3,104,435
PEN AND PENCIL HOLDER
Coin J. Beuck, 717 27th St., Sioux City, Iowa
Filed Nov. 9, 1961, Ser. No. 151,393
1 Claim. (Cl. 24—10)

My invention relates to a pen and pencil holder.

An object of my invention is to provide a pen and pencil holder which can be conveniently and firmly attached within the pocket of the wearer.

A further object of my invention is to provide a holder which will securely retain pens or pencils.

A further object of my invention is to provide means whereby the pens or pencils can be readily disengaged from the holder.

A further object of my invention is to provide a holder which will project above the upper edge of the pocket so as to provide more positive manipulation.

With these and other objects in view, my invention consists in the construction, arrangement, and combination of the various parts of my device, whereby the objects contemplated are attained, as hereinafter more fully set forth, pointed out in my claim and illustrated in the accompanying drawings, in which:

FIGURE 1 is a plan view of the holder,

FIGURE 2 is a forward elevation of FIGURE 1,

FIGURE 3 is a sectional view taken along the lines 3—3 of FIGURE 2,

FIGURE 4 is a sectional view taken along the lines 4—4 of FIGURE 2 and

FIGURE 5 is a sectional view taken exteriorly of the holder through the pocket.

My invention contemplates the provision of an economically constructed pen and pencil holder which includes the various advantages above mentioned, and which also will protect the pocket of the user from undue wear and the like.

I have used the character **10** to designate a slightly arcuate sheet of plastic or other suitable material, this sheet including the openings or apertures **11** which are suitably punched out of the material **10**, the apertures **11** being bounded by the prongs **12**, and the apertures **11** including the extending integral apertures **13** extending therefrom, the apertures **13** being directly adjacent to the sloping wall portions **14** which are provided in the member **10**.

The character **15** indicates further sloping wall portions provided at the top of the member **10**. Attached as at **16** to the member **10** are the clip members **17** which can include the roughened portions at **18** to thereby firmly engage the fabric **19** of the pocket **20** in which the holder is to be inserted.

Attached to the member **10** is a transparent strip of material **21** which is positioned behind the apertures **11** to thereby provide protection means.

FIGURE 2 especially indicates how the device is used, it being noted that the clips **17** are placed over the upper edge **22** of the pocket material **19**, it being noted that there will be a projecting portion **23** of the member **10** extending above said upper edge to thereby insure more convenient manipulation of the pens or pencils.

2

It will also be noted in FIGURE 2 that more than one pencil or pen can be used in the apertures **11**.

The pens or pencils are indicated generally by the character **24**, the clips thereof being indicated by the character **25**, and the ball or rounded ends being indicated by the character **26**.

The pens or pencils **24** are inserted by merely placing the ball portions **26** at the portions **15** of the holder **10**, and pressing downwardly whereby the sloping portions **15** will provide easy entrance of the pen or pencil into the pocket, and when it is desired to remove the pen or pencil it is merely pulled over to the position at **27** shown in FIGURE 2 whereby the ball member **26** will bear against the sloping wall **14** whereby the pen or pencil can be readily removed by means of the smooth action against this surface.

It will now be noted that I have provided the various advantages mentioned in the objects of my invention with further advantages being apparent.

Some changes may be made in the construction and arrangement of the parts of my invention without departing from the real spirit and purpose of my invention, and it is my intention to cover by my claim any modified forms of structure or use of mechanical equivalents which may be reasonably included within their scope.

I claim as my invention:

A pen and pencil holder comprising a main body portion, said body portion having a plurality of laterally spaced apertures, said body portion being formed of relatively thin material to allow attachment of pen clips thereto, said apertures having further aperture portions extending from said apertures, said body portion having sloping wall portions merging with said further apertures whereby a pen clip can be smoothly drawn along the same, said body portion including upper sloping portions for providing ready attachment of said pen clips, said further apertures extending laterally from said apertures, clips attached to said main body portion for attaching said body portion to a pocket, said clips being spaced from the upper edge of said main body portion whereby an upper portion of said body portion will extend above the upper edge of said pocket, a transparent member attached behind said apertures.
