The invention features a method for treating a patient having a cancer or other neoplasm, by administering to the patient (i) a benzimidazole or a metabolite or analog thereof; and (ii) pentamidine or a metabolite or analog thereof simultaneously or within 14 days of each other in amounts sufficient to inhibit the growth of the neoplasm.
COMBINATIONS OF DRUGS (E.G., A BENZIMIDAZOLE AND PENTAMIDINE) FOR THE TREATMENT OF NEOPLASTIC DISORDERS

CROSS-REFERENCE TO RELATED APPLICATIONS

BACKGROUND OF THE INVENTION

[0002] The invention relates to the treatment of neoplastic disorders such as cancer.

[0003] Cancer is a disease marked by the uncontrolled growth of abnormal cells. The abnormal cells may no longer do the work of normal cells, and they crowd out and destroy healthy tissue.

[0004] Lung cancer is the most common cancer-related cause of death among men and women. It is the second most commonly occurring cancer among men and women; it has been estimated that there will be more than 164,000 new cases of lung cancer in the U.S. in the year 2000 alone. While the rate of lung cancer cases is declining among men in the U.S., it continues to increase among women. Lung cancer can be lethal; according to the American Lung Association, an estimated 156,000 Americans are expected to die due to lung cancer in 2000.

[0005] Cancers that begin in the lungs are divided into two major types, non-small cell lung cancer and small cell lung cancer, depending on how the cells appear under a microscope. Non-small cell lung cancer (squamous cell carcinoma, adenocarcinoma, and large cell carcinoma) generally spreads to other organs more slowly than does small cell lung cancer. Small cell lung cancer is the less common type, accounting for about 20% of all lung cancer.

[0006] Other cancers include brain cancer, breast cancer, cervical cancer, colon cancer, gastric cancer, kidney cancer, leukemia, liver cancer, lymphoma, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcoma, skin cancer, testicular cancer, and uterine cancer. These cancers, like lung cancer, are sometimes treated with chemotherapy.

[0007] Chemotherapeutic drugs currently in use or in clinical trials include paclitaxel, docetaxel, tamoxifen, vinorelbine, gemcitabine, cisplatin, etoposide, topotecan, irinotecan, anastrozole, rituximab, trastuzumab, fludarabine, cyclophosphamide, gemcitabine, carboplatin, interferon, and doxorubicin. The most commonly used anticancer agent is paclitaxel, which is used alone or in combination with other chemotherapy drugs such as: 5-FU, doxorubicin, vinorelbine, cytostatin, and cisplatin.

SUMMARY OF THE INVENTION

[0008] We have discovered that the combination of one of the antihelmintic drugs albendazole, mebendazole, or oxibendazole and the antiprotozoal drug pentamidine exhibits substantial antiproliferative activity against cancer cells. Structural and functional analogs of each of these compounds are known, and any of these analogs can be used in the antiproliferative combinations of the invention. Metabolites of albendazole and pentamidine are also known. Many of these metabolites share one or more biological activities with the parent compound and, accordingly, can also be used in the antiproliferative combinations of the invention. Accordingly, the invention features a method for treating a patient having a cancer or other neoplasm, by administering to the patient (i) albendazole, mebendazole, or oxibendazole; and (ii) pentamidine simultaneously or within 14 days of each other in amounts sufficient to inhibit the growth of the neoplasm.

[0009] Preferably, the two compounds are administered within ten days of each other, more preferably within five days of each other, and most preferably within twenty-four hours of each other or even simultaneously. The cancer treated according to any of the methods of the invention, described below, can be lung cancer (squamous cell carcinoma, adenocarcinoma, or large cell carcinoma), brain cancer, breast cancer, cervical cancer, colon cancer, gastric cancer, kidney cancer, leukemia, liver cancer, lymphoma, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcoma, skin cancer, testicular cancer, or uterine cancer.

[0010] In a related aspect, the invention also features a method for treating a patient having a neoplasm such as cancer. In this method, the patient is administered (a) a first compound selected from albendazole, albendazole sulfate, albendazole sulfone, albendazole sulfoxide, astemizole, benomyl, 2-benimidazolylurea, benzthiazuron, cambendazole, cyclobendazole, domiperidone, droperidol, fenbendazole, flubendazole, fentizole, 5-hydroxymebenda zole, lobendazole, luxabendazole, mebendazole, mehtaben zthiazuron, mercaptozole, mifepristone, nocodazole, omeprazole, oxendazole, oxibendazole, parbendazole, pimozide, and tioxazole (or a salt of any of the above), NSC 181928 (ethyl 5-amino-1,2-dihydro-3-[(N-methylaminio)methyl]-pyrido[3,4-b]pyrazin-7-ylcarbamate), and TN-16 (3-[(1-anilinoethylidene)-5-benzyl-pyrodilin-2,4-dione); and (b) a second compound selected from pentamidine, propanam ide, butamidine, heptamidine, nomadinide, stilbamide, hydroxyStilbamidine, diminazene, benzamidine, dibromopropamidine, 1,3-bis(4-amidino-2-methoxyphenoxy)propane, phenamidine, and amicarbazide (or a salt of any of the above). Alternatively, the second compound can be a functional analog of pentamidine, such as netropsin, distamycin, bleomycin, actinomycin, or daunorubicin. The first and second compounds are preferably administered simultaneously or within 14 days of each other and in amounts sufficient to inhibit the growth of the neoplasm.

[0011] In another related aspect, the invention also features a method for treating a patient having a neoplasm such as cancer by administering the following:

[0012] a a first compound having the formula (I):
wherein:

R₁ is selected from the group consisting of:

(A-1)

(A-2)

(A-3)

(A-4) and

R₂ is selected from the group consisting of:

(B-1)

(B-2)

(B-3)

(B-4)

(B-5)

(B-6)

(B-7)

(B-8)

(B-9)

(B-10)

(B-11)

(B-12)

(B-13) and

each of R₃ and R₄ is independently selected from the group consisting of:

(C-1)

(C-2)

(C-3)

(C-4)

(C-5)

(C-6)

(C-7)

(C-8)

(C-9)
[0017] and

[0018] b) a second compound having the formula (II):

\[
\text{II}
\]

wherein each of Y and Z is, independently, O or N; each of R\textsubscript{7} and R\textsubscript{8} is, independently, —H, —OH, —halogen, —O—C\textsubscript{1-10} alkyl, —OCF\textsubscript{3}, —NO\textsubscript{2}, or NH\textsubscript{2}; n is an integer between 2 and 6, inclusive; and each of R\textsubscript{7} and R\textsubscript{8} is, independently, at the meta or para position and is selected from the group consisting of:

\[
\text{D-1}
\]

\[
\text{D-2}
\]

\[
\text{D-3}
\]
[0020] wherein the first and second compounds are administered simultaneously or within 14 days of each other in amounts sufficient to inhibit the growth of the neoplasm.

[0021] In another related aspect, the invention also features a method for treating a patient having a neoplasm such as cancer by administering the following:

[0022] a) a first compound having the formula (III):

\[
\begin{align*}
\text{(III)} & \\
R_1 & \\
R_{10} & \\
R_9 & \\
\end{align*}
\]

[0023] wherein:

[0024] A is selected from the group consisting of O, S, and NR\_2;

[0025] R\_9 is selected from the group consisting of:

\[
\begin{align*}
\text{(B-1)} & \\
\text{(B-2)} & \\
\text{(B-3)} & \\
\text{(B-4)} & \\
\text{(B-5)} & \\
\text{(B-6)} & \\
\text{(B-7)} & \\
\text{(B-8)} & \\
\text{(B-9)} & \\
\text{(B-10)} & \\
\text{(B-11)} & \\
\text{(B-12)} & \\
\text{(B-13)} & \\
\end{align*}
\]

[0026] each of R\_10 and R\_11 is independently selected from the group consisting of —H, —halo, —NO\_2, —OH, —SH, —O—C\_1-10 alkyl, —O—(C\_1-10 alkyl)\_2-aryl, —O—(C\_1-10 alkyl)\_2—heteroaryl, —O—(C\_1-10 alkyl)\_2—heterocyclyl, —C\_1-10 alkoxy carbonyl, —S(O)\_2—C\_1-10 alkyl, —S(O)\_2—(C\_1-10 alkyl)\_2—aryl, —S(O)\_2—(C\_1-10 alkyl)\_2—heteroaryl, —S(O)\_2—(C\_1-10 alkyl)\_2—heterocyclyl, and —C\_1-10 alkyl or —C\_2-10 alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of —aryl, —heteroaryl, —heterocyclyl, —O—C\_1-10 alkyl, —O—(C\_1-10 alkyl)\_2—aryl, —O—(C\_1-10 alkyl)\_2—heteroaryl, —O—(C\_1-10 alkyl)\_2—heterocyclyl, —C\_1-10 alkoxy carbonyl, —S(O)\_2—C\_1-10 alkyl, —S(O)\_2—(C\_1-10 alkyl)\_2—aryl, —S(O)\_2—(C\_1-10 alkyl)\_2—heteroaryl, —S(O)\_2—(C\_1-10 alkyl)\_2—heterocyclyl, —N(R\_12), —OR\_13, —oxo, —cyano, —halogen, —NO\_2, —OH, and —SH;

[0027] R\_12 is selected from the group consisting of —C\_1-10 alkyl or —C\_2-30 alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of —aryl, —heteroaryl, —heterocyclyl, —O—C\_1-10 alkyl,
[0028] each R13 is independently selected from the group consisting of H and C13:10 alkyl or C8:10 alkynyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of -aryl, -heteroaryl, -heterocyclyl, -O-(C8:10 alkyl), -O-(C8:10 alkoycarbonyl), -SO2-(C8:10 alkyl), -SO3-(C8:10 alkyl), -N(R11)2, -OR13, -OC10 alkyl, -CN, -halo, -NO2, -OH, and -SH; and

[0029] b) a second compound having the formula (II):

![Diagram]

[0030] wherein each of Y and Z is, independently, O or N; each of R5 and R6 is, independently, -H, -OH, -halogen, -O-C8:10 alkyl, -OCF3, -NO2, or NH2; n is an integer between 2 and 6, inclusive; and each of R7 and R8 is, independently, at the meta or para position and is selected from the group consisting of:

[D-1] [D-2] [D-3] [D-4] [D-5]

[0031] wherein the first and second compounds are administered simultaneously or within 14 days of each other in amounts sufficient to inhibit the growth of the neoplasm.

[0032] In any of the foregoing treatment methods, both compounds are preferably together in a pharmaceutical composition that also includes a pharmaceutically acceptable carrier. A benzimidazole is preferably administered at a dosage of 1 to 2500 milligrams and pentamide is preferably administered at a dosage of 1 to 1000 milligrams. Suitable modes of administration include intravenous, intramuscular, inhalation, topical, and oral administration.

[0033] The antiproliferative combinations of the invention can also be provided as components of a pharmaceutical pack. The two drugs can be formulated together or separately and in individual dosage amounts.

[0034] It will be understood by those in the art that the compounds are also useful when formulated as salts. For example, as is described herein, the isethionate salt of pentamide exhibits synergistic antiproliferative activity when combined with a benzimidazole. Other salts of pentamide include the platinum salt, the dihydrochloride salt, and the dimethanesulfonate salt (see, for example, Mongardito et al., Lancet 2:108, 1989). Similarly, benzimidazole salts include, for example, halide, sulfate, nitrate, phosphate, phosphinate salts.

[0035] The invention also features a method for identifying compounds useful for treating a patient having a neoplasm. The method includes the steps of: contacting cancer cells in vitro with (i) pentamide or a benzimidazole (or an analog of pentamide or a benzimidazole) and (ii) a candidate compound, and determining whether the cancer cells grow more slowly than (a) cancer cells contacted with the benzimidazole or pentamide but not contacted with the candidate compound, and (b) cancer cells contacted with the candidate compound but not with the benzimidazole or pentamide. A compound that is useful for treating a patient having a neoplasm is any candidate compound that, when combined with the benzimidazole or pentamide, reduces cell proliferation but, in the absence of the benzimidazole or pentamide, does not.

[0036] Combination therapy according to the invention may be provided wherever chemotherapy is performed: at home, the doctor’s office, a clinic, a hospital’s outpatient department, or a hospital. Treatment generally begins at a hospital so that the doctor can observe the therapy’s effects closely and make any adjustments that are needed. The duration of the combination therapy depends on the kind of cancer being treated, the age and condition of the patient, the stage and type of the patient’s disease, and how the patient’s body responds to the treatment. Drug administration may be performed at any of various intervals (e.g., daily, weekly, or monthly) and the dosage, frequency, and mode of administration of each agent can be determined individually. Combination therapy may be given in on-and-off cycles that include rest periods so that the patient’s body has a chance to build healthy new cells and regain strength.

[0037] Depending on the type of cancer and its stage of development, the combination therapy can be used to treat cancer, to slow the spreading of the cancer, to slow the cancer’s growth, to kill or arrest cancer cells that may have spread to other parts of the body from the original tumor, to relieve symptoms caused by the cancer, or to prevent cancer
in the first place. Combination therapy can also help people live more comfortably by eliminating cancer cells that cause pain or discomfort.

[0038] As used herein, the terms “alkyl,” “alkenyl,” and the prefix “alk-” are inclusive of both straight chain and branched chain groups and of cyclic groups, i.e., cycloalkyl and cycloalkenyl groups. Cyclic groups can be monocyclic or polycyclic and preferably have from 3 to 10 ring carbon atoms, inclusive. Exemplary cyclic groups include cyclopropyl, cyclopentyl, cyclohexyl, and adamantyl groups.

[0039] The term “aryl” includes carbocyclic aromatic rings or ring systems. Examples of aryl groups include phenyl, naphthyl, biphenyl, fluorenyl, and indenyl groups. The term “heteroaryl” includes aromatic rings or ring systems that contain at least one ring hetero atom (e.g., O, S, N). Heteroaryl groups include furyl, thienyl, pyridyl, quinolinyl, tetrazolyl, and imidazo groups.

[0040] “Heterocyclyl” includes non-aromatic rings or ring systems that contain at least one ring hetero atom (e.g., O, S, N). Heterocyclic groups include, for example, pyrrolidinyl, tetrahydrofuranyl, morpholinyl, thiazolidinyl, and imidazolidinyl groups.

[0041] The aryl, heteroaryl, and heterocyclyl groups may be unsubstituted or substituted by one or more substituents selected from the group consisting of C1-C10 alkyl, hydroxy, halo, nitro, C1-C10 alkoxy, alkylthio, trihalomethyl, C2-C10 acyl, arylcarbonyl, heteroarylcarbonyl, nitrile, C1-C10 alkoxy-carbonyl, oxo, aryalkyl (wherein the alkyl group has from 1 to 10 carbon atoms) and heteroarylalkyl (wherein the alkyl group has from 1 to 10 carbon atoms).

[0042] Compounds useful in the invention include those described herein in any of their pharmaceutically acceptable forms, including isomers such as diastereomers and enantiomers, salts, solvates, and polymorphs, thereof, as well as racemic mixtures of the compounds described herein.

[0043] Other features and advantages of the invention will be apparent from the following detailed description, and from the claims.

DETAILED DESCRIPTION OF THE INVENTION

[0044] We have discovered that the anthelmintic drugs albendazole, mebendazole, or oxibendazole in combination with the antiparasitic drug pentamidine exhibit substantial antiproliferative activity against cancer cells. Concentrations that exhibited maximal antiproliferative activity against cancer cells were not toxic to normal cells. Thus, this drug combination is useful for the treatment of cancer and other neoplasms. We have also discovered that the combination of pentamidine isethionate with either exhibits similar antiproliferative activity.

[0045] Based on known properties that are shared among albendazole, mebendazole, and oxibendazole, their metabolites, and other benzimidazoles, as well as those shared among pentamidine and its analogs and metabolites, it is likely that structurally related compounds could be substituted for albendazole, mebendazole, and oxibendazole and for pentamidine in the antiproliferative combinations of the invention. Information regarding each of the drugs and its analogs and metabolites is provided below.
[0053] Examples of substituents $R_1$, $R_3$, and $R_4$ are provided below.

$R_1$

$R_3$ and $R_4$

[0051] each of $R_3$ and $R_4$ is independently selected from the group consisting of: $-H$, 5-halo, $-NO_2$, $-OH$, $-SH$, $-O-C_{1-10}$ alkyl, $-O-(C_{1-10})_n$-aryl, $-O-(C_{1-10})_n$-heteroaryl, $-O-(C_{1-10})_n$-heterocyclic, $-C_{1-10}$ alkoxy carbonyl, $-S(O)_2-C_{1-10}$ alkyl, $-S(O)_2-(C_{1-10})_n$-aryl, $-S(O)_2-(C_{1-10})_n$-heteroaryl, $-S(O)_2-(C_{1-10})_n$-heterocyclic, and $-C_{1-10}$ alkyl or $-C_{2-10}$ alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of -aryl, -heteroaryl, -heterocyclic, $-O-C_{1-10}$ alkyl, $-O-(C_{1-10})_n$-aryl, $-O(C_{1-10})_n$-heteroaryl, $-O-(C_{1-10})_n$-heterocyclic, $-C_{1-10}$ alkoxy carbonyl, $-S(O)_2-C_{1-10}$ alkyl, $-S(O)_2-(C_{1-10})_n$-aryl, $-S(O)_2-(C_{1-10})_n$-heteroaryl, $-S(O)_2-(C_{1-10})_n$-heterocyclic, $-N(R_{13})_2$, $-OR_{13}$, $-Oxo$, $-cyano$, $-halogen$, $-NO_2$, $-OH$, and $-SH$; and

[0052] each $R_{13}$ is selected from the group consisting of $H$ and $C_{1-10}$ alkyl or $C_{2-10}$ alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of-aryl, -heteroaryl, -heterocyclic, $-O-C_{1-10}$ alkyl, $-O-(C_{1-10})_n$-aryl, $-O-(C_{1-10})_n$-heteroaryl, $-O-(C_{1-10})_n$-heterocyclic, $-C_{1-10}$ alkoxy carbonyl, $-Oxo$, $-cyano$, $-halo$, $-NO_2$, $-OH$, and $-SH$. 
One of the most commonly prescribed members of the benzimidazole family is albendazole, which has the structure:

Albendazole is currently available as an oral suspension and in tablets.

Albendazole Metabolites

Albendazole undergoes metabolic transformation into a number of metabolites that may be therapeutically active; these metabolites may be substituted for albendazole in the antiproliferative combination of the invention. The metabolism of albendazole can yield, for example, albendazole sulfonate, albendazole sulfone, and albendazole sulfoxide.

Benzimidazole Analogs

Analogs of benzimidazoles include benzothioles and benzoxazoles having the structure of formula IV:

![Formula IV](image)
[0060] wherein:

[0061] B is O or S;

[0062] R₂ is selected from the group consisting of:

(B-1)

[0063] and each of R₁₀ and R₁₁ is independently selected from the group consisting of —H, -halo, —NO₂, —OH, —SH, —O—C1₁₅ alkyl, —O—(C₃₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₃₋₁₀ alkyl)ₙ₋₁, heterocyclic, —C₃₋₁₀ alkoxy carbonyl, —S(O)₂₋₂—C₃₋₁₀ alkyl, —S(O)₂₋₂—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —S(O)₂₋₂—(C₃₋₁₀ alkyl)ₙ₋₁, heterocyclic, and —C₁₋₁₀ alkyl or —C₂₋₁₀ alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of -aryl, -heteroaryl, -heterocyclic, —O—C₁₋₁₀ alkyl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, heterocyclic, —O—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, heterocyclic, —O—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, heterocyclic, and —S(O)₂₋₂—(C₃₋₁₀ alkyl)ₙ₋₁, heterocyclic, —N(R₁₃)₂, —OR₁₃, -oxo, -cyano, -halogen, —NO₂, —OH, and —SH; and

[0064] each R₁₃ is independently selected from the group consisting of H and C₁₋₁₀ alkyl or C₂₋₁₀ alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of -aryl, -heteroaryl, -heterocyclic, —O—C₁₋₁₀ alkyl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, heterocyclic, —O—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, heterocyclic, —O—(C₁₋₁₀ alkyl)ₙ₋₁, -aryl, —O—(C₁₋₁₀ alkyl)ₙ₋₁, heterocyclic, and —S(O)₂₋₂—C₃₋₁₀ alkyl.

[0065] Suitable benzimidazoles and benzimidazole analogs for use in the methods of the invention include astemizole, benadryl, 2-benzimidazoylurea, benzthiazuron, cambendazole, cyclobendazole, domperidone, droperidol, fenbendazole, flubendazole, fentizole, 5-hydroxybenzimidazole, lobendazole, luxabendazole, mebendazole, methabenzthiazuron, mercaptozole, mephenzyl, nodazolone, omeprazole, oxendazole, oxibendazole, parbendazole, pimozide, and tioxazoline.

[0066] Some benzimidazoles and benzimidazole analogs fit the following formula (III).

(B-10)

[0067] wherein:

[0068] A is selected from the group consisting of O, S, and NR₁₂;

[0069] R₂₀, R₂₁, R₂₂, and R₁₃ are as described above for formula (IV).
[0070] R₁₂ is selected from the group consisting of —H and —C₃₋₁₀ alkyl or —C₂₋₁₀ alkenyl that is unsubstituted or substituted by one or more substituents selected from the group consisting of —aryls, —heteroaryl, —heterocyclic, —O—C₁₋₁₀ alkyl, —O(—C₁₋₁₀ alkyl), —O(—C₁₋₁₀ alkyl)ₙ, —heteroaryl, —O—(—C₁₋₁₀ alkyl)ₙ, —heterocyclic, —C₁₋₁₀ alkoxy carbonyl, —S(O)₂—C₁₋₁₀ alkyl, —S(O)₂—(C₁₋₁₀ alkyl)ₙ, —heteroaryl, —S(O)₃—(C₁₋₁₀ alkyl)ₙ, —heterocyclic, —N(R₁)₂, —OR, —O(O), —cyano, —halo, —NOₓ, —OH, and —SH; and

[0071] Pentamidine

[0072] Pentamidine is currently used for the treatment of Pneumocystis carinii, Leishmania donovani, Trypanosoma brucei, T. gambiense, and T. rhodesiense infections. The structure of pentamidine is:

(F-1)

[0073] It is available formulated for injection or inhalation. For injection, pentamidine is packaged as a nonpyrogenic, lyophilized product. After reconstitution, it is administered by intramuscular or intravenous injection.

[0074] Pentamidine isethionate is a white, crystalline powder soluble in water and glycerin and insoluble in ether, acetone, and chloroform. It is chemically designated 4,4-diaminodihydroxyethane sulfonate. The molecular formula is C₂₂H₂₆N₄O₁₀S₂ and the molecular weight is 592.68.

[0075] The antiprotozoal mode of action of pentamidine is not fully understood. In vitro studies with mammalian tissues and the protozoan Crithidia oncophili indicate that the drug interferes with nuclear metabolism, causing inhibition of the synthesis of DNA, RNA, phospholipids, and proteins.

[0076] Little is also known about the drug’s pharmacokinetics. In one published study, seven patients treated with daily i.m. doses of pentamidine at 4 mg/kg for 10 to 12 days were found to have plasma concentrations between 0.3 and 0.5 µg/mL. The patients continued to excrete decreasing amounts of pentamidine in urine up to six to eight weeks after cessation of treatment.

[0077] Tissue distribution of pentamidine has been studied in mice given a single intraperitoneal injection of pentamidine at 10 mg/kg. The concentration in the kidneys was the highest, followed by that in the liver. In mice, pentamidine was excreted unchanged, primarily via the kidneys with some elimination in the feces. The ratio of amounts excreted in the urine and feces (4:1) was constant over the period of study.

[0078] Pentamidine Analogs

[0079] Aromatic diamidino compounds can replace pentamidine in the antiproliferative combination of the invention. These compounds are referred to as pentamidine analogs. Examples are propamidine, butamidine, heptamidine, and nonamidine, all of which, like pentamidine, exhibit antipathogenic or DNA binding properties. Other analogs (e.g., stilbamidine and indole analogs of stilbamidine, hydroxysilamidines, dimazene, benzamidine, dibromopropamide, 1,3-bis(4-amidino-2-methoxyphenoxyl) propane (DAMP), netropsin, distamycin, phenamidine, amicarlide, bleomycin, actinomycin, and daunorubicin) also exhibit properties in common with pentamidine. It is likely that these compounds will have antiproliferative activity when administered in combination with a benzimidazole (or an analog or metabolite of a benzimidazole).

[0080] Suitable analogs are those falling within formula (II).

[0081] wherein each of Y and Z is, independently, —O— or —N—; each of R₇ and R₈ is, independently, —H, —OH, —Cl, —Br, —F, —OCH₃, —OCF₃, —NOₓ, or —NH₃; n is an integer between 2 and 6, inclusive; and each of R₁ and R₂ is, independently, at the meta or para position and is selected from the group consisting of:

(D-1)

(D-2)

(D-3)

(D-4)

(D-5)
Other suitable pentamidine analogs include stilbamidine (G-1) and hydroxystilbamidine (G-2), and their indole analogs (e.g., G-3):

Each amidine moiety may independently be replaced with one of the moieties depicted as D-2, D-3, D-4, or D-5, above. As is the case for the benzimidazoles and pentamidine, salts of stilbamidine, hydroxystilbamidine, and their indole derivatives are also useful in the method of the invention. Preferred salts include, for example, dihydrochloride and methanesulfonate salts.

Pentamidine Metabolites

Pentamidine metabolites are also useful in the antiproliferative combination of the invention. Pentamidine is rapidly metabolized in the body to at least seven primary metabolites. Some of these metabolites share one or more activities with pentamidine. It is likely that some pentamidine metabolites will exhibit antiproliferative activity when combined with a benzimidazole or an analog thereof.

Seven pentamidine metabolites are shown below.

Therapy

The combinations of compounds of the invention are useful for the treatment of neoplasms. Combination therapy may be performed alone or in conjunction with another therapy (e.g., surgery, radiation, chemotherapy, biologic therapy). Additionally, a person having a greater risk of developing a neoplasm (e.g., who is genetically predisposed or one who previously had a neoplasm) may receive prophylactic treatment to inhibit or delay neoplastic formation.

The dosage and frequency of administration of each component of the combination can be controlled independently. For example, one compound may be administered orally three times per day, while the second compound may be administered intramuscularly once per day. The compounds may also be formulated together such that one administration delivers both compounds. Formulations and dosages are described further below.

Formulation of Pharmaceutical Compositions

The administration of each compound of the combination may be by any suitable means that results in a concentration of the compound that, combined with the other component, is anti-neoplastic upon reaching the target region. The compound may be contained in any appropriate amount in any suitable carrier substance, and is generally present in an amount of 1-95% by weight of the total weight of the composition. The composition may be provided in a dosage form that is suitable for the oral, parenteral (e.g., intravenously, intramuscularly), rectal, cutaneous, nasal, vaginal, inhental, skin (patch), or ocular administration route. Thus, the composition may be in form of, e.g., tablets,

[0092] Pharmaceutical compositions according to the invention may be formulated to release the active compound substantially immediately upon administration or at any predetermined time or time period after administration. The latter types of compositions are generally known as controlled release formulations, which include (i) formulations that create a substantially constant concentration of the drug within the body over an extended period of time; (ii) formulations that after a predetermined lag time create a substantially constant concentration of the drug within the body over an extended period of time; (iii) formulations that sustain drug action during a predetermined time period by maintaining a relatively constant, effective drug level in the body with concomitant minimization of undesirable side effects associated with fluctuations in the plasma level of the active drug substance (sawtooth kinetic pattern); (iv) formulations that localize drug action by, e.g., spatial placement of a controlled release composition adjacent to or in the diseased tissue or organ; and (v) formulations that target drug action by using carriers or chemical derivatives to deliver the drug to a particular target cell type.

[0093] Administration of compounds in the form of a controlled release formulation is especially preferred in cases in which the compound, either alone or in combination, has (i) a narrow therapeutic index (i.e., the difference between the plasma concentration leading to harmful side effects or toxic reactions and the plasma concentration leading to a therapeutic effect is small; in general, the therapeutic index, TI, is defined as the ratio of median lethal dose (LD50) to median effective dose (ED50); (ii) a narrow absorption window in the gastro-intestinal tract; or (iii) a very short biological half-life so that frequent dosing during a day is required in order to sustain the plasma level at a therapeutic level.

[0094] Any of a number of strategies can be pursued in order to obtain controlled release in which the rate of release outweighs the rate of metabolism of the compound in question. In one example, controlled release is obtained by appropriate selection of various formulation parameters and ingredients, including, e.g., various types of controlled release compositions and coatings. Thus, the drug is formulated with appropriate excipients into a pharmaceutical composition that, upon administration, releases the drug in a controlled manner. Examples include single or multiple unit tablet or capsule compositions, oil solutions, suspensions, emulsions, microcapsules, microspheres, nanoparticles, patches, and liposomes.

[0095] Solid Dosage Forms for Oral Use

[0096] Formulations for oral use include tablets containing the active ingredient(s) in a mixture with non-toxic pharmaceutically acceptable excipients. These excipients may be, for example, inert diluents or fillers (e.g., sucrose, sorbitol, sugar, mannitol, microcrystalline cellulose, starches including potato starch, calcium carbonate, sodium chloride, lactose, calcium phosphate, calcium sulfate, or sodium phosphate); granulating and disintegrating agents (e.g., cellulose derivatives including microcrystalline cellulose, starches including potato starch, croscarmellose sodium, alginates, or alginic acid); binding agents (e.g., sucrose, glucose, sorbitol, acesulfame, acesulfame, sodium alginate, gelatin, starch, pregelatinized starch, microcrystalline cellulose, magnesium aluminum silicate, carboxymethylcellulose sodium, methylcellulose, hydroxypropyl methylcellulose, ethylcellulose, polyvinylpyrrolidone, or polyethylene glycol); and lubricating agents, glidants, and antiadhesives (e.g., magnesium stearate, zinc stearate, stearic acid, silicas, hydrogenated vegetable oils, or talc). Other pharmaceutically acceptable excipients can be colorants, flavoring agents, plasticizers, humectants, buffering agents, and the like.

[0097] The tablets may be uncoated or they may be coated by known techniques, optionally to delay disintegration and absorption in the gastrointestinal tract and thereby providing a sustained action over a longer period. The coating may be adapted to release the active drug substance in a predetermined pattern (e.g., in order to achieve a controlled release formulation) or it may be adapted not to release the active drug substance until after passage of the stomach (enteric coating). The coating may be a sugar coating, a film coating (e.g., based on hydroxypropyl methylcellulose, methylcellulose, methylhydroxyethylcellulose, hydroxypropylecellulose, carbomethylcellulose, acrylate copolymers, polyethylene glycols and/or polyvinylpyrrolidone), or an enteric coating (e.g., based on methacrylic acid copolymer, cellulose acetate phthalate, hydroxypropyl methylcellulose phthalate, hydroxypropyl methylcellulose acetate succinate, polyvinyl acetate phthalate, shellac, and/or ethylcellulose). Furthermore, a time delay material such as, e.g., glycercin monostearate or glyceryl distearate may be employed.

[0098] The solid tablet compositions may include a coating adapted to protect the composition from unwanted chemical changes, (e.g., chemical degradation prior to the release of the active drug substance). The coating may be applied on the solid dosage form in a similar manner as that described in Encyclopedia of Pharmaceutical Technology, supra.

[0099] The two drugs may be mixed together in the tablet, or may be partitioned. In one example, the first drug is contained on the inside of the tablet, and the second drug is on the outside, such that a substantial portion of the second drug is released prior to the release of the first drug.

[0100] Formulations for oral use may also be presented as chewable tablets, or as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent (e.g., potato starch, lactose, microcrystalline cellulose, calcium carbonate, calcium phosphate or kaolin), or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin, or olive oil. Powders and granulates may be prepared using the ingredients mentioned above under tablets and capsules in a conventional manner using, e.g., a mixer, a fluid bed apparatus or a spray drying equipment.
Controlled Release Oral Dosage Forms

Controlled release compositions for oral use may, e.g., be constructed to release the active drug by controlling the dissolution and/or the diffusion of the active drug substance.

Dissolution or diffusion controlled release can be achieved by appropriate coating of a tablet, capsule, pellet, or granulate formulation of compounds, or by incorporating the compound into an appropriate matrix. A controlled release coating may include one or more of the coating substances mentioned above and/or, e.g., shellac, beeswax, glycowax, castor wax, camaba wax, stearyl alcohol, glyceryl monostearate, glyceryl distearate, glycerol palmitostearate, ethylcellulose, acrylic resins, dl-polylactic acid, cellulose acetate butyrate, polyvinyl chloride, polyvinyl acetate, vinyl pyrrolidone, polyethylene, polymethacrylate, methymethacrylate, 2-hydroxymethacrylate, methacrylate hydrogels, 1,3 butylene glycol, ethylene glycol methacrylate, and/or polyethylene glycols. In a controlled release matrix formulation, the matrix material may also include, e.g., hydrated methycellulose, camaba wax and stearyl alcohol, carbopol 934, silicon, glyceryl tristearate, methyl acrylate-methyl methacrylate, polyvinyl chloride, polyethylene, and/or halogenated fluorocarbon.

A controlled release composition containing one or more of the compounds of the claimed combinations may also be in the form of a buccal tablet or capsule (i.e., a tablet or capsule that, upon oral administration, floats on top of the gastric content for a certain period of time). A buccal tablet formulation of the compound(s) can be prepared by granulating a mixture of the drug(s) with excipients and 20-75% w/w of hydrocolloids, such as hydroxyethylcellulose, hydroxypropylcellulose, or hydroxypropylmethylcellulose. The obtained granules can then be compressed into tablets. On contact with the gastric juice, the tablet forms a substantially water-impermeable gel barrier around its surface. This gel barrier takes part in maintaining a density of less than one, thereby allowing the tablet to remain buoyant in the gastric juice.

 Liquids for Oral Administration

Powders, dispersible powders, or granules suitable for preparation of an aqueous suspension by addition of water are convenient dosage forms for oral administration. Formulation as a suspension provides the active ingredient in a mixture with a dispersing or wetting agent, suspending agent, and one or more preservatives. Suitable dispersing or wetting agents are, for example, naturally-occurring phosphatides (e.g., lecithin or condensation products of ethylene oxide with a fatty acid, a long chain aliphatic alcohol, or a partial ester derived from fatty acids) and a hexitol or a hexitol anhydride (e.g., polyoxyethylene stearate, polyoxyethylene sorbitol monooctate, polyoxyethylene sorbitan monooleate, and the like). Suitable suspending agents are, for example, sodium carboxymethylcellulose, methylcellulose, sodium alginate, and the like.

Parenteral Compositions

The pharmaceutical composition may also be administered parenterally by injection, infusion or implantation (intravenous, intramuscular, subcutaneous, or the like) in dosage forms, formulations, or via suitable delivery devices or implants containing conventional, non-toxic pharmaceutically acceptable carriers and adjuvants. The formulation and preparation of such compositions is well-known to those skilled in the art of pharmaceutical formulation. Formulations can be found in Remington: The Science and Practice of Pharmacy, supra.

Compositions for parenteral use may be provided in unit dosage forms (e.g., in single-dose ampoules), or in vials containing several doses and in which a suitable preservative may be added (see below). The composition may be in form of a solution, a suspension, an emulsion, an infusion device, or a delivery device for implantation, or it may be presented as a dry powder to be reconstituted with water or another suitable vehicle before use. Apart from the active drug(s), the composition may include suitable parenterally acceptable carriers and/or excipients. The active drug(s) may be incorporated into microspheres, microcapsules, nanoparticles, liposomes, or the like for controlled release. Furthermore, the composition may include suspending, solubilizing, stabilizing, pH-adjusting agents, and/or dispersing agents.

As indicated above, the pharmaceutical compositions according to the invention may be in the form suitable for sterile injection. To prepare such a composition, the suitable active drug(s) are dissolved or suspended in a parenterally acceptable liquid vehicle. Among acceptable vehicles and solvents that may be employed are water, water adjusted to a suitable pH by addition of an appropriate amount of hydrochloric acid, sodium hydroxide or a suitable buffer, 1,3-butandiol, Ringer’s solution, and isotonic sodium chloride solution. The aqueous formulation may also contain one or more preservatives (e.g., methyl, ethyl or n-propyl p-hydroxybenzoate). In cases where one of the compounds is only sparingly or slightly soluble in water, a dissolution enhancing or solubilizing agent can be added, or the solvent may include 10-60% w/w of propylene glycol or the like.

Controlled Release Parenteral Compositions

Controlled release parenteral compositions may be in form of aqueous suspensions, microspheres, microcapsules, magnetic microspheres, oil solutions, oil suspensions, or emulsions. Alternatively, the active drug(s) may be incorporated in biocompatible carriers, liposomes, nanoparticles, implants, or infusion devices.

Materials for use in the preparation of microspheres and/or microcapsules are, e.g., biodegradable bioerodible polymers such as poly(lactide), poly(isobutyl cyanoacrylate), poly(2-hydroxyethyl-L-glutamate) and, poly(lactic acid). Biocompatible carriers that may be used when formulating a controlled release parenteral formulation are carbohydrates (e.g., dextrans), proteins (e.g., albumin), lipoproteins, or antibodies.

Materials for use in implants can be non-biodegradable (e.g., polydimethyl siloxane) or biodegradable (e.g., poly(caprolactone), poly(lactic acid), poly(glycolic acid) or poly(ortho esters)).

Rectal Compositions

For rectal application, suitable dosage forms for a composition include suppositories (emulsion or suspension type), and rectal gelatin capsules (solutions or suspensions). In a typical suppository formulation, the active drug(s) are
combined with an appropriate pharmaceutically acceptable suppository base such as cocoa butter, esterified fatty acids, glycerinated gelatin, and various water-soluble or dispersible bases like polyethylene glycols and polyoxyethylene sorbitan fatty acid esters. Various additives, enhancers, or surfactants may be incorporated.

[0117] Compositions for Inhalation

[0118] For administration by inhalation, typical dosage forms include nasal sprays and aerosols. In a typically nasal formulation, the active ingredient(s) are dissolved or dispersed in a suitable vehicle. The pharmaceutically acceptable vehicles and excipients (as well as other pharmaceutically acceptable materials present in the composition such as diluents, enhancers, flavoring agents, and preservatives) are selected in accordance with conventional pharmaceutical practice in a manner understood by the persons skilled in the art of formulating pharmaceuticals.

[0119] Percutaneous and Topical Compositions

[0120] The pharmaceutical compositions may also be administered topically on the skin for percutaneous absorption in dosage forms or formulations containing conventionally non-toxic pharmaceutical acceptable carriers and excipients including microspheres and liposomes. The formulations include creams, ointments, lotions, liniments, gels, hydrogels, solutions, suspensions, slacks, sprays, pastes, plasters, and other kinds of transdermal drug delivery systems. The pharmaceutically acceptable carriers or excipients may include emulsifying agents, antioxidants, buffering agents, preservatives, humectants, penetration enhancers, chelating agents, gelling agents, ointment bases, perfumes, and skin protective agents.

[0121] Examples of emulsifying agents are naturally occurring gums (e.g., gum acacia or gum tragacanth) and naturally occurring phosphatides (e.g., soybean lecithin and sorbitan monoleate derivatives). Examples of antioxidants are butylated hydroxy anisole (BHA), ascorbic acid and derivatives thereof, tocopherol and derivatives thereof, butylated hydroxy anisole, and cysteine. Examples of preservatives are parabens, such as methyl or propyl p-hydroxybenzoate, and benzalkonium chloride. Examples of humectants are glycercin, propylene glycol, sorbitol, and urea. Examples of penetration enhancers are propylene glycol, DMSO, triethanolamine, N,N-dimethyacetamide, N,N-dimethylformamide, 2-pyrrolidone and derivatives thereof, tetrahydrofurfuryl alcohol, and AZONE. Examples of chelating agents are sodium EDTA, citric acid, and phosphoric acid. Examples of gel forming agents are CARBOPOL, cellulose derivatives, bentonite, alginates, gelatin and polyvinylpyrrolidone. Examples of ointment bases are beeswax, paraffin, cetaryl palmitate, vegetable oils, sorbitan esters of fatty acids (Span), polyethylene glycols, and condensation products between sorbitan esters of fatty acids and ethylene oxide (e.g., polyoxyethylene sorbitan monooleate (TWEEN™)).

[0122] The pharmaceutical compositions described above for topical administration on the skin may also be used in connection with topical administration onto or close to the part of the body that is to be treated. The compositions may be adapted for direct application or for introduction into relevant orifice(s) of the body (e.g., rectal, urethral, vaginal or oral orifices). The composition may be applied by means of special drug delivery devices such as dressings or alternatively plasters, pads, sponges, strips, or other forms of suitable flexible material.

[0123] Controlled Release Percutaneous and Topical Compositions

[0124] There are several approaches for providing rate control over the release and transdermal permeation of a drug, including: membrane-moderated systems, adhesive diffusion-controlled systems, matrix dispersion-type systems, and microreservoir systems. A controlled release percutaneous and/or topical composition may be obtained by using a suitable mixture of the above-mentioned approaches.

[0125] In a membrane-moderated system, the active drug is present in a reservoir which is totally encapsulated in a shallow compartment molded from a drug-impermeable laminate, such as a metallic plastic laminate, and a rate-controlling polymeric membrane such as a microporous or a non porous polymeric membrane (e.g., ethylene-vinyl acetate copolymer). The active compound is only released through the rate-controlling polymeric membrane. In the drug reservoir, the active drug substance may either be dispersed in a solid polymer matrix or suspended in a viscous liquid medium such as silicone fluid. On the external surface of the polymeric membrane, a thin layer of an adhesive polymer is applied to achieve an intimate contact of the transdermal system with the skin surface. The adhesive polymer is preferably a hypoallergenic polymer that is compatible with the active drug.

[0126] In an adhesive diffusion-controlled system, a reservoir of the active drug is formed by directly dispersing the active drug in an adhesive polymer and then spreading the adhesive containing the active drug onto a flat sheet of substantially drug-impermeable metallic plastic backing to form a thin drug reservoir layer. A matrix dispersion-type system is characterized in that a reservoir of the active drug substance is formed by substantially homogeneously dispersing the active drug substance in a hydrophilic or lipophilic polymer matrix and then molding the drug-containing polymer into a disc with a substantially well-defined surface area and thickness. The adhesive polymer is spread along the circumference to form a strip of adhesive around the disc.

[0127] In a microreservoir system, the reservoir of the active substance is formed by first suspending the drug solids in an aqueous solution of water-soluble polymer, and then dispersing the drug suspension in a lipophilic polymer to form a plurality of microscopic spheres of drug reservoirs.

[0128] Dosages

[0129] The dosage of each compound of the claimed combinations depends on several factors, including: the administration method, the disease to be treated, the severity of the disease, whether the disease is to be treated or prevented, and the age, weight, and health of the person to be treated.

[0130] The compounds are preferably administered in an amount of about 0.1-30 mg/kg body weight per day, and more preferably in an amount of about 0.5-15 mg/kg body weight per day. As described above, the compound in question may be administered orally in the form of tablets, capsules, elixirs or syrups, or rectally in the form of suppositories. Parenteral administration of a compound is suitably performed, for example, in the form of saline solutions or with the compound incorporated into liposomes. In cases where the compound in itself is not sufficiently soluble to be dissolved, a solubilizer such as ethanol can be applied.
Below, for illustrative purposes, the dosages for benzimidazoles and pentamidine are described. One skilled in the art will recognize that if a second compound is substituted for either a benzimidazole or pentamidine, the correct dosage can be determined by examining the efficacy of the compound in cell proliferation assays, as well as its toxicity in humans.

[0131] Oral Administration

[0132] For a benzimidazole adapted for oral administration for systemic use, the dosage is normally about 1 mg to 1000 mg per dose administered (preferably about 5 mg to 500 mg, and more preferably about 10 mg to 300 mg) one to ten times daily (preferably one to five times daily) for one day to one year, and may even be for the life of the patient; because the combinations of the invention function primarily as cytostatic rather than cytotoxic agents, and exhibit low toxicity, chronic, long-term administration will be indicated in many cases. Dosages up to 8 g per day may be necessary.

[0133] For pentamidine, the dosage is normally about 0.1 mg to 300 mg per dose administered (preferably about 1 mg to 100 mg) one to four times daily for one day to one year, and, like a benzimidazole, may be administered for the life of the patient. Administration may also be given in cycles, such that there are periods during which time pentamidine is not administered. This period could be, for example, about a day, a week, a month, or a year or more.

[0134] Rectal Administration

[0135] For compositions adapted for rectal use for preventing disease, a somewhat higher amount of a compound is usually preferred. Thus a dosage of a benzimidazole is normally about 5 mg to 2000 mg per dose (preferably about 10 mg to 1000 mg, more preferably about 25 mg to 500 mg) administered one to four times daily. Treatment durations are as described for oral administration. The dosage of pentamidine is as described for orally administered pentamidine.

[0136] Parenteral Administration

[0137] For intravenous or intramuscular administration of a benzimidazole, a dose of about 0.1 mg/kg to about 100 mg/kg body weight per day is recommended, a dose of about 1 mg/kg to 25 mg/kg is preferred, and a dose of 1 mg/kg to 10 mg/kg is most preferred. Pentamidine is administered at a dose of about 0.1 mg/kg to about 20 mg/kg, preferably at a dose of about 0.5 mg/kg to about 10 mg/kg, and more preferably at a dose of about 1 mg/kg to about 4 mg/kg.

[0138] Each compound is usually administered daily for up to about 6 to 12 months or more. It may be desirable to administer a compound over a one to three hour period; this period may be extended to last 24 hours or more. As is described for oral administration, there may be periods of about one day to one year or longer during which at least one of the drugs is not administered.

[0139] Inhalation

[0140] For inhalation, a benzimidazole is administered at a dose of about 1 mg to 1000 mg daily, and preferably at a dose of about 10 mg to 500 mg daily. For pentamidine, a dose of about 10 mg to 1000 mg, and preferably at a dose of 30 mg to 600 mg, is administered daily.

[0141] Percutaneous Administration

[0142] For topical administration of either compound, a dose of about 1 mg to about 5 g administered one to ten times daily for one week to 12 months is usually preferable.

[0143] The following examples are to illustrate the invention. They are not meant to limit the invention in any way.

**EXAMPLE 1**

Preparation of the Alendazole/Pentamidine Isethionate Dilution Matrix

[0144] Stock solutions of alendazole and pentamidine isethionate (Sigma catalog number A4673 and PO4, respectively) were made in dimethylsulfoxide (DMSO) at concentrations of 15.07 mM and 6.74 mM respectively. An 8x stock solution (128 μM) of each individual compound was made in Dulbecco’s Modified Eagle Medium (DMEM) (Gibco 11995-040) containing 10% fetal bovine serum (FBS), 200 mL L-glutamine, and 1% antibotic/antimycotic solution. From this a 2-fold dilution series was made in DMEM. This series provided nine concentrations ranging from 64 μM to 240 μM, and one concentration of 0 M. The compound mixture matrix was prepared by filling columns of a 384-well plate with the dilution series of pentamidine isethionate (first column: 32 μM; second column: 16 μM; third column: 8 μM; fourth column: 4 μM; fifth column: 2 μM; sixth column: 1 μM; seventh column: 500 nM; eighth column: 250 nM; ninth column: 125 nM; and tenth column: no compound) and filling the rows with the dilution series of alendazole (first row: 32 μM; second row: 16 μM; third row: 8 μM; fourth row: 4 μM; fifth row: 2 μM; sixth row: 1 μM; seventh row: 500 nM; eighth row: 250 nM; ninth row: 125 nM; and tenth row: no compound) using a 16-channel pipettor (Finnpipette). This compound mixture plate provided 4x concentrations of each compound that are transferred to assay plates. The dilution matrix thus contained 100 different points—81 wells where varying amounts of a benzimidazole and pentamidine were present, as well as a ten-point dilution series (2-fold) for each individual compound.

**EXAMPLE 2**

Assay for Antiproliferative Activity of Alendazole and Pentamidine Isethionate

[0145] The compound dilution matrix was assayed using the A549 bromodeoxyuridine (BrdU) cytoblot method. Forty-five microliters of a suspension containing A549 lung adenocarcinoma cells (ATCC# CCL-185) was seeded in a white opaque polystyrene cell culture treated sterile 384-well plate (Nalgene, #164610) using a multidrop (Lab-systems) to give a density of 3000 cells per well. Fifteen microliters of the 4x compound mixture matrix was added to each well of the plate containing the cells. The compound mixture matrix was transferred using a 16-channel pipettor (Finnpipette). In addition, control wells with pachitael (final concentration 4.6 μM), podophyllotoxin (9.6 μM), and quinacrine (8.5 μM) were added to each plate. Each experiment was conducted in triplicate plates.

[0146] After incubation for 48 hours at 37°C, BrdU was added to each well at a concentration of 10 μM. After 16 hours, the media was aspirated and the cells were fixed by
the addition of 70% ethanol and phosphate-buffered saline (PBS) at room temperature for one hour. The fixative was aspirated and 2N HCl with Tween 20 (polyoxyethylene sorbitan monolaurate) was added to each well and the plates were incubated for 20 minutes at room temperature. The HCl was neutralized with a solution of 2N NaOH and the cells were washed twice with Hank’s Balanced Salt Solution (HBSS) and once with PBS containing 0.5% bovine serum albumin (BSA) and 0.1% Tween 20. The wash solution was removed and mouse anti-BrdU primary antibody (PharMingen #55527) was diluted 1:1000 in PBS containing BSA, Tween 20, and secondary antibody at a dilution of 1:2000 (Amersham #NA931). The secondary antibody recognizes the mouse antibody and is conjugated to the enzyme horse-radish peroxidase (HRP). After one hour of incubation, the antibody solution was removed and the cells washed once with PBS. After the PBS wash, the HRP substrate (which contains luminal, hydrogen peroxide, and an enhancer such as para-iodophenol) was added to each well. The plates were read using an ILJL Analyzer. All aspirations as well as the washes with PBS and HBSS were performed using a TECAN™ Power Washer 384. The amount of light output from each well indicates the amount of DNA synthesis that occurred in that well. Decreased light indicates antiproliferative action of the compounds.

[0147] Luminescence for each position in the albendazole/pentamidine isethionate dilution matrix was divided into the luminescence values for A549 cells treated with only DMSO vehicle, providing antiproliferative ratios for each position in the albendazole/pentamidine isethionate dilution matrix. Antiproliferative ratios were also calculated for paclitaxel, podophyllotoxin, and quinacrine and used for comparison.

[0148] At 2.0 µM, pentamidine isethionate alone yields an antiproliferative ratio of 1.9 (i.e., inhibition of 47% of growth) and this increases to a ratio of 2.2 (inhibition of 55% of growth) when the concentration is doubled to 4.0 µM. Two micromolar albendazole yields a ratio of 2.5 (inhibition of 60% of growth), and this is increased no further by doubling the concentration to 4.0 µM. When 2.0 µM pentamidine isethionate is tested in combination with 2.0 µM albendazole (4.0 µM total compound species), an antiproliferative ratio of 7.0 is achieved (inhibition of 85.7% of growth). Thus, a combination of albendazole and pentamidine isethionate yields an antiproliferative ratio higher than that seen for paclitaxel (4.0), an effect that was not achieved by either drug alone.

[0149] In another analysis, the potency of the single compounds is shifted by the presence of the other compound. The maximal antiproliferative ratio achieved by albendazole alone was 3.1 (at 8.0 µM). A similar antiproliferative ratio was observed when 1 µM pentamidine isethionate was combined with albendazole at concentrations as low as 250 nM, significantly reducing the total drug species needed to achieve this effect.

[0150] Because albendazole shares antihelminthic activity with other benzimidazoles, we tested the combination of pentamidine isethionate with benzimidazoles mebendazole, oxibendazole, albendazole sulfoxide, and thiabendazole (Tables 2-5). The assays were performed as described in Example 2, above. In the case of mebendazole and oxibendazole, the combination of the benzimidazole with pentamidine resulted in greater antiproliferative activity than that achieved by either drug alone (Tables 2 and 3).

[0151] The combination of thiabendazole and pentamidine isethionate did not result in greater antiproliferative activity than either drug alone (Table 4). These results are consistent with the findings by Gupta (Mol. Pharmacol. 30:142-148, 1986) of a lack of cross-resistance of the nocodazole-resistant NocR and PodriR cell lines to thiabendazole (but not to other benzimidazoles tested), indicating that the mechanism of action of this compound is different from that of other benzimidazoles.

[0153] The anti-proliferative effect demonstrated with A459 cells can be similarly demonstrated using other cancer cell lines, such as MCT7 mammary adenocarcinoma, PA-1 ovarian teratocarcinoma, HT29 colorectal adenocarcinoma, H1299 large cell carcinoma, U-2 OS osteogenic sarcoma, U-373 MG glioblastoma, Hep-3B hepatocellular carcinoma, BT-549 mammary carcinoma, T-24 bladder cancer, C-33A cervical carcinoma, HT-3 metastatic cervical carcinoma, SiHa squamous cervical carcinoma, CaSki epidermoid cervical carcinoma, NCI-H292 mucoepidermoid lung carcinoma, NCI-2030, non small cell lung carcinoma, HeLa, epithelial cervical adenocarcinoma, KB epithelial mouth carcinoma, HT1080 epithelial fibrosarcoma, Saos-2 epithelial osteogenic sarcoma, PC3 epithelial prostate adenocarcinoma, SW-480 colorectal carcinoma, CCL-228, and MS-751 epidermoid cervical carcinoma cell lines. Specificity can be tested by using cells such as NHEL lung fibroblasts, NHDF dermal fibroblasts, HMEC mammary epithelial cells, PrEC prostate epithelial cells, HRE renal epithelial cells, NIHBE bronchial epithelial cells, CoSmC Colon smooth muscle cells, CoEC colon endothelial cells, NHEK epidermal keratinocytes, and bone marrow cells as control cells.

[0154] What is claimed is:

1. A method for treating a patient having a neoplasm or a person at risk for developing a neoplasm, said method comprising administering to said patient:

   a) a first compound having the formula (I):

   ![Chemical Structure](image)

   wherein R₂ is selected from the group consisting of:

   ![Chemical Structure](image)

   R₂ is selected from the group consisting of:

   ![Chemical Structure](image)
and each of $R_3$ and $R_4$ is selected from the group consisting of:

(B-2)

(B-3)

(B-4)

(B-5)

(B-6)

(B-7)

(B-8)

(B-9)

(B-10)

(B-11)

(B-12)

(B-13)

(C-1)

(C-2)

(C-3)

(C-4)

(C-5)

(C-6)

(C-7)

(C-8)

(C-9)

(C-10)

(C-11)

(C-12)
b) a second compound having the formula (II):

wherein each of $Y$ and $Z$ is, independently, O or N; each of $R_7$ and $R_8$ is, independently, H, OH, Cl, Br, OCH$_3$, OCF$_3$, NO$_2$, or NH$_2$; $n$ is an integer between 2 and 6, inclusive; and each of $R_7$ and $R_8$ is, independently, at the meta or para position and is selected from the group consisting of:

wherein said first and second compounds are administered simultaneously or within 14 days of each other in amounts sufficient to inhibit the growth of a neoplasm in said person.

2. The method of claim 1, wherein said first and second compounds are administered within ten days of each other.

3. The method of claim 2, wherein said first and second compounds are administered within five days of each other.
4. The method of claim 3, wherein said first and second compounds are administered within twenty-four hours of each other.

5. The method of claim 1, wherein said neoplasm is cancer.

6. The method of claim 5, wherein said cancer is selected from the group consisting of brain cancer, breast cancer, cervical cancer, colon cancer, gastric cancer, kidney cancer, leukemia, liver cancer, lung cancer, lymphoma, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcoma, skin cancer, testicular cancer, and uterine cancer.

7. The method of claim 6, wherein said cancer is lung cancer.

8. The method of claim 7, wherein said lung cancer is selected from the group consisting of squamous cell carcinoma, adenocarcinoma, and large cell carcinoma.

9. The method of claim 6, wherein said cancer is breast cancer.

10. The method of claim 6, wherein said cancer is colon cancer.

11. The method of claim 6, wherein said cancer is gastric cancer.

12. The method of claim 6, wherein said cancer is kidney cancer.

13. The method of claim 6, wherein said cancer is leukemia.

14. The method of claim 6, wherein said cancer is liver cancer.

15. The method of claim 6, wherein said cancer is lymphoma.

16. The method of claim 6, wherein said cancer is prostate cancer.

17. The method of claim 6, wherein said cancer is sarcoma.

18. The method of claim 6, wherein said cancer is skin cancer.

19. The method of claim 6, wherein said cancer is testicular cancer.

20. The method of claim 6, wherein said cancer is uterine cancer.

21. The method of claim 1, wherein said first and second compounds are administered to said patient by intravenous, intramuscular, inhalation, rectal, topical, or oral administration.

22. A composition comprising a) a first compound having the formula (I):

wherein R₂ is selected from the group consisting of:

(A-1)

(A-2)

(A-3)

(A-4)

(B-1)

(B-2)

(B-3)

(B-4)

(B-5)

(B-6)

(B-7)

(B-8)

(B-9)

(B-10)
and each of $R_3$ and $R_4$ is selected from the group consisting of:

- $\text{Cl}$
- $\text{CH}_3$
- $\text{CH}_3$
- $\text{SO}_2$
- $\text{SO}_2$
- $\text{OCH}_3$
- $\text{OCH}_3$
- $\text{NO}_2$
- $\text{NO}_2$
- $\text{S}$
- $\text{S}$
- $\text{CH}_3$
and

b) a second compound having the formula (II):

wherein each of Y and Z is, independently, O or N; each of R7 and R8 is, independently, H, OH, Cl, Br, OCH₃, OCF₃, NO₂, or NH₂; n is an integer between 2 and 6,
