TITLE OF THE INVENTION

NOVEL TRICYCLIC COMPOUNDS AS INHIBITORS OF MUTANT IDH ENZYMES

BACKGROUND OF THE INVENTION

Isocitrate dehydrogenase (IDH) is a family of enzymes found in cellular metabolism. They are NADP⁺/NAD⁺ and metal dependent oxidoreductases of the enzyme class EC 1.1.1.42. The wild type proteins catalyze the oxidative decarboxylation of isocitrate to alpha-ketoglutarate, generating carbon dioxide and NADPH/NADH in the process. They are also known to convert oxalosuccinate into alpha-ketoglutarate. Mutations in IDH1 (cytosolic) and IDH2 (mitochondrial) have been identified in multiple cancer types including, but not limited to, glioma, glioblastoma multiforme, paraganglioma, supratentorial primordial neuroectodermal tumors, acute myeloid leukemia (AML), prostate cancer, thyroid cancer, colon cancer, chondrosarcoma, cholangiocarcinoma, peripheral T-cell lymphoma, and melanoma. (See L. Dang et al., Trends Mol. Med., 2010, 16, 387; T. Shibata et al., Am. J. Pathol., 2011, 178(3), 1395; Gaal et al., J. Clin. Endocrinol. Metab. 2010, 95(3), 1274; Balss et al., Acta Neuropathol., 2008, 116, 597). The mutations have been found at or near key residues in the active site: G97D, R100Q, R132H, H133Q, and A134D for IDH1, and R140 and R172 for IDH2. (See L. Dang et al., Nature, 2009, 462, 739; L. Sellner et al., Eur. J. Haematol., 2010, 85, 457).

These mutant forms of IDH are believed to have a neomorphic activity, reducing alpha-ketoglutarate to 2-hydroxyglutarate (2-HG). (See P.S. Ward et al., Cancer Cell, 2010, 17, 225) In general, production of 2-HG is enantiospecific, resulting in generation of the D-enantiomer (also known as the R enantiomer or R-2-HG). Normal cells generally have low native levels of 2-HG, whereas cells harboring these mutations in IDH1 or IDH2 show significantly elevated levels of 2-HG. High levels of 2-HG have also been detected in tumors harboring the mutations. High levels of 2-HG have been detected in the plasma of patients with mutant IDH containing AML. (See S. Gross et al., J. Exp. Med., 2010, 207(2), 339).

Mutations in IDH1 have been associated with multiple cancers and patients having these disorders often have increased levels of 2-HG in their urine, plasma or cerebrospinal fluid. (See M. Kranendijk et al., Science, 2010, 330, 336) There is a continuing need for small molecule inhibitors of mutant IDH enzymes, or more specifically IDH1 enzymes, for the treatment of diseases and disorders associated with these enzymes.
SUMMARY OF THE INVENTION

The present invention is also directed to uses of these compositions in the potential prevention or treatment of such cancers.

\[ \text{Heterocyclic groups may be optionally substituted with one or more substituents as defined herein.} \]

“Optionally substituted” refers to “unsubstituted or substituted,” and therefore, the generic structural formulas described herein encompass compounds containing the specified optional substituent(s) as well as compounds that do not contain the optional substituent(s).

Each substituent is independently defined each time it occurs within the generic structural formula definitions.

Polymorphism

A compound of formula (I), including a salt or solvate thereof, may exist in crystalline form, non-crystalline form, or a mixture thereof. A compound or a salt or solvate thereof may also exhibit polymorphism, i.e. the capacity of occurring in different crystalline forms. These different crystalline forms are typically known as "polymorphs". Polymorphs have the same chemical composition but differ in packing, geometrical arrangement, and other descriptive properties of crystalline solid state. Polymorphs, therefore, may have different physical properties such as shape, density, hardness, deformability, stability, and dissolution properties. Polymorphs typically exhibit different melting points, IR spectra, and X-ray powder diffraction patterns, all of which may be used for identification. One of ordinary skill in the art will appreciate that different polymorphs may be produced, for example, by changing or adjusting the conditions used in crystallizing/recrystallizing a compound of formula (I).

Optical Isomers - Diastereomers - Geometric Isomers – Tautomers

Included herein are various isomers of the compounds of formula (I). The term "isomers" refers to compounds that have the same composition and molecular weight but differ in physical and/or chemical properties. The structural difference may be in constitution (geometric isomers) or in the ability to rotate the plane of polarized light (stereoisomers).

With regard to stereoisomers, a compound of formula (I) may have one or more asymmetric carbon atom and may occur as a racemic mixture or as individual enantiomers or diastereomers.
All such isomeric forms are included herein, including mixtures thereof. If a compound of formula (I) contains a double bond, the substituent may be in the E or Z configuration. If a compound of formula (I) contains a disubstituted cycloalkyl, the cycloalkyl substituent may have a cis- or trans- configuration. All tautomeric forms are also intended to be included.

Any asymmetric atom (e.g., carbon) of a compound of formula (I) can be present in racemic mixture or enantiomerically enriched, for example the (R)-, (S)- or (R,S)-configuration. In certain embodiments, each asymmetric atom has at least 50% enantiomeric excess, at least 60% enantiomeric excess, at least 70% enantiomeric excess, at least 80% enantiomeric excess, at least 90% enantiomeric excess, at least 95% enantiomeric excess, or at least 99% enantiomeric excess in the (R)- or (S)-configuration. Substituents at atoms with unsaturated double bonds may, if possible, be present in cis- (Z)- or trans- (E)- form.

A compound of formula (I) can be in the form of one of the possible isomers, rotamers, atropisomers, tautomers or mixtures thereof, for example, as substantially pure geometric (cis or trans) isomers, diastereomers, optical isomers (antipodes), racemates or mixtures thereof.

Any resulting mixtures of isomers can be separated on the basis of the physicochemical differences of the constituents, into the pure or substantially pure geometric or optical isomers, diastereomers, racemates, for example, by chromatography and/or fractional crystallization.

Any resulting racemates of the final compounds of the examples or intermediates can be resolved into the optical antipodes by known methods, e.g., by separation of the diastereomeric salts thereof, obtained with an optically active acid or base, and liberating the optically active acidic or basic compound. In particular, a basic moiety may thus be employed to resolve the compounds of the present invention into their optical antipodes, e.g., by fractional crystallization of a salt formed with an optically active acid, e.g., tartaric acid, dibenzoyl tartaric acid, diacetyl tartaric acid, di-O,O'-p-toluoyl tartaric acid, mandelic acid, malic acid or camphor-10-sulfonic acid. Racemic compounds can also be resolved by chiral chromatography, e.g., high pressure liquid chromatography (HPLC) using a chiral adsorbent.

Some of the compounds described herein may exist with different points of attachment of hydrogen, referred to as tautomers. For example, compounds including carbonyl -CH₂C(O)- groups (keto forms) may undergo tautomerism to form hydroxyl – CH=CH₂C(OH)- groups (enol forms). Both keto and enol forms, individually as well as mixtures thereof, are included within the scope of the present invention.
Isotopic Variations

Compounds of formula (I) include unlabeled forms, as well as isotopically labeled forms. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds disclosed herein include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, sulfur, fluorine, iodine and chlorine, such as $^2$H (i.e., Deuterium or “D”), $^3$H, $^{11}$C, $^{13}$C, $^{14}$C, $^{15}$N, $^{18}$O, $^{17}$O, $^{18}$O, $^{32}$P, $^{33}$S, $^{18}$F, $^{125}$I, $^{125}$I and $^{36}$Cl. The invention includes various isotopically labeled compounds as defined herein, for example those into which radioactive isotopes, such as $^1$H and $^{14}$C, or those into which non-radioactive isotopes, such as $^2$H and $^{13}$C are present. Such isotopically labelled compounds are useful in metabolic studies (with $^{14}$C), reaction kinetic studies (with, for example $^2$H or $^3$H), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, substitution with positron emitting isotopes, such as $^{11}$C, $^{18}$F, $^{18}$O and $^{15}$N, may be particularly desirable for PET or SPECT studies.

Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art. Furthermore, substitution with heavier isotopes, particularly deuterium (i.e., $^2$H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index.

A subject administered with a compound disclosed herein, or a pharmaceutically acceptable salt thereof, is generally a mammal, such as a human being, male or female. A subject also refers to cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice, fish, and birds. In one embodiment, the subject is a human.

As used herein, the terms "treatment" and "treating" refer to all processes wherein there may be a slowing, interrupting, arresting, controlling, or stopping of the progression of a disease or disorder described herein that may be associated with mutant IDH enzyme activity. The terms do not necessarily indicate a total elimination of all disease or disorder symptoms. The terms also include the potential prophylactic therapy of the mentioned conditions, particularly in a subject that is predisposed to such disease or disorder.

The terms "administration of" and or "administering a" compound should be understood to include providing a compound described herein, or a pharmaceutically acceptable salt thereof, and compositions of the foregoing to a subject.

The amount of a compound administered to a subject is an amount sufficient to inhibit mutant IDH enzyme activity in the subject. In an embodiment, the amount of a compound can be an “effective amount”, wherein the subject compound is administered in an amount that will elicit a biological or medical response of a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician. An effective amount does not necessarily include considerations of toxicity and safety related to the administration of a compound. It is recognized that one skilled in the art may affect physiological disorders associated with an IDH mutation by treating a subject presently afflicted with the disorders, or by prophylactically treating a subject likely to be afflicted with the disorders, with an effective amount of a compound disclosed herein, or a pharmaceutically acceptable salt thereof.

An effective amount of a compound will vary with the particular compound chosen (e.g. considering the potency, efficacy, and/or half-life of the compound); the route of administration chosen; the condition being treated; the severity of the condition being treated; the age, size, weight, and physical condition of the subject being treated; the medical history of the
subject being treated; the duration of the treatment; the nature of a concurrent therapy; the desired therapeutic effect; and like factors and can be routinely determined by the skilled artisan.

The compounds disclosed herein may be administered by any suitable route including oral and parenteral administration. Parenteral administration is typically by injection or infusion and includes intravenous, intramuscular, and subcutaneous injection or infusion.

The compounds disclosed herein may be administered once or according to a dosing regimen wherein a number of doses are administered at varying intervals of time for a given period of time. For example, doses may be administered one, two, three, or four times per day. Doses may be administered until the desired therapeutic effect is achieved or indefinitely to maintain the desired therapeutic effect. Suitable dosing regimens for a compound disclosed herein depend on the pharmacokinetic properties of that compound, such as absorption, distribution and half-life which can be determined by a skilled artisan. In addition, suitable dosing regimens, including the duration such regimens are administered, for a compound disclosed herein depend on the disease or condition being treated, the severity of the disease or condition, the age and physical condition of the subject being treated, the medical history of the subject being treated, the nature of concurrent therapy, the desired therapeutic effect, and like factors within the knowledge and expertise of the skilled artisan. It will be further understood by such skilled artisans that suitable dosing regimens may require adjustment given an individual subject's response to the dosing regimen or over time as the individual subject needs change.

Typical daily dosages may vary depending upon the particular route of administration chosen. Typical daily dosages for oral administration, to a human weighing approximately 70 kg would range from about 0.1 mg to about 2 grams, or more specifically, 0.1 mg to 500 mg, or even more specifically, 0.2 mg to 100 mg, of a compound of formula (I).

![Chemical structure of Intermediate 34](image)

To an oven-dried, nitrogen-cooled vial was added 8-bromo-6,11-dihydro-5\textit{H}-pyrido[2,3-
\textit{b}][1,5]benzodiazepine, HCl (50.0 mg, 0.181 mmol), chloro(2-dicyclohexylphosphino-2',6'-di-i-
propoxy-1,1'-biphenyl)[2-(2-aminoethylphenyl)]palladium(II), methyl-\textit{t}-butylether adduct (7.4
mg, 9.1 \textmu mol), and 2-dicyclohexylphosphino-2',6'-di-i-propoxy-1,1'-biphenyl (4.2 mg, 9.1
\textmu mol). The mixture was placed under a nitrogen atmosphere by performing 3 vacuum/nitrogen
cycles. LiHMDS (1.0 M in THF, 845 \mu L, 1.27 mmol) was added dropwise, followed by
piperidine-4-carbonitrile (23.9 mg, 0.217 mmol), and the reaction mixture was heated to 100°C
for 16 h. The reaction was cooled to room temperature, quenched with methanol, filtered, and
concentrated under reduced pressure to afford the title compound as a solid. MS: 306 (M + 1).

**Intermediate 35:** Racemic \textit{trans} (8-bromo-5,11-dihydro-6\textit{H}-pyrido[2,3-\textit{b}][1,5]benzodiazepin-6-
yl)(4,4-difluoro-2-methylcyclohexyl)methanone

![Chemical structure of Intermediate 35](image)

**Step 1:** To a flask containing ethyl 2-methyl-4-oxocyclohex-2-ene-1-carboxylate (250 g, 1.37
mol) and ethanol (1.2 L) was added a slurry of 10% Pd/C (14.6 g, 0.05 wt %) in ethanol (70 mL).
HCl (2 N, 44 mL) was added under nitrogen at room temperature, and the resulting slurry was
stirred under hydrogen at 400 psi for 3 h. The reaction mixture was filtered through celite and
washed with methanol (3 \times 750 mL). The combined filtrates were concentrated under reduced
pressure, and the residue was purified by column chromatography on silica gel (2 – 10%
EtOAc/petroleum ether) to afford ethyl 2-methyl-4-oxocyclohexanecarboxylate as a liquid
(mixture of \textit{cis} isomers).

**Step 2:** To a flask equipped with a magnetic stirrer and thermocouple connected to a nitrogen
line was charged with ethyl 2-methyl-4-oxocyclohexanecarboxylate (200 g, 1.08 mol, mixture of
cis isomers) and dichloromethane (2 L). The reaction mixture was cooled to -78°C and DAST (350 mL, 2.16 mol) was added dropwise over 45 min while maintaining an internal temperature between -65 and -78°C. Once the addition was complete, the reaction mixture was gradually brought to room temperature and stirred for 15 h. The mixture was quenched with water (500 mL) and the organic layer was separated. The aqueous layer was extracted with dichloromethane (2 × 500 mL), washed with brine (2 × 100 mL), dried over sodium sulfate, filtered, and concentrated under reduced pressure to afford a mixture of three compounds: ethyl 4,4-difluoro-2-methylcyclohexanecarboxylate, ethyl 4-fluoro-6-methylcyclohex-3-ene-1-carboxylate, and ethyl 4-fluoro-2-methylcyclohex-3-ene-1-carboxylate as a liquid that are all mixtures of cis isomers.

The reaction mixture was stirred at room temperature for 15 h. The mixture was diluted with water (200 mL) and extracted with dichloromethane (2 × 600 mL). The combined organic layers were washed with brine (2 × 300 mL), dried over sodium sulfate, filtered, and concentrated under reduced pressure. Example 11: Tert-butyl 4-(8-morpholino-6,11-dihydro-5H-benzo[b]pyrido[2,3-e][1,4]diazepine-6-carbonyl)piperidine-1-carboxylate

To a solution of 1-(tert-butoxycarbonyl) piperidine-4-carboxylic acid (1 g, 4.36 mmol) in dichloromethane (44 mL) was added one drop of DMF. The solution was cooled to 0°C and oxalyl chloride (0.40 mL, 4.6 mmol) was added. The reaction mixture was warmed to room temperature and stirred for 2.5 h. The mixture was concentrated under reduced pressure to afford crude tert-butyl 4-(chlorocarbonyl)piperidine-1-carboxylate (1.1 g, 4.3 mmol). The acid chloride (0.53 g, 2.1 mmol) which was taken up in DCE (5 mL) and added to a suspension of 4-(6,11-dihydro-5H-benzo[b]pyrido[2,3-e][1,4]diazepin-8-yl)morphone (0.6 g, 2.13 mmol) in DCE (15 mL) at 80°C via syringe. DMAP (0.026 g, 0.21 mmol) was added, and the reaction was heated at 80°C for 18 h. Another equivalent of tert-butyl 4-(chlorocarbonyl)piperidine-1-carboxylate (0.53 g, 2.1 mmol) was added and the mixture was heated at 80°C for another 18 h.

The reaction mixture was cooled to room temperature, diluted with DCM, and washed with aqueous sodium bicarboante. The aqueous layer was extracted with DCM (2x), and the combined organic layers were dried over sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (0-5% MeOH/DCM), followed by a second purification using reverse phase HPLC (10-90%...
ACN/water with 0.05% TFA over 10 min.) to afford the title compound as a solid TFA salt. MS: 495 (M + 1). $^1$H NMR (500 MHz, CD$_3$OD) $\delta$ 7.98 (d, $J = 6.2$ Hz, 2H), 7.31 (d, $J = 8.8$ Hz, 1H), 7.15-7.05 (m, 1H), 7.01 (s, 1H) 7.05-6.95 (m, 1H), 5.45-5.35 (m, 1H), 4.15-4.02 (m, 1H), 3.90-3.80 (m, 4H), 3.25-3.12 (m, 5H), 3.05-2.91 (m, 1H), 2.88-2.71 (m, 1H), 2.15-2.06 (m, 1H), 2.05-1.98 (m, 1H), 1.89-1.82 (m, 1H), 1.75-1.60 (m, 1H), 1.60-1.45 (m, 1H), 1.38 (s, 9H), 1.20-1.10 (m, 1H).

6-[(Cis-4-methoxycyclohexyl)carbonyl]-8-morpholin-4-yl-6,11-dihydro-5H-pyrido[2,3-b][1,5]benzodiazepine

To a vial was added 8-(morpholin-4-yl)-6,11-dihydro-5H-pyrido[2,3-b][1,5]benzodiazepine (27 mg, 0.096 mmol), PS-PPh3 (2.06 mmol/g loading, 139 mg, 0.287 mmol), 1, 4-methoxycyclohexanecarboxylic acid (15 mg, 0.098 mmol), and acetonitrile (1.6 mL). Trichloroacetonitrile (48 µL, 0.48 mmol) was added and the reaction mixture was heated to 100°C for 10 minutes in a microwave reactor. The material was filtered through celite and washed with methanol. The filtrate was concentrated under reduced pressure and the residue was purified by mass triggered reverse phase HPLC (ACN/water with 0.1% TFA modifier) to afford both isomers as follows:

5-((Trans-4-[(R)-cyclopropyl(methoxy)methyl]cyclohexyl)carbonyl)-8-morpholin-4-yl-6,11-dihydro-5H-pyrido[2,3-b][1,5]benzodiazepine isomer 1, and
6-((Trans-4-[(S)-cyclopropyl(methoxy)methyl]cyclohexyl)carbonyl)-8-morpholin-4-yl-6,11-dihydro-5H-pyrido[2,3-b][1,5]benzodiazepine isomer 2

10 **Step 1:** To a mixture of methyl 4-formylcyclohexanecarboxylate (1.0 g, 5.9 mmol) in THF (12 mL) at 0°C was added cyclopropylmagnesium bromide (1.0 M in 2-methyltetrahydrofuran, 5.9 mL, 5.9 mmol) and the mixture was then allowed to warm to room temperature for 2 h. The mixture was then quenched slowly with water and then ethyl acetate was added. The organic layer was separated, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel to afford methyl 4-(cyclopropyl(hydroxy)methyl)cyclohexanecarboxylate.

15 **Step 2:** To a mixture of methyl 4-(cyclopropyl(hydroxy)methyl)cyclohexanecarboxylate (354 mg, 1.67 mmol) in DMF (1.0 mL) at 0°C was added sodium hydride (60% dispersion in mineral oil, 100 mg, 2.50 mmol). After stirring for 5 minutes at 0°C, iodomethane (260 µL, 4.17 mmol) was added dropwise. The mixture was then heated to 60°C for 2 hours. Upon cooling to room temperature, the mixture was quenched with water and then ethyl acetate was added. The organic layer was separated, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel to afford methyl 4-(cyclopropyl(methoxy)methyl)cyclohexanecarboxylate.

20 **Step 3:** To a mixture of methyl 4-(cyclopropyl(methoxy)methyl)cyclohexanecarboxylate (224 mg, 0.990 mmol) in THF (3.30 mL), water (0.80 mL) and methanol (0.80 mL) was added lithium hydroxide (59 mg, 2.5 mmol) and the mixture was stirred at room temperature for 16 h. The mixture was then quenched with aqueous HCl (6 M, 0.40 mL, 2.5 mmol) and then extracted with ethyl acetate (2x). The combined organic layers were dried over magnesium sulfate,
filtered, and concentrated under reduced pressure to afford 4-(cyclopropyl(methoxy)methyl)cyclohexanecarboxylic acid that was used without further purification or characterization.

**Step 4:** To a microwave vial containing 4-(cyclopropyl(methoxy)methyl)cyclohexanecarboxylic acid (132 mg, 0.620 mmol) and 4-(6,11-dihydro-5H-benzo[b]pyrido[2,3-e][1,4]diazepin-8-yl)morpholine (175 mg, 0.620 mmol) was added acetonitrile (6.0 mL). PS-PPh₃ (2.06 mmol/g loading, 129 mg, 0.492 mmol) and trichloroacetonitrile (0.31 mL, 3.1 mmol) were added and the mixture was irradiated in the microwave to 100°C for 10 minutes. Upon cooling to room temperature, the mixture was filtered and then concentrated under reduced pressure. The residue was taken up in ethyl acetate and saturated aqueous sodium bicarbonate. The organic layer was separated, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel to afford the title compounds as a mixture of 4 isomers. The product was then separated into the 4 isomers by SFC (IC, 2.1 X 25 cm, methanol with 0.25% DMEA and 40% modifier in CO₂). The first run separated two isomers. The fractions that contained a mixture of isomers were concentrated and then purified again by SFC (IC, 2.1 X 25 cm, isopropanol with 0.25% DMEA and 30% modifier in CO₂) to afford the remaining two pure fractions.

**Step 1**: To an oven-dried, nitrogen cooled vial was added racemic trans (8-bromo-5,11-dihydro-6H-pyrido[2,3-b][1,5]benzodiazepin-6-yl)(4,4-difluoro-2-methylcyclohexyl)methanone (65 mg, 0.15 mmol), bis(pinacolato)diboron (76 mg, 0.30 mmol), potassium acetate (29 mg, 0.30 mmol),

DMA (0.75 mL) was added, the mixture was degassed under a nitrogen atmosphere for 10 minutes, and then heated to 90°C for 16 h. The reaction mixture was allowed to cool to room temperature, filtered over a pad of celite, diluted with water, and extracted with EtOAc (3x). The combined organic layers were washed with brine, dried over sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (0 – 50% 3:1 EtOAc:EtOH/Hexanes to afford racemic trans (4,4-difluoro-2-methylcyclohexyl)[8-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-5,11-dihydro-6H-pyrido[2,3-b][1,5]benzodiazepin-6-yl]methane as a solid. MS: 484 (M + 1).

Step 2:

To an oven-dried, nitrogen cooled vial was added trans (4,4-difluoro-2-methylcyclohexyl)[8-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-5,11-dihydro-6H-pyrido[2,3-b][1,5]benzodiazepin-6-yl]methane (66 mg, 0.14 mmol), methyl 5-bromopyridine-2-carboxylate (35 mg, 0.16 mmol), and 3rd generation x-phos palladacycle (12 mg, 0.014 mmol). THF (0.68 mL) was added, followed by potassium phosphate, tribasic (0.5 M in water, 1.4 mL, 0.70 mmol), and the reaction mixture was heated to 50°C for 16 hours. Example 351: 6-\{[\textit{Trans}-4-(1-methylthoxy)cyclohexyl]carbonyl\}-8-(tetrahydro-2\textit{H}-pyran-4-yl)-6,11-dihydro-5\textit{H}-pyrido[2,3-\textit{b}][1,5]benzodiazepine

\end{center}

\textbf{Step 1:} To an oven-dried, nitrogen-cooled vial was added (8-bromo-5,11-dihydro-6\textit{H}-pyrido[2,3-\textit{b}][1,5]benzodiazepin-6-yl)[\textit{trans}-4-(propan-2-yloxy)cyclohexyl]methanone (50 mg, 0.11 mmol), 4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-3,6-dihydro-2\textit{H}-pyran (28 mg, 0.14 mmol), and 3\textsuperscript{rd} generation x-phos palladacycle (10 mg, 0.011 mmol). THF (0.56 mL) and then potassium phosphate, tribasic (0.5 M in water, 1.1 mL, 0.56 mmol) were added and the reaction mixture was heated to 50°C for 16 h. The mixture was allowed to cool to room temperature and diluted with EtOAc. The mixture was washed with water, and the organic layer was dried over sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel (0 - 40% 3:1 EtOAc:EtOH/Hexanes) to afford [8-(3,6-dihydro-2\textit{H}-pyran-4-yl)-5,11-dihydro-6\textit{H}-pyrido[2,3-\textit{b}][1,5]benzodiazepin-6-yl][\textit{trans}-4-(propan-2-yloxy)cyclohexyl]methanone as an oil. MS: 448 (M + 1).

\textbf{Step 2:} To a flask containing palladium on carbon (10% weight loading, 7 mg, 7 \textmu mol) under a nitrogen atmosphere was added MeOH (1 mL). [8-(3,6-Dihydro-2\textit{H}-pyran-4-yl)-5,11-dihydro-6\textit{H}-pyrido[2,3-\textit{b}][1,5]benzodiazepin-6-yl][\textit{trans}-4-(propan-2-yloxy)cyclohexyl]methanone (30 mg, 0.067 mmol) was added and the flask was evacuated and back-filled 3x with hydrogen gas via a balloon. The mixture was stirred under a hydrogen atmosphere at room temperature for 16 h. The reaction mixture was then filtered over a pad of celite and the filtrate was concentrated under reduced pressure. The residue was purified by mass triggered reverse phase HPLC (ACN/water with 0.1% TFA modifier) to afford the title compound as a solid TFA salt. MS: 450 (M + 1). \textsuperscript{1}H NMR (500 MHz, DMSO-\textit{d}_6) \delta 9.55 (s, 1H), 8.06 – 8.00 (m, 1H), 7.53 (d, \textit{J} = 7.2 Hz, 1H).
The compounds in the following table were prepared using the methodology herein and the general procedure described in Example 351.

Example 435: 2-Methyl-2-[6-({trans-4-[(2,2,2-trifluoroethyl)amino]cyclohexyl}carbonyl)-6,11-
dihydro-5H-pyrido[2,3-b][1,5]benzodiazepin-8-yl]propanenitrile

Step 1: To a vial equipped with a stir bar was added ethyl 4-oxocyclohexanecarboxylate (500 
mg, 2.94 mmol), sodium hydroxide (587 mg, 14.7 mmol), and ethanol (12 mL). The reaction 
was stirred at room temperature for 2 h. The mixture was quenched via the dropwise addition of 
aqueous HCl (4N) to pH~1-3. The mixture was extracted with ethyl acetate, and the organic 
layer was washed with brine and dried over sodium sulfate, filtered, and concentrated under 
reduced pressure to afford 4-oxocyclohexanecarboxylic acid as an oil that was used without 
further characterization.

Step 2: To a vial was added 2-(6,11-dihydro-5H-benzo[b]pyrido[2,3-e][1,4]diazepin-8-yl)-2-
methylpropanenitrile (80 mg, 0.30 mmol) and PS-PPh3 (2.06 mmol/g loading, 441 mg, 0.908 
mmol). A mixture of 4-oxocyclohexanecarboxylic acid (52 mg, 0.36 mmol) in acetonitrile (2 
ml) was added followed by trichloroacetonitrile (152 µL, 1.51 mmol). The vial was heated to 
100°C for 10 minutes in a microwave reactor. The reaction mixture was allowed to cool to room 
temperature, dissolved in MeOH (3 mL), and stirred for 10 minutes. The mixture was filtered 
and concentrated under reduced pressure. The residue was diluted with ethyl acetate and washed 
with saturated sodium bicarbonate and then brine. The combined organic layers were dried over 
magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified 
by column chromatography on silica gel (0 – 100% EtOAc/hexanes) to afford 2-methyl-2-{6-[(4-
oxocyclohexyl)carbonyl]-6,11-dihydro-5H-pyrido[2,3-b][1,5]benzodiazepin-8-yl]propanenitrile 
as a solid. MS: 389 (M + 1).

Step 3: To a vial equipped with a stir bar was added 2-methyl-2-{6-[(4-
oxocyclohexyl)carbonyl]-6,11-dihydro-5H-pyrido[2,3-b][1,5]benzodiazepin-8-yl]propanenitrile
(118 mg, 0.304 mmol), 2,2,2-trifluoroethanamine (24 µL, 0.30 mmol), and DCE (1.5 mL). Acetic acid (35 µL, 0.61 mmol) was added, followed by the slow addition of sodium triacetoxyborohydride (103 mg, 0.486 mmol). The reaction was stirred at room temperature for 2.5 h. The crude mixture was diluted with ethyl acetate and washed with saturated sodium bicarbonate and then brine. The organic layer was dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by mass triggered reverse phase HPLC (ACN/water with 0.1% TFA modifier) to afford the title compound as a solid TFA salt.

MS: 472 (M + 1). 1H NMR (600 MHz, DMSO-d6) δ 9.72 (s, 1H), 9.26 (s, 1H), 8.07 (d, J = 5.0 Hz, 1H), 7.54 (d, J = 7.2 Hz, 1H), 7.45 (s, 1H), 7.38 (s, 2H), 6.81 – 6.74 (m, 1H), 5.26 (d, J = 15.0 Hz, 1H), 4.06 – 3.87 (m, 3H), 3.08 – 2.92 (m, 1H), 2.82 – 2.72 (m, 1H), 2.08 – 1.93 (m, 2H), 1.77 – 1.59 (m, 7H), 1.54 – 1.40 (m, 2H), 1.39 – 1.18 (m, 2H), 1.13 – 0.99 (m, 1H).

The compounds in the following table were prepared using the methodology herein and the general procedure described in Example 435.

Step 1: To a solution of tert-butyl 8-formyl-6-(4-methoxycyclohexanecarbonyl)-5H-
benzo[b]pyrido[2,3-e][1,4]diazepine-11(6H)-carboxylate (428 mg, 0.922 mmol) in DCM (1 mL)
was added TFA (1 mL) at room temperature. The reaction was stirred for 40 minutes and then
concentrated under reduced pressure to afford 6-(4-methoxycyclohexanecarbonyl)-6,11-dihydro-
5H-benzo[b]pyrido[2,3-e][1,4]diazepine-8-carbaldehyde. MS: 366 (M + 1).

Step 2: To a vial was added 6-(4-methoxycyclohexanecarbonyl)-6,11-dihydro-5H-
benzo[b]pyrido[2,3-e][1,4]diazepine-8-carbaldehyde (30 mg, 0.082 mmol) and 1-
(trifluoromethyl)cyclopropanamine, HCl (14 mg, 0.086 mmol). The solids were dissolved in
DCE (0.8 mL), and then acetic acid (10 µL) and sodium triacetoxyborohydride (40 mg, 0.19
mmol) were added. The reaction was stirred at room temperature for 16 h. The reaction was
quenched with saturated aqueous sodium bicarbonate, extracted with ethyl acetate, dried over
sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by
mass triggered reverse phase HPLC (ACN/water with 0.1% NH₄OH) to afford the title compounds as solids.

R132H IDH1 Enzymatic Assay

Each test compound (10 mM stock in DMSO) is diluted in DMSO to make a 10-point, 3-fold dilution series. 125 nL of each dilution or DMSO alone is dispensed to a 384-well Greiner Lumintra 200 assay plate using an Echo® Liquid Handler. To each well of the plate is added 20 uL of enzyme in assay buffer or assay buffer alone. Assay buffer consists of 50 mM sodium phosphate, pH 7.0, 50 mM magnesium chloride, 50 mM sodium chloride, and 0.01% (w/v) bovine serum albumin. When present, the R132H mutant IDH1 enzyme is at a working concentration of 1.875 nM (final concentration in assay of 1.5 nM). The assay plate is allowed to incubate for 30 minutes at room temperature and 5 uL of 5x substrate mixture (2.5 uM nicotinamide adenine dinucleotide phosphate, 100 uM adenosine diphosphate, 7.5 mM glyceraldehyde-3-phosphate, 7.5 ug/mL of spinach glyceraldehyde-3-phosphate dehydrogenase, 25 nM phosphoglycerate kinase, and 5 mM alpha-ketoglutarate in assay buffer) is added to all wells. The reaction plate is incubated for 60 minutes followed by addition of 25 uL of Promega Kinase-GLO reagent to all wells and 10-minute incubation.

Luminescence is measured using a PerkinElmer Envision plate reader. The percent activity of each dilution is determined as the ratio of background corrected signal to the background corrected signal of wells receiving only DMSO. IC_{50} values are determined by fitting percent activity data to a four-parameter logistic dose response equation. The IC_{50} values of the exemplified compounds are included in the table below.

Using the above biological assay, all compounds in the examples have IC_{50} of about 1 nM to about 25,000 nM, or more specifically, about 5 nM to about 20,000 nM, or even more specifically, about 10 nM to about 15,000 nM, or even more specifically, about 10 nM to about 10,000 nM, or still more specifically, about 10 nM to about 5,000 nM. Such a result is indicative of the intrinsic activity of the compounds in use as an inhibitor of a mutant IDH1 enzyme. Specific IC_{50} activity data for the exemplified compounds disclosed herein is provided in the following table.
