(54) Title: PYRAZOLEALKANAMIDE SUBSTITUTED THIOPHENES AS AMPA POTENTIATORS

(57) Abstract: The present invention relates to a heterocyclic derivative according to Formula (I) wherein the variables are defined as in the specification, or to a pharmaceutically acceptable salt or solvate thereof. The present invention also relates to a pharmaceutical composition comprising said heterocyclic derivatives and to their use in therapy, for instance in the treatment or prevention of psychiatric

diseases where an enhancement of synaptic responses mediated by AMPA receptors is required, including schizophrenia, depression and Alzheimer's disease.

PYRAZOLEALKANAMIDE SUBSTITUTED THIOPHENES AS AMPA POTENTIATORS

The present invention relates to heterocyclic derivatives, to pharmaceutical compositions comprising these compounds and to their use in therapy, in particular to their use for the
5 manufacture of a medicament for the treatment or prevention of psychiatric diseases where an enhancement of synaptic responses mediated by AMPA receptors is required.

L-glutamate is the most abundant excitatory neurotransmitter located in the mammalian central nervous system (CNS). L-glutamate plays a significant role in the control of
10 cognition, mood and motor function and these processes are imbalanced in psychiatric and neurological disorders. The physiological effects of glutamate are mediated through two receptor families, the metabotropic (G-protein coupled) receptors and the ionotropic (ligand-gated ion channels) receptors. The ionotropic receptors are responsible for mediating the fast synaptic response to extracellular L-glutamate. The ionotropic
15 glutamate receptors are separated into three subclasses on the basis of molecular and pharmacological differences and are named after the small molecule agonists which were originally identified to selectively activate them: AMPA (α -amino-3-hydroxy-5-methyl-4-isoxazole-propionic acid), NMDA (*N*-methyl-D-aspartate) and kainate (2-carboxy-3-carboxymethyl-4-isopropenylpyrrolidine). The importance of AMPA receptors in brain
20 physiology is widely recognised and it has been shown that AMPA receptors control the majority of fast excitatory amino acid transmission in the CNS and also contribute to synaptic plasticity playing a role in a variety of physiological processes such as learning and memory. To this end there has been a growing appreciation of the utility of positive allosteric modulators of the AMPA receptor for a variety of clinical indications including
25 schizophrenia, depression and Alzheimer's disease.

AMPA receptor subunits are encoded by four distinct genes (termed GluR1 to 4), each representing proteins of around 900 amino acids. The individual sub-units consist of a large extracellular N-terminal domain, an extracellular ligand binding site for L-glutamate
30 formed by domains designated S1 and S2. The transmembrane domain consists of three transmembrane regions, M1, M3 and M4 together with the re-entrant loop M2. This is then followed by a long intracellular C-terminal domain. All four AMPA receptor subunits contain so-called 'flip' and 'flop' splice variants which differ in alternate slicing of 38 amino acid encoding exons (differing by less than 10 amino acids) in the S2 extracellular
35 domain. Further heterogeneity of the AMPA receptors results from RNA editing, the most significant being the Q/R site located in the pore region (M2) of the GluR2 subunit. The R

variant, which a large proportion of native GluR2 subunits are believed to comprise, is characterised by significantly reduced calcium permeability. A further R/G editing site is located in the S2 domain of GluR2, GluR3 and GluR4 with the G form exhibiting an acceleration in the kinetics of recovery from desensitisation.

5

The kinetics of desensitisation and deactivation are important functional properties of the AMPA receptor that control the magnitude and duration of the synaptic response to glutamate. The processes of desensitisation and deactivation can be modulated by AMPA receptor positive allosteric modulators that bind remotely from the agonist binding
10 site, yet influence agonist binding, or indeed agonist mediated conformational changes in the receptor associated with gating and/or desensitisation. Consequently there are continued efforts to develop drugs that specifically target these properties and which will have therapeutic potential in the treatment of a wide variety of CNS disorders associated with diminished glutamatergic signalling. These conditions include age-related memory
15 impairment, Alzheimer's Disease, Parkinson's Disease, depression, psychosis, cognitive defects associated with psychosis, attention deficit disorder and attention deficit hyperactivity disorder.

A variety of structural classes of compounds are known which act as AMPA receptor
20 modulators (see G. Lynch, *Current Opinion in Pharmacology*, 2006, **6**, 82-88 for a recent review). For example, there are the so-called benzamide compounds related to aniracetam (see A. Arai *et al.*, *J Pharmacol Exp. Ther.*, 2002, **30**, 1075-1085), the benzothiadiazine derivatives such as S-18689 (see B. Pirotte, *J Med. Chem.*, 1998, **41**, 2946-2959) and the biarylpropylsulfonamide derivatives (see P.L. Ornstein *et al.*, *J Med.*
25 *Chem.* 2000, **43**, 4354-4358). Another class of AMPA receptor modulators was disclosed in International Patent Applications WO 2005/040110 and WO 2005/070916 which detail various heterocyclic compounds as being of utility as glutamate modulators. Compounds in each of these classes exhibit varying degrees of potentiation of the AMPA receptor.

30 Sustained AMPA receptor activation, however, is also associated with seizures and other proconvulsant side effects (Yamada K.A., *Exp. Opin. Invest. Drugs* 2000, **9**, 765-777). Consequently there remains a need for further AMPA receptor modulators which have an optimal separation between beneficial therapeutic effects and unwanted neurotoxic effects.

35

US 2004/171603 A1 discloses heterocyclic compounds indicated to be protein kinase inhibitors useful for the treatment of mycobacterial infections. WO 2005/033102 discloses certain thiophene based compounds indicated to be useful for the treatment of diseases associated with ATP-utilizing enzyme inhibition. WO 2006/044826 discloses further

5 thiophene based heterocyclic compounds useful as anti-tumor agents. None of these publications relate to compounds useful for the treatment or prevention of psychiatric diseases where an enhancement of synaptic responses mediated by AMPA receptors is required.

- 10 In a first aspect the present invention relates to a heterocyclic derivative according to formula I

formula I

- 15 wherein

R¹ is C₁₋₄alkyl or CN, said C₁₋₄alkyl being optionally substituted with 1-3 halogens;

R² is C₁₋₄alkyl, C₁₋₄alkyloxy, or C₁₋₅acyl, said C₁₋₄alkyl being optionally substituted with a substituent selected from OH, C₁₋₄alkyloxy and NR⁷R⁸ or R² together with R³ forms a 5 to 7 membered unsaturated carbocyclic ring optionally comprising a N.

- 20 R³ is H or methyl optionally substituted with hydroxy or 1-3 halogens or R³ together with R² forms a 5 to 7 membered unsaturated carbocyclic ring optionally comprising a N

R⁴ is hydroxymethyl, CO₂H or CONR⁹R¹⁰;

R⁵ and R⁶ are independently H, C₁₋₄alkyl or C₃₋₈cycloalkyl or R⁵ together with R⁶ forms a 5 or 6 membered unsaturated carbocyclic ring optionally comprising a heteroatomic

25 moiety selected from O and NR¹¹;

R⁷ and R⁸ are independently H, C₁₋₆alkyl or C₃₋₈cycloalkyl, said C₁₋₆alkyl being optionally substituted with hydroxy, C₁₋₄alkyloxy or 1-3 halogens; or R⁷ and R⁸ together with the N to which they are bonded form a 3-6 membered saturated heterocyclic ring;

- R⁹ is H or C₁₋₄alkyl optionally substituted with 1-3 groups selected from hydroxy, C₁₋₆alkyloxy, NR¹²R¹³, CONR¹⁴R¹⁵ and Y, wherein Y is a 5-6 membered heteroaryl comprising 1-2 heteroatoms selected from O, N and S, or wherein Y is C₃₋₈cycloalkyl
- 30

- optionally comprising 1-2 heteroatomic moieties selected from O, S, SO₂ and NR¹⁶, Y being optionally substituted with 1-2 substituents selected from C₁₋₄alkyl, CH₂OH and CH₂NR¹⁷R¹⁸;
- or R⁹ is C₃₋₈cycloalkyl comprising a heteroatomic moiety selected from O, S and NR¹⁶;
- 5 or R⁹ and R¹⁰ together with the N to which they are bonded form a 5-6 membered saturated heterocyclic ring optionally comprising a heteroatomic moiety selected from O and NR¹⁶;
- R¹⁰ is H or methyl with the proviso that when R⁹ is methyl R¹⁰ must be C₁₋₄alkyl or R¹⁰ and R⁹ together with the N to which they are bonded form a 5-6 membered
- 10 saturated heterocyclic ring optionally comprising a heteroatomic moiety selected from O and NR¹⁶;
- R¹¹ is H or methyl;
- R¹² is H or C₁₋₄alkyl or R¹² and R¹³ together with the N to which they are bonded form a 5-6 membered saturated heterocyclic ring optionally comprising a heteroatomic moiety
- 15 selected from O, S and NR¹⁹;
- R¹³ is H, C₁₋₄alkyl, CO₂R²⁰ or SO₂R²⁰ or R¹³ and R¹² together with the N to which they are bonded form a 5-6 membered saturated heterocyclic ring optionally comprising a heteroatomic moiety selected from O, S and NR¹⁹;
- R¹⁴ - R¹⁹ are independently H or C₁₋₄alkyl;
- 20 R²⁰ is C₁₋₄alkyl and
- m is 1-4
- with the proviso that when R¹ is CF₃, R² together with R³ forms a 6 membered unsaturated carbocyclic ring and R⁵ together with R⁶ forms a 6 membered unsaturated carbocyclic ring, R⁴ cannot be CONH₂
- 25 or a pharmaceutically acceptable salt or solvate thereof.

The term C₁₋₆ alkyl, as used herein, represents a branched or unbranched alkyl group having 1-6 carbon atoms. Examples of such groups are methyl, ethyl, isopropyl, tertiary butyl and neopentyl. Similarly the term C₁₋₄ alkyl, as used herein, represents a branched or

30 unbranched alkyl group having 1-4 carbon atoms.

The term C₃₋₈ cycloalkyl, as used herein, represents a branched or unbranched cyclic alkyl group having 3-8 carbon atoms. Examples of such groups are cyclopropyl, cyclopentyl and 2-methylcyclohexyl.

The term C₁₋₆ alkyloxy, as used herein, represents a branched or unbranched alkyloxy group having 1-6 carbon atoms. Examples of such groups are methoxy, ethoxy, isopropoxy and tertiary butyloxy. Similarly the term C₁₋₄ alkyloxy, as used herein, represents a branched or unbranched alkyloxy group having 1-4 carbon atoms.

5

The term C₃₋₆ cycloalkyloxy, as used herein, represents a branched or unbranched cyclic alkyloxy group having 3-6 carbon atoms. Examples of such groups are cyclopropyloxy, cyclopentyloxy and 2-methylcyclopentyloxy. Similarly, the term C₄₋₆ cycloalkyloxy represents a branched or unbranched cyclic alkyloxy group having 4-6 carbon atoms.

10

The term C₁₋₅ acyl, as used herein, represents an acyl group derived from a carboxylic acid having 1-5 carbon atoms. The acyl group can comprise a hydrocarbon which may be branched, unbranched, saturated or unsaturated. Examples of such groups include formyl, acetyl, propanoyl, propenoyl and pivaloyl. Also included within the definition of C₁₋

15 ₅ acyl are groups derived from dicarboxylic acids like hemi-malanoyl.

The term halogen, as used herein, represents a fluorine, chlorine, bromine or iodine.

Examples of 5 to 7 membered unsaturated carbocyclic rings optionally comprising a N
20 formed by R² together with R³ include cyclopentenylene, cyclohexenylene, phenylene and pyridinylene .

Examples of 6 to 8 membered unsaturated carbocyclic rings optionally comprising a heteroatomic moiety selected from O and NR¹¹ formed by R⁵ together with R⁶ include
25 cyclohexenylene and 1-methyl-1,2,5,6-tetrahydropyridinylene.

Examples of 3 to 5 membered saturated heterocyclic rings formed by R⁷ and R⁸ together with the nitrogen to which they are bonded include azetidine and pyrrolidine.

30 Examples of 5 or 6 membered heteroaryl comprising 1 or 2 heteroatoms selected from O, N and S include furanyl, thienyl, thiazolyl and pyridinyl.

Examples of C₃₋₈cycloalkyl comprising a heteroatomic moiety selected from O, S, SO₂ and NR¹⁶, wherein R¹⁶ has the previously defined meaning, include azetidiny, pyrrolidinyl,
35 piperidinyl and homopiperidinyl.

Examples of 5 or 6 membered saturated heterocyclic rings optionally comprising a heteroatomic moiety selected from O and NR^{16} , formed by R^9 and R^{10} together with the nitrogen to which they are bonded include pyrrolidine, piperidine and piperazine.

- 5 Similarly examples of 5 or 6 membered saturated heterocyclic rings optionally comprising a heteroatomic moiety selected from O and NR^{19} , formed by R^{12} and R^{13} together with the nitrogen to which they are bonded include pyrrolidine, piperidine and piperazine.

In one embodiment R^1 is isopropyl, tertiary butyl, CN or trifluoromethyl. In a further
10 embodiment R^1 is trifluoromethyl.

In another embodiment R^2 is methyl optionally substituted with hydroxy, C_{1-4} alkyloxy or NR^7R^8 , wherein R^7 and R^8 have the previously defined meanings. In a further embodiment R^2 is hydroxymethyl or $\text{CH}_2\text{NR}^7\text{R}^8$.

15

In a further embodiment R^2 together with R^3 form a cyclohexenylene or cycloheptenylene ring.

In another embodiment R^4 is $\text{CONR}^9\text{R}^{10}$, wherein R^9 and R^{10} have the previously defined
20 meanings.

In another embodiment R^5 and R^6 are independently H or C_{1-4} alkyl. In a further embodiment R^5 and R^6 are independently H, methyl or ethyl. In a further embodiment R^5 together with R^6 form a 5, 6 or 7 membered unsaturated carbocyclic ring optionally
25 comprising an O.

In another embodiment R^7 and R^8 are independently H, C_{1-4} alkyl or C_{3-6} cycloalkyl.

In another embodiment R^9 is H or C_{1-4} alkyl optionally substituted with hydroxy, C_{1-6} alkyloxy
30 or $\text{NR}^{12}\text{R}^{13}$, wherein R^{12} and R^{13} have the previously defined meanings. In a further embodiment R^9 is C_{1-4} alkyl optionally substituted with Y, wherein Y is C_{4-6} cycloalkyl comprising 1-2 heteroatomic moieties selected from O and NR^{16} , wherein R^{16} has the previously defined meaning.

35 In another embodiment R^{10} is H or C_{1-4} alkyl. In a further embodiment R^{10} is H or methyl.

In another embodiment R¹¹ is H or methyl.

In another embodiment is a heterocyclic derivative selected from

- The heterocyclic derivatives of the present invention are prepared by methods well known
25 in the art of organic chemistry. See, for example, J. March, '*Advanced Organic Chemistry*' 4th Edition, John Wiley and Sons. During synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This is achieved by means of conventional protecting groups, such as those described in T.W. Greene and P.G.M. Wuts '*Protective Groups in Organic Synthesis*' 2nd
30 Edition, John Wiley and Sons, 1991. The protective groups are optionally removed at a convenient subsequent stage using methods well known in the art.

The synthesis of heterocyclic derivatives of the general formula (I) may be accomplished as outlined in Schemes 1-6 below.

Heterocyclic derivatives such as (8) are prepared as shown in **Scheme 1**. Alkylation of pyrazole derivative (1) using a base such as NaH or potassium carbonate in *N,N*-dimethylformamide (DMF) provides the acetate derivative (2). Subsequent removal of the *t*-butyl group with acid, for example, using trifluoroacetic acid (TFA) provides the acid 5 derivative (3). Coupling of the acid derivative (3) with an aminothiophene derivative (4) using, for example, *O*-(7-Azabenzotriazole-1-yl)-*N,N,N',N'*-tetramethyluronium hexafluorophosphate (HATU) in the presence of an organic base such as diisopropylethylamine (DIEA) gives the amide (5). Removal of the *t*-butyl ester with an acid such as TFA or HCl and subsequent treatment of the resulting carboxylic acid intermediate (6) with an amine together with a coupling reagent such as HATU in the presence of an organic base such as DIEA provides the amide derivative (7). Finally deprotection of the Boc group with an acid such as TFA or HCl gives the alkylamide (8).

Scheme 1.

15

Pyrazole derivatives (1) and aminothiophene derivatives (4), are obtained from commercial sources, or are prepared by literature procedures or modifications of literature procedures known to persons skilled in the art. For example, as adumbrated in **Scheme 2**, aminothiophene derivatives (4) are prepared by the condensation of *t*-

butylcyanoacetate, cyclohexanone and sulfur in the presence of an organic base such as diethylamine or *N*-methylmorpholine.

Scheme 2.

5

An alternative construction of the indazole amide system is delineated in **Scheme 3**. Treatment of the aminothiophene derivative (9) with a suitable acid halide in, for example, DCM and in the presence of triethylamine, provides the halogenated amide derivatives (10). Further reaction of amides (10) with a pyrazole derivative (11) in the presence of a base, such as, potassium carbonate or NaH gives the adducts (12). Similarly, bromoacetamide (10) is elaborated to give the amide adducts (15). Reductive amination of (12), using, for example, triacetoxyborohydride and acetic acid in MeOH, gives the (13). Alternatively, reduction of (12) using, for example, sodium borohydride in MeOH, gives the amides (14).

15

Scheme 3.

Amine derivatives of the type (13a) are also be prepared as illustrated in **Scheme 4**. Alkylation of 3-(trifluoromethyl)-4-cyanopyrazole (16) with bromoacetamide derivative (10) 5 using a base, such as NaH, provides (17). Reduction of (17) with sodium borohydride in the presence of a cobalt salt furnishes the amine (18). Subsequent reductive amination using, for example, acetone in the presence of sodium triacetoxyborohydride in DCM provides the amine (19).

10 **Scheme 4.**

As shown in **Scheme 5**, the acid derivative (6) is decarboxylated upon heating with 15 copper in quinoline. The thiophene (20) is then carbonylated using, for example, phosphorus oxychloride and DMF in dichloroethane to provide the aldehyde (21). The alcohol (22) results following reduction of (21) with, for example, sodium borohydride in EtOH.

20

25

Scheme 5.

5 Aldehyde derivatives of the type (11) may be prepared as illustrated in **Scheme 6**. Formation of the pinacol semicarbazone (25) using semicarbazide (24), followed by treatment with phosphorus oxychloride in DMF provides aldehyde (11). Alternatively, reduction of esters of the type (26) with reagents such as lithium aluminium hydride to give alcohol (27) followed by oxidation with manganese dioxide or similar reagent
10 provides aldehyde (11).

Scheme 6

15 Heterocyclic derivatives such as (34) are prepared as shown in **Scheme 7**. Displacement of the ester can be achieved using, for example, ethanolamine at reflux. The cyanoactamide obtained (29) can be condensed with, for example, cyclohexanone under dehydrating conditions to give (30). Cyclisation with sulfur in the presence of an organic
20 base such as diethylamine or *N*-methylmorpholine gives the aminothiophene derivative (31). Treatment of the aminothiophene derivative (31) with bromoacetyl bromide in, for example, THF and in the presence of diisopropylethylamine, provides the

bromoacetamide derivative (32). Further reaction of bromoacetamide (32) with a pyrazole derivative (11) in the presence of a base, such as potassium carbonate, gives adduct (33). Reductive amination of the aldehyde (33), using, for example, triacetoxyborohydride and acetic acid in MeOH or palladium on carbon, hydrogen and acetic acid in DCM gives the

5 amine (34).

Scheme 7

10

Substituted pyrazole derivatives of the type (37) may be prepared as illustrated in **Scheme 8**. Treatment of the aldehyde (12a) with a suitable Grignard reagent followed by oxidation using, for example, the Dess-Martin periodinane reagent gives intermediate ketone (36). Reductive amination using sodium cyanoborohydride furnishes amine (37).

15

Scheme 8

Pyrazolyl amine derivatives of the type (41) can be prepared as delineated in **Scheme 9**. Treatment of bromacetamide derivative (10a) with a pyrazole alcohol (38) in the presence of a suitable base provides intermediate (39). Conversion of the alcohol into a suitable leaving group followed by displacement with an amine furnishes the desired alkyl amine derivative (41).

Scheme 9

The present invention also includes within its scope all stereoisomeric forms of heterocyclic derivatives according to the present invention resulting, for example, because of configurational or geometrical isomerism. Such stereoisomeric forms are enantiomers, diastereoisomers, *cis* and *trans* isomers *etc.* For example, in the case where R^2 is 1-hydroxyethyl the compound exists as a pair of enantiomers. In the case where R^5 is 2-methyl-1-cyclopentyl, both *cis* and *trans* geometric isomers are possible. In the case of the individual stereoisomers of heterocyclic derivatives of formula I or salts or solvates thereof, the present invention includes the aforementioned stereoisomers substantially free, *i.e.*, associated with less than 5%, preferably less than 2% and in particular less than 1% of the other stereoisomer. Mixtures of stereoisomers in any proportion, for example a racemic mixture comprising substantially equal amounts of two enantiomers are also included within the scope of the present invention.

For chiral compounds, methods for asymmetric synthesis whereby the pure stereoisomers are obtained are well known in the art, *e.g.*, synthesis with chiral induction, synthesis starting from chiral intermediates, enantioselective enzymatic conversions, separation of stereoisomers using chromatography on chiral media. Such methods are described in

Chirality In Industry (edited by A.N. Collins, G.N. Sheldrake and J. Crosby, 1992; John Wiley). Likewise methods for synthesis of geometrical isomers are also well known in the art.

5 The heterocyclic derivatives of the present invention, in the form as a free base, are isolated from reaction mixtures as pharmaceutically acceptable salts. These salts are also obtained by treatment of said free base with an organic or inorganic acid, for example, hydrogen chloride, hydrogen bromide, hydrogen iodide, sulfuric acid, phosphoric acid, acetic acid, trifluoroacetic acid, propionic acid, glycolic acid, maleic acid, malonic
10 acid, methanesulfonic acid, fumaric acid, succinic acid, tartaric acid, citric acid, benzoic acid and ascorbic acid.

The heterocyclic derivatives of the present invention exist in both solvated and unsolvated forms, including hydrated forms. These forms are also encompassed within the scope of
15 the present invention.

The heterocyclic derivatives of the present invention also exist as amorphous forms. Multiple crystalline forms are also possible. All these physical forms are included within the scope of the present invention.

20

In a further aspect, the heterocyclic derivatives of the present invention and their pharmaceutically acceptable salts and solvates are useful in therapy. As such the heterocyclic derivatives of the present invention are useful for the manufacture of a medicament for the treatment or prevention of psychiatric diseases where an
25 enhancement of synaptic responses mediated by AMPA receptors is required. In particular the heterocyclic derivatives are useful for the manufacture of a medicament for the treatment of neurodegenerative disorders, cognitive or memory dysfunction, memory and learning disorders, attention disorder, trauma, stroke, epilepsy, Alzheimer's disease, depression, schizophrenia, psychotic disorders, anxiety, autism, a disorder or disease
30 resulting from neurotic agents, substance abuse, alcohol psychiatric disorders, Parkinson's Disease, sleep disorders or narcolepsy or other conditions resulting from sleep deprivation. The present invention further includes a heterocyclic derivative for use in the treatment of any of the aforementioned diseases or disorders.

35 The present invention further includes a method for the treatment of a mammal, including a human, suffering from or liable to suffer from depression or any of the aforementioned

disorders, which comprises administering an effective amount of a heterocyclic derivative according to the present invention or a pharmaceutically acceptable salt or solvate thereof.

- 5 The amount of a heterocyclic derivative of the present invention or a pharmaceutically acceptable salt or solvate thereof, also referred to herein as the active ingredient, which is required to achieve a therapeutic effect will, of course, vary with the particular compound, the route of administration, the age and condition of the recipient and the particular disorder or disease being treated.

10

A suitable daily dose for any of the above mentioned disorders will be in the range of 0.001 to 50 mg per kilogram body weight of the recipient (e.g. a human) per day, preferably in the range of 0.01 to 20 mg per kilogram body weight per day. The desired dose may be presented as multiple sub-doses administered at appropriate intervals

- 15 throughout the day.

Whilst it is possible for the active ingredient to be administered alone, it is preferable to present it as a pharmaceutical composition. The present invention therefore also provides a pharmaceutical composition comprising a heterocyclic derivative according to the
20 present invention in admixture with one or more pharmaceutically acceptable excipients, such as the ones described in Gennaro *et. al.*, Remington: *The Science and Practice of Pharmacy*, 20th Edition, Lippincott, Williams and Wilkins, 2000; see especially part 5: pharmaceutical manufacturing. Suitable excipients are described e.g., in the Handbook of Pharmaceutical Excipients, 2nd Edition; Editors A. Wade and P.J.Weller, American
25 Pharmaceutical Association, Washington, The Pharmaceutical Press, London, 1994. Compositions include those suitable for oral, nasal, topical (including buccal, sublingual and transdermal), parenteral (including subcutaneous, intravenous and intramuscular) or rectal administration.

- 30 The mixtures of a heterocyclic derivative according to the present invention and one or more pharmaceutically acceptable excipient or excipients may be compressed into solid dosage units, such as tablets, or be processed into capsules or suppositories. By means of pharmaceutically suitable liquids the compounds can also be applied as an injection preparation in the form of a solution, suspension, emulsion, or as a spray, e.g., a nasal or
35 buccal spray. For making dosage units e.g., tablets, the use of conventional additives such as fillers, colorants, polymeric binders and the like is contemplated. In general, any

pharmaceutically acceptable additive can be used. The compounds of the invention are also suitable for use in an implant, a patch, a gel or any other preparation for immediate and/or sustained release.

- 5 Suitable fillers with which the pharmaceutical compositions can be prepared and administered include lactose, starch, cellulose and derivatives thereof, and the like, or mixtures thereof used in suitable amounts.

The invention is further illustrated by the following examples.

10

Example 1

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid (2-dimethylamino-ethyl)-amide

15

a) (3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetic acid

- 20 Sodium hydride (60 % [w/w] dispersion in mineral oil, 632 mg, 15.8 mmol) was added portionwise to a stirred solution of 4,5,6,7-tetrahydro-3-(trifluoromethyl)-indazole (3.00 g, 15.8 mmol) in DMF (60 mL), and the mixture stirred at RT for 30 min. *Tert*-butyl bromoacetate (2.33 mL, 15.8 mmol) was added and the reaction mixture stirred at 80 °C for 2 h, and allowed to cool to RT. Water (50 mL) was added and the resulting solution
- 25 extracted with EtOAc (3 x 200 mL), washed with water (200 mL), brine (200 mL), dried over sodium sulfate, and concentrated *in vacuo* to afford (3-Trifluoromethyl-4,5,6,7-tetrahydro-indazol-1-yl)-acetic acid *tert*-butyl ester.

- (3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetic acid *tert*-butyl ester was dissolved
- 30 in a solution of DCM (30 mL) and TFA (30 mL), and the resulting mixture stirred at RT for 30 min, before concentration *in vacuo* to afford the title compound (4.50 g). This was used directly in the next step without any further purification.

b) 2-Amino-4,5,6,7-tetrahydro-benzo[*b*]thiophene-3-carboxylic acid *tert*-butyl ester

5 Cyclohexanone (2.0 g, 20.4 mmol), *tert*-butyl cyanoacetate (2.88 g, 20.4 mmol), sulphur (650 mg, 20.4 mmol) were stirred in EtOH (8 mL). Diethylamine (2.5 mL, 24.2 mmol) was added and the reaction mixture stirred at RT overnight. Water (30 mL) was added and the reaction mixture extracted with EtOAc (3 x 30 mL). The combined EtOAc layers were washed with brine, dried over MgSO₄, filtered and the solvent removed *in vacuo* to give
10 desired product as a gum (5.5 g). The compound was used directly without any further purification.

MS (ESI) : *m/z* 254 [M + H]⁺

c) 2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetyl-amino]-4,5,6,7-tetrahydro-benzo[*b*]thiophene-3-carboxylic acid *tert*-butyl ester

(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetic acid (638 mg, 2.57 mmol) was
20 suspended in a solution of DCM (10 mL) and DMF (1 mL) and O-(7-azabenzotriazol-1-yl)-*N,N,N',N'*-tetramethyluronium hexafluorophosphate (1.17 g, 3.08 mmol) and *N,N'*-diisopropylethylamine (537 μ L, 3.08 mmol) added, followed by 2-Amino-4,5,6,7-tetrahydro-benzo[*b*]thiophene-3-carboxylic acid *tert*-butyl ester (651 mg, 2.57 mmol). The resultant mixture was stirred at RT overnight. The solution was concentrated *in vacuo*.
25 The residue was purified by silica gel chromatography using DCM as eluent, to afford the title compound as a yellow solid (0.93 g, 1.93 mmol, 75 %).

d) 2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxylic acid

5

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxylic acid *tert*-butyl ester was dissolved in a solution of DCM (5 mL) and TFA (5 mL), and the resulting mixture stirred at RT for 3 h, before concentration *in vacuo* to afford the title compound as a pale yellow solid (870 mg). This
10 was used directly in the next step without any further purification.

e) 2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxylic acid (2-dimethylamino-ethyl)-amide

15

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxylic acid (50 mg, 0.117 mmol) was dissolved in a solution of DCM (2 mL) and DMF (0.4 mL). O-(7-azabenzotriazol-1-yl)-*N,N,N',N'*-tetramethyluronium
20 hexafluorophosphate (54 mg, 0.141 mmol) was added, followed by *N,N*-dimethylethylenediamine (15.5 μ L, 0.141 mmol) and *N,N*-diisopropylethylamine (24.6 μ L, 0.141 mmol). The resultant mixture was stirred at RT overnight. The solvent was removed under reduced pressure, and the residue obtained purified by preparative reverse phase HPLC, to afford the title compound, a colourless oil, as the TFA salt (52
25 mg, 0.084 mmol, 72 %).

Example 2

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetyl-amino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid (2-piperidin-1-yl-ethyl)-amide

5

In a similar manner to example 1e, 1-(2-aminoethyl)-piperidine was used in place of *N,N*-dimethylethylenediamine to yield the title compound, an orange/brown residue, as the TFA salt (7 mg, 0.011 mmol, 9 %).

MS (ESI) : m/z 538.7 $[M + H]^+$.

10

Example 3

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetyl-amino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid (2-hydroxy-1,1-dimethyl-ethyl)-amide

15

In a similar manner to example 1e, 2-amino-2-methyl-1-propanol was used in place of *N,N*-dimethylethylenediamine to yield the title compound as a pale brown oil (13 mg, 0.026 mmol, 23 %).

MS (ESI) : m/z 499.3 $[M + H]^+$.

20

Example 4

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetyl-amino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid cyclopropylamide

In a similar manner to example 1e, cyclopropylamine was used in place of *N, N*-dimethylethylenediamine to yield the title compound as a white solid (5 mg, 0.011 mmol, 10 %).

5 MS (ESI) : m/z 467.3 $[M + H]^+$.

Example 5

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-
10 benzo[b]thiophene-3-carboxylic acid (3-hydroxy-propyl)-amide

In a similar manner to example 1e, 3-amino-1-propanol was used in place of *N, N*-
15 dimethylethylenediamine to yield the title compound (4 mg, 0.007 mmol, 12 %).

MS (ESI) : m/z 485.8 $[M + H]^+$.

Example 6

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-
20 benzo[b]thiophene-3-carboxylic acid (3-methoxy-propyl)-amide

In a similar manner to example 1e, 3-methoxypropylamine was used in place of *N,N*-dimethylethylenediamine to yield the title compound (8 mg, 0.017 mmol, 29 %).

MS (ESI) : m/z 499.3 $[M + H]^+$.

5

Example 7

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid (2,3-dihydroxy-propyl)-amide

10

In a similar manner to example 1e, 3-amino-1,2-propanediol was used in place of *N,N*-dimethylethylenediamine to yield the title compound (9 mg, 0.018 mmol, 31 %).

15 MS (ESI) : m/z 501.3 $[M + H]^+$.

Example 8

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid (3-imidazol-1-yl-propyl)-amide

20

In a similar manner to example 1e, 1-(3-aminopropyl)imidazole was used in place of *N,N*-dimethylethylenediamine to yield the title compound (3 mg, 0.005 mmol, 9 %).

MS (ESI) : m/z 532.2 $[M + H]^+$.

5

Example 9

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid propylamide

10

In a similar manner, propylamine was used in place of *N,N*-dimethylethylenediamine to yield the title compound (2 mg, 0.004 mmol, 7 %).

15 MS (ESI) : m/z 469.3 $[M + H]^+$.

Example 10

2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[b]thiophene-3-carboxylic acid (pyridin-3-ylmethyl)-amide

20

In a similar manner to example 1e, 3-(aminomethyl)pyridine was used in place of *N,N*-dimethylethylenediamine to yield the title compound (7 mg, 0.011 mmol, 18 %).

5 MS (ESI) : m/z 518.3 $[M + H]^+$.

Example 11

10 2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[*b*]thiophene-3-carboxylic acid [2-(4-methyl-piperazin-1-yl)-2-oxo-ethyl]-amide

In a similar manner to example 1e, 2-amino-1-(4-methylpiperazinyl)ethanone. 2HCl was used in place of *N,N*-dimethylethylenediamine to yield the title compound (7 mg, 0.012 mmol, 17 %).

MS (ESI) : m/z 567.5 $[M + H]^+$.

Example 12

20 2-[2-(3-Trifluoromethyl-4,5,6,7-tetrahydroindazol-1-yl)-acetylamino]-4,5,6,7-tetrahydro-benzo[*b*]thiophene-3-carboxylic acid methylcarbamoylmethyl-amide

In a similar manner to example 1e, 2-Amino-*N*-methyl-acetamide.HCl was used in place of *N*, *N*-dimethylethylenediamine to yield the title compound (11 mg, 0.022 mmol, 31 %).

5 MS (ESI) : m/z 498.6 [M + H]⁺.

2-(2-(4-cyano-3-(trifluoromethyl)pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo
[b]thiophene-3-carboxamide (270 mg, 68 mmol) was dissolved in MeOH (10 mL). A
5 catalytic amount of $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$ was added. Sodium borohydride (51 mg, 13.7 mmol) was
added in a portionwise manner. The reaction mixture was left to stir overnight. Water (20
mL) was added and the reaction mixture extracted with EtOAc (3 x 20 mL). The
combined EtOAc layers were washed with brine (20 mL), dried over MgSO_4 , filtered and
the solvent removed under reduced pressure to give the crude reaction mixture as a
10 cream solid (120 mg). An analytically pure sample was obtained by purification of 20 mg
of crude product. Preparative reverse phase HPLC gave desired product as the TFA salt
(2.5 mg, 0.049 mmol, 1 %).

N-methyl-2-(2-(4-((methylamino)methyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxamide

a) 2-Amino-N-methyl-4,5,6,7-tetrahydrobenzo[*b*]thiophene-3-carboxamide

20

Cyclohexanone (3.70 g, 37.7 mmol), 2-cyano-N-methylacetamide (3.70 g, 37.7 mmol), and sulphur (1.21 g, 37.7 mmol) were stirred in EtOH (15 mL). Diethylamine (5.60 mL,
 25 54.1 mmol) was added and the reaction mixture stirred at 20 °C for 5 days. The crude material was directly preabsorbed onto silica. Purification by flash chromatography (eluent 0-100 % EtOAc:heptane) gave the desired product as a yellow solid (1.51 g, 7.18 mmol, 19 %).

¹H NMR (400MHz, CDCl₃): δ 1.60 (m, 4H), 2.45 (m, 2H), 2.57 (m, 2H), 2.69 (d, 3H), 6.62 (s, 2H), 6.69 (s, 1H).

b) 2-(2-Bromoacetamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

In a similar manner to example 50a, 2-amino-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide was used in place of 2-amino-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide to yield the title compound as a yellow solid (0.67 g, 2.02 mmol, 71 %).

MS (ESI) : m/z 333 [M + H]⁺.

c) 2-(2-(4-Formyl-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

3-(Trifluoromethyl)pyrazole-4-carbaldehyde (332 mg, 2.02 mmol) was dissolved in THF (10 mL). Potassium *tert*-butoxide (454 mg, 4.05 mmol) was added, followed by 2-(2-bromoacetamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (670 mg, 2.02 mmol). The reaction mixture was stirred at RT overnight. Aqueous NH₄Cl (10 mL) was added and the reaction mixture extracted with DCM (3 x 10 mL). The combined DCM layers were washed with sodium bicarbonate solution (5 x 10 mL). The aqueous was separated using hydrophobic filter paper and the solvent removed *in vacuo* to give the desired product as a brown foam (0.73 g, 1.76 mmol, 87 %).

MS (ESI) : m/z 415 [M + H]⁺.

d) N-methyl-2-(2-(4-((methylamino)methyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

5

2-(2-(4-Formyl-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (338 mg, 0.816 mmol) was dissolved in NMP (10 mL) and methylamine hydrochloride (275 mg, 4.08 mmol) added, followed by glacial acetic acid (0.5 mL). The resulting mixture was stirred at RT for 5 min, before portionwise addition of sodium triacetoxyborohydride (691 mg, 3.26 mmol). The reaction was stirred at RT overnight. The reaction was quenched with water, and diluted with DCM (10 mL) and saturated sodium bicarbonate solution (10 mL). The phases were separated and the aqueous extracted with DCM (2 x 10 mL). The combined organics were concentrated to a brown oil which was loaded on to an SCX column and eluted with MeOH, then 2N NH₃ in MeOH. The fractions were monitored by TLC (DCM, 10 % MeOH) and combined to give a brown residue (160 mg). Purification by flash chromatography (eluent 5-10-20 % MeOH:DCM) gave the desired product as a yellow/brown oil which solidified on standing (106 mg, 0.25 mmol, 30 %).

MS (ESI) : m/z 430 [M + H]⁺.

N-(2-hydroxyethyl)-2-(2-(4-((methylamino)methyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

10

a) 2-Cyano-N-(2-hydroxyethyl)acetamide

To a solution of ethyl 2-cyanoacetate (10 g, 9.41 mL, 88 mmol) in EtOH (100 mL) was
15 added 2-aminoethanol (5.40 g, 5.34 mL, 88 mmol). The mixture was refluxed for ~4 h before concentration *in vacuo*. The mixture was purified on a 100g Silica column eluting with 0-10 % MeOH/DCM. Desired fractions were collected and concentrated to yield the desired product as a brown oil (10.2g, 79.7 mmol, 90 %). The sample was used directly in the next step without any further purification.

20

b) 2-Cyano-2-cyclohexylidene-N-(2-hydroxyethyl)acetamide

2-Cyano-N-(2-hydroxyethyl)acetamide (4.62g, 36.1 mmol), cyclohexanone (3.89 g, 4.10
25 mL, 39.7 mmol), acetic acid (0.433 g, 0.413 mL, 7.21 mmol) and ammonium acetate (2.78 g, 36.1 mmol) were suspended in toluene (150 mL) and the mixture heated to reflux under Dean-Stark conditions until no more water was collected (~1.5 h). The mixture was concentrated to remove toluene before partitioning between EtOAc/Water. The organic phase was collected, dried and concentrated to a lower volume before addition of small
30 quantities of heptane. The glass was etched until precipitation occurred and the solid collected by filtration. The desired product was isolated in 3 batches (4.2 g, 20.2 mmol, 56 %). The sample was used directly in the next step without any further purification.

c) 2-Amino-N-(2-hydroxyethyl)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

5 2-Cyano-2-cyclohexylidene-N-(2-hydroxyethyl)acetamide (3.70 g, 17.77 mmol) was dissolved in EtOH (75 mL) and sulfur (1.14 g, 35.5 mmol) followed by diethylamine (2.60 g, 3.68 mL, 35.5 mmol) added. The mixture was heated to reflux for 30 min. The reaction mixture was filtered while warm and the solid washed with EtOH. The combined EtOH portions were concentrated to dryness to yield the title product as a dark solid (4.6 g, 10 19.19 mmol, 108 %). The sample was used directly in the next step without any further purification.

d) 2-(2-Bromoacetyl)-N-(2-hydroxyethyl)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

15

2-Amino-N-(2-hydroxyethyl)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (4.6 g, 19.14 mmol) and DIPEA (4.95 g, 6.33 mL, 38.3 mmol) were dissolved in THF (100 mL) and the mixture purged with nitrogen and cooled in an ice bath. 2-Bromoacetyl bromide 20 (3.86 g, 1.667 mL, 19.14 mmol) dissolved in THF (5 mL) was added dropwise and the reaction monitored by TLC. After 30 min TLC indicated 3:1 product: starting material with a faint spot for bis-acylated material. An additional quantity of 2-bromoacetyl bromide (0.97 g, 0.417 mL, 4.79 mmol) was added and stirring continued for a further 30 min. The mixture was quenched by addition of water before removal of THF under reduced 25 pressure. The mixture was then partitioned between EtOAc/water and the organic layer collected - additional DCM was added to aid solubility. The aqueous layer was further washed with DCM. Combined organics were dried and concentrated to give a thick dark oil which was purified on silica eluting with 20-60 % EtOAc/heptane. Desired fractions were collected and concentrated to yield the desired product as a light yellow solid (2.96

g, 8.23 mmol, 43 %). The sample was used directly in the next step without any further purification.

5 4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

- 2-(2-Bromoacetamido)-N-(2-hydroxyethyl)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-
10 carboxamide (2.91 g, 8.06 mmol) was dissolved in DMF (25 mL) and potassium carbonate (2.23 g, 16.11 mmol), followed by 3-(trifluoromethyl)-1H-pyrazole-4-carbaldehyde (1.39 g, 8.46 mmol), added. The mixture was stirred at 60 °C for 25 min after which time the reaction mixture was diluted with water (~800 mL), then acidified with 5 N HCl until pH 1. During acidification a free flowing solid was obtained which was collected by filtration.
15 NMR analysis indicated ~60-70 % purity of desired product. The solid was successfully triturated with a mixture of DCM/ether to give a light beige solid which was collected by filtration. The mother liquor was concentrated and a second batch obtained using a similar process. The batches were combined to yield the title product (1.76 g, 3.95 mmol, 49 %).

- f) N-(2-hydroxyethyl)-2-(2-(4-((methylamino)methyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

- 25 2-(2-(4-Formyl-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-N-(2-hydroxyethyl)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (100 mg, 0.225 mmol), Methylamine (2 M in THF, 0.45 mL, 0.90 mmol) and DCM (3 mL) were treated with acetic acid (13.51 mg,

0.225 mmol) to give pH 4-5 and the solution stirred at RT for 20 min. 10 % Pd/C (20 mg) was added as a slurry in DCM and the mixture stirred under 4 barr hydrogen overnight. The mixture was taken into a 20 mL syringe and the residue of the flask washed with MeOH/DCM and also taken into the syringe. The mixture was filtered thorough a filter tip
5 and concentrated to give a yellow oil (~200 mg). Purification was achieved on silica eluting with 4% 2 M NH₃ in MeOH/DCM and the product obtained as a light yellow glass (74.2 mg, 0.160 mmol, 71 %).

b) 2-(3-(4-Formyl-3-(trifluoromethyl)-1H-pyrazol-1-yl)propanamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

20

3-(Trifluoromethyl)-1H-pyrazole-4-carbaldehyde (437 mg, 2.66 mmol) and 2-(3-chloropropanamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (801 mg, 2.66 mmol) were dissolved in DMF (15 mL). Potassium carbonate (368 mg, 2.66 mmol) was added followed by potassium iodide (10 mg, 0.06 mmol). The reaction mixture was left to stand for 7 days. Water was added and the reaction mixture extracted into EtOAc (x 3). The EtOAc layers were combined and washed with water (x 5), brine, dried

over MgSO_4 , filtered and the solvent removed *in vacuo* to give desired product as a yellow solid (970 mg, 2.26 mmol, 85 %).

c) N-methyl 2-(3-(4-((methylamino)methyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)propanamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

10

2-(3-(4-Formyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)propanamido)-N-methyl-4,5,6,7-

15 tetrahydrobenzo[b]thiophene-3-carboxamide (25 mg, 0.058 mmol) was dissolved in DCM/DMF (2:1, 3 mL). Methylamine (1.81 mg, 0.058 mmol) was added, followed by acetic acid (0.36 mg, 0.006 mmol). The reaction mixture was stirred at RT for 30 min before addition of sodium triacetoxyborohydride (51 mg, 0.242 mmol). The reaction mixture was stirred at RT overnight. The DCM was removed *in vacuo* and the reaction mixture filtered, then
20 purified by preparative reverse phase HPLC to give the desired product as the TFA salt. The sample was passed through an SCX column, washed with MeOH, then eluted with 2 M NH_3 in MeOH to give the desired product (5.1 mg, 0.012 mmol, 20 %).

Example 90

2-(2-(4-(2-(Methylamino)ethyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

30

a) 2-(1-(2-(3-Carbamoyl-4,5,6,7-tetrahydrobenzo[b]thiophen-2-ylamino)-2-oxoethyl)-3-(trifluoromethyl)1H-pyrazol-4-yl)ethyl methane sulfonate

2-(2-(4-(2-Hydroxyethyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (Example 64, 480 mg, 1.153 mmol) was dissolved in DCM (10 mL). Triethylamine (117 mg, 1.153 mmol) was added, followed by methanesulfonyl chloride (132 mg, 1.153 mmol). The reaction mixture was stirred at RT for 3 h. Water was added and the reaction mixture extracted with DCM (x 3). The combined DCM layers were then washed with brine, dried over MgSO₄, filtered and the solvent removed *in vacuo* to yield the desired product (450 mg, 0.91 mmol, 79 %).

b) 2-(2-(4-(2-(Methylamino)ethyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

15

The 2-(1-(2-(3-carbamoyl-4,5,6,7-tetrahydrobenzo[b]thiophen-2-ylamino)-2-oxoethyl)-3-(trifluoromethyl)-1H-pyrazol-4-yl)ethyl methanesulfonate (30 mg, 0.061 mmol) was dissolved in DMF (1 mL) and methylamine (2 M in THF, 1 mL, 2 mmol) added. The reaction mixture was heated at 120 °C for 5 min in the microwave. The THF was removed *in vacuo* and the reaction mixture filtered and purified by preparative reverse phase HPLC to give the formic acid salt of the desired product (3.6 mg, 0.008 mmol, 12 %).

Example 91

2-(2-(3-(Trifluoromethyl)-1H-pyrazolo[4,3-c]pyridin-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

30

a) 1-(4-(dimethylamino)pyridin-3-yl)-2,2,2-trifluoroethanone

5 To a solution of N,N-dimethylpyridin-4-amine (500 mg, 4.09 mmol) in toluene (5 mL) was added 2,2,2-trifluoroacetic anhydride (430 mg, 0.284 mL, 2.046 mmol). The reaction mixture was heated to 85 °C and this temperature was maintained for 8 h before the mixture was allowed to cool to RT overnight. The precipitate (DMAP-TFA salt) was removed by filtration and the filtrate concentrated to dryness to give the desired product
10 as a light brown oil (330 mg, 1.5 mmol, 37 %).

MS (ESI): m/z 219 $[M + H]^+$.

b) 3-(Trifluoromethyl)-1H-pyrazolo[4,3-c]pyridine

15

A suspension of 1-(4-(dimethylamino)pyridin-3-yl)-2,2,2-trifluoroethanone (259 mg, 1.187 mmol) and hydrazine monohydrochloride (244 mg, 3.56 mmol) in butan-1-ol (2.5 mL) was heated to 200 °C for 35 min. The reaction mixture was applied to a 10g SPE cartridge
20 that had been pre-conditioned with 3 % MeOH/DCM and eluted with the same system to give a light yellow solid (189 mg, 1.0 mmol, 85 %).

MS (ESI): m/z 188 $[M + H]^+$.

c) 2-(2-(3-(Trifluoromethyl)-1H-pyrazolo[4,3-c]pyridin-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide
25

A mixture of 3-(trifluoromethyl)-1H-pyrazolo[4,3-c]pyridine (20 mg, 0.107 mmol), 2-(2-bromoacetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide (33.9 mg, 0.107 mmol) and potassium carbonate (29.5 mg, 0.214 mmol) in DMF (0.5 mL) was heated to 60 °C and this temperature maintained for 2h. The reaction mixture was allowed to cool to RT, and purified by preparative reverse phase HPLC to give a white solid (2.1 mg, 5 µmol, 4.6 %).

MS (ESI): m/z 424 [M + H]⁺.

10 Example 92

N-methyl-2-(2-(3-(trifluoromethyl)-1H-pyrazolo[4,3-c]pyridin-1-yl)acetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide

15

In a similar manner to example 91c, 2-(2-bromoacetamido)-N-methyl-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide was used in place of 2-(2-bromoacetamido)-4,5,6,7-tetrahydrobenzo[b]thiophene-3-carboxamide to give the title compound as a white solid (8.1 mg, 19 µmol, 17 %).

MS (ESI): m/z 438 [M + H]⁺.

Example 93 - biological assays

25 The compounds in this invention may be tested using a biological assay which measures Ca²⁺ influx mediated through positive modulation of the AMPA (GluR1) receptor using standard techniques in the art such as, but not limited to, a FLEXstation (manufactured by Molecular Devices, Sunnyvale, CA). An optical readout using fluorescent probes is employed to measure ion channel dependent changes in intracellular ion concentration or membrane potential. The assay utilises the Ca²⁺ conductance of functional homomeric GluR1(i) AMPA receptors to generate glutamate-dependent Ca²⁺ responses. Influx of Ca²⁺ through the ion channel is measured indirectly through an increase in intracellular Ca²⁺

30

levels using the calcium sensitive dye such as, but not limited to, Fluo-3 (Molecular Devices, Sunnyvale, CA) in FLEXstation. A positive AMPA receptor modulator, in the presence of glutamate, will result in an influx of Ca^{2+} through the ion channel which can be measured indirectly through an increase in intracellular Ca^{2+} levels using the calcium sensitive dye Fluo-3 in FLEXstation.

HEK.GluR1(i) cells were maintained in DMEM supplemented with 10% fetal calf serum, 1% non-essential amino acids and 150 $\mu\text{g}/\text{mL}$ hygromycin, at $37^\circ\text{C}/5\% \text{CO}_2$. Twenty-four h prior to the assay, the cells were harvested with trypsin and seeded onto Costar 96 well clear bottomed black plates at a density of 3.5×10^4 per well.

Cells were loaded with 5 μM fluo3-AM in DMEM media in the absence of hygromycin and incubated at $37^\circ\text{C}/5\% \text{CO}_2$ for one h. After dye loading, the cells were washed once with 200 μL of low calcium solution (10 mM hepes, pH 7.4, 160 mM NaCl, 4.5 mM KCl, 2 mM CaCl_2 , 1 mM MgCl_2 , 10 mM glucose) containing 0.625 mM of probenecid (inhibitor for the anion-exchange protein) to remove the dye. Then 200 μL of low calcium solution was added to each well. The Flexstation added 50 μL of glutamate +/- test compound in high calcium solution (10 mM Hepes, pH 7.4, 160 mM NaCl, 4.5 mM KCl, 20 mM CaCl_2 , 1 mM MgCl_2 and 10 mM glucose) to each well and the ensuing response was monitored on FLEXstation.

The compounds of this invention exhibit positive modulation of the AMPA receptor having EC_{50} values in the range 0.001 μM to 30 μM . For instance, Example 67 gave an EC_{50} of 2.2 μM .

The claims defining the invention are as follows:

- 5 1. A heterocyclic derivative according to formula I
