WO 2008/112913 A1
INHIBITORS OF THE HEDGEHOG PATHWAY

FIELD OF THE INVENTION

[0001] This invention relates to methods of treating cancer with a compound that modulates the Hedgehog pathway and the resultant modulation of cellular activities (such as proliferation, differentiation, programmed cell death, migration, chemoinvasion and metabolism) alone or in combination with anticancer agents.

BACKGROUND OF THE INVENTION

[0003] Improvements in the specificity of agents used to treat various disease states such as cancer, metabolic, and inflammatory diseases is of considerable interest because of the therapeutic benefits which would be realized if the side effects associated with the administration of these agents could be reduced. Traditionally, dramatic improvements in the treatment of cancer are associated with identification of therapeutic agents acting through novel mechanisms.

[0004] Aberrant hedgehog (Hh) pathway signaling has been implicated in human malignancies ranging from semi-malignant tumors of the skin to highly aggressive cancers of the brain, lung, pancreas, breast, prostate and lymphoid lineages (Rubin, L. L. and de...

Finally, the Hh pathway is an essential regulator of "cancer stem cells (CSC)", which are discrete tumor cell populations that display highly enhanced survival, self-renewal, and tumorigenicity properties (Beachy, P. A., et. al. Nature, 432: 324-331, 2004). Activation of the Hh pathway has been shown to be critical for CSCs of the breast (Liu, S., et. al. Cancer Res, 66: 6063-6071, 2006), central nervous system (Clement, V., Curr Biol, 17: 165-172, 2007) as well as in hematological malignancies (Peacock, C. D., PNAS, 104: 4048-4053, 2007). These cells, in some experimental contexts, have shown to confer resistance to currently used chemotherapy (Bao, S., et. al. Nature, 444: 756-760, 2006; Dean, M., et. al. Nat Rev Cancer, 5: 275-284, 2005). Therefore, a Hh pathway inhibitor may have broad clinical utility treating of a wide range of chemotherapy-resistant malignancies.

In view of the important role of the Hedgehog pathway in biological processes and disease states, modulators of this pathway are desirable.

Typically, but not necessarily, fused-polycyclics share a vicinal set of atoms, for example naphthalene or 1,2,3,4-tetrahydro-naphthalene. A spiro ring system is not a fused-polycyclic by this definition, but fused polycyclic ring systems of the invention may themselves have spiro rings attached thereto via a single ring atom of the fused-polycyclic. In some examples, as appreciated by one of ordinary skill in the art, two adjacent groups on an aromatic system may be fused together to form a ring structure. One or two ring carbon atoms of any nonaromatic rings comprising a bicyclic or tricyclic radical may be replaced by a -C(O)-, -C(S)-, or -C(=NH)- group. R\(^x\) is hydrogen, alkyl, hydroxy, alkoxy, acyl, or alkylsulfonyl. Fused bicyclic radical includes bridged ring systems. Stella, "Pro-drugs as Novel Delivery Systems," Vol 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference for all purposes.

"Therapeutically effective amount" is an amount of a compound of the invention, that when administered to a patient, ameliorates a symptom of the disease. The amount of a compound of the invention which constitutes a "therapeutically effective amount" will vary depending on the compound, the disease state and its severity, the age of the patient to be treated, and the like. The therapeutically effective amount can be determined routinely by one of ordinary skill in the art having regard to their knowledge and to this disclosure.

"Treating" or "treatment" of a disease, disorder, or syndrome, as used herein, includes (i) preventing the disease, disorder, or syndrome from occurring in a human, i.e. causing the clinical symptoms of the disease, disorder, or syndrome not to develop in an
animal that may be exposed to or predisposed to the disease, disorder, or syndrome but does
not yet experience or display symptoms of the disease, disorder, or syndrome; (ii) inhibiting
the disease, disorder, or syndrome, i.e., arresting its development; and (iii) relieving the
disease, disorder, or syndrome, i.e., causing regression of the disease, disorder, or syndrome.

As is known in the art, adjustments for systemic versus localized delivery, age, body weight,
general health, sex, diet, time of administration, drug interaction and the severity of the
condition may be necessary, and will be ascertainable with routine experimentation by one of
ordinary skill in the art.

**General Administration**

In one aspect, the invention provides pharmaceutical compositions comprising a
modulator of the Hedgehog pathway according to the invention and a pharmaceutically
acceptable carrier, excipient, or diluent. In certain other embodiments, administration may be
by the oral route. Administration of the compounds of the invention, or their
pharmaceutically acceptable salts, in pure form or in an appropriate pharmaceutical
composition, can be carried out via any of the accepted modes of administration or agents for
serving similar utilities. Thus, administration can be, for example, orally, nasally, parenterally
(intravenous, intramuscular, or subcutaneous), topically, transdermally, intravaginally,
intravesically, intracistemally, or rectally, in the form of solid, semi-solid, lyophilized
powder, or liquid dosage forms, such as for example, tablets, suppositories, pills, soft elastic
and hard gelatin capsules, powders, solutions, suspensions, or aerosols, or the like, in unit
dosage forms suitable for simple administration of precise dosages. When treating brain
cancers, including glioblastomas, the administration may be by placing a gliadel, a
dissolvable material that contains the chemotherapy drug (in particular BCNU), directly into
brain tumors during an operation.

The compositions will include a compound of Formula I or II as the/an active
agent and can include a conventional pharmaceutical carrier or excipient and in addition may
include other medicinal agents and pharmaceutical agents that are generally administered to a
patient being treated for cancer.

Adjuvants include preserving, wetting, suspending, sweetening, flavoring,
perfuming, emulsifying, and dispensing agents. Prevention of the action of microorganisms
can be ensured by various antibacterial and antifungal agents, for example, parabens,
chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic
agents, for example sugars, sodium chloride, and the like. Prolonged absorption of the
injectable pharmaceutical form can be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

If desired, a pharmaceutical composition of the invention may also contain minor amounts of auxiliary substances such as wetting or emulsifying agents, pH buffering agents, antioxidants, and the like, such as, for example, citric acid, sorbitan monolaurate, triethanolamine olate, butylalted hydroxytoluene, etc.

The choice of formulation depends on various factors such as the mode of drug administration (e.g., for oral administration, formulations in the form of tablets, pills or capsules) and the bioavailability of the drug substance. Recently, pharmaceutical formulations have been developed especially for drugs that show poor bioavailability based upon the principle that bioavailability can be increased by increasing the surface area i.e., decreasing particle size. For example, U.S. Pat. No. 4,107,288 describes a pharmaceutical formulation having particles in the size range from 10 to 1,000 nm in which the active material is supported on a crosslinked matrix of macromolecules. U.S. Pat. No. 5,145,684 describes the production of a pharmaceutical formulation in which the drug substance is pulverized to nanoparticles (average particle size of 400 nm) in the presence of a surface modifier and then dispersed in a liquid medium to give a pharmaceutical formulation that exhibits remarkably high bioavailability.

Compositions suitable for parenteral injection may comprise physiologically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, and sterile powders for reconstrution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (propyleneglycol, polyethyleneglycol, glycerol, and the like), suitable mixtures thereof, vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

One route of administration is oral, using a convenient daily dosage regimen that can be adjusted according to the degree of severity of the disease-state to be treated.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is admixed with at least one inert customary excipient (or carrier) such as sodium citrate or dicalcium phosphate or (a) fillers or extenders, as for example, starches, lactose, sucrose, glucose, mannitol, and silicic acid, (b) binders, as for example, cellulose derivatives, starch, alignates, gelatin,
polyvinylpyrrolidone, sucrose, and gum acacia, (c) humectants, for example, glycerol, (d) disintegrating agents, for example, agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, croscarmellose sodium, complex silicates, and sodium carbonate, (e) solution retarders, for example paraffin, (f) absorption accelerators, for example, quaternary ammonium compounds, (g) wetting agents, for example, cetyl alcohol, and glycerol monostearate, magnesium stearate and the like (h) adsorbents, for example, kaolin and bentonite, and (i) lubricants, for example, talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, or mixtures thereof. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents.

[00261] Solid dosage forms as described above can be prepared with coatings and shells, such as enteric coatings and others well known in the art. They may contain pacifying agents, and can also be of such composition that they release the active compound or compounds in a certain part of the intestinal tract in a delayed manner. Examples of embedded compositions that can be used are polymeric substances and waxes. The active compounds can also be in microencapsulated form, if appropriate, with one or more of the above-mentioned excipients.

[00262] Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs. Such dosage forms are prepared, for example, by dissolving, dispersing, etc., a compound(s) of the invention, or a pharmaceutically acceptable salt, hydrate, solvate or combination thereof, and optional pharmaceutical adjuvants in a carrier, such as, for example, water, saline, aqueous dextrose, glycerol, ethanol and the like; solubilizing agents and emulsifiers, as for example, ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butanediol, dimethylformamide; oils, in particular, cottonseed oil, groundnut oil, corn germ oil, olive oil, castor oil and sesame oil, glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan; or mixtures of these substances, and the like, to thereby form a solution or suspension.

[00263] Suspensions, in addition to the active compounds, may contain suspending agents, as for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metaphosphate, bentonite, agar-agar and tragacanth, or mixtures of these substances, and the like.

[00264] Compositions for rectal administrations are, for example, suppositories that can be prepared by mixing the compounds of the present invention with for example suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax,
which are solid at ordinary temperatures but liquid at body temperature and therefore, melt
while in a suitable body cavity and release the active component therein.

[00265] Dosage forms for topical administration of a compound of this invention include
ointments, powders, sprays, and inhalants. The active component is admixed under sterile
conditions with a physiologically acceptable carrier and any preservatives, buffers, or
propellants as may be required. Ophthalmic formulations, eye ointments, powders, and
solutions are also contemplated as being within the scope of this invention.

[00266] Compressed gases may be used to disperse a compound of this invention in
aerosol form. Inert gases suitable for this purpose are nitrogen, carbon dioxide, etc.

[00267] Generally, depending on the intended mode of administration, the
pharmaceutically acceptable compositions will contain about 1% to about 99% by weight of a
compound(s) of the invention, or a pharmaceutically acceptable salt, hydrate, solvate or
combination thereof, and 99% to 1% by weight of a suitable pharmaceutical excipient. In one
example, the composition will be between about 5% and about 75% by weight of a
compound(s) of the invention, or a pharmaceutically acceptable salt, hydrate, solvate or
combination thereof, with the rest being suitable pharmaceutical excipients.

[00268] Actual methods of preparing such dosage forms are known, or will be apparent, to
those skilled in this art; for example, see Remington's Pharmaceutical Sciences, 18th Ed.,
(Mack Publishing Company, Easton, Pa., 1990). The composition to be administered will, in
any event, contain a therapeutically effective amount of a compound of the invention, or a
pharmaceutically acceptable salt, hydrate, solvate or combination thereof, for treatment of a
disease-state in accordance with the teachings of this invention.

[00269] The compounds of the invention, or their pharmaceutically acceptable salts,
hydrates, solvates or combinations thereof, are administered in a therapeutically effective
amount which will vary depending upon a variety of factors including the activity of the
specific compound employed, the metabolic stability and length of action of the compound,
the age, body weight, general health, sex, diet, mode and time of administration, rate of
excretion, drug combination, the severity of the particular disease-states, and the host
undergoing therapy. The compounds of the present invention can be administered to a patient
at dosage levels in the range of about 0.1 to about 1,000 mg per day. For a normal human
adult having a body weight of about 70 kilograms, a dosage in the range of about 0.01 to
about 300 mg per kilogram of body weight per day is an example. In another example the
dose range is 3-100 mg/kg of body weight per day. The specific dosage used, however, can
vary. For example, the dosage can depend on a number of factors including the requirements
of the patient, the severity of the condition being treated, and the pharmacological activity of
the compound being used. The determination of optimum dosages for a particular patient is
well known to one of ordinary skill in the art. These
techniques generally modify appropriate functional groups in a given compound. These

[00270] If formulated as a fixed dose, such combination products employ the compounds
of this invention within the dosage range described above and the other pharmaceutically
active agent(s) within its approved dosage range. Compounds of the instant invention may
alternatively be used sequentially with known pharmaceutically acceptable agent(s) when a
combination formulation is inappropriate.

[00271] Representative pharmaceutical formulations containing a compound of Formula I
or II are described below in the Pharmaceutical Composition Examples.

UTILITY

[00272] Certain compounds of Formula I have been tested using the assay described in
Biological Examples 1 and 2 and have been determined to be modulators of the Hedgehog
pathway. As such compounds of Formula I are useful for treating diseases, particularly
cancer in which Hedgehog pathway activity contributes to the pathology and/or
symptomatology of the disease. For example, cancer in which Hedgehog pathway activity
contributes to its pathology and/or symptomatology include basal cell carcinomas,
medulloblastomas, rhabdomyosarcomas, breast carcinomas, meningiomas, pancreatic
cancers, stomach cancers, esophageal cancers, biliary tract cancers, prostate cancers, small
cell lung cancers, non-small cell lung cancers, glial cell cancers, multiple myelomas, and
colon cancers, and the like.

[00273] Suitable in vitro assays for measuring Hedgehog pathway activity and the
inhibition thereof by compounds are known. For example, see Chen et ai, Proc Natl Acad
Sd USA 2002, 99,14071-14076. Also see Chen et. al. Genes Dev 2002, 16, 2743-2748. For
further details of in vitro assays for measuring cellular activity, see Biological Examples 1, 2,
3, 4, and 5, infra. Suitable in vivo models of cancer are known to those of ordinary skill in
the art. For further details of in vivo assays see Biological Examples 6-9, infra. A
pharmacodynamic assay is described in Biological Example 10. Efficacy models are
described in Examples 11-12. Following the examples disclosed herein, as well as that
disclosed in the art, a person of ordinary skill in the art can determine the ability of a
compound of this invention to modulate Hedgehog pathway activity.

PREPARATIONS OF THE INTERMEDIATES AND COMPOUNDS OF THE INVENTION

[00274] Prodrugs can be prepared by techniques known to one skilled in the art. These
techniques generally modify appropriate functional groups in a given compound. These
modified functional groups regenerate original functional groups by routine manipulation or in vivo. Amides and esters of the compounds of the present invention may be prepared according to conventional methods. A thorough discussion of prodrugs is provided in T. Higuchi and V. Stella, "Pro-drugs as Novel Delivery Systems," Vol 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference for all purposes.

[00275] The compounds of the invention, or their pharmaceutically acceptable salts, hydrates, solvates or combinations thereof, may have asymmetric carbon atoms or quaternized nitrogen atoms in their structure. Compounds of Formula I that may be prepared through the syntheses described herein may exist as single stereoisomers, racemates, and as mixtures of enantiomers and diastereomers. The compounds may also exist as geometric isomers. All such single stereoisomers, racemates and mixtures thereof, and geometric isomers are intended to be within the scope of this invention. When the term "single isomer" is used, it includes the terms stereoisomer, enantiomer, diastereomer, geometric isomer, and atrope isomer.

[00276] Some of the compounds of the invention may exist as tautomers. For example, where a ketone or aldehyde is present, the molecule may exist in the enol form; where an amide is present, the molecule may exist as the imidic acid; and where an enamine is present, the molecule may exist as an imine. All such tautomers are within the scope of the invention.

[00277] The present invention also includes N-oxide derivatives and protected derivatives of compounds of Formula I. For example, when compounds of Formula I contain an oxidizable nitrogen atom, the nitrogen atom can be converted to an N-oxide by methods well known in the art. When compounds of Formula I contain groups such as hydroxy, carboxy, thiol or any group containing a nitrogen atom(s), these groups can be protected with a suitable "protecting group" or "protective group". A comprehensive list of suitable protective groups can be found in T.W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, Inc. 1991, the disclosure of which is incorporated herein by reference in its entirety. The protected derivatives of compounds of Formula I can be prepared by methods well known in the art.

[00278] Methods for the preparation and/or separation and isolation of single stereoisomers from racemic mixtures or non-racemic mixtures of stereoisomers are well known in the art. For example, optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. Enantiomers
(R- and S-isomers) may be resolved by methods known to one of ordinary skill in the art, for example by: formation of diastereoisomeric salts or complexes which may be separated, for example, by crystallization; via formation of diastereoisomeric derivatives which may be separated, for example, by crystallization, selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic oxidation or reduction, followed by separation of the modified and unmodified enantiomers; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support, such as silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where a desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step may be required to liberate the desired enantiomeric form. Alternatively, specific enantiomer may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents or by converting on enantiomer to the other by asymmetric transformation. For a mixture of enantiomers, enriched in a particular enantiomer, the major component enantiomer may be further enriched (with concomitant loss in yield) by recrystallization.

[00279] In addition, the compounds of the present invention can exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like. In general, the solvated forms are considered equivalent to the unsolvated forms for the purposes of the present invention.

[00280] Compounds of Formula I can be prepared using methods known to one of ordinary skill in the art. Unless specified to the contrary, the reactions described herein take place at atmospheric pressure and over a temperature range from about -78 °C to about 150 °C, in another example from about 0°C to about 125 °C and in another example at about room (or ambient) temperature, e.g., about 20 °C. Unless otherwise stated (as in the case of an hydrogenation), all reactions are performed under an atmosphere of nitrogen.

Example 10: 7V-(5-cyano-2-methylphenyl)-4-[(4-phenylquinazolin-2-yl)amino]benzamide.

[00336] To a solution of 2-chloro-4-phenylquinazoline (9.6 g, 40 mmol) in 2-propanol (130 mL) was added 4-aminobenzoic acid (8.2 g, 60 mmol) and the mixture was stirred at reflux for 4 h. The mixture was cooled to rt and the precipitate was collected by filtration and washed with 2-propanol. The product, 4-(4-phenylquinazolin-2-ylamino)benzoic acid, was isolated as a yellow solid (12.9 g, 95%).

A stirred solution of \( 7V\)-4-dimethyl-\( 7V\)-(methylxylo)-3-[[[4-[(4-phenylquinazolin-2-yl)amino]phenyl]carbonyl]amino]benzamide (1.16 g, 2.24 mmol) in dichloromethane (150 mL) was cooled to -78 °C under nitrogen and a 1 M solution of diisobutylaluminum hydride in dichloromethane (6.7 mL, 6.7 mmol) was added dropwise over 30 min. The cooled solution was stirred for additional 1 h, then excess ethyl acetate was added to quench the reaction. The cooling bath was removed and the mixture was warmed to 0 °C using an ice bath. Methanol (2 mL) and then water (2 mL) was added carefully to the reaction mixture with vigorous stirring. A solution of 1 N hydrochloric acid (20 mL) was then added and the precipitates that formed were collected. The filtrates were separated and the aqueous layer was extracted with dichloromethane. The combined organic extracts were dried over sodium.
sulfate and concentrated on a rotary evaporator to give yellow solid that was combined with
the previously collected precipitate, washed with water and dried under reduced pressure to
give 7V-(5-formyl-2-methylphenyl)-4-[(4-phenylquinazolin-2-yl)amino]benzamide (791 mg,
77%).

dichloromethane (10 mL), tetrahydrofuran (2 drops) and acetic acid (2 drops) was stirred at rt
for 1 h. Sodium triacetoxyborohydride (275 mg, 1.30 mmol) was added and the mixture was
stirred overnight. The crude reaction was diluted with dichloromethane, washed with
saturated sodium bicarbonate and saturated sodium chloride and dried over sodium sulfate.
The solution was concentrated on a rotary evaporator and purified by HPLC to give a yellow
solid (143 mg, 52%).

Example 122: 7V-[2-methyl-5-[(methylamino)methyl]phenyl]-4-[(4-phenylquinazolin-2-yl)amino]benzamide

[00451] To a stirred suspension of 4-(4-phenylquinazolin-2-ylamino)benzoic acid (1.19 g, 3.49 mmol), prepared as described in Example 10, in dichloromethane (50 mL) was added a catalytic amount of dimethylformamide (100 µL) and thionyl chloride (1.50 mL, 20.6 mmol), and the resulting mixture was stirred at rt overnight. The solid was filtered, washed with hexanes, and dried under reduced pressure (high vacuum) to give the product (4-(4-phenylquinazolin-2-ylamino)benzoyl chloride) as a yellow solid (1.21 g, 97%). This material was then added portionwise to a solution of commercially available 3-amino-4-methylbenzyl alcohol (600 mg, 4.37 mmol), and triethylamine (1.0 mL, 7.2 mmol) in dichloromethane (50 mL) that had been cooled to 0 ºC in an ice bath. The mixture was allowed to warm to rt overnight, then the solid was collected by filtration, washed with saturated sodium bicarbonate and water and dried under reduced pressure to give 7V-(5-hydroxymethyl-2-methylphenyl)-4-(4-phenylquinazolin-2-ylamino)benzamide as a pure yellow solid (1.33 g, 86%).
To a suspension of N-(5-hydroxymethyl-2-methylphenyl)-4-(4-phenylquinazolin-2-ylamino)benzamide (1.88 g, 4.08 mmol) in dichloromethane (50 mL) that had been cooled to 0 °C in an ice bath was added slowly thionyl chloride (475 μL, 6.54 mmol), and the mixture was stirred at 0 °C for 2 h. Excess thionyl chloride and dichloromethane were removed on a rotary evaporator. The residue was stirred with ether, filtered, washed with ether, and dried to give 7V-(5-chloromethyl-2-methylphenyl)-4-(4-phenylquinazolin-2-ylamino)benzamide as a yellow solid (2.15 g, 100%). This material was then added to a 1.6 M solution of methylamine in tetrahydrofuran (20 mL, 32 mmol) that had been cooled to 0 °C in an ice bath. The stirred mixture was allowed to warm to rt overnight and then was concentrated on a rotary evaporator. The residue was redissolved in dichloromethane, washed with saturated sodium bicarbonate and dried over sodium sulfate. The solvent was then removed on a rotary evaporator and the residue purified by flash column chromatography to give N-[2-methyl-5-[(methylamino)methyl]-phenyl]-4-{(4-phenylquinazolin-2-yl)amino}benzamide (1.12 g, 57%) as a yellow solid. 1H NMR (400 MHz, DMSO-d6): δ 10.33 (s, 1H), 9.71 (s, 1H), 8.17 (d, 2H), 8.00 (d, 2H), 7.89-7.79 (m, 5H), 7.65 (m, 3H), 7.42 (m, 1H), 7.34 (s, 1H), 7.21 (d, 1H), 7.12 (d, 1H), 3.65 (s, 2H), 2.28 (s, 3H), 2.23 (s, 3H). The combined organic phases were dried over sodium sulfate, filtered and concentrated on a rotary evaporator. The product was purified by preparative reverse phase HPLC (CH₃CN/H₂O). Acetonitrile was removed from the isolated pure fractions on a rotary evaporator and the aqueous remainder was lyophilized to give N-(2,6-dimethylphenyl)-3-methyl-4-[(4-phenylquinazolin-2-yl)amino]benzamide as a white solid (114 mg, 47%).

Scheme 6

Example 147: \(N-(2,6\text{-dimethylphenyl})-4-\{4-(1\text{-H-indol-5-yl})\text{quinazolin-2-yl}\}\text{amino}\) benzamide

[00480] To a round bottomed flask containing 2,4-dichloroquinazaline (800 mg, 4.02 mmol) was added indol-5-boronic acid (647 mg, 4.02 mmol), dichloro-((bis-diphenylphosphino)-ferrocenyl)-palladium (II) (complex with methylene chloride, 235 mg, 0.32 mmol), triethylamine (1.5 mL, 10 mmol), dimethoxyethane (20 mL), and water (0.5 mL). The reaction mixture was heated at 80 °C for 14 h, then cooled to rt and diluted with ethyl acetate. The organic layer was washed with saturated sodium bicarbonate, dried over sodium sulfate, filtered, and concentrated on a rotary evaporator. The material was purified by flash column chromatography to afford 2-chloro-4-(1\text{-H-indol-5-yl})\text{quinazoline} as a brown solid (740 mg, 66%).

[00481] To a tube containing 2-chloro-4-(1\text{-H-indol-5-yl})\text{quinazoline} (740 mg, 2.65 mmol) was added 4-aminobenzoic acid (363 mg, 2.65 mmol) and n-butanol (10 mL). The mixture was heated at reflux for 1 h while allowing the solvent to boil off, then cooled to rt. Diethyl ether was added and the mixture was filtered to collect 4-(4-(1\text{-H-indol-5-yl})\text{quinazolin-2-ylamino})benzoic acid as a yellow solid (869 mg, 86%).

[00482] To a round bottomed flask containing 4-(4-(1\text{-i/-indol-5-yl})\text{quinazolin-2-ylamino})benzoic acid (428 mg, 1.13 mmol) was added 2,6-dimethylaniline (137 mg, 1.13 mmol), HATU (428 mg, 1.13), Hunig’s base (400 µL, 2.3 mmol), and dimethylacetamide (4 mL). The stirred mixture was heated to at 50 °C for 14 h, diluted with water and extracted with ethyl acetate. The combined organic extracts were washed with 5% aqueous lithium chloride and saturated sodium chloride, dried over sodium sulfate, filtered, and concentrated on a
rotary evaporator. The crude material was purified by preparative reverse phase HPLC to afford Λ-(2,6-dimethylphenyl)-4-[(4-\(H\)-indol-5-yl)quinazolin-2-yl]amino]benzamide as a yellow solid (24 mg, 5%). \(^1\)H NMR (400 MHz, DMSO-\(\text{d}_6\)): \(\delta\) 11.45 (s, IH), 10.23 (s, IH), 9.60 (s, IH), 8.19 (d, 2H), 8.02 (m, 4H), 7.83 (m, 2H), 7.62 (m, 2H), 7.51 (m, IH), 7.41 (m, IH), 7.13 (s, 3H), 6.63 (m, IH), 2.20 (s, 6H). [00527] A solution of 2-aminophenyl-2-pyridyl ketone (0.95 g, 4.8 mmol), urea (500 mg, 8.3 mmol) and acetic acid (10 mL) was stirred at 110 °C for 18 h. The reaction mixture was cooled to rt and filtered. The solid was washed with water and dried under reduced pressure to give 4-(pyridin-2-yl)quinazolin-2(1 H)-one as a yellow solid (0.83 g, 78%), which was dissolved in phosphorous oxychloride (3 mL) and the mixture was stirred at reflux for 30 min. The reaction mixture was cooled to rt and slowly poured over an ice/water mixture. The mixture was filtered and the solid was dried under reduced pressure to give 2-chloro-4-(pyridin-2-yl)quinazoline as an off-white solid (56 mg, 6%).

[00528] To a solution of 2-chloro-4-(pyridin-2-yl)quinazoline (60 mg, 0.25 mmol) in butanol was added 4-aminobenzoic acid (36 mg, 0.26 mmol) and the stirred mixture was heated to reflux for 20 min, after which time the reaction mixture was cooled and the solvent removed on a rotary evaporator. The residue was redissolved in dimethylformamide (20 mL) and 5-((dimethylamino)methyl)-2-methylaniline (50 mg, 0.30 mmol), HATU (170 mg, 0.45 mmol) and Hunig's base (150 µL, 0.87 mmol) were added to the solution. The stirred mixture was heated to 70 °C for 18 h, then diluted with ethyl acetate and the solution was extracted with 10 % aqueous lithium chloride and 1 N hydrochloric acid. The combined
acidic washes were made basic with saturated sodium bicarbonate and extracted with ethyl acetate. The combined organic extracts were then dried over sodium sulfate, filtered and concentrated on a rotary evaporator. The product was purified by preparative reverse phase HPLC to give N-{5-[(dimethylamino)methyl]-2-methylphenyl}-4-[(4-pyridin-2-ylquinazolin-2-yl)amino]benzamide as a yellow solid (39 mg, 16 % yield).

Example 191: JV-(2,6-dimethylphenyl)-4-[(4-(1-methylpiperidin-4-yl)quinazolin-2-yl)amino]benzamide

[00529] To a suspension of magnesium (1.8 g, 74 mmol) in dry THF (50 mL) in a flame-dried round bottomed flask under nitrogen was added 4-chloro-1-methylpiperidine (9.0 g, 68 mmol). A crystal of iodine and a catalytic amount of cyclohexylmagnesium chloride was added and the mixture was heated to reflux for 2 h. A gray precipitate formed, which was removed via vacuum filtration under a nitrogen atmosphere. To the filtrate was added a solution of 2-aminobenzonitrile (1.6 g, 14 mmol) in dry THF (15mL). The stirred mixture was heated to 45 $^\circ$C for 2 h. Ice was added and the reaction was quenched with 1 M sulfuric acid. The mixture was extracted with ethyl acetate and the acidic aqueous layer was then neutralized with 1 N sodium hydroxide, concentrated on a rotary evaporator and extracted
with ethyl acetate. The combined organics were dried over sodium sulfate, filtered and concentrated to afford (2-aminophenyl)(1-methylpiperidin-4-yl)methanone as a yellow oil (1.0 g, 7%).

[00530] A stirred mixture of (2-aminophenyl)(1-methylpiperidin-4-yl)methanone (1.10 g, 4.58 mmol), urea (550 mg, 9.17 mmol) and acetic acid (15 mL) was heated to overnight. The mixture was cooled to rt, neutralized with 1 N sodium hydroxide and concentrated to ~10 mL on a rotary evaporator. The aqueous residue was extracted with ethyl acetate and the combined organics were dried over sodium sulfate, filtered and concentrated on a rotary evaporator to afford 4-(1-methylpiperidin-4-yl)quinazolin-2(1H)-one as a yellow solid (1.10 g, 97%).

[00531] A stirred mixture of 4-(1-methylpiperidin-4-yl)quinazolin-2(1H)-one (500 mg, 2.29 mmol) and phosphorous oxychloride (5 mL, 56 mmol) was heated to reflux for 3 h. The reaction was then concentrated on a rotary evaporator and treated with ice water. The aqueous mixture was then extracted with ethyl acetate, and the combined organic extracts were dried over sodium sulfate, filtered and concentrated on a rotary evaporator. The residue was treated with 4-aminobenzoic acid (534 mg, 3.90 mmol), triethylamine (660 µL, 4.58 mmol) and n-butanol (5 mL) and the mixture was heated to 140 °C for 25 min. The mixture was cooled and the solvent was removed on a rotary evaporator. This material was then treated with HATU (1.63 g, 4.29 mmol) and Hunig's base (1.1 mL, 6.3 mmol) in dimethylformamide (10 mL) and the mixture stirred until it became homogenous. To this mixture was added 2,6-dimethylaniline (620 mg, 5.12 mmol) and the reaction was heated to 50 °C overnight. The mixture was cooled to rt, diluted with water and extracted with ethyl acetate. The combined organic extracts were washed with 1 N sodium bicarbonate and a 5% aqueous solution of lithium chloride, then was extracted with 1 N hydrochloric acid. The combined acidic washes were neutralized with 1 N sodium hydroxide and extracted with dichloromethane. These combined organic extracts were dried over sodium sulfate, filtered and concentrated on a rotary evaporator. Purification of this material via preparative reverse phase HPLC gave /V-(2,6-dimethylphenyl)-4-[(4-(1-methylpiperidin-4-yl)quinazolin-2-yl)amino]benzamide as a white solid (19.7 mg, 2%). 1H NMR (400 MHz, CDCl₃): δ 8.02-7.95 (m, 5H), 7.85-7.72 (m, 3H), 7.44-7.32 (m, 2H), 7.18-7.08 (m, 3H), 4.20-3.65 (br s, 3H), 3.55-3.45 (m, IH), 3.20 (d, 2H), 2.44 (s, 3H), 2.39-2.18 (m, 10H), 2.07 (s, 2H), 1.99 (d, 2H). Scheme 9

Example 225: 7V-(5-[2-(dimethylamino)ethyl]oxy)-2-methylphenyl)-4-[(4-
phenylquinazolin-2-yl)amino]benzamide.

[00566] To a solution of 4-methyl-3-nitrophenol (250 mg, 1.6 mmol) in dichloromethane
(50 mL) was added triphenylphosphate (542 mg, 2.45 mmol), AIVTV-dimethylethanolamine
(246 µL, 2.45 mmol) and diisopropylazido dicarboxylate (475 µL, 2.45 mmol), and the reaction
was stirred at rt under nitrogen for 1 h. The solution was concentrated on a rotary evaporator
and purified by flash column chromatography to give a yellow solid (286 mg, 80%). This
material was dissolved in ethanol (50 mL) and placed in a hydrogenation vessel with 5%
palladium on carbon (100 mg) and a drop of concentrated hydrochloric acid. The reaction
was shaken on a Parr apparatus under a hydrogen atmosphere (-45 ppm) for 1 h, then filtered through Celite and washed with methanol. The solvent was removed on a rotary evaporator to give 5-(2-(dimethylamino)ethoxy)-2-methylaniline (262 mg, 100%), which was used without further purification. This material was dissolved in tetrahydrofuran (100 mL), and Hunig’s base (300 µL, 1.7 mmol) and 4-(4-phenylquinazolin-2-ylamino)benzoyl chloride (530 mg, 1.48 mmol, vide supra) were added. The mixture was stirred at rt overnight, then concentrated on a rotary evaporator and purified by preparative reverse phase HPLC to give N-([2-(dimethylamino)ethyl]oxy)-2-methylphenyl)-4-[(4-phenylquinazolin-2-yl)amino]benzamide as a yellow solid (76 mg, 11%). 1H NMR (400 MHz, DMSO-d6): δ 10.32 (s, 1H), 9.63 (s, 1H), 8.18 (d, 2H), 7.79 (d, 2H), 7.90-7.79 (m, 5H), 7.66-7.63 (m, 3H), 7.43-7.40 (m, 1H), 7.18 (d, 1H), 7.06 (d, 1H), 6.79 (m, 1H), 4.10 (t, 2H), 2.86 (br s, 2H), 2.39 (s, 6H), 2.19 (s, 3H). Light II Assay

Test compounds were serially diluted in DMSO and 1.5 µL aliquots were transferred to 384-well non-binding plates. Compounds were diluted with 85 µL of assay media (DMEM + 0.5% FBS, 5mM Hepes, 1% NEAA, 1% PenStrep, 0.8% Geneticin). Cell plates were prepared by adding 50 µL of assay media (240 cells/µL) to white TC coated 384-well plates (final cell concentration is 12,000 cells/well). Cell plates were incubated overnight at 37 °C.

Media was removed from the cell plates and 30 µL of compound in assay media + rSHh (1.5 µg/well) was added to the cell plates. Plates were incubated at 37 °C for 24 hours. Following overnight incubation, media was aspirated from the cell plates and 20 µL of luciferase media (Bright-glo, Promega) was added to the cell. Cells were incubated for 5 minutes and measured on an Envision™ plate reader (Perkn Elmer) using the luciferase detection protocol. Biological Example 2
Daoy-Glil Assay

Daoy is a human medulloblastoma line that responds to sonic hedgehog by induction of numerous genes including the pathway components GUI and PTCH1. This assay measures the Hh-specific induction of an endogenous target gene in a human tumor cell line. Activating mutations in the GPCR-like receptor Smoothened (Smo) are found in around 40% of sporadic BCC (6, 12-14) and 25% of primitive neuroectodermal tumours (12, 14). Forced expression of the mutant Smo receptors in the Daoy medulloblastoma cell line (W353L and S533N) results in elevated pathway activity that is not further induced by the addition of rSHh-N. These engineered cell lines, Daoy_Smo_W535L and Daoy_Smo_S533N, were used to assess the ability of compounds to inhibit the function of a pathologically relevant mutant receptor.

Daoy cells were plated at 3 x 10^4 cells/well in 96-well plates in MEM/10% FCS, and the following day cells were serum-starved in MEM/0.05% FCS for 24 hrs. Cells were subsequently treated for 24 hrs with 50 µg/mL rSHh-N in MEM/0.05% FCS/0.3% DMSO plus or minus compounds. KAAD-cyclopamine was the control antagonist. The starting dose was 1000 nM for the Compounds of the Invention. Compound treatments were done in triplicate as six-point doses with four-fold serial dilutions. Following compound treatment,
mRNA isolation, cDNA synthesis, and TaqMan® reactions were done with the following kits: mRNA Catcher™ (Invitrogen) and TaqMan® (Applied Biosystems). TaqMan® reactions were done in quadruplicate using duplexed probes for GUI (target) and β2-macroglobulin (control). GHI induction by rSHh is generally ten-fold to twenty-fold using this protocol.

5 [00616] Compounds of the invention were tested in this assay and demonstrated the ability to modulate Hedgehog pathway activity. The following embodiments are directed to the compounds themselves as well as their use in a method of treating. For example, in one embodiment of the invention, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 2800 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 1000 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 450 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 200 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 50 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 20 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 10 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 6 nM or less. In another embodiment, the Hedgehog pathway modulator is selected from the compounds in Table 1 having cellular activity in the Daoy-Gli1 assay of about 4 nM or less.

Hedgehog cell-based readout: Real time PCR (Taqman®) assay in KYSE-180 cells

[00617] KYSE-180 is a human esophageal cancer line shown to be responsive to SHh stimulation as measured by the induction of numerous Hh-responsive genes, including the pathway GHI and PTCHI. This assay measures the Hh-specific induction of an endogenous target gene in a human tumor cell line.
KYSE-180 cells were plated at 1.4 x 10^5 cells in RPMI/10% FCS in 96-well plates. The following day cells were serum-starved in MEM/ 0.05% FCS for 24 hrs. Cells were subsequently treated for 24 hrs in MEM/ 0.05% FCS / 0.3% DMSO plus or minus compounds. Compound treatments were done in triplicate as six-point dose responses with four-fold serial dilutions. Following compound treatment, mRNA isolation, cDNA synthesis, and TaqMan® reactions were done with the following kits: mRNA Catcher™ (Invitrogen) and TaqMan® (Applied Biosystems). TaqMan® reactions were done in quadruplicate using duplexed probes for GUI (target) and β2-macroglobulin (control). Gli1 induction by rSHh is generally five-fold to ten-fold for KYSE-180 cells using this protocol.

**Hedgehog cell-based readouts: GUI, G12 and Gli3 protein accumulation**

Both Gli1 and GH2 has been shown to function primarily as a transcriptional activator and elevated Hh signaling results in the accumulation of the active Gli1 and GH2 proteins. On the other hand, GH3 has both transcriptional activator and repressor functions. In the absence of Hh signaling, the larger GH3 activator (GH3A, 190 kDa) is processed to the smaller repressor form (Gli3R, 85 kDa), while stimulation of the pathway results in the accumulation of GH3A at the expense of the GH3R. Assessing the levels of these proximal readouts in Hh-responsive cell lines in vitro and in vivo (from tumor xenografts) provides a direct readout for pathway activation.

**Hedgehog cell-based readouts: Gli1, G12 and Gli3 protein accumulation** Immunoprecipitation (IP)-Western protocol

Three μg of capture antibody (anti-Gli1 (AF3324, R&D Systems, anti-GK2 (sc-28674, Santa Cruz Biotechnology) or anti-Gli3 (sc-20688, Santa Cruz Biotechnology) were independently incubated with 2000 μg of total protein from cleared lysates (from tumors or cell-based studies) were used overnight at 4 °C in the presence of 20 μL of protein G-coated Sepharose beads (Amersham). The beads were washed four times with lysis buffer (50 mM Tris-HCl, pH 8.0, 150 mM NaCl, 1% Triton X-100, 0.1%SDS, 0.5% sodium deoxycholate, 1 mM EDTA, 50 mM NaF, 1 mM sodium pyrophosphate, 1 mM sodium orthovanadate, 2 mM phenylmethylsulfonyl fluoride, 10 μg/ml aprotinin, 5 μg/mL leupeptin and 5 μg/mL pepstatin A). Capture beads were mixed with 20 μL LDS sample buffer and reducing reagent and heated at 75°C for 10 minutes. Samples were loaded onto Criterion 4-12% Bis-Tris gels (Biorad), and proteins were transferred to nitrocellulose membranes. Gli proteins were
detected by blotting with primary antibodies (anti-Gli1 (sc-20687, Santa Cruz Biotechnology, anti-GH2 (sc-28674, Santa Cruz Biotechnology) or anti-Gli3 (sc-20688, Santa Cruz Biotechnology)) at 1:200 dilution in 5% non-fat milk/TBST overnight at 4 °C. Blots were washed three times in TBST and blotted with HRP-conjugated anti-rabbit antibody in 5% non-fat milk/TBST) for 60 min using the ReliaBLOT kit (WB 120, Bethyl Labs). Membranes were probed with for 5 min at room temperature with SuperSignal West Pico kit (Pierce) and exposed to film. Quantification was done using ImageQuant TL.

Pharmacodynamic xenograft tumor models

Daoy human medulloblastoma cell line

[00621] The human Daoy medulloblastoma cell line was engineered to over-express the N-terminal domain of sonic hedgeghog (SHh-N). A single clone (clone4) of this line with elevated levels of SHh (verified by Taqman® analysis) was chosen based on high levels of in vitro expression of GIil and Ptchl mRNA. Furthermore, analysis of this clone grown as a xenograft in female athymic mice revealed elevated levels of both human and mouse Hh responsive genes (GIil and Ptchl) when compared to tumors comprised of the parental Daoy cell line as assessed in real-time PCR (Taqman®) assays with species specific primers. Therefore, this cell line was utilized to assess the ability of hedgehog pathway inhibitors to modulate the activity of the pathway in vivo.

Intradermal (ID) tumors were generated by implanting 5x1 0⁶ cells (in HBSS) + 50% Matrigel (in HBSS) into the hind flank of nude mice. Compounds were administered to tumor-bearing mice by oral gavage (po). Tumors were collected at different time points followed by RNA isolation, cDNA synthesis, and TaqMan® reactions with the kits: mRNA Catcher™ (Invitrogen) and TaqMan® (Applied Biosystems), respectively. TaqMan® reactions were done in quadruplicate using duplexed probes for Gli1 (target) and GAPDH (control). Additionally, whole blood was collected and plasma prepared for bioanalytical analysis of compounds. Bioanalytical analysis of crude tumor lysates was also done.

Panc-1 human pancreatic cancer cell line

[00623] Panc-1 human pancreatic ductal carcinoma cells were found to express the SHh ligand. The mouse Hh responsive genes (Gli1 and Ptchl) were found to be upregulated in the mouse stromal compartment in Panc-1 tumors grown in female nude mice hosts and administration of Hh pathway inhibitors reduced the expression level mouse GIil and Ptchl. In contrast, no significant inhibition of the human Hh responsive genes following Hh
inhibitor administration in mice harboring Panc-1 tumors was observed. Therefore, Panc-1 xenografts tumors represent clinically-relevant model of pancreatic tumors that secrete SHh and regulate the activity of the Hh pathway in the stromal compartment that supports tumor growth. The majority of human pancreatic adenocarcinomas and its precursor lesion abnormally express SHh. In addition, the forced expression of SHh in a prostate xenograft tumor model has been shown to enhance tumor growth. For implantation in vivo, 3 × 10^6 cells in 100 μL cold Hanks balanced salt solution were injected into the right hind flank of female nude mice.

**HT-29 human colon cancer cell line**

HT29 cells represent differentiated human colon adenocarcinoma. This cell line was reported in the literature to respond to exogenous SHh stimulation. Analysis revealed overexpression of SHh and IHH ligands. The mouse Hh responsive genes (GHI and Ptc/h) are upregulated in the mouse stromal compartment in Panc-1 tumors grown in female nude mice hosts and administration of Hh pathway inhibitors reduced the expression level mouse Glil and Ptc/h. In contrast, no significant inhibition was observed of the human Hh responsive genes following Hh inhibitor administration in mice harboring HT-29 tumors. Therefore, HT-29 xenograft tumors represent clinically-relevant model of colon tumors that secrete SHh and regulate the activity of the Hh pathway in the stromal compartment that supports tumor growth. It has been reported in the literature that dysregulation of SHh pathway is very often found in human colorectal cancers. In addition, the forced expression of SHh in a prostate xenograft tumor model has been shown to enhance tumor growth. Therefore, HT-29 xenograft tumors are a relevant model to investigate the effect of SHh pathway inhibitors in human colorectal adenocarcinoma. For implantation in vivo, 2 × 10^6 cells in 100 μL cold Hanks balanced salt solution were injected into the right hind flank of female nude mice.

**U-87MG human glioblastoma cell line**

U-87MG cell line was previous described in the literature to be sensitive to Smo inhibitor cylopamine treatment, both in vitro and in vivo studies. In addition, this cell line was reported to express a number of sternness genes, indicating presence of tumor stem cells, which may be responsible for tumor self-renewal and regrowth after following chemotherapy. Significance of stem cells for clinical course of glioblastomas appears to be well established, and targeting this cell population with Hh inhibitors may provide therapeutic advantage. Thus, U-87MG glioblastoma xenografts can provide a valuable and
relevant animal models for testing the effect of Hh pathway inhibitors on stem cell-driven regrowth and chemoresistance of CNS tumors. For implantation in vivo, 2 x 10⁶ cells in 100 µl cold Hanks balanced salt solution were injected into the right hind flank of female nude mice.

**Biological Example 10**

Pharmacodynamic study protocol

[00626] Subcutaneous xenograft tumors were generated in nude mice as described above. Compounds were administered to tumor-bearing mice by oral gavage (po) in formulations that were specific to each chemical scaffold, which varied from solutions to homogenous suspensions. Tumors were collected at different time points followed by RNA isolation, cDNA synthesis, and TaqMan® reactions with the kits: mRNA Catcher™ (Invitrogen) and TaqMan® (Applied Biosystems), respectively. TaqMan® reactions were done in quadruplicate using species-specific probes for mouse and human GHI, Ptchl and GAPDH (control). Whole blood and crude tumor lysates were collected and prepared for bioanalytical analysis to determine the concentrations of the test compounds.

**Biological Example 11-12: Efficacy study protocols**

Single agent treatment

[00627] The standard experimental design for these studies involved oral administration of Smo inhibitors at dose range expected to modulate the Hh signaling pathway based on PD studies. The dosing regimen is initiated when the established solid tumors reached ~100 mg. Exploration of alternative dose regimens was also performed by administration of the compounds in a cyclical fashion (q2d or q3d). Throughout the dosing period of 14 days, tumor size was measured twice weekly and body weight was measured daily. Tolerability was monitored in these studies by daily measurement of body weight. Blood plasma samples were collected for clinical chemistry and hematology analysis and to determine plasma profile of compound concentration.

Combined and/or sequential treatment with standard chemotherapeutics

[00628] Cancer stem cells are defined as discrete cell populations that express specific cell-surface markers and display highly enhanced survival, self-renewal, and tumorigenicity properties. These cancer stem cells, in some experimental contexts described in the literature, have shown to confer resistance to currently used chemotherapy. In the literature, the hedgehog pathway has been shown to be essential for stem cell renewal in tumors of the
breast, central nervous system, and in multiple myeloma. Further, upregulation of Hh signaling has been described in the literature following chemotherapy in an esophageal cancer model. Pancreatic cancer and gliomas are among the most chemoreistant human malignancies and sternness gene expression profile ("sternness signature") was described in clinical samples as well as in xenograft models of both tumor types in the literature. These tumors models are used to address if inhibitors of Hh pathway can potentiate efficacy of standard chemotherapeutic agents when administered in combined treatment or defer tumor regrowth when used sequentially after the administration of a chemotherapy. Antimetabolite treatments, such as gemcitabine, are used in combination in Panc-1 pancreatic cancer and temozolomide, an alkylating agent, are used in U-87MG glioblastoma tumor xenograft models.

In concurrent combination treatment, Hh pathway inhibitors are administered in combination with the standard chemotherapy agents (gemcitabine or temozolomide). Single agent treatments are conducted to evaluate potential additive or synergistic effects when the compounds are administered in combination. The dosing regimen is initiated when the established solid tumors reached ~100 mg. Throughout the dosing period of 14 days, tumor size was measured twice weekly and body weight was measured daily. Tolerability was monitored in these studies by daily measurement of body weight. Blood plasma samples were collected for clinical chemistry and hematology analysis and to determine plasma profile of compound concentration.

In sequential regimens, single agent standard chemotherapeutics (gemcitabine or temozolomide) are administered for a period of 14 days to inhibit tumor growth and/or induce tumor regression. Subsequent to the standard chemotherapeutics treatment, Hh inhibitors are dosed to determine their effect on tumor regrowth. Treatment with Hh inhibitors can be initiated immediately after completion standard chemotherapy or after certain "off-treatment" period, depending on the study design. The dosing regimen is initiated when the established solid tumors reached ~100 mg. Throughout the dosing period of 14 days, tumor size was measured twice weekly and body weight was measured daily. Tolerability was monitored in these studies by daily measurement of body weight. Blood plasma samples were collected for clinical chemistry and hematology analysis and to determine plasma profile of compound concentration.

Immunohistochemistry.

At the termination of efficacy studies, tumors were excised and examined histologically for induction of apoptosis (TUNEL), microvessel density (CD31 staining),
proliferating cells (Ki67 staining) and necrosis (hematoxylin/eosin staining). Additionally, tumor sections were stained for expression of SHh pathway (GUI, SHh, Smo) and biomarkers of cancer stem cells (e.g., Nestin, CD131, ALDH). Tolerability was monitored in these studies by daily measurement of body weight. Blood plasma samples were collected for clinical chemistry and hematology analysis and to determine plasma profile of compound concentration.

INTERNATIONAL SEARCH REPORT

Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons.

1  ☑  Claims Nos because they relate to subject matter not required to be searched by this Authority, namely

2  ☑  Claims Nos because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically

3  ☒  Claims Nos 33-38 because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6 4(a)

Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows.

1  ☑  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2  ☑  As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3  ☑  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos

4  ☑  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims, it is covered by claims Nos

Remark on Protest  ☑  The additional search fees were accompanied by the applicant’s protest and, where applicable, the payment of a protest fee.

☐  The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☐  No protest accompanied the payment of additional search fees.
