong remission.

i) Salvage chemotherapy or palliative chemotherapy is given without curative intent, but simply to decrease tumor load and increase life expectancy. For these regimens, a better toxicity profile is generally expected.

[0067] When combined with the compounds of formula (I), preventive or curative forms of chemotherapy (or *mutatis mutandis*: radiotherapy) such as those listed under a), b) c), d), e), and especially g) and / or h) above are preferred.

[0068] "Simultaneously" or "simultaneous", when referring to an administration type, means in the present application that the administration type concerned consists in the administration of two or more active ingredients by the same route and at approximately the same time. When administered simultaneously, said two or more active ingredients may be administered in a fixed dose combination, or equivalent (e.g. by using two or more different pharmaceutical compositions, in general to be administered by the same route of administration at approximately the same time),

[0069] "Fixed dose combination", when referring to an administration type, means in the present application that the administration type concerned consists in the administration of one single pharmaceutical composition comprising the two or more active ingredients.

[0070] "Separately" or "separate", when referring to an administration type, means in the present application that the administration type concerned consists in the administration of two or more active ingredients at approximately the same time by at least two different routes. It is understood that a separate administration will lead to a treatment phase where for a certain period of time (e.g. at least one day) the subject is exposed to only one of the two or more active ingredients and/or treatments, and to a treatment phase where the subject is exposed to the two or more active ingredients and/or treatments at the same time. Separate administration especially refers to situations wherein at least one of the active ingredients and/or treatments is given with a periodicity substantially different from daily (such as once or twice daily) administration (e.g. wherein one active ingredient and/or treatment is given once or twice a day, and another is given once a week). For example when used in combination with radiotherapy, the present CXCR7 modulators would be used

"separately".

[0071] By administration "over a period of time" is meant in the present application the administration of two or more active ingredients / or of one or more active ingredients in combination with radiotherapy treatment, at different times. In a sub-embodiment, the term refers to an administration method according to which the entire administration of one of the active ingredients and / or of the radiotherapy treatment, is completed before the administration of the other / the others begins. In this way it is possible to administer one of the active ingredients / to use radiotherapy, for several months before administering the other active ingredient or ingredients. Administration "over a period of time" encompasses situations wherein the active ingredients are not given with the same periodicity (e.g. wherein one active ingredient is given once a day and another is given once a week).

[0072] Administration "over a period of time" also encompasses situations wherein the CXCR7 modulators of formula (I) would be used in a treatment that starts after an initial chemotherapeutic or radiotherapeutic treatment (for example an induction chemotherapy), optionally in combination with a further / an ongoing chemotherapeutic or radiotherapeutic treatment (for example in combination with a consolidation chemotherapy, an intensification chemotherapy, an adjuvant chemotherapy, or a maintenance chemotherapy; or radiotherapeutic equivalents thereof); wherein such further / ongoing chemotherapeutic or radiotherapeutic treatment would be simultaneously, separately, or over a period of time in the sense of "not given with the same periodicity".

[0073] Autoimmune disorders may be defined as comprising rheumatoid arthritis (RA); multiple sclerosis (MS); autoimmune encephalomyelitis; and inflammatory bowel disease (IBD, especially comprising Crohn's disease and ulcerative colitis). In addition, autoimmune diseases further comprise disorders such as systemic lupus erythematosus (SLE); psoriasis; psoriatic arthritis; lupus nephritis; interstitial cystitis; celiac disease; auto-immune encephalomyelitis; demyelinating diseases; osteoarthritis; antiphospholipid syndrome; thyroiditis such as Hashimoto's thyroiditis; lymphocytic thyroiditis; myasthenia gravis; type I diabetes; uveitis; episcleritis; scleritis; Kawasaki's disease; uveo-retinitis; posterior uveitis; uveitis associated with Behcet's disease; uveomeningitis syndrome; allergic encephalomyelitis; atopic diseases such as rhinitis, conjunctivitis, dermatitis; and post-infectious autoimmune diseases including rheumatic fever and post-infectious glomerulonephritis. In a sub-embodiment, autoimmune disorders include rheumatoid arthritis (RA); multiple sclerosis (MS); and inflammatory bowel disease (comprising Crohn's disease and ulcerative colitis); as well as systemic lupus erythematosus (SLE); lupus nephritis; interstitial cystitis; celiac disease; auto-immune encephalomyelitis; demyelinating diseases; osteoarthritis; and type I diabetes.

[0074] Inflammatory diseases may be defined as comprising especially chronic rhinitis, as well as asthma, chronic obstructive pulmonary disorder (COPD), atherosclerosis, myocarditis, dry eye disease, sarcoidosis, inflammatory myopathies, and acute lung injury.

[0075] Transplant rejection may be defined as comprising rejection of transplanted organs such as kidney, liver, heart, lung, pancreas, cornea, and skin; graft-versus-host diseases brought about by hematopoietic stem cell transplantation; chronic allograft rejection and chronic allograft vasculopathy.

[0076] Fibrosis may be defined as comprising especially liver fibrosis, liver cirrhosis, idiopathic pulmonary fibrosis, renal fibrosis, endomyocardial fibrosis, and arthrofibrosis.

[0077] The compounds of formula (I) according to embodiments 1) to 28) are also useful in method of treating tumors comprising administering an effective amount of the compound of formula (I) wherein said effective amount leads to a change of tumor properties, and wherein said modification is achieved by modulating the CXCL12 receptor pathway; wherein said treatment may optionally be effected in combination with a conventional chemotherapeutic or radiotherapeutic treatment (in which case the tumor is notably a malignant glioma, in particular a glioblastoma multiforme). Such combined treatment may be effected simultaneously, separately, or over a period of time.

[0078] The compounds of formula (I) are also useful in method of modulating an immune response comprising the administration of an effective amount of the compound of formula (I) wherein said effective amount modulates an inflammatory disease and wherein said response is mediated by the CXCL12 receptor pathway.

[0079] Besides, any preferences, (sub-)embodiments, and uses indicated for the compounds of formula (I) (whether for the compounds themselves, salts thereof, compositions containing the compounds or salts thereof, or uses of the compounds or salts thereof, etc.) apply *mutatis mutandis* to compounds of formula (II), (III), (IV), and (V).

Preparation of compounds of Formula (I)

[0080] A further aspect of the invention is a process for the preparation of compounds of Formula (I). Compounds of Formula (I) can be prepared from commercially available or well-known starting materials according to the methods described in the experimental part, by analogous methods; or according to the general sequence of reactions outlined below, wherein R¹, R⁴, L¹, L², X, Y¹, Y² and Ar¹ are as defined for Formula (I). Optimum reaction conditions may vary with the particular reactants or solvents used, but such conditions can be determined by a person skilled in the art by routine optimisation procedures. Other abbreviations used herein are explicitly defined, or are as defined in the experimental section. In some instances the generic groups R¹, R⁴, L¹, L², X, Y¹, Y² and Ar¹ might be incompatible with the

assembly illustrated in the schemes below and so will require the use of protecting groups (PG). The use of protecting groups is well known in the art (see for example "Protective Groups in Organic Synthesis", T.W. Greene, P.G.M. Wuts, Wiley-Interscience, 1999). For the purposes of this discussion, it will be assumed that such protecting groups as necessary are in place. In some cases the final product may be further modified, for example, by manipulation of substituents to give a new final product. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, and hydrolysis reactions which are commonly known to those skilled in the art. The compounds obtained may also be converted into salts, especially pharmaceutically acceptable salts, in a manner known *per se*.

Preparation of compounds of Formula (I)

[0081] Generally compounds of Formula (I) can be obtained by reaction of a compound of Structure A with an amine of Structure B in a typical amide coupling reaction, using HATU or another coupling agent in a solvent such as DCM or DMF or a combination of both at a temperature of 0°C or at RT or at elevated temperature.

Preparation of compounds of Formula (III)

[0082] Compounds of Formula (I) can generally also be obtained by derivatization of a free amine precursor. For example compounds of Formula (I) wherein the seven-membered ring is as in the compounds of Formula (III) can be obtained from a free amine precursor of Structure 1 and an aldehyde of Structure 2 in the conditions of a typical reductive amination reaction. In this particular case, R⁵ represents R^{5a})CH₂. For example a compound of Structure 1 is reacted with an aldehyde of Structure 2 in a solvent such as DCM, THF or MeOH using NaBH₃CN, NaBH(OAc)₃ or NaBH₄ as the reducing agent.

Formula (III)

[0083] Similarly, examples of Formula (III) wherein R⁵ represents R^{5b})CO can be obtained by reaction of a compound of Structure 1, preferably in presence of a base such as TEA or DIPEA, with:

- a carboxylic acid of Structure 3 in presence of a coupling reagent such as HATU or like in a solvent such as DCM or DMF at 0°C or RT; or
- a carboxylic acid derivative of Structure 3' wherein the group LG represents a leaving group such as Cl or the like in a solvent such as THF, DCM or the like preferably at 0°C.

Structure 1

Structure 2

Structure 3

Structure 3'

[0084] Depending on the compatibility of the generic groups R^4 , L^1 , L^2 , R^5 , and Ar^1 a final deprotection step according to conditions well known in the art may be required for reaching the final compound of Formula (III).

[0085] Compounds of Structure 3A which are a particular case of compounds of Structure 1 can be made in a four steps procedure from compounds of Structure 3A-1 which are commercially available or easily made by a person skilled in the art, e.g. as shown in Scheme 1 below.

[0086] In a first step a compound of Structure 3A-1 may be alkylated with ethyl- or methylbromoacetate in an alkylation reaction in a polar solvent such as MeCN, DMF or THF in presence of an organic base such as DIPEA, TEA or of an inorganic base such as K_2CO_3 to yield an ester of Structure 3A-2. This ester can be then saponified using a base such as LiOH, NaOH or the like in a solvent such as THF, EtOH, MeOH or a mixture of those, typically at RT to yield the corresponding acid 3A-3. This acid can be reacted in an amide coupling reaction with a base of Structure B with HATU or a similar amide coupling reagent in a solvent such as DCM or DMF or a combination of those in presence of a base such as DIPEA or TEA to yield an amide of Structure 3A-4. Finally the protecting group can be removed using well-known methods to give a compound of Structure 3A.

Scheme 1

[0087] Compounds of Structure 3B which are a particular case of compounds of Structure 1 can be prepared following the Scheme 2 below. In the first step a trifluoromethanesulfonate of Structure 3B-1 is synthesized from a compound of Structure 3A-1 by reaction of the phenol moiety with trifluoromethane-sulfonic anhydride at a temperature below $0^\circ C$ in a solvent such as DCM. Then the compound of Structure 3B-1 is reacted with the amine of Structure 5A-2 (which synthesis is described below) under typical conditions of a Buchwald-Hartwig reaction. In this reaction a mixture of the compound of Structure 3B-1 and an amine of Structure C are heated to a temperature between $80^\circ C$ to $140^\circ C$ in a flask or a sealed tube under inert atmosphere in the presence of a palladium catalyst, for example $Pd_2(dba)_3$ or $Pd(PPh_3)_4$ with a base such as *tert*-BuOH, KOH or preferentially Cs_2CO_3 in a solvent such as dioxane, DMF or toluene in presence

of a ligand, preferentially Brettphos®. Removal of the protecting group from compound of Structure 3B-2 allows for the formation of a compound of Structure 3B.

Scheme 2

Preparation of compounds of Formula (IV)

[0088] Compounds of Formula (I) wherein the seven-membered ring is as in the compounds of Formula (IV) can be prepared according to the general sequence of reactions outlined below.

Formula (IV)

[0089] Generally examples of Formula (IV) are obtained from a carboxylic acid precursor of Structure 4 and an amine of Structure B using HATU or another amide coupling reagent in a solvent such as DCM or DMF at RT or 0°C in the presence of a base like TEA or DIPEA. Depending on the compatibility of the generic groups R⁴, L¹, L², R⁵, Y¹ and Ar¹ a final deprotection step according to conditions well known in the art may be required for reaching the final derivative of Formula (IV).

Structure 4

Preparation of compounds of Structure 4

[0090] Compounds of Structure 4A which represent a particular case of compounds of Structure 4 can be prepared by one of the synthetic pathways described below.

Structure 4A

[0091] Compounds of Structure 4A wherein Y² represents CH₂ may be prepared by the procedure illustrated in Scheme 3. A commercially available amine 4A-1 is alkylated by treatment with 2-hydroxy-3-nitrobenzaldehyde in the presence of a reductive reagent like NaBH₄, NaBH₃CN, NaBH(OAc)₃ in a solvent like DCM, MeOH, THF to give the corresponding amine 4A-2. Compound 4A-2 can be reacted with a glycolic acid derivative (with or without protecting group) in presence of an amide coupling reagent such as HATU or HBTU in a solvent such as DCM or DMF at RT or 0°C in the presence of a base like TEA or DIPEA to yield compound 4A-3 after a last deprotection step if required. Cyclization to yield derivative 4A-5 requires activation of the alcohol of the glycolic acid moiety which can be achieved in numerous ways: the alcohol 4A-3 can be treated under Mitsunobu reaction conditions (PPh₃, DEAD) in a compatible solvent such as THF at RT or 0°C; or derivatives 4A-3 can be converted into compounds 4A-4 where the alcohol is activated through transformation into well-known leaving groups; either halides such as Cl, Br or I upon treatment with thionyl or oxalyl halide reagent or the like, or Appel reaction condition; or into sulfonic esters such as methyl- or 4-methylphenyl-sulfonate upon treatment with the appropriate sulfonyl chloride, in a solvent such as DCM or THF and in presence of a base such as TEA, Pyridine or DIPEA; alternatively compound 4A-4 can be obtained directly from derivative 4A-2 upon treatment with glycolic acid derivatives such as 2-chloroacetyl chloride or 2-bromoacetyl chloride in a solvent such as toluene or DMF at RT or 0°C in the presence of a base like pyridine, TEA or DIPEA. Compounds 4A-5 can then be obtained through displacement of these leaving groups by the phenolate anion, formed in situ by basic treatment such as addition of K₂CO₃ or NaOH aqueous solution, in a solvent such as EtOH or DMF, at RT or up to reflux temperature.

[0092] Compounds 4A-6 can be obtained through reduction of the lactam function: in a typical experiment, a derivative 4A-5 is reacted with excess (such as 2 to 20 eq.) of a borane reagent such as BH₃. THF complex in a solvent such as THF at RT or reflux; partial or complete reduction of the nitro to yield derivative 4A-7 along with 4A-6 can be observed depending on the compound and reaction conditions, but the mixture can be carried on into the next step as such. Derivatives 4A-6 can then be reduced into the compounds 4A-7: in a typical experiment a compound 4A-6 is reduced with Pd/C in a solvent such as EtOH, THF, EtOAc or the like at RT in presence of H₂ or with the help of an H-Cube® hydrogen generator; alternatively a compound 4A-7 can be obtained from a compound 4A-6 by reaction at 0°C or RT with a metal powder such as Zn or Fe in presence of a mild acid proton source such as NH₄Cl in a solvent such as acetone. Similarly, by selective reduction of the nitro group, the compounds of structure 4A-5 can be converted directly to compounds of structure 4A-7 wherein X² represents CO. Compounds of Structure 4A can then be made by reaction of a compound 4A-7 with glyoxylic acid monohydrate in presence of NaBH₃CN in a solvent such as MeOH or the like; alternatively the mixture of compound 4A-7 and glyoxylic acid can be treated with Pd/C in a solvent such as MeOH, EtOH, EtOAc or the like at RT in presence of H₂ or with the help of an H-Cube® hydrogen generator to yield Structure 4A.

Scheme 3

[0093] Alternatively the intermediates of structure 4A-6 can be synthesized according to the procedure illustrated in Scheme 4.

[0094] Compounds 4A-9 are obtained by reacting an aminoethanol derivative 4A-8 with the commercially available 2-fluoro-3-nitrobenzoyl chloride in presence of a base such as pyridine or (10%) NaOH aqueous solution, in a solvent such as DCM or DMF, at 0°C or RT; aminoethanol derivatives 4A-8, with PG standing for any compatible protecting group such as TBDMS or Benzyl or even H if not protecting group is necessary, are extensively reported in literature.

Scheme 4

[0095] Alternatively 2-fluoro-3-nitrobenzoic acid can be reacted with 4A-8 using HATU or another amide coupling reagent in a solvent such as DCM or DMF at RT or 0°C in the presence of a base like TEA or DIPEA to yield 4A-9. After deprotection step if required, the alcohol in 4A-9 (PG=H) can cyclize in basic conditions to yield the derivatives 4A-10: in a typical experiment, the TBDMS alcohol protection in 4A-9 is selectively removed by treatment with a fluorine source such as TBAF (catalytic or stoichiometric amounts) in THF or the like at 0°C or RT and the *in situ* generated alkoxide anion cyclizes spontaneously to yield the derivative 4A-10. Compounds 4A-6 can be obtained through reduction of the lactam function: in a typical experiment, a derivative 4A-10 is reacted with excess of borane reagent such as BH₃-THF complex in a solvent such as THF at RT or reflux. Partial or complete reduction of the nitro group to yield derivative 4A-

7 along with 4A-6 can be observed depending on the compound and reaction conditions, but the mixture can be carried on into the next step as such. Alternatively compounds 4A-6 can be obtained through reduction of the lactam function: in a typical experiment, a derivative 4A-10 is reacted at RT with an excess of a reduction agent prepared by treatment of lithium aluminium hydride with 0.5 equivalent of concentrated sulphuric acid at 0°C in a solvent such as THF. Compounds of Structure 4B which represent a particular case of compounds of Structure 4 can be prepared by the procedure illustrated in Scheme 5.

Structure 4B

[0096] Derivatives 4B-1 wherein R may be R^{Y1} as defined for formula (I), or a suitable protecting group (PG), are commercially available or their syntheses are extensively reported in literature (see for example the patent WO2008/039420, for the synthesis of the compound with R=PMB). Derivatives 4B-1 can be oxidized into the aldehyde 4B-2 by numerous ways for whoever is skilled in the art, such as submitting compound 4B-1 to Swern oxidation or its like or by treating 4B-1 with hypervalent iodine reagent such as IBX or well-known Dess-Martin reagent in a solvent such as DCM or EtOAc at 0°C or RT. A commercially available amine 4B-3 is alkylated by treatment with compound 4B-2 in the presence of a reductive reagent like NaBH₄, NaBH₃CN, NaBH(OAc)₃ in a solvent like DCM, MeOH, THF to give the corresponding ethylenediamine derivative 4B-4.

Scheme 5

[0097] Compounds 4B-5 are obtained by reacting derivative 4B-4 with 2-fluoro-3-nitrobenzoic acid or derivatives (Z = OH, a leaving group), e.g. commercially available 2-fluoro-3-nitrobenzoyl chloride in presence of a base such as pyridine or (10%) aq. NaOH solution, in solvent such as DCM or DMF, at 0°C or RT. Alternatively, 2-fluoro-3-nitrobenzoic acid can be reacted with 4B-4 using HATU or another amide coupling reagent in a solvent such as DCM or DMF at RT or 0°C in the presence of a base like TEA or DIPEA to yield 4B-5. After standard Boc deprotection, the amine in 4B-5 can cyclize in basic conditions to yield the derivatives 4B-6: in a typical experiment, the Boc protecting group in 4B-5 is selectively removed by treatment with a strong acid such as HCl in organic solution or TFA in a solvent such as DCM, EtOAc or Dioxane at 0°C or RT; at the end of the deprotection step, excess of acid reagent is removed and the mixture

is treated with a base such as TEA or DIPEA in a solvent such as DMF or toluene at RT or up to reflux to promote cyclization and yield the corresponding derivative 4B-6. Compounds 4B-7 can be obtained through reduction of the lactam function: in a typical experiment, a derivative 4B-6 is reacted with excess (such as 2 to 20 eq.) of borane reagent such as BH_3 . THF complex in a solvent such as THF at RT or reflux; partial or complete reduction of the nitro group to yield derivative 4B-8 along with 4B-7 can be observed depending on the compound and reaction conditions, but the mixture can be carried on into the next step as such. Derivatives 4B-7 can then be reduced into the compounds 4B-8 wherein Y^2 represents CH_2 : in a typical experiment, a compound 4B-8 can be obtained from a compound 4B-7 by reaction at 0°C or RT with a metal powder such as Zn or Fe in presence of a mild acid proton source such as ammonium chloride in a solvent such as acetone according to a reaction well known by a person skilled in the art. Similarly, by selective reduction of the nitro group, the compounds of structure 4B-6 can be converted directly to compounds of structure 4B-8 wherein Y^2 represents CO. Compounds of Structure 4B can then be obtained by reaction of a compound 4B-8 with glyoxylic acid monohydrate in presence of NaBH_3CN in a solvent such as MeOH or the like; alternatively the mixture of compound 4B-8 and glyoxylic acid can be treated with Pd/C in a solvent such as MeOH, EtOH, EtOAc or the like at RT in presence of H_2 or with the help of an H-Cube® hydrogen generator to yield Structure 4B.

[0098] In case R represents a protecting group compatible with the entire reaction sequence such as PMB or allyl moieties, after the general coupling step between Structure 4B and the amine of Structure B, a last well-known deprotection step will be required to yield the corresponding compounds of Formula (IV) wherein Y^1 is NH and X^2 is CH_2 (scheme 6).

Scheme 6

[0099] In a particular case, wherein Y^1 , Y^2 and X^2 represent a CH_2 group, and L^1 is $-\text{NHCH}_2-$, Example compounds can be obtained from intermediates of Formula 4C. The synthesis of a compound of Formula 4C starts with commercially available 6-methoxy-2,3,4,5-tetrahydro-1H-benzo[c]azepine and follows a synthetic pathway in close analogy to the synthesis of compounds of Structure 3B.

[0100] In an alternative approach to compounds of Formula (IV), in case the R^5 group used in the Schemes 3, 4 and 5 represents a protecting group compatible with the entire reaction sequence such as PMB or allyl moieties, after deprotection of such group according to conditions well-known in the art, the final R^5 groups may be introduced to generate the final compounds of Formula (IV): in a typical experiment, the PMB group is cleaved off by treatment with Pd/C in a solvent such as MeOH, EtOH, EtOAc or the like at RT in presence of H_2 or with the help of an H-Cube® hydrogen generator and then the resulting scaffold can be further functionalized into final compounds of Formula (IV) wherein Y^1 is NR^Y and X^2 is CH_2 ; these manipulations may include, but are not limited to, alkylation, acylation, carbamate or urea formation which are commonly known to those skilled in the art.

Preparation of compounds of Formula (V)

[0107] Compounds of Formula (I) wherein the seven-membered ring is as in the compounds of Formula (V) can be prepared according to the general sequence of reactions outlined below.

Formula (V)

Preparation of compounds of Structure 5A

[0108] Compounds of Structure 5A which represent a particular case of compounds of Formula (V) can be prepared by one of the synthetic pathways described below.

Structure 5A

[0109] Compounds of Structure 5A may be prepared by the procedure illustrated in Scheme 12. The synthesis reaction sequence starts with *tert*-butyl 6-bromo-2,3-dihydrobenzo[*f*][1,4]oxazepine-4(5*H*)-carboxylate (EP2123644). Compounds of structure 5A-1 are obtained from the (*tert*-butoxycarbonyl)glycine and an amine of Structure B using HATU or another amide coupling reagent in a solvent such as DCM or DMF at RT or 0°C in the presence of a base like TEA or DIPEA. Deprotection of derivatives 5A-1 according to conditions well-known in the art, such as treatment with TFA or HCl in an organic solvent such as dioxane or DCM at 0°C or RT yields compounds 5A-2.

[0110] Derivative 5A-3 can be obtained through a Buchwald reaction or its like. In a typical experiment, *tert*-butyl 6-bromo-2,3-dihydrobenzo[*f*][1,4]oxazepine-4(5*H*)-carboxylate is treated with the amine 5A-2 in presence of a palladium(0) source such as Pd₂(dba)₃ or Pd(PPh₃)₄, an appropriate ligand such as Josiphos® or X-Phos®, a base such as Cs₂CO₃ or *tert*-BuOK in a solvent such as DMF or NMP at RT or higher temperature, typically at 100°C. Deprotection of derivatives 5A-3 according to conditions commonly known to those skilled in the art, such as treatment with TFA or HCl in an organic solvent such as dioxane or DCM at 0°C or RT yields compounds 5A-4. Derivatives of Formula 5A are then obtained by further functionalization of compounds 5A-4: the final R⁵ groups may be introduced to generate new compounds of Formula (IV): these manipulations may include, but are not limited to, alkylation, acylation, carbamate or urea formation which are commonly known to those skilled in the art; in a typical experiment, 5A-4 is alkylated by treatment with commercial aldehydes in the presence of a reductive reagent like NaBH₄, NaBH₃CN, NaBH(OAc)₃ in a solvent like DCM, MeOH, THF to give the corresponding compound of formula (5A). In an alternative approach, *tert*-butyl 6-bromo-2,3-dihydrobenzo[*f*][1,4]oxazepine-4(5*H*)-carboxylate is treated with well-known ammonia analogues, such as benzophenone imine or KHMDS in presence of a palladium(0) source such as Pd₂(dba)₃ or Pd(PPh₃)₄, an appropriate ligand such as Josiphos or X-Phos, a base such as Cs₂CO₃ or KO^tBu in a solvent such as DMF or NMP at RT or higher temperature, typically at 100°C; well-known treatment such as an excess of hydrazine in a solvent such as MeOH at RT in the case of the benzophenone imine exposes the amine to yield derivative 5A-5. Compounds 5A-6 can then be obtained by reaction of a compound 5A-5 with glyoxylic acid monohydrate in presence of NaBH₃CN in a solvent such as MeOH or the like; alternatively the mixture of compound 5A-5 and glyoxylic acid can be treated with Pd/C in a solvent such as MeOH, EtOH, EtOAc or the like at RT in presence of H₂ or with the help of an H-Cube® hydrogen generator to yield 5A-6. Reaction of 5A-6 with an amine of Structure B in presence of HATU or another amide coupling reagent in a solvent such as DCM or DMF at RT or 0°C in the presence of a base like TEA or DIPEA yields 5A-3 derivatives described above.

Scheme 12

[0111] Alternatively compounds of Structure 5A can be synthesized via a chemical sequence described in the Scheme 13 below.

[0112] Thus a compound of Structure 5A-7 is synthesized from 2-nitro-6-fluorobenzoic acid and $R^5NCH_2CH_2OH$ following an amide coupling reaction well known by a person skilled in the art. A compound of Structure 5A-7 is then cyclized in an intramolecular nucleophilic aromatic substitution to a compound of Structure 5A-8 by treatment with a base such as NaH or Cs_2CO_3 in a solvent such as DMF, THF or the like. The carbonyl function of the amide group is then removed to yield a compound of Structure 5A-9 following a reduction with borane such as BH_3 -THF as described previously for the transformation of amide 4A-10 to amine 4A-6. Then the aromatic nitro function of compound 5A-9 is transformed into the corresponding aniline by reduction using a metal such as zinc dust in a solvent such as acetone, or following a typical reduction with palladium/charcoal under a hydrogen atmosphere. Subsequently a compound of Structure 5A-11 is then obtained by reaction of 5A-10 with glyoxylic acid in a reductive amination reaction using a solvent such as methanol with a reducing agent such as $NaBH_3CN$ or the like. Finally a compound of structure 5A can be obtained from a compound of Structure 5A-11 and an amine of Structure B as described hereinabove. Similarly, by selective reduction of the nitro group, the compounds of structure 5A-8 can be converted directly to compounds of structure 5A-10 and then subsequently to a compound of structure 5A wherein Y^1 represents CO.

[0114] Compounds of Structure B are commercially available or are made by condensation of a primary amine of Structure B-1 with an aldehyde of Structure B-2 in a typical reductive amination reaction with a reducing agent such as $NaBH(OAc)_3$, $NaBH_3CN$ or $NaBH_4$ in a solvent such as THF, DCM, MeOH, water or the like at temperatures between $0^\circ C$ and reflux, preferentially at RT. In this case L^2 corresponds to $-CH_2-L^3$.

NMR spectroscopy

[0117] Bruker Avance II spectrometer equipped with a 400 MHz Ultrashield™ Magnet and a BBO 5mm probehead or a PAXTI 1mm probehead. Chemical shifts (δ) are reported in parts per million (ppm) relative to proton resonances resulting from incomplete deuteration of the NMR solvent, e.g. for dimethylsulfoxide $\delta(H)$ 2.49 ppm, for chloroform $\delta(H)$ 7.24 ppm. The abbreviations *s*, *d*, *t*, *q* and *m* refer to singlet, doublet, triplet, quartet, multiplet and *br* to broad, respectively. Coupling constants *J* are reported in Hz. In case NMR spectra are measured using 1mm Microprobe® tubes and a PAXTI 1mm probehead, the compounds are dissolved in non-deuterated DMSO. The spectra are then measured with double irradiation for suppression of the DMSO and H₂O peaks. In that case only a selection of representative NMR peaks of the compound is given.

II. Biological Assays

In vitro assay

[0215] The CXCI12 receptor and CXCR7 agonistic activities of the compounds of formula (I) are determined in accordance with the following experimental method.

[0216] The assay is using the PathHunter™ CHO-K1 CXCR7 β -arrestin cell line from DiscoverX. The system is based on the Enzyme Fragment Complementation Technology. Two complementing fragments of the β -galactosidase enzyme are expressed within stably transfected cells. The larger portion of β -gal, termed EA for Enzyme Acceptor, is fused to the C-terminus of β -arrestin 2. The smaller fragment, termed ProLink™ tag, is fused to CXCR7 at the C-terminus. Upon activation, β -arrestin is recruited which forces the interaction of ProLink and EA, allowing complementation of the two fragments of β -gal and the formation of a functional enzyme which is capable of hydrolysing the substrate and generating a chemiluminescent signal.

[0217] CHO-K1 CXCR7 β -arrestin cells are detached from culture dishes with a cell dissociation buffer (Invitrogen, #13151-014) and collected in growing medium (F12 HAMS 90 % (v/v) / FCS 10% (v/v), Penicilin/streptomycin 1 % (v/v)). 5000 cells per well (in 20 μ l) are seeded in a 384 well plate (white-walled, clear bottom; BD Falcon # 353274). The plate is incubated at 37°C / 5% CO₂ for 24 hours. Medium is then replaced by 20 μ l OPTIMEM (Invitrogen #31985) for 3 to 4 hours. Test compounds are dissolved at 10mM in DMSO and serially diluted in DMSO to 200X of the final concentration for dose response curves. Compounds are then diluted 1:33.3 in HBSS1X. 5 μ l / well of HBSS1X / 20mM HEPES / 0.2% BSA are added to the assay plate followed by addition of 5 μ l / well of diluted compounds. CXCL12 (Peprtech #300-28A) may be used as a reference agonist. The plate is incubated for 90 minutes at 37°C. 12 μ l of detection reagent (Path Hunter Detection Kit, DiscoverRx, #93-0001) is transferred to the assay plate and to the plate is incubated for 1 hour at room temperature. Luminescent signal is read in a microplate reader (FLUOstar Optima, bmg). The calculated EC₅₀ values may fluctuate depending on the daily cellular assay performance. Fluctuations of this kind are known to those skilled in the art. Average EC₅₀ values from several measurements are given as geometric mean values.
