Abstract Title: Storage system consisting of trays and tubs supported in a rack

A storage system includes a tray 14 that can be stored on automated storage and retrieval racks. A tub 12 is removably securable to the tray 14. The tub 12 includes a bottom wall 16, a pair of opposed side walls and a pair of opposed end walls. The bottom wall 16 of the tub 12 is removably secured to the tray 14. Thus, some of the trays 14 in the storage system can be provided with tubs 12 for the storage of loose items. Preferably the trays 14 include a plurality of ribs 28, which serve as reinforcement members, extending transversely to a bottom wall 16. Additionally the trays 14 may each include a connector 30 protruding upward from the bottom wall, the connector 30 being complimentary with a connector provided on each of the tubs 12.
TUB AND TRAY ASSEMBLY

BACKGROUND OF THE INVENTION

The present invention relates generally to storage systems and containers.

Some automated storage and retrieval systems include racks having rows and columns of shelves provided by pairs of spaced-apart supports or rails. Trays are supported on the rails. Objects are stored on the trays and the trays and objects are stored in the racks. The automated retrieval equipment lifts and retrieves selected trays from the rails when necessary.

SUMMARY OF THE INVENTION

The present invention provides a tray and tub assembly, particularly useful in a storage system. The tray can be used on the known storage and retrieval racks. The tub is removably securable to the tray. The tub includes a bottom wall, a pair of opposed side walls and a pair of opposed end walls. The bottom wall of the tub is removably secured to the tray. Thus, some of the trays in the storage system can be provided with tubs for the storage of loose items.

Because the tub will be connected to and supported by the tray, the tub does not have to be rigid enough to support itself and its load on the spaced-apart rails of the rack. Also, connecting the tubs to the trays provides uniformity in the handling and storage of the trays, i.e. trays with and without tubs can be handled similarly. Because the tub does not need to provide rigid support, the tub need not be reinforced with ribs and can even be thermoformed.

BRIEF DESCRIPTION OF THE DRAWINGS

Other advantages of the present invention will be readily appreciated as the same becomes better understood by reference to the following detailed description when considered in connection with the accompanying drawings wherein:

Figure 1 is a perspective view of a tub and tray storage system according to the present invention.

Figure 2 is a top view of the tub and tray of Figure 1.

Figure 3 is a side view of the tub and tray.
Figure 4 is a front view of the tub and tray.

Figure 5 is a perspective view of the tray of Figure 1.

Figure 6 is an enlarged view of a portion of the upper surface of the tray of Figure 5.

Figure 7 is a side view of the tray.

Figure 8 is a front view of the tray.

Figure 9 is an enlarged perspective view of a portion of the tub of Figure 1.

Figure 10 is a front view of the tub.

Figure 11 is a side view of the tub.

Figure 12 is a perspective view of the tub of Figure 1 having a similar tub nested therein.

Figure 13 is a section view of the tubs of Figure 12.

Figure 14 is a section view through the tub and tray of Figure 1.

Figure 14A is an enlarged view of Area A of Figure 14.

Figure 14B is an enlarged view of Area B of Figure 14.

Figure 15 is a front view of a storage system including a plurality of the tubs and trays of Figure 1.

Figure 16 is a bottom perspective view of an alternate tray.

Figure 17 is a front view, partially broken away, of the tray of Figure 16 on supports similar to the supports of Figure 15.

**DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT**

Referring to Figure 1, a storage assembly 10 according to one embodiment of the present invention includes a tub 12 supported by and removably secured to a tray 14. The tub 12 includes a bottom wall 16 up from which extend side walls 18 and end walls 20. A lip 24 protrudes outward from the upper edge of the side walls 18 and end walls 20. As shown, the height of the end walls 20 may be significantly less than that of the side walls 18 to define access openings 22. Alternatively, the end walls 20 could be the same height as the side walls 18. The bottom wall includes a plurality of connector openings 30 and alignment openings 32.

The tray 14 includes a bottom wall 26 having a plurality of ribs 28 including a peripheral rib 29 extending upward therefrom. The tray 14 further includes a
plurality of connectors 34 and alignment features 36 protruding upward. The connectors 34 extend through the connector openings 30 of the tub 12 to connect the tray 14 to the tub 12. The alignment features 36 extend through the alignment openings 32 to align the tub 12 to the tray 14.

Figure 2 is a top view of the storage assembly 10 of Figure 1. The connector openings 30 include a large portion 38 contiguous with a small portion 40. The large portion 38 and the small portion 40 are both defined by a flange 44, which is generally a portion of the bottom wall 16 having reduced thickness. The alignment openings 32 also are defined by a flange 48, which is generally a portion of the bottom wall 16 having reduced thickness.

Figure 3 is a side view of the tub 12 and tray 14. Figure 4 is a front view of the tub 12 and tray 14. Preferably, if the tub 12 and tray 14 are to be used in a storage system, the tub 12 does not extend past the edges of the tray 14.

Figure 5 is a perspective view of the tray 14, which can be used independently of the tub 12 (Figure 1). The plurality of ribs 28 may be formed in a grid as shown or in other arrangements. The plurality of connectors 34 and alignment features 36 protruding upward from raised portions of the bottom wall 16, as shown more clearly in Figure 6. The connectors 34 and alignment features 36 are equal in height to the ribs 28 to provide a generally planar upper surface.

Alternatively, they may be recessed relative to the plurality of ribs 28 as shown, or could have greater height than the ribs 28. The ribs 28 preferably extend upward from the bottom wall 16 as shown, so that a smooth bottom surface is provided which is better suited for sliding along surfaces in the storage and retrieval system. Alternatively, however, the ribs 28 could extend downward from the wall to provide a smooth upper surface. As another alternative, a wall could be welded to outer ends of the ribs 28, whether extending upwardly or downwardly, in order to provide smooth upper and lower surfaces and added strength.

Figure 7 is a side view of the tray 14. Figure 8 is a front view of the tray 14.

Figure 9 is an enlarged perspective view of a portion of the tub 12 of Figure 1, illustrating one of the connector openings 30 and two of the alignment openings 32. The flange 44 of the connector opening 30 includes a neck 46 between the large
portion 38 and the small portion 40, reducing the dimension of the connector opening 30 below that of the small portion 40.

The flanges 44, 48 of the connector openings 30, 32 preferably protrude downward from the bottom wall 16, as shown in Figures 10 and 11, although this is not required.

The walls 18, 20 of the tub 12 are tapered down to the bottom wall 16, such that a similar tub 12' can be nested within the tub 12 when empty, as shown in Figures 12 and 13. This facilitates storage and shipping when empty.

Figure 14 is a section view through the tub 12 and tray 14 of Figure 1. Figure 14A is an enlarged view of Area A of Figure 14. The connector 34 has wings 52 protruding in opposite directions from its outer end. The wings 52 are larger than the small portion 40 of the connector opening 30, but smaller than the large portion 38. For assembly, the connector 34 is inserted through the large portion 38. The tub 12 is then slid relative to the tray 14 so that the connector 34 is slid into the small portion 40 and the wings 52 of the connector 34 are interlocked over the flange 44, thereby retaining the tub 12 to the tray 14.

Figure 14B is an enlarged view of Area B of Figure 14, showing the engagement of the alignment feature 36 in the alignment opening 32. The alignment feature 36 can slide within the elongated alignment opening 32 as the tub 12 is slid relative to the tray 14. The alignment feature 36 and alignment openings 32 align the tub 12 with the tray 14.

Figure 15 is a side view of a storage system 60 including a rack 62 having a plurality of pairs of spaced apart supports or rails 64. The pairs of rails 64 are arranged in rows and columns. The trays 14 are sized to be supported at opposite sides of the tray 14 by the rails 64. The trays 14 can be used alone for storing objects, particularly boxed or larger objects, in the rack 62. Unboxed smaller objects can be placed in tub 12 and tray 14 assemblies. The tub 12 and tray 14 assemblies are supported by the rails 64 by the trays 14. Because the tray 14 is reinforced sufficiently to support the weight, the tubs 12 need not be reinforced, but can be molded with a single-wall thickness, such as by injection molding, thermoforming, compression molding, rotational molding or other suitable processes. This reduces the cost and weight of the tubs 12. In particular, since the
tubs 12 can have a single-wall thickness without reinforcement ribs, they can be produced economically in low volumes via thermoforming.

The trays 14 may be formed by injection molding or other suitable process that provides sufficient strength for the trays 14 to be supported at opposite sides by the rails 64. The storage system 60 can be part of an automated storage and retrieval system, where the trays 14 are handled by automated storage and retrieval equipment. The equipment can be adapted to handle the trays 14 in a similar manner, whether or not the trays 14 have tubs 12 secured thereto.

Figure 16 is a bottom perspective view of an alternate tray 14a, which is identical to the tray 14 in the previous Figures except for two additional features. First, the tray 14a further includes ribs forming end stops 56 at the front and rear ends of the tray 14a. The end stops 56 provide generally perpendicular surfaces for engaging with complementary stops formed at the front and rear ends of the rails 64. This prevents the trays 14a from sliding off the front or rear of the rails 64. The tray 14a further includes side ribs 58, which simply adjust the fit of the tray 14a on the rails 64. The inclusion of the side ribs 58 and the size of the side ribs 58 depends upon the particular rails 64 with which the tray 14a is to be used.

Figure 17 is a front view, partially broken away, of the tray 14a of Figure 16 on supports 64a similar to those of Figure 15, with the further inclusion of end stops 65, which engage the end stops 56 on the tray 14a to prevent the tray 14a from sliding off the front and rear of the rails 64a.

Although the examples above illustrate molded-in connectors for securing the tray 14 to the tub 12, separate connectors, such as a bolt, wire tie, post and cotter pin, etc. could also be used. The tray 14 could include different types of reinforcement members instead of or in addition to the ribs 28. For example, the tray 14 could be twin-sheet thermoformed and include steel inserts for reinforcement members.

Although a preferred embodiment of this invention has been disclosed, a worker of ordinary skill in this art would recognize that certain modifications would come within the scope of this invention. For that reason, the following claims should be studied to determine the true scope and content of this invention.
CLAIMS

1. A storage system comprising:
   rows and columns of pairs of spaced-apart supports;
   a plurality of trays, each supported at opposite ends by one of the pair of
   spaced-apart supports; and
   a plurality of tubs removably secured to a first subset of the plurality of trays.

2. The system of claim 1 wherein the plurality of trays each include a plurality
   of ribs extending transversely to a bottom wall.

3. The system of claim 2 wherein the plurality of trays each include a connector
   protruding upward from the bottom wall.

4. The system of claim 3 wherein the plurality of tubs each include a connector
   complementary to the connector on each of the plurality of trays.

5. The system of claim 4 wherein the plurality of tubs each include a pair of
   opposed first walls extending upward from a bottom wall, each tub further including
   a pair of opposed second walls that are each significantly shorter than the first walls.

6. The system of claim 5 wherein each tub further includes a lip protruding
   outwardly from an upper edge of the first walls and the second walls.

7. The system of claim 6 wherein the plurality of tubs are thermoformed.

8. The system of claim 4 wherein the connectors on the trays are recessed
   relative to the plurality of ribs.

9. The system of claim 8 wherein the connectors on the tubs protrude
   downward from the bottom wall.
10. The system of claim 9 wherein the connectors on the tubs include openings through the bottom wall.

11. The system of any one of the preceding claims wherein the tubs each include a bottom wall having a single wall thickness and without ribs.

12. The system of claim 11 wherein the plurality of tubs are thermoformed.

13. A tub and tray assembly comprising:

   a tray including a plurality of reinforcement members; and

   a tub removably secured to the tray.

14. The tub and tray assembly of claim 13 wherein the plurality of reinforcement members include support ribs that extend upward from a bottom wall of the tray and wherein the tub is supported on outer, free ends of the plurality of support ribs.

15. The tub and tray assembly of claim 14 wherein the tray includes a connector protruding upward from the tray.

16. The tub and tray assembly of claim 15 wherein the tub includes a connector complementary to the connector on the tray.

17. The tub and tray assembly of claim 16 wherein the connector on the tray is recessed relative to the support ribs.

18. The tub and tray assembly of claim 17 wherein the tub includes a pair of opposed first walls extending upward from a bottom wall, the tub further including a second wall that is significantly shorter than the first walls.

19. The tub and tray assembly of claim 18 wherein the tub further includes a lip protruding outwardly from an upper edge of the first walls and the second wall.
20. The tub and tray assembly of claim 19 wherein the tub is thermoformed.

21. The tub and tray assembly of claim 18 wherein the connector on the tub protrudes downward from the bottom wall.

22. The tub and tray assembly of claim 21 wherein the connector on the tub includes an opening through the bottom wall.

23. The tub and tray assembly of claim 22 wherein the opening includes a large portion and a small portion, the large portion larger than the connector on the tray, the small portion smaller than the connector on the tray.

24. The tub and tray assembly of any one of claims 13 to 23 wherein the tub includes a single bottom wall without ribs.

25. A container comprising:
   a bottom wall having a plurality of openings therethrough, at least one of the openings including a large portion and a contiguous small portion;
   a pair of opposed first walls extending upward from the bottom wall; and
   a pair of opposed second walls extending upward from the bottom wall.

26. The container of claim 25 wherein at least one of the second walls significantly shorter than the first walls.

27. The container of claim 25 wherein the container is thermoformed.

28. The container of claim 25 wherein the bottom wall is a single wall without ribs.

29. The container of claim 25 further including a lip protruding outwardly from an upper edge of the first walls and the second walls.
30. The container of claim 25 wherein the first walls and the second walls are angled away from one another, such that a similar container could be received therein.

31. The container of claim 25 wherein the bottom wall includes a flange portion around the large portion and the small portion of the at least one opening, the flange portion protruding downward from the bottom wall.

32. A method for making a storage system including the steps of:
   forming a tub having a bottom wall and a pair of opposed walls;
   forming a tray having a plurality of reinforcement members and at least one connector adapted to removably connect the tray to the tub; and
   removably securing the tub to the tray via the at least one connector.

33. The method of claim 32 wherein said step a) includes the step of thermoforming the tub.

34. The method of claim 32 wherein said step a) includes the step of forming the bottom wall without ribs.

35. The method of claim 34 wherein said step a) further includes the step of forming at least one opening through the bottom wall, the at least one opening adapted to connect to the at least one connector of the tray.

36. A storage system substantially as herein described with reference to the accompanying drawings.

37. A container substantially as herein described with reference to the accompanying drawings.

38. A method for making a storage system substantially as herein described with reference to the accompanying drawings.
