This invention provides a compound having the structure (I) wherein α, β, A, B, and R₁-R₄ are defined herein. This invention also provides pharmaceutical compositions comprising the above compounds, a method of accelerating the healing of a wound, a method of inhibiting the activity and/or levels of a matrix metalloproteinase (MMP), a method of inhibiting the production of a cytokine in a population of cells, a method of inhibiting the production of a growth factor in a population of cells, and a method of inhibiting NFK-B α inhibition in a population of cells.
This application claims priority of U.S. Provisional Application No. 61/548,035, filed October 17, 2011, the contents of which are hereby incorporated by reference.

Throughout this application, certain publications are referenced in parentheses. Full citations for these publications may be found immediately preceding the claims. The disclosures of these publications in their entireties are hereby incorporated by reference into this application in order to describe more fully the state of the art to which this invention relates.

Background of the Invention
Curcumin (diferuloylmethane), the major component in curcuma/turmeric, is an antioxidant polyphenol from the plant Curcuma longa and is commonly used as a spice component. Curcumin has been used to treat inflammation and exerts antiproliferative and proapoptotic effects against various tumors in vitro and in vivo, and it has been found to suppress carcinogenesis of the breast and other organs (9, 10). Bachmeier and coworkers have reported downregulation of the inflammatory cytokines CXCL1 and CXCL2 in breast cancer cells via NFkB (9). Oral curcumin efficacy in vivo has been shown in models for many conditions with oxidative damage and inflammation, including many types of cancer, diabetes, atherosclerosis, arthritis, stroke, peripheral neuropathy, inflammatory bowel disease, and brain trauma (11). Curcumin, along with its tetrahydro derivative, tetrahydrocurcumin, has been shown to inhibit IL-1β in an acute brain inflammation model while curcumin was more effective than THC in attenuating plaque pathogenesis in studies of curcumin efficacy in models of neuroinflammation, which is implicated
in the pathogenesis of many neurodegenerative disorders, including Alzheimer's disease (AD) (11).

Curcumin has been known to be useful in the treatment of skin disorders, including, but not limited to, wounds, psoriasis, acne, burns, eczema, as well as inflammation accompanying such disorders (20-24). Singer and co-workers have shown that curcumin reduces burn progression in rats (21) and Sidhu and co-workers have shown curcumin to be effective in enhancing wound healing in animals (22), including streptozotocin-induced diabetic rats and genetically diabetic mice (23). In addition, Phan and co-workers have shown that curcumin exhibits powerful inhibition against hydrogen peroxide damage in human keratinocytes and fibroblasts (24).

While curcumin has been shown to have multiple beneficial effects, its poor oral absorption and lack of solubility in physiological fluid has all but precluded its use as a medicinal substance. Therefore, novel chemically-modified curcumins with enhanced pharmacokinetic and pharmacodynamic properties are needed.
Summary of the Invention

This invention provides a compound having the structure

\[
\begin{array}{c}
\text{A} \\
\text{R}_3 \overset{\beta}{\longrightarrow} \text{R}_2 \\
\text{B} \overset{\alpha}{\longrightarrow} \text{R}_1 \\
\end{array}
\]

wherein

- bond \( a \) and \( \beta \) are each, independently, present or absent;
- \( A \) is an aromatic or heteroaromatic ring; \( B \) is an aromatic or heteroaromatic ring;
- \( \text{R}_i \) is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, \( C_1 \)-io alkyl, \( C_2 \)-io alkenyl, \( C_2 \)-io alkynyl, aryl, heteroaryl, heterocyclyl, or heteroaromatic ring;

wherein \( \text{R}_{13}, \text{R}_{14}, \text{R}_{15}, \text{R}_{16}, \) and \( \text{R}_{17} \) are each independently, \( H \), halogen, \( -\text{OC}_2\text{Z}_3, -\text{CZ}_3, -\text{OCH}_2\text{CH(OH)}\text{CH}_2\text{OH}, -\text{OCH}(\text{CH}_2\text{OH})_2, -\text{NO}_2, -\text{OCH}_4, -\text{CN}, -\text{NR}_i\text{R}_{19}, -\text{SR}_{18}, -\text{CO}_2\text{R}_{18}, -\text{OR}_{20}, -\text{COR}_{20}, -\text{CSR}_{20}, -\text{NHCOR}_{18}, -\text{SOR}_{18}, -\text{POR}_{17}, -\text{C}(=\text{S})\text{R}_{18}, -\text{C}(=\text{NH})\text{R}_{18}, -\text{C}(=\text{NR}_{18})\text{R}_{18}, -\text{C}(=\text{N})\text{R}_{18}, -\text{POR}_{18}, -\text{P}(=\text{O})(\text{OR}_{18})(\text{OR}_{18}), -\text{P}(\text{OR}_{18})(\text{OR}_{18}), -\text{C}(=\text{S})\text{R}_{18}, -\text{NHR}_{18}\text{R}_{18}, -\text{C}(=\text{O})\text{-heterocyclyl}, \text{C}_{10} \) alkyl, \( C_{2 \geq 0} \) alkenyl, \( C_{2 \geq 0} \) alkynyl, aryl, heteroaryl, or heterocyclyl;

wherein \( Z \) is halogen, and
- \( \text{R}_{18}, \text{R}_{19}, \) and \( \text{R}_{20} \) are each, independently, \( H, \) \( \text{Ci}_{i0} \) alkyl, \( C_{2 \geq 0} \) alkenyl, \( C_{2 \geq 0} \) alkynyl, aryl, heteroaryl, or heterocyclyl;

\( \text{R}_2 \) is \( H, -\text{CH}_3, -\text{OR}_{21}, -\text{CO}_2\text{R}_{21}, -\text{CF}_3, \text{Ci}_{i5} \) alkyl, \( C_{2 \geq 5} \) alkenyl, \( C_{2 \geq 5} \) alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein \( \text{R}_{21} \) is, \( H, -\text{CF}_3, -\text{CH}_3, \text{Ci}_{i5} \) alkyl, \( C_{2 \geq 5} \) alkenyl, \( C_{2 \geq 5} \) alkynyl, or \( -\text{C}(=\text{O})\text{-heterocyclyl} \) and
- \( \text{R}_3 \) and \( \text{R}_4 \) are each independently, halogen, \( -\text{NO}_2, -\text{NR}_{22}\text{R}_{23}, -\text{NHR}_{22}\text{R}_{23}, -\text{SR}_{22}, -\text{SO}_2\text{R}_{22}, -\text{SO}_2\text{R}_{22}, -\text{OR}_{22}, -\text{CO}_2\text{R}_{22}, -\text{CF}_3, -\text{POR}_{22}, -\text{P}(=\text{O})(\text{OR}_{22})(\text{OR}_{23}), \) or \(-\text{P}(\text{OR}_{22})(\text{OR}_{23})\),
wherein \( R_2 \) and \( R_3 \) are each, \( H \), \(-\text{CF}_3\), \(-\text{CH}_3\), \( \text{c}_{i-5} \) alkyl, \( \text{C}_{2-5} \) alkenyl, \( \text{C}_{2-5} \) alkynyl, aryl, heteroaryl, heterocyclyl, or \(-\text{C}(=\text{O})\) heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted; and

when \( a \) and \( \beta \) are present, \( A \) is phenyl with \( R_3 \) at the para position, \( B \) is phenyl with \( R_4 \) at the para position, \( R_2 \) is \( H \), \( R_3 \) is \(-\text{OH}\) or \(-\text{N}(\text{CH}_3)_2\), and \( R_4 \) is \(-\text{OH}\) or \(-\text{N}(\text{CH}_3)_2\), then \( R_1 \) is other than unsubstituted phenyl,

or a salt thereof.

This invention provides method of accelerating the healing of a wound in a subject having a wound, comprising administering to the subject a compound having the structure

![Chemical structure](image)

wherein bond \( a \) and \( \beta \) are each, independently, present or absent;

\( A \) is an aromatic or heteroaromatic ring; \( B \) is an aromatic or heteroaromatic ring;

\( R_1 \) is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, \( \text{c}_{i-10} \) alkyl, \( \text{C}_{2-10} \) alkenyl, \( \text{C}_{2-10} \) alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein \( R_{13}, R_{14}, R_{15}, R_{16}, \) and \( R_{17} \) are each independently, \( H \), halogen, \(-\text{OC}_3\), \(-\text{C}_3\), \(-\text{OCH}_2\text{CH} (\text{OH}) \text{CH}_2\text{OH}\), \(-\text{OCH}(\text{CH}_2\text{OH})_2\), \(-\text{NO}_2\), \(-\text{OCH}_3\), \(-\text{CN}\), \(-\text{NR}_{14}\text{R}_{19}\), \(-\text{SR}_{18}\), \(-\text{CO}_{2}\text{R}_{18}\), \(-\text{OR}_{20}\), \(-\text{COR}_{20}\), -

alkenyl, C2-5 alkynyl, aryl, heteroaryl, heterocyclyl, or
-C(=0)-heterocyclyl, and
wherein each occurrence in the compound of alkyl, alkenyl, or
alkynyl is branched or unbranched, unsubstituted or
substituted,
or a salt thereof.
**Brief Description of the Figures**

**Figure 1.** 6mm skin biopsy wounds in a typical normal (NDC) or diabetic rat at the time of circular biopsy (before treatment: time=0).

**Figure 2.** Blood glucose levels in normal (NDC) rats and in diabetic vehicle treated controls (D), diabetic topically treated wounds with 1% and 3% Compound 4, respectively and systemically treated diabetic rats with 30mg/kg Compound 4. Each value is the mean ± S.E.M of 3 rats/group.

**Figure 3.** Effect of topical and systemic administration of Compound 4. Examples of the clinical appearance of standardized skin wounds in normal (NDC) rats and in diabetic vehicle treated controls (D), topically treated diabetic wounds with 1% and 3% Compound 4, respectively and systemically treated diabetic rats with 30mg/kg Compound 4, after 7 days of healing.

**Figure 4.** Healing (% reduction in diameter) of skin wounds in normal (NDC), diabetic vehicle treated controls (D), topically treated diabetic wounds with 1% and 3% Compound 4, respectively and systemically treated diabetic rat samples treated with 30mg/kg Compound 4. Each value is the mean ± S.E.M. for 18 measurements.

**Figure 5.** Diabetes increases MMP-9 (92kDa gelatinase) but not MMP-2 (72kDa gelatinase) in skin wounds. Effect of topical & systemic administration of Compound 4. Lane 1 shows the 92kD and 72kD latent/pro-forms of MMP-9 & MMP-2, respectively (standards). Lane 2 shows a normal non-diabetic control rat sample, lanes 3 and 4 show the MMP expression in diabetically induced rats. Lanes 5 and 6 reveal the reduction in MMP-9 after treatment with 1% Compound.
4, while lanes 7 and 8 show the expression of MMP-2 and MMP-9 after treatment with 3% Compound 4. Finally, lanes 9 and 10 show samples extracted from rat wounds treated systemically with 30mg/kg of Compound 4.

Figure 6. Densitometric analysis of gelatin zymograms.

Figure 7. The effect of topical and systemic treatment with Compound 4. Histology (H&E Staining) of skin wounds after 7 days of treatment with Compound 4 in normal & diabetic rats.

Figure 8. Diabetes significantly suppressed re-epithelialization of standardized skin wounds. The effect of topical and systemic Compound 4. Each value represents the mean ± SEM of 12 histomorphometric analysis /group.

Figure 9. Trichrome staining for collagen. Indicates: (a) that diabetes delays wound healing in skin, and (b) that 1% Compound 4 is more effective than the other treatments in "normalizing" wound healing.

Figure 10. Histological measurement of wound diameter (Trichrome Staining) after 7 days healing in normal and diabetic rats. Each value represents the mean ± SEM of 12 measurements/group.

Figure 11. Proposed model for wound healing mechanism using Compound 4. Diabetes is proposed to decrease inflammatory cell "competence" (e.g. decreased M0 chemotactic activity) prolonging the inflammatory phase and delaying connective tissue repair. Without wishing to be bound by any scientific theory, Compound 4 is proposed to "normalize" inflammatory cell "competence", resolve the inflammatory phase
and restore collagen formation. Diabetes decreases M0 chemotactic activity, increases accumulation of M0 in exudates (note increased area-under-the-curve from M0 in diabetic rats) and increases MMPs and PICs (see, e.g. Example 7).

Figure 12. The Effect of oral administration of Compound 4 (30 mg/kg; 21 days) on macrophage accumulation in peritoneal exudates of diabetic rats. (Each value represents the mean of 3 rats/group ± S.E.M. Note: Compound 4 did NOT affect the severity of hyperglycemia in the diabetics).

Figure 13. Oral administration of Compound 4 in diabetic rats: effect on IL-6 production by peritoneal macrophages in cell culture with (b), and without (a), stimulation by P. gingivalis LPS (Note: Compound 4 was administered in vivo in both (a) and (b)).

Figure 14. Oral administration of Compound 4 in diabetic rats: effect on IL-1β production by peritoneal macrophages in cell culture with (b), or without (a) stimulation by P. gingivalis LPS (Note: Compound 4 was administered in vivo in both (a) and (b)).

Figure 15. Oral administration of Compound 4 in diabetic rats: effect on MMP-9 levels in conditioned media of peritoneal macrophages in cell culture (no LPS added).

Figure 16. Oral administration of Compound 4 in diabetic rats: effect on cell migration (chemotaxis) of peritoneal macrophages in cell culture.
Detailed Description of the Invention

This invention provides a compound having the structure

![Chemical Structure Diagram]

wherein

bond \( a \) and \( \beta \) are each, independently, present or absent;

\( A \) is an aromatic or heteroaromatic ring; \( B \) is an aromatic or heteroaromatic ring;

\( R_i \) is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, \( \text{Ci-io} \) alkyl, \( \text{C}_2\text{-io} \) alkenyl, \( \text{C}_2\text{-io} \) alkynyl, aryl, heteroaryl, heterocyclyl, or

![Chemical Structure Diagram]

wherein \( R_{13}, R_{14}, R_{15}, R_{16}, \) and \( R_{17} \) are each independently, H, halogen, \(-\text{OCZ}_3\), \(-\text{CZ}_3\), \(-\text{OCH}_2\text{CH(OH)}\text{CH}_2\text{OH}\), \(-\text{OCH}(\text{CH}_2\text{OH})_2\), \(-\text{NO}_2\), \(-\text{OCH}_3\), \(-\text{CN}\), \(-\text{NR}_i\text{R}_i\), \(-\text{SR}_i\), \(-\text{CO}_2\text{R}_i\), \(-\text{OR}_i\), \(-\text{COR}_i\), \(-\text{CSR}_i\), \(-\text{NHCOR}_i\), \(-\text{SOR}_i\), \(-\text{P(OR}_i\text{)(OR}_i\text{)}\), \(-\text{C(=S)R}_i\), \(-\text{C}(-\text{NH})\text{R}_i\), \(-\text{C}(=\text{N})\text{R}_i\), \(-\text{P}(\text{OR}_i\text{)(OR}_i\text{)}\), \(-\text{C}(=\text{N})\text{R}_i\), \(-\text{NH}_{\text{i-o}}\text{R}_i\), \(-\text{NHR}_i\text{R}_i\text{+}\), \(-\text{C}(=\text{O})-\text{heterocyclyl}\), \(-\text{Ci-o} \) alkyl, \( \text{C}_2\text{-io} \) alkenyl, \( \text{C}_2\text{-io} \) alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein \( Z \) is halogen, and

\( \text{Ri}_8, \text{Rig}, \) and \( \text{R}2_0 \) are each, independently, H, \( \text{Ci-o} \) alkyl, \( \text{C}_2\text{-io} \) alkenyl, \( \text{C}_2\text{-io} \) alkynyl, aryl, heteroaryl, or heterocyclyl;

\( \text{R}_2 \) is H, \(-\text{CH}_3\), \(-\text{OR}_{2_1}\), \(-\text{CO}_2\text{R}_{2_2}\), \(-\text{CF}_3\), \( \text{Ci} \)-alkyl, \( \text{C}_2\)-alkenyl, \( \text{C}_2\)-alkynyl, \( \text{aryl}, \text{heteroaryl, or heterocyclyl,} \)

wherein \( \text{R}_{2_1} \) is, H, \(-\text{CF}_3\), \(-\text{CH}_3\), \( \text{Ci} \)-alkyl, \( \text{C}_2\)-alkenyl, \( \text{C}_2\)-alkynyl, \( \text{aryl}, \text{heteroaryl, or } \text{C}(=\text{O})-\text{heterocyclyl} \); and

\( \text{R}_3 \) and \( \text{R}_4 \) are each, independently, halogen, \(-\text{NO}_2\), \(-\text{NR}_{2_2}\text{R}_{2_3} \), \(-\text{NHR}_{2_2}\text{R}_{2_3}^{-}\), \(-\text{SR}_{2_2}\), \(-\text{SO}_2\text{R}_{2_2}\), \(-\text{SO}_3\text{R}_{2_2}\), \(-\text{OR}_{2_2}\), \(-\text{CO}_2\text{R}_{2_2}\), \(-\text{CF}_3\), \(-\text{POR}_{2_2}\), \(-\text{P}(=\text{O})(\text{OR}_{2_2})(\text{OR}_{2_3})\), or \(-\text{P}(\text{OR}_{2_2})(\text{OR}_{2_3})\).
wherein $R_{22}$ and $R_{23}$ are each, $H$, $-CF_3$, $-CH_3$, $C_{1-5}$ alkyl, $C_2$-alkenyl, $C_2$-alkynyl, aryl, heteroaryl, heterocyclyl, or $-C(=0)$-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted; and

when $a$ and $\beta$ are present, $A$ is phenyl with $R_3$ at the para position, $B$ is phenyl with $R_4$ at the para position, $R_2$ is $H$, $R_3$ is $-OH$ or $-N(CH_3)_2$, and $R_4$ is $-OH$ or $-N(CH_3)_2$, then $R_1$ is other than unsubstituted phenyl,

or a salt thereof.

In an embodiment, the compound has the structure

wherein

bond $a$ and $\beta$ are each, independently, present or absent;

$X$ is $-CH$, $-CR_3$ or $N$; $Y$ is $-CH$, $-CR_4$ or $N$;

$R_i$ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, $Cl_i_0$ alkyl, $C_{2-i_0}$ alkenyl, $C_{2-i_0}$ alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein $R_{13}$, $R_{14}$, $R_{15}$, $R_{16}$, and $R_{17}$ are each independently, $H$, halogen, $-OCZ_3$, $-CZ_3$, $-OCH_2CH(OH)CH_2OH$, $-OCH(CH_2OH)_2$, $-NO_2$, $OCH_4$, $-CN$, $-NR_{18}R_{19}$, $-SR_{18}$, $-CO_3R_{18}$, $-OR_{20}$, $-COR_{20}$, $-CSR_{20}$, $-NHCOR_{18}$, $-SOR_{18}$, $-POR_{17}$, $-C(=S)R_{18}$, $-C(=NH)R_{18}$, $C(=NR_{18})R_{18}$, $-C(=N)R_{18}$, $-POR_{18}$, $-P(=0)($OR$_{18})$ (OR$_{19}$), $-P($OR$_{18})($OR$_{19}$), $-C(=S)R_{18}$, $-NHR_{18}R_{19}$, $-C(=0)$-heterocyclyl, $Cl_-$.
alkyl, C₂₋₈ alkenyl, C₂₋₈ alkynyl, aryl, heteroaryl, or heterocyclyl,
wherein Z is halogen, and
R₁, R₂, and R₂₀ are each, independently, H, C₁₋₈ alkyl, C₂₋₈ alkenyl, C₂₋₈ alkynyl, aryl, heteroaryl, or heterocyclyl;
R₂ is H, -CH₃, -OR₂₁, -CO₂R₂₁, -CF₃, C₂₋₈ alkyl, C₂₋₈ alkenyl, C₂₋₈ alkynyl, aryl, heteroaryl, or heterocyclyl,
wherein R₂₁ is, H, -CF₃, -CH₃, C₁₋₈ alkyl, C₂₋₈ alkenyl, C₂₋₈ alkynyl, or -C (=O) -heterocyclyl ; and
R₃ and R₄ are each independently, halogen, -NO₂, -NR₂₂R₂₃, -NHR₂₁R₂³, -SR₂₂, -SO₂R₂₂, -SO₃R₂₂, -OR₂₂, -CO₂R₂₂, -CF₃, -POR₂₂, -P (=O) (OR₂₂) (OR₂₃), or -P (OR₂₂) (OR₂₃),
wherein R₂₂ and R₂₃ are each, H, -CF₃, -CH₃, C₁₋₈ alkyl, C₂₋₈ alkenyl, C₂₋₈ alkynyl, or -C (=O) -heterocyclyl , and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted; and

when a and β are present, X is -CH, Y is -CH., R₂ is H, R₃ is -OH or -N(CH₃)₂, and R₄ is -OH or -N(CH₃)₂, then R₁ is other than unsubstituted phenyl,
or a salt thereof.

In an embodiment, X is N, or a salt thereof.

In an embodiment, a and β are both present, or a salt thereof.

In an embodiment, the compound has the structure

![Chemical Structure](attachment:image.png)

wherein
Ri is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, Cl-i0 alkyl, C2-i0 alkenyl, C2-i0 alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein R1, R14, R15, R16 and R17 and are each independently, H, halogen, -OCZ3, -CZ3, -OCH2CH(OH)CH2OH, -OCH(CH3)2, -NO2, OCH3, -CN, -NRi8Ri9, -SRi8, -CO2Ri8, -OR20, -COR20, -CSR20, -NHCOR18, -SOR18, -POR18, -C(=S)Ri8, C(-NH)Ri8, C(-NRI8)Ri8, -C(-NRi8)Ri8, -P(=O)(ORi8)(ORi9), -P(Ori8)(ORi9), -C(=S)Ri8, -NHRI8RI9, -C(=O)-heterocyclyl, Ci-i0 alkyl, C2-i0 alkenyl, C2-i0 alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and R1, R8, R19, and R20 are each independently, H, Cl-i0 alkyl, C2-i0 alkenyl, C2-i0 alkynyl, aryl, heteroaryl, or heterocyclyl;

R2 is H or -CH3; and

R3 and R4 are each -OR22,

wherein R22 is H, -CF3, -CH3, Cl-i5 alkyl, C2-i5 alkenyl, C2-i5 alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=O)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

In an embodiment, the compound has the structure

wherein
R is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, Ci-io alkyl, C$_2$-io alkenyl, C$_2$-io alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein R$_{13}$, R$_{14}$, R$_{15}$, R$_{16}$ and R$_{17}$ and are each independently, H, halogen, -OCZ$_3$, -CZ$_3$, -OCH$_2$CH(OM)CH$_2$OH, -OCH(CH$_2$OH)$_2$, -NO$_2$, OCH$_3$, -CN, -NR$_i$$_8$R$_i$$_9$, -SR$_i$$_8$, -C$_2$R$_i$$_8$, -OR$_{20}$, -COR$_{20}$, -CSR$_{20}$, -NHCOR$_{18}$, -SOR$_{18}$, -POR$_{18}$, -C(=S)R$_i$$_8$, C(=NH)R$_i$$_8$, C(=NR$_i$$_8$)R$_i$$_8$, -C(=N)R$_i$$_8$, -OR$_{22}$, -O(OR$_i$$_8$)(OR$_i$$_9$), -C(=S)R$_i$$_8$, -NHRR$_i$R$_i$$_9$, -C(=0) -heterocyclyl, Ci-i$_0$ alkyl, C$_2$-i$_0$ alkenyl, C$_2$-i$_0$ alkynyl, aryl, heteroaryl, or heterocyclyl, or heterocyclyl,

wherein Z is halogen, and R$_i$$_8$, R$_i$$_9$, and R$_{20}$ are each, independently, H, Ci-i$_0$

alkyl, C$_2$-i$_0$ alkenyl, C$_2$-i$_0$ alkynyl, aryl, heteroaryl, or heterocyclyl; and

R$_3$ and R$_4$ are each -OR$_{22}$,

wherein R$_{22}$ is H, -CF$_3$, -CH$_3$, Ci-$_5$ alkyl, C$_2$-$_5$ alkenyl, C$_2$-$_5$ alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-

heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

The compound of claim 4 or 5, wherein R$_{22}$ is H, Ci-$_5$ alkyl, C$_2$-$_5$ alkenyl, C$_2$-$_5$ alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-heterocyclyl, wherein each occurrence of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

In an embodiment, the compound has the structure
wherein

$X_i$ is $-\text{CH}, -\text{CR}_3$ or $\text{N}$; $Y_i$ is $-\text{CH}, -\text{CR}_4$ or $\text{N}$;

$R_i$ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, $c_i_\text{alkyl}$, $C_2$-alkenyl, $C_2$-alkynyl, aryl, heteroaryl, or heterocyclyl;

$R_2$ is $\text{H}$ or $-\text{CH}_3$; and

$R_3$ and $R_4$ are each independently, halogen, $-\text{NO}_2$, $-\text{NR}_2\text{R}_3$, $-\text{NHR}_2\text{R}_3$, $-\text{SO}_2\text{R}_2$, $-\text{SO}_2\text{R}_3$, $-\text{OR}_2$, $-\text{CO}_2\text{R}_2$, $-\text{PO}_2\text{R}_2$, $-\text{P}(=\text{O})(\text{OR}_2)$, $-\text{P}(=\text{O})(\text{OR}_2)$, or $-\text{P}(=\text{O})(\text{OR}_2)$,

wherein $R_{22}$ and $R_{23}$ are each, $\text{H}$, $-\text{CF}_3$, $-\text{CH}_3$, $c_i_\text{alkyl}$, $C_2$-$c_6$ alkenyl, $C_2$-$c_6$ alkynyl, aryl, heteroaryl, heterocyclyl, or $-\text{C}(=\text{O})$-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

In an embodiment, the compound has the structure

wherein

$X$ is $-\text{CH}, -\text{CR}_3$ or $\text{N}$; $Y$ is $-\text{CH}, -\text{CR}_4$ or $\text{N}$;

$R_i$ is $R_{13}$, $R_{14}$, or $R_{15}$.
wherein \( R_{13}, R_{14}, \) or \( R_{15} \) is \( H, \) halogen, \(-OCZ_3, -CZ_3, -OC_2(CH_2OH), -OCH(CH_2OH)_2, -NO_2, -OC_3, -CN, -NR_8R_9, -SR_{18}, -CO2R_{18}, -OR_{20}, -COR_{20}, -CSR_{20}, -NHCOR_{18}, -SOR_{18}, -POR_{17}, -C(=S)R_{18}, -C(=NH)R_{18}, -C(=NR_{18})R_{18}, -C(=N)R_{18}, -POR_{18}, -P(-0)(OR_{19})(OR_{19}), -P(OR_8)(OR_{19}), -C(=S)R_{18}, -NH(=0)R_{15}, -C(=O)-heterocyclyl, \( Ci_0 \) alkyl, \( C_2-io \) alkenyl, \( C_2-io \) alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein \( Z \) is halogen, and \( \text{Ric, Rig, and R}_{20} \) are each, independently, \( H, \) \( Ci_0 \) alkyl, \( C_2-io \) alkenyl, \( C_2-io \) alkynyl, aryl, heteroaryl, or heterocyclyl;

\( R_2 \) is \( H \) or \(-CH_3; \) and \( R_3 \) and \( R_4 \) are each independently, halogen, \(-NO_2, -NR_{22}R_{23}, -NHR_{22}R_{23}, -SR_{22}, -SO_{2}R_{22}, -SO_{3}R_{22}, -OR_{22}, -CO_2R_{22}, -CF_3, -POR_{22}, -P(-0)(OR_{22})(OR_{23}), -P(OR_{22})(OR_{23}); \) wherein \( R_{22} \) and \( R_{23} \) are each, \( H, -CF_3, -CH_3, Ci_5 \) alkyl, \( C_2-s \) alkenyl, \( C_2-s \) alkynyl, aryl, heteroaryl, heterocyclyl, or \(-C(-0)-heterocyclyl, \) and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

In an embodiment, the compound has the structure

\[
\begin{align*}
\text{R}_3 & \quad \text{O} \quad \text{N} \quad \text{R}_1 \\
\text{H} & \quad \text{O} \quad \text{N} \\
\text{R}_4 & \quad \text{O} \\
\end{align*}
\]

wherein

\[
\begin{align*}
\text{R}_1 & \quad \text{R}_{13}, \quad \text{R}_{14}, \quad \text{or} \quad \text{R}_{15}, \\
\end{align*}
\]
wherein \( R_{13}, R_{14}, \) or \( R_{15} \) is H, halogen, \(-OC3, -CZ3, -\)
\( OCH2CH(OH)CH2OH, -OCH(CH2OH)2, -NO2, OCH3, -CN, -NR, Ri9, -\)
\( SRi8, -CO2Ri8, -OR20, -COR20, -CSR20, -NHCORi8, -SORi8, -PORi7, -\)
\( C (=S) Ri8, -C (=NH) Ri8, C (=NRi8) R_{18}, -C (=N) R_{18}, -POR_{18}, -\)
P\( (-0) (OR_{18}) (OR_{19}), -P (OR) (OR_{18}), -C (=S) R_{18}, -NHR_{18}R_{19}^+, -\)
\( C (=0) -heterocyclyl, Ci_{10} alkyl, C_{2}io alkenyl, C_{2}io alkynyl, \)
\( alkynyl, aryl, heteroaryl, or heterocyclyl, \)

wherein \( Z \) is halogen, and

\( R_{10} \) alkyl, \( C_{2}io \) alkenyl, \( C_{2}io \) alkynyl, aryl, heteroaryl, or heterocyclyl; and

\( R_{3} \) and \( R_{4} \) are each independently, halogen, \(-NO2, -NR_{2}R_{22}, -\)
\( NHR_{2}R_{22}^+, -SR_{2}R_{2}, -SO_{2}R_{22}, -SO_{2}R_{2}, -OR_{2}, -CO_{2}R_{22}, -CF_{3}, -POR_{22}, -\)
P\( (-0) (OR_{22}) (OR_{23}), or -P (OR) (OR_{22}) (OR_{23}), \)

wherein \( R_{22} \) and \( R_{23} \) are each, H, -CF\(_3\), -CH\(_3\), Ci\(_{15}\) alkyl, \( C_{2}5 \)
\( alkenyl, C_{2}5 \) alkynyl, aryl, heteroaryl, heterocyclyl, or
\( -C (=0) -heterocyclyl, and \)

wherein each occurrence in the compound of alkyl, alkenyl, or
\( alkynyl \) is branched or unbranched, unsubstituted or
\( substituted, \)

or a salt thereof.

25 In an embodiment,

\[ \text{Ri is} \]

\[ \text{Ri5 is} \]

wherein \( R_{15} \) is H, halogen, \(-OC3, -C3, -OCH2CH(OH)CH2OH, -\)
\( OCH(CH2OH)2, -NO2, OCH3, -CN, -NRi9, -SRi8, -C0_{2}Ri8, -OR_{20}, -\)
\( COR20, -CSR20, -NHCOR, -SOR, -POR_{17}, -C (=S) Ri8, -\)
P\( (=0) (ORi9) (OR_{19}), -C (=S) Ri8, -NHRi8Ri9^+, -C (=0) -heterocyclyl, Ci_{10} \)
\( alkyl, C_{2}io \) alkenyl, \( C_{2}io \) alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein \( Z \) is halogen, and
Ri, Rig, and R2o are each, independently, H, Ci-i alkyl, C2-i alkenyl, C2-i alkynyl, aryl, heteroaryl, or heterocyclyl; and

R3 and R4 are each independently, halogen, -NO2, -NR22R23, -NHR22R23', -SR22, -SO2R22, -SO3R22, -OR22, -COR22, -P(=O)(OR22)(OR23), or -P(=O)(OR22)

wherein R22 and R23 are each, H, -CF3, -CH3, Ci-5 alkyl, C2-5 alkenyl, C2-5 alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=O)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

In an embodiment, R3 and R4 are each -OR22, wherein R22 is H, -CF3, -CH3, Ci-5 alkyl, C2-5 alkenyl, C2-5 alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=O)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

In an embodiment, R22 is H.

In an embodiment, the compound has the structure
This invention provides a pharmaceutical composition comprising a pharmaceutically acceptable carrier and one of the compounds described above.

The compounds described above are referred to herein as "Compound 4 homologues".

This invention provides method of accelerating the healing of a wound in a subject having a wound, comprising administering to the subject a compound having the structure

\[
\begin{align*}
\text{R}_{1} & \quad \text{A} \quad \text{B} \quad \text{R}_{2} \\
& \quad \text{R}_{3} \quad \text{R}_{4} \\
& \quad \text{R}_{5} \\
\end{align*}
\]

wherein

- bond α and β are each, independently, present or absent;
- A is an aromatic or heteroaromatic ring; B is an aromatic or heteroaromatic ring;
- R₁ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, C₁₀ alkyl, C₂₀ alkenyl, C₂₀ alkynyl, aryl, heteroaryl, heterocyclyl, or

\[
\begin{align*}
\text{R}_{13}, \text{R}_{14}, \text{R}_{15}, \text{R}_{16}, \text{R}_{17} \quad \text{or} \quad \text{heterocyclyl, C}_1\text{C}_10 \text{alkyl, C}_2\text{C}_10 \text{alkenyl, C}_2\text{C}_10 \text{alkynyl, aryl, heteroaryl, or heterocyclyl,}
\end{align*}
\]

wherein Z is halogen, and
R₁, R₂, and R₃ are each, independently, H, Cₐₗₖyl, C₂₋₅ alkenyl, C₂₋₅ alkynyl, aryl, heteroaryl, or heterocyclyl;

R₂ is H, -CH₃, -OR, -CO₂R₂, -CF₃, Cl₋₅ alkyl, C₂₋₅ alkenyl, C₂₋₅ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein R₂₁ is, H, -CF₃, -CH₃, Cl₋₅ alkyl, C₂₋₅ alkenyl, C₂₋₅ alkynyl, or -C(-0)-heterocyclyl; and

R₃ and R₄ are each independently, halogen, -NO₂, -NR₂, -SH, SO₂R₂, -OR₂, -CO₂R₂, -CF₃, -POR₂, -P(-0)(OR₂), or -P[(OR₂)(OR₂)],

wherein R₂₂ and R₂₃ are each, H, -CF₃, -CH₃, Cl₋₅ alkyl, C₂₋₅ alkenyl, C₂₋₅ alkynyl, aryl, heteroaryl, heterocyclyl, or -C(-0)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,
or a salt thereof.

In an embodiment, the compound administered has the structure

![Compound Structure](image)

wherein

bond a and β are each, independently, present or absent;
X is -CH, -CR₃ or N; Y is -CH, -CR₄ or N;
R₁ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, Cl₋₁₀ alkyl, C₂₋₁₀ alkenyl, C₂₋₁₀ alkynyl, aryl, heteroaryl, heterocyclyl, or
wherein $R_3$, $R_4$, $R_5$, $R_6$, and $R_7$ are each independently, 
H, halogen, $-OCH_3$, $-CZ_3$, $-OCH_2CH(\text{OH})CH_2OH$, $-OCH(\text{CH}_2\text{OH})_2$, 
$-\text{NO}_2$, $\text{OCH}_3$, $-\text{CN}$, $-\text{NR}_4\text{R}_8$, $-\text{SR}_2$, $-\text{CO}_2\text{R}_8$, $-\text{OR}_2$, $-\text{COR}_2$, 
$-\text{CSR}_2$, $-\text{NHCOR}_{18}$, $-\text{SOR}_8$, $-\text{POR}_{17}$, $-\text{C(-)}\text{R}_8$, $-\text{C(-)}\text{NH}\text{R}_8$,
$C(-\text{NR}_4\text{R}_8)\text{R}_{18}$, $-\text{P(OR}_8\text{)}\text{(OR}_9\text{)}, -\text{P(-)}\text{OR}_8\text{(OR}_9\text{)}, 
P\text{(OR}_8\text{)}\text{(OR}_9\text{)}, -\text{C(-)}\text{S}\text{R}_8$, $-\text{NHR}_8\text{R}_9$", $-\text{C(-)}\text{OR}_8\text{(OR}_9\text{)},$ 
alkyl, $C_2\text{-}i_0$ alkenyl, $C_2\text{-}i_0$ alkynyl, ary1, heteroaryl, or 
heterocyclyl,
wherein $Z$ is halogen, and
$\text{Ri8}$, $\text{Ri9}$, and $\text{Ri0}$ are each, independently, $\text{H}$, $C_1\text{-}i_0$
alkyl, $C_2\text{-}i_0$ alkenyl, $C_2\text{-}i_0$ alkynyl, ary1, heteroaryl, or 
or heterocyclyl;
$R_2$ is $\text{H}$, $-\text{CH}_3$, $-\text{OR}_2$, $-\text{CO}_2\text{R}_2$, $-\text{CF}_3$, $\text{Cl}_5$ alkenyl, $C_2\text{-}i_0$ alkenyl, $C_2\text{-}i_0$
alkynyl, ary1, heteroaryl, or heterocyclyl,
wherein $R_{21}$ is, $\text{H}$, $-\text{CF}_3$, $-\text{CH}_3$, $\text{Cl}_5$ alkenyl, $C_2\text{-}i_0$ alkenyl, $C_2\text{-}i_0$
alcohol, or $-\text{C(-)}\text{OR}_2$ heterocyclyl; and
$R_3$ and $R_4$ are each independently, halogen, $-\text{NO}_2$, $-\text{NR}_2\text{R}_3$, $-\text{NHR}_2\text{R}_3$ 
$-\text{SR}_2$, $-\text{SO}_2\text{R}_2$, $-\text{SO}_2\text{R}_3$, $-\text{OR}_2$, $-\text{COR}_2$, $-\text{CF}_3$, $-\text{POR}_2$, 
$-\text{P(-)}\text{OR}_2\text{(OR}_3\text{)},$ or $-\text{P(OR}_2\text{)}\text{(OR}_3\text{)},$
wherein $R_{22}$ and $R_{23}$ are each, $\text{H}$, $-\text{CF}_3$, $-\text{CH}_3$, $\text{Cl}_5$ alkenyl, $C_2\text{-}i_0$
alcohol, $C_2\text{-}i_0$ alkynyl, ary1, heteroaryl, heterocyclyl, or 
$-\text{C(-)}\text{OR}_2$ heterocyclyl, and
wherein each occurrence in the compound of alkyl, alkenyl, or 
alcohol is branched or unbranched, unsubstituted or 
substituted,
or a salt thereof.

In an embodiment, when $a$ and $\beta$ are present, $X$ is $-\text{CH}_3$, $Y$ is 
$-\text{CH}_3$, $R_2$ is $\text{H}$, $R_3$ is $-\text{N(CH}_3)_2$ and $R_4$ is $-\text{N(CH}_3)_2$, then $R_1$ is other 
than unsubstituted phenyl.

In an embodiment, the compound administered has the structure
wherein

$R_i$ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, C$_i$-io alkyl, C$_2$-io alkenyl, C$_2$-io alkynyl, aryl, heteroaryl, heterocyclyl, or

$\text{\includegraphics[width=0.5\textwidth]{compound_diagram.png}}$

wherein $R_{13}$, $R_{14}$, $R_{15}$, $R_{16}$ and $R_{17}$ and are each independently, H, halogen, -OCZ$_3$, -CZ$_3$, -OCH$_2$CH$(OH)$CH$_2$OH, -OCH$(CH$_2$OH)$_2$, -NO$_2$, OCH$_3$, -CN, -NR$_i$R$_i$, -SR$_i$, -CO$_2$R$_i$, -OR$_i$, -COR$_i$, -CSR$_i$, -NHCOR$_i$, -SOR$_i$, -P(=0)(OR$_i$)$_2$, -P(OR$_i$)$_2$, -C(=S)R$_i$, -H$_2$R$_i$, -C(=0)heterocyclyl, Ci$_{1-10}$alkyl, C$_{2-10}$ alkenyl, C$_{2-10}$ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and

$R_{18}$, $R_{19}$, and $R_{20}$ are each independently, H, Ci$_{10}$ alkyl, C$_{2-10}$ alkenyl, C$_{2-10}$ alkynyl, aryl, heteroaryl, or heterocyclyl; and

$R_3$ and $R_4$ are each -OR$_{22}$,

wherein $R_{22}$ is H, -CF$_3$, -CH$_3$, Ci$_{1-5}$ alkyl, C$_{2-5}$ alkenyl, C$_{2-5}$ alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

In an embodiment, the compound administered has the structure

21
wherein

\[
\text{R}_3, \text{R}_1, \text{or R}_i \text{ is } H, \text{ halogen, } -\text{OC}_3, -\text{C}_3, -
\]

\[

\[
\text{22}
\]
wherein $R_{15}$ is H, halogen, -OC$_2$Z$_3$, -CZ$_3$, -OCH$_2$CH(OH)CH$_2$OH, -OCH(CH$_2$OH)$_2$, -NO$_2$, OCH$_3$, -CN, -NRi$_8$Ri$_9$, -SRi$_8$, -C0$_2$Ri$_8$, -OR$_{20}$, -COR$_{20}$, -CSR$_{20}$, -NHCOR$_{18}$, -SORi$_8$, -POR$_{17}$, -C($=S$)Ri$_8$, -C($=NH$)Ri$_8$, C($=NR$)Ri$_8$, -C($=N$)Ri$_8$, -P0R$_{18}$, -P($=0$)(OR$_{19}$), -C($=S$)Ri$_8$, -NHRi$_8$Ri$_9^+$, -C($=0$)-heterocyclyl, alkyl, alkenyl, alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein $Z$ is halogen, and

$R_{18}$, Rig, and $R_{20}$ are each, independently, H, Cl$_{i_0}$ alkyl, C$_2$-i$_0$ alkynyl, Cl$_{i_0}$ alkynyl, aryl, heteroaryl, or heterocyclyl; and

$R_3$ and $R_4$ are each independently, halogen, -NO$_2$, -NR$_{22}$R$_{23}$, -NHR$_{22}$R$_{23}^+$, -SR$_{22}$, -SO$_2$R$_{22}$, -SO$_3$R$_{22}$, -OR$_{22}$, -C0$_2$R$_{22}$, -CF$_3$, -POR$_{22}$, -P($=0$)(OR$_{22}$), or -P(OR$_{22}$)(OR$_{23}$),

wherein $R_{22}$ and $R_{23}$ are each, H, -CF$_3$, -CH$_3$, Cl$_{-5}$ alkyl, C$_2$-i$_5$ alkenyl, C$_2$-i$_5$ alkynyl, aryl, heteroaryl, heterocyclyl, or -C($=0$)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

In an embodiment, $R_3$ and $R_4$ are each -OR$_{22}$, wherein $R_{22}$ is H, -CF$_3$, -CH$_3$, Cl$_{-5}$ alkyl, C$_2$-i$_5$ alkenyl, C$_2$-i$_5$ alkynyl, aryl, heteroaryl, heterocyclyl, or -C($=0$)-heterocyclyl,

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.
In an embodiment, the compound administered has the structure

or a salt thereof.

In an embodiment, the compound administered has the structure

or a salt thereof.

In an embodiment, the wound is a skin wound.

In an embodiment, the compound is administered to the subject topically.

In an embodiment, the compound is in a carrier which comprises a concentration of the compound.

In an embodiment, the concentration of the compound in the carrier is less than about 5% (w/w).

In an embodiment, the concentration of the compound in the carrier is between about 0.01% and about 3% (w/w).

In an embodiment, the concentration of the compound in the carrier is less than about 3% (w/w).
In an embodiment, the concentration of the compound in the carrier is about 1.5% (w/w).

In an embodiment, the concentration of the compound in the carrier is about 1% (w/w).

In an embodiment, the concentration of the compound in the carrier is about 0.5% (w/w).

In an embodiment, the concentration of the compound in the carrier is between about 0.01% and about 3% (w/w).

In an embodiment, the concentration of the compound in the carrier is about 0.01%, about 0.05%, about 0.1%, about 0.15%, about 0.2%, about 0.25%, about 0.3%, about 0.35%, about 0.4%, about 0.45% or about 0.5% (w/w).

In an embodiment, the concentration of the compound in the carrier is about 0.3% (w/w).

In an embodiment, the concentration of the compound in the carrier is about 0.25% (w/w).

In an embodiment, the concentration of the compound in the carrier is about 0.1% (w/w).

In an embodiment, the carrier is petrolatum jelly.

In an embodiment, the compound is administered to the subject orally.

In an embodiment, the amount of the compound administered is between about 0.1 and about 15.0mg/kg body weight of the subject/day.

In an embodiment, the subject is a human subject.
In an embodiment, the amount of the compound administered to the human subject is between about 10mg and about 1000mg.

In an embodiment, the amount of the compound administered is about 4.0mg/kg body weight of the subject/day.

In an embodiment, the compound is administered to the subject once per day for a period of 7 days.

In an embodiment, the wound is a skin wound.

In an embodiment, the compound is administered to the subject after the skin wound has begun to heal.

In an embodiment, the skin wound is a cut in the skin, an abrasion of the skin, a puncture of the skin, a burn, contact dermatitis, or an insect bite.

In an embodiment, the skin wound is itching.

In an embodiment, the skin wound is an insect bite.

In an embodiment, the insect is a mosquito, chigger, bed bug, horse fly, or sand fly.

A burn may be a heat burn, a chemical burn, or a radiation burn. A radiation burn may be, e.g., a burn caused by ultraviolet light, such as a sun burn. In some embodiments, a bite may be an insect bite or an arachnid bite. In some embodiments, the insect is a hornet, a wasp, a bee, an ant, a chigger, a bed bug, a mosquito, a sand fly, a horse fly (i.e., a biting insect in the family Tabanidae), a dog fly (i.e., a biting insect in the family Muscidae) or a black fly (i.e., a biting insect in the family Simuliidae). In some embodiments, the arachnid is a mite, flea, tick, scorpion or spider.

In an embodiment, the skin wound is contact dermatitis.
In an embodiment, the contact dermatitis is caused by contact with poison ivy, poison oak, or poison sumac.

Contact dermatitis may be caused by contact with an allergen or an irritant. In some embodiments, contact dermatitis is caused by contact with a poisonous plant. Non-limiting examples of plants that may cause contact dermatitis are those of the Toxicodendron genus, such as poison ivy, poison oak and poison sumac. In some embodiments, contact dermatitis is caused by exposure to a metal, such as nickel. In some embodiments, contact dermatitis is caused by contact with an irritant. Non-limiting examples of irritants that may cause contact dermatitis are detergents and other cleaning products.

A skin wound may be caused by a chemical or biological weapon. A non-limiting example of a chemical weapon that may cause a skin wound is mustard gas. A non-limiting example of a biological weapon that may cause a skin wound is weaponized B. anthracis (e.g. B. anthracis spores).

In an embodiment, the wound is in the oral cavity of the subject.

In an embodiment, the compound is solubilized in a non-toxic organic solubilizing agent.

In an embodiment, the non-toxic organic solubilizing agent is N-methylglucamine.

In an embodiment, the wound is periodontitis, gingivitis, root caries, a canker sore, mucositis, pemphigoid, lichen planus, ulcer or a blistering lesion.

In an embodiment, the method wherein the accelerating of the healing of the wound comprises increasing levels of newly synthesized collagen.
In an embodiment, the method wherein the wound is a skin wound.

In an embodiment, the method wherein the levels of newly synthesized collagen in the wounded skin are increased.

In an embodiment, the method wherein the wound is a skin wound the levels of newly synthesized collagen in the wounded skin are increased.

In an embodiment, the method wherein the subject is diabetic.

In an embodiment, the method wherein the subject is hyperglycemic.

In an embodiment, the compounds of the present invention for use in accelerating the healing of a wound in a subject having a wound.

In some embodiments, including those in which a compound is administered to treat a wound in the oral cavity of a subject, the compound is solubilized in a non-toxic organic solubilizing agent. A non-limiting example of a non-toxic organic solubilizing agent is N-methylglucamine, which is also known as "meglumine". Therefore, aspects of the invention provide a mouthrinse that comprises a compound of the invention and a non-toxic organic solubilizing agent such as meglumine.

The advantages of using a solubilizing agent such as meglumine include:

1) Meglumine is presumed safe for daily oral use as a topical mouthrinse and, if inadvertently swallowed, should also be safe because it has been used I.V. in the past, to administer other types of agents in humans.
2) A formulation comprising meglumine and a compound of the invention, unlike other popular mouthrinses (e.g., Listerine), does not require alcohol; alcohol-containing mouthrinses have been reported to increase the risk for oral cancer.

3) A formulation comprising meglumine is pleasant tasting since it is a derivative of glucose, namely a glycitol, and would not be metabolized like glucose.

In some embodiments, a compound of the invention is solubilized in meglumine as a mouthrinse (i.e., mouthwash) formulation, and the concentration of the compound in the formulation is effective to suppress MMPs activity and cytokine levels in the oral cavity.

In preferred embodiments, mouthrinse formulations that comprise a compound of the invention do not cause tooth staining.

Aspects of the invention provide toothpaste which comprises a compound of the invention.

This invention provides a pharmaceutical composition comprising a pharmaceutically acceptable carrier and of the above compounds.

This invention also provides a method of inhibiting the activity and/or levels of a matrix metalloproteinase (MMP) comprising contacting the matrix metalloproteinase or a cell producing an MMP or MMPs with any one of the above compounds so as to inhibit the activity of a matrix metalloproteinase.

In an embodiment, the matrix metalloproteinase is MMP-1, MMP-2, MMP-3, MMP-7, MMP-8, MMP-9, MMP-12, MMP-13, or MMP-14.

This invention further provides a method of inhibiting the production of a cytokine in a population of mammalian cells
comprising contacting the population of cells with any one of the above compounds so as to inhibit production of a cytokine.

In an embodiment, the population of cells is a population of human cells.

In another embodiment, the cytokine is TNF-α, IL-1β, MCP-1, IL-8, or IL-6.

In yet another embodiment, the production of a cytokine is induced by an endotoxin, lipopolysaccharide (LPS), a hormone, a cholesterol complex, or an inflammatory mediator, including but not limited to nitric oxide, and reactive oxygen species. In another embodiment, the production of a cytokine is induced by a factor that increases cytokine levels in a diabetic subject, such as a non-enzymatic glycated protein or an Advanced Glycation End-product (AGE).

This invention yet further provides a method of inhibiting the production of a growth factor in a population of mammalian cells comprising contacting the population of cells with the any one of the above compounds so as to inhibit production of a growth factor.

In an embodiment, the growth factor is VEGF, PDGF, TGF-β, or MIP1α.

This invention provides a method of inhibiting NFK-B activation in a population of cells comprising contacting the population of cells with the any one of the above compounds so as to inhibit NFK-B activation.

In an embodiment, the population of cells is a population of human cells.
It is understood that the structures described in the embodiments of the methods hereinabove can be the same as the structures of the compounds described hereinabove.

It is understood that where a parameter range is provided, all integers within that range, and tenths thereof, are also provided by the invention. For example, "0.2-5 mg/kg/day" is a disclosure of 0.2 mg/kg/day, 0.3 mg/kg/day, 0.4 mg/kg/day, 0.5 mg/kg/day, 0.6 mg/kg/day etc. up to 5.0 mg/kg/day.

Terms
As used herein, and unless stated otherwise, each of the following terms shall have the definition set forth below.

As used herein, "about" in the context of a numerical value or range means ±10% of the numerical value or range recited or claimed, unless the context requires a more limited range.

As used herein, "wound" encompasses any injury in which an external surface, internal mucosa, oral lining or any epithelial tissue of a subject is torn, pierced, cut, abraded or otherwise broken, and any disruption of an external surface, internal mucosa, oral lining or any epithelial tissue of a subject which results from an injury, an infection, from direct contact with an allergen or irritant, or from an autoimmune disease. A non-limiting example of an autoimmune disease is pemphigoid.

As used herein, "skin wound" encompasses any injury in which the skin of a subject is torn, pierced, cut, or otherwise broken, and any disruption of the skin which results from an injury, an infection, from direct contact with an allergen or irritant, or from an autoimmune disease. Examples of skin wounds include but are not limited to cuts, abrasions, punctures, blisters, boils, wheals, burns, rashes, contact dermatitis, bites and psoriasis.
As used herein, "contact dermatitis" means a skin reaction resulting from exposure to an allergen (allergic contact dermatitis) or an irritant (irritant contact dermatitis). Phototoxic dermatitis may occur when an allergen or irritant is activated by sunlight.

As used herein, the term "activity" refers to the activation, production, expression, synthesis, intercellular effect, and/or pathological or aberrant effect of the referenced molecule, either inside and/or outside of a cell. Such molecules include, but are not limited to, cytokines, enzymes, growth factors, pro-growth factors, active growth factors, and pro-enzymes. Molecules such as cytokines, enzymes, growth factors, pro-growth factors, active growth factors, and pro-enzymes may be produced, expressed, or synthesized within a cell where they may exert an effect. Such molecules may also be transported outside of the cell to the extracellular matrix where they may induce an effect on the extracellular matrix or on a neighboring cell. It is understood that activation of inactive cytokines, enzymes and pro-enzymes may occur inside and/or outside of a cell and that both inactive and active forms may be present at any point inside and/or outside of a cell. It is also understood that cells may possess basal levels of such molecules for normal function and that abnormally high or low levels of such active molecules may lead to pathological or aberrant effects that may be corrected by pharmacological intervention.

The compounds of the present invention include all hydrates, solvates, and complexes of the compounds used by this invention. If a chiral center or another form of an isomeric center is present in a compound of the present invention, all forms of such isomer or isomers, including enantiomers and diastereomers, are intended to be covered herein. Compounds containing a chiral center may be used as a racemic mixture, an enantiomerically enriched mixture, or the racemic mixture may be separated using well-known techniques and an individual
enantiomer may be used alone. The compounds described in the present invention are in racemic form or as individual enantiomers. The enantiomers can be separated using known techniques, such as those described in Pure and Applied Chemistry 69, 1469-1474, (1997) IUPAC. In cases in which compounds have unsaturated carbon-carbon double bonds, both the cis ($\alpha$) and trans ($\epsilon$) isomers are within the scope of this invention.

The compounds of the subject invention may have spontaneous tautomeric forms. In cases wherein compounds may exist in tautomeric forms, such as keto-enol tautomers, each tautomeric form is contemplated as being included within this invention whether existing in equilibrium or predominantly in one form.

In the compound structures depicted herein, hydrogen atoms are not shown for carbon atoms having less than four bonds to non-hydrogen atoms. However, it is understood that enough hydrogen atoms exist on said carbon atoms to satisfy the octet rule.

As used herein, "alkyl" includes both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms and may be unsubstituted or substituted. Thus, $\text{Ci-C}_n$ as in "$\text{Ci-C}_n$ alkyl" is defined to include groups having 1, 2, ..., $n-1$ or $n$ carbons in a linear or branched arrangement. For example, $\text{Ci-C}_6$ as in "$\text{d-C}_6$ alkyl" is defined to include groups having 1, 2, 3, 4, 5, or 6 carbons in a linear or branched arrangement, and specifically includes methyl, ethyl, $n$-propyl, isopropyl, $n$-butyl, t-butyl, pentyl, hexyl, and octyl.

As used herein, "alkenyl" refers to a non-aromatic hydrocarbon radical, straight or branched, containing at least 1 carbon to carbon double bond, and up to the maximum possible number of non-aromatic carbon-carbon double bonds may be present, and may be unsubstituted or substituted. For example, "$\text{C}_2$-$\text{C}_5$ alkenyl" means an alkenyl radical having 2, 3, 4, 5, or 6
carbon atoms, and up to 1, 2, 3, 4, or 5 carbon-carbon double bonds respectively. Alkenyl groups include ethenyl, propenyl, butenyl and cyclohexenyl.

The term "alkynyl" refers to a hydrocarbon radical straight or branched, containing at least 1 carbon to carbon triple bond, and up to the maximum possible number of non-aromatic carbon-carbon triple bonds may be present, and may be unsubstituted or substituted. Thus, "C$_2$-C$_6$ alkynyl" means an alkynyl radical having 2 or 3 carbon atoms and 1 carbon-carbon triple bond, or having 4 or 5 carbon atoms and up to 2 carbon-carbon triple bonds, or having 6 carbon atoms and up to 3 carbon-carbon triple bonds. Alkynyl groups include ethynyl, propynyl and butynyl.

"Alkylene", "alkenylene" and "alkynylene" shall mean, respectively, a divalent alkane, alkene and alkyne radical, respectively. It is understood that an alkylene, alkenylene, and alkynylene may be straight or branched. An alkylene, alkenylene, and alkynylene may be unsubstituted or substituted.

As used herein, "aryl" is intended to mean any stable monocyclic, bicyclic or polycyclic carbon ring of up to 10 atoms in each ring, wherein at least one ring is aromatic, and may be unsubstituted or substituted. Examples of such aryl elements include phenyl, p-toluenyl (4-methylphenyl), naphthyl, tetrahydro-naphthyl, indanyl, biphenyl, phenanthryl, anthryl or acenaphthyl. In cases where the aryl substituent is bicyclic and one ring is non-aromatic, it is understood that attachment is via the aromatic ring. Where an aryl group is polycyclic, at least 2 aromatic rings are adjacent, i.e. share one side. For example, polycyclic aryl groups do not include moieties containing a tetracycline structure.

Further, the use of the term "polycyclic" is not limited to aryl groups. The term "polycyclic" as used herein may also
refer to unsaturated or partially unsaturated multiple fused ring structures. However, the term "polycyclic" as used herein in any context excludes the tetracycline structure.

The term "arylalkyl" refers to alkyl groups as described above wherein one or more bonds to hydrogen contained therein are replaced by a bond to an aryl group as described above. It is understood that an "arylalkyl" group is connected to a core molecule through a bond from the alkyl group and that the aryl group acts as a substituent on the alkyl group. Examples of arylalkyl moieties include, but are not limited to, benzyl (phenylmethyl), p-trifluoromethylbenzyl (4-trifluoromethylphenylmethyl), 1-phenylethyl, 2-phenylethyl, 3-phenylpropyl, 2-phenylpropyl and the like.

The term "heteroaryl", as used herein, represents a stable monocyclic, bicyclic or polycyclic ring of up to 10 atoms in each ring, wherein at least one ring is aromatic and contains from 1 to 4 heteroatoms selected from the group consisting of 0, N and S. Bicyclic aromatic heteroaryl groups include phenyl, pyridine, pyrimidine or pyridazine rings that are (a) fused to a 6-membered aromatic (unsaturated) heterocyclic ring having one nitrogen atom; (b) fused to a 5- or 6-membered aromatic (unsaturated) heterocyclic ring having two nitrogen atoms; (c) fused to a 5-membered aromatic (unsaturated) heterocyclic ring having one nitrogen atom together with either one oxygen or one sulfur atom; or (d) fused to a 5-membered aromatic (unsaturated) heterocyclic ring having one heteroatom selected from 0, N or S. Heteroaryl groups within the scope of this definition include but are not limited to: benzoimidazolyl, benzofuranyl, benzofuranazanyl, benzopyrazolyl, benzotriazolyl, benzothiophenyl, benzoazolyl, carbazolyl, cinnolinyln, furanyl, indolinyln, indolyln, indolazinyl, indazolyl, isobenzofuranyl, isoindolyl, isoquinolyl, isothiazolyl, isoxazolyl, naphthpyridinyl, oxadiazolyl, oxazolyl, oxazoline, isoxazoline, oxetanyl, pyranyl, pyrazinyl, pyrazolyl, pyridazinyl, pyridopyridinyl,
pyridazinyl, pyridyl, pyrimidyl, pyrrolyl, quinazolinyl, quinolyl, quinoxalinyl, tetrazolyl, tetrazolopyridyl, thiadiazolyl, thiazolyl, thienyl, triazolyl, azetidinyl, aziridinyl, 1,4-dioxanyl, hexahydroazepinyl, dihydrobenzoimidazolyl, dihydrobenzothiophenyl, dihydrobenzoazoxazolyl, dihydrofuranyl, dihydroisothiazolyl, dihydroisoxazolyl, dihydrooxadiazolyl, dihydrooxazolyl, dihydroopyrazinyl, dihydropyrazolyl, dihydroquinolinyl, dihydropyridine, dihydroquinolinyl, dihydroquinoxalinyl, dihydrotetrazolyl, dihydrothiadiazolyl, dihydrothiazolyl, dihydrothienyl, dihydrotriazolyl, methylenedioxybenzoyl, tetrahydrofuran, tetrahydrothienyl, acridinyl, carbazolyl, cinnolinyl, quinoxalinyl, pyrazolyl, indolyl, benzotriazolyl, benzothiazolyl, benzoazolyl, isoxazolyl, isothiazolyl, furanyl, thienyl, benzothienyl, benzofuranyl, quinolinyl, isoquinolinyl, oxazolyl, isoxazolyl, indolyl, pyrazinyl, pyridazinyl, pyridinyl, pyrimidinyl, pyrrolyl, tetra-hydroquinoline. In cases where the heteroaryl substituent is bicyclic and one ring is non-aromatic or contains no heteroatoms, it is understood that attachment is via the aromatic ring or via the heteroatom containing ring, respectively. If the heteroaryl contains nitrogen atoms, it is understood that the corresponding N-oxides thereof are also encompassed by this definition.

The term "heterocycle" or "heterocyclyl" refers to a mono- or poly-cyclic ring system which can be saturated or contains one or more degrees of unsaturation and contains one or more heteroatoms. Preferred heteroatoms include N, O, and/or S, including N-oxides, sulfur oxides, and dioxides. Preferably the ring is three to ten-membered and is either saturated or has one or more degrees of unsaturation. The heterocycle may be unsubstituted or substituted, with multiple degrees of substitution being allowed. Such rings may be optionally fused to one or more of another "heterocyclic" ring(s), heteroaryl ring(s), aryl ring(s), or cycloalkyl ring(s). Examples of
heterocycles include, but are not limited to, tetrahydrofur'an, pyran, 1,4-dioxane, 1,3-dioxane, piperidine, piperazine, pyrrolidine, morpholine, thiomorpholine, tetrahydrothiopyran, tetrahydrothiophene, 1,3-oxathiolane, and the like.

The alkyl, alkenyl, alkynyl, aryl, heteroaryl and heterocyclic substituents may be substituted or unsubstituted, unless specifically defined otherwise.

In the compounds of the present invention, alkyl, alkenyl, alkynyl, aryl, heterocyclic and heteroaryl groups can be further substituted by replacing one or more hydrogen atoms with alternative non-hydrogen groups. These include, but are not limited to, halo, hydroxy, mercapto, amino, carboxy, cyano and carbamoyl.

As used herein, the term "halogen" refers to F, Cl, Br, and I.

The term "substituted" refers to a functional group as described above in which one or more bonds to a hydrogen atom contained therein are replaced by a bond to non-hydrogen or non-carbon atoms, provided that normal valencies are maintained and that the substitution results in a stable compound. Substituted groups also include groups in which one or more bonds to a carbon(s) or hydrogen(s) atom are replaced by one or more bonds, including double or triple bonds, to a heteroatom. Examples of substituents include the functional groups described above, and, in particular, halogens (i.e., F, Cl, Br, and I); alkyl groups, such as methyl, ethyl, n-propyl, isopropyl, n-butyl, tert-butyl, and trifluoromethyl; hydroxy; alkoxy groups, such as methoxy, ethoxy, n-propoxy, and isopropoxy; aryloxy groups, such as phenoxy; arylalkyloxy, such as benzyloxy (phenylmethoxy) and p-trifluoromethylbenzyloxy (4-trifluoromethylphenylmethoxy); heteroaryloxy groups; sulfonyl groups, such as trifluoromethanesulfonyl, methanesulfonyl, and p-toluenesulfonyl; nitro, nitrosyl; mercapto; sulfanyl groups,
such as methylsulfanyl, ethylsulfanyl and propylsulfanyl; cyano; amino groups, such as amino, methylamino, dimethylamino, ethylamino, and diethylamino; and carboxyl. Where multiple substituent moieties are disclosed or claimed, the substituted compound can be independently substituted by one or more of the disclosed or claimed substituent moieties, singly or pluraly. By independently substituted, it is meant that the (two or more) substituents can be the same or different.

It is understood that substituents and substitution patterns on the compounds of the instant invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art, as well as those methods set forth below, from readily available starting materials. If a substituent is itself substituted with more than one group, it is understood that these multiple groups may be on the same carbon or on different carbons, so long as a stable structure results.

As used herein, abbreviations are defined as follows:

IL = interleukin
MCP = monocyte chemoattractant protein
TNF = tumor necrosis factor
VEGF = vascular endothelial growth factor
MMP = matrix metalloproteinase
LPS = lipopolysaccharide
HPLC = high-performance liquid chromatography

In choosing the compounds of the present invention, one of ordinary skill in the art will recognize that the various substituents, i.e., $R_1$, $R_2$, etc. are to be chosen in conformity with well-known principles of chemical structure connectivity.

The various R groups attached to the aromatic rings of the compounds disclosed herein may be added to the rings by

Various examples of "curcumin homologues" or "chemically modified curcumins" are described in PCT International Application Publication No. WO 2010/132815, the contents of which are hereby incorporated by reference. Curcumin homologues have improved biological activity compared to curcumin, however some curcumin homologues show toxicity in subjects at high doses. Compound 4 is a curcumin homologue. "Compound 4 homologues" are a subclass of curcumin homologues that are homologues of Compound 4 which have improved biological activity compared to other curcumin homologues such as, for example, Compounds 2 and 3 which are not Compound 4 homologues. Compound 4 homologues are structurally defined hereinabove at the beginning of this Detailed Description of the Invention.

Without wishing to be bound by any scientific theory, the improved biological activity of Compound 4 and its homologues in the subject application may be attributed in part to their ability to access and bind zinc ions and an enhanced solubility. The improved biological activity of Compound 4 and its homologues may also be attributed to their improved ability to bind to the zinc/calcium-based catalytic site in an MMP enzyme compared to another curcumin homologue which is not a Compound 4 homologue. This invention describes that the enhancement of zinc binding and/or MMP catalytic site affinity through the installation of electron-withdrawing and electron-donating groups at strategic locations, namely the C-4 carbon and the aryl rings, on the curcumin skeleton and results in the enhancement of biological activity, including inhibition of MMP activity, NF\(_k\)B activation, and cytokine production. Additionally, Compound 4 and its homologues are particularly
well tolerated in animal and human subjects. PCT International
Application Publication No. WO 2010/132815, discusses curcumin
homologues, and describes methods of synthesis of curcumin
homologues. The entire contents of PCT International
Application Publication No. WO 2010/132815 are hereby
incorporated by reference.

The compounds of the instant invention may be in a salt form.
As used herein, a "salt" is the salt of the instant compounds
which has been modified by making acid or base salts of the
compounds. Acidic substances can form salts with acceptable
bases, including, but not limited to, lysine, arginine, and
the like. In the case of compounds administered to a subject,
eg. a human, the salt is pharmaceutically acceptable. Examples
of pharmaceutically acceptable salts include, but are not
limited to, mineral or organic acid salts formed at basic
residues such as amino groups; alkali or organic base salts
formed at acidic residues such as phenols, carboxylic acids,
and carbons having at least 1 acidic hydrogen atom adjacent to
a carbonyl. Where acid salts are formed, such salts can be
made using an organic or inorganic acid. Such acid salts
include, but are not limited to, chlorides, bromides,
sulfates, nitrates, phosphates, sulfonates, formates,
tartrates, maleates, malates, citrates, benzoates,
salicylates, ascorbates, and the like. Because the compounds
of the subject invention also possess carbons having at least
1 acidic hydrogen atom adjacent to a carbonyl, enolate salts
may be formed by reaction with a suitable base. Suitable bases
include, but are not limited, to inorganic bases, such as
alkali and alkaline earth metal hydroxides; and organic bases,
including, but not limited to, ammonia, alkyl amines, amino
alcohols, amino sugars, amino acids, such as glycine,
histidine, and lysine, and alkali metal amides, such as
lithium diisopropylamide. The term "pharmaceutically
acceptable salt" in this respect, refers to the relatively
non-toxic, inorganic and organic acid or base addition salts
of compounds of the present invention. These salts can be

40
prepared in situ during the final isolation and purification of the compounds of the invention, or by separately reacting a purified compound of the invention in its free base or free acid form with a suitable organic or inorganic acid or base, and isolating the salt thus formed. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, phosphate, nitrate, acetate, valerate, oleate, palmitate, stearate, laurate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphylate, mesylate, glucoheptonate, lactobionate, and laurylsulphonate salts and the like. (See, e.g., Berge et al. (1977) "Pharmaceutical Salts", J. Pharm. Sci. 66:1-19).

The compounds and compositions of this invention may be administered in various forms, including those detailed herein. The treatment with the compound may be a component of a combination therapy or an adjunct therapy, i.e. the subject or patient in need of the drug is treated or given another drug for the disease in conjunction with one or more of the instant compounds. This combination therapy can be sequential therapy where the patient is treated first with one drug and then the other or the two drugs are given simultaneously. These can be administered independently by the same route or by two or more different routes of administration depending on the dosage forms employed.

As used herein, a "pharmaceutically acceptable carrier" is a pharmaceutically acceptable solvent, suspending agent or vehicle, for delivering the instant compounds to the animal or human. The carrier may be liquid or solid and is selected with the planned manner of administration in mind. Liposomes are also a pharmaceutically acceptable carrier.

The dosage of the compounds administered in treatment will vary depending upon factors such as the pharmacodynamic characteristics of a specific chemotherapeutic agent and its mode and route of administration; the age, sex, metabolic
rate, absorptive efficiency, health and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment being administered; the frequency of treatment with; and the desired therapeutic effect.

A dosage unit of the compounds may comprise a single compound or mixtures thereof with other compounds also used to treat rheumatoid arthritis (RA), osteoarthritis (OA), Alzheimer's Disease (AD), metastases, periodontal disease, such as periodontitis, angiogenesis, emphysema, acute respiratory distress syndrome, multiple sclerosis, cardiovascular disease, such as atherosclerosis, myocardial infarction, arterial restenosis after angioplasty and aneurysm development; inflammatory disorders, including neuroinflammation and inflammatory bowel disease; many types of cancer, including breast cancer, skin cancer, including, but not limited to, melanoma, and prostate cancer; diabetes, stroke, peripheral neuropathy, brain trauma, pancreatitis, and skin disorders, including, but not limited to, wounds, including ulcers of the skin, accelerated aging, and inflammatory diseases of the skin, such as psoriasis, acne and rosacea; bone diseases including, but not limited to, osteoporosis. The compounds can be administered in oral dosage forms as tablets, capsules, pills, powders, granules, elixirs, tinctures, suspensions, syrups, and emulsions. The compounds may also be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form, or introduced directly, e.g. by topical administration, injection or other methods, to the afflicted area, such as a wound, including ulcers of the skin, all using dosage forms well known to those of ordinary skill in the pharmaceutical arts.

A compound of the present invention may be administered to a subject topically in a carrier. In some embodiments, a compound of the invention is administered in a formulation which also comprises petrolatum jelly. It will be understood that compositions which comprise a compound of the invention
and a carrier may be formulated by a variety of methods. For example, a finely-ground sample (0.1g) of a compound of the invention may be i) added to petrolatum jelly (9g) and ii) the mixture may be homogenized for 15 minutes at 25°C then iii) allowed to settle for 5 minutes. Steps ii) and iii) may be repeated multiple times until a homogeneous product having a cream-like consistency is obtained. Such a composition may then be used in topical application to wounds.

The improved compounds and compositions of the subject invention are useful for the treatment of skin disorders, including, but not limited to, wounds, including ulcers of the skin, and inflammatory diseases of the skin.

Specific examples of pharmaceutical acceptable carriers and excipients that may be used to formulate oral dosage forms of the present invention are described in the following references: 7 Modern Pharmaceutics, Chapters 9 and 10 (Banker & Rhodes, Editors, 1979); Pharmaceutical Dosage Forms: Tablets (Lieberman et al., 1981); Ansel, Introduction to Pharmaceutical Dosage Forms 2nd Edition (1976); Remington's Pharmaceutical Sciences, 17th ed. (Mack Publishing Company, Easton, Pa., 1985); Advances in Pharmaceutical Sciences (David Ganderton, Trevor Jones, Eds., 1992); Advances in Pharmaceutical Sciences Vol 7. (David Ganderton, Trevor Jones, James McGinity, Eds., 1995); Aqueous Polymeric Coatings for Pharmaceutical Dosage Forms (Drugs and the Pharmaceutical Sciences, Series 36 (James McGinity, Ed., 1989); Pharmaceutical Particulate Carriers: Therapeutic Applications: Drugs and the Pharmaceutical Sciences, Vol 61 (Alain Rolland, Ed., 1993); Drug Delivery to the Gastrointestinal Tract (Ellis Horwood Books in the Biological Sciences. Series in Pharmaceutical Technology; J. G. Hardy, S. S. Davis, Clive G. Wilson, Eds.); Modern Pharmaceutics Drugs and the Pharmaceutical Sciences, Vol 40 (Gilbert S. Banker,
The Compounds such as Compound 2 (a chemically-modified curcumin) may be relatively insoluble in water. Such compounds may be solubilized in a safe organic solubilizing agent, such as meglumine (i.e., N-methyl glucamine which is a deoxy(methylamino) glucitol, a derivative of glucose) to solubilize such compounds to improve their efficacy systemically, e.g. by swallowing a teaspoon of a composition comprising a compound of the invention and meglumine qd or even by I.V. injection. Compositions comprising a compound of the invention and meglumine may be used to formulate a therapeutic mouthrinse which is non-toxic, non-alcohol based (because mouthrinses, e.g. Listerine, which contain contain alcohol have been reported to increase the risk of oral cancer), non cariogenic (no sugar content), pleasant tasting (contains an amino-glucitiol sorbitol derivative), and able to suppress MMPs and pro-inflammatory cytokines in the mouth. In some embodiments, the amount of a compound of the invention that is in a mouthrinse is effective to suppress an MMP or pro-inflammatory cytokine in the saliva, an orifice of the periodontal lesion/pocket, or the gingiva. In some embodiments, the amount of a compound of the invention that is in a mouthrinse is effective to treat one or more oral conditions which may include but are not limited to root caries (particularly in elderly subjects), periodontal disease, mucositis, pemphigoid, lichen planus, and other oral blistering and ulcerative diseases (e.g., aphthous ulcers, and ulcers caused by herpes simplex), and impaired wound healing such as in diabetic subjects.
periodontal disease, such as periodontitis, angiogenesis, emphysema, acute respiratory distress syndrome, multiple sclerosis, cardiovascular disease, such as atherosclerosis, myocardial infarction, arterial restenosis after angioplasty and aneurysm development; inflammatory disorders, including neuroinflammation and inflammatory bowel disease; many types of cancer, including breast cancer, skin cancer, including, but not limited to, melanoma, and prostate cancer; diabetes, stroke, peripheral neuropathy, brain trauma, and pancreatitis; bone diseases including, but not limited to, osteoporosis.

Variations on the following general synthetic methods will be readily apparent to those skilled in the art and are deemed to be within the scope of the present invention (47).

Scheme 1. Synthesis of curcumin analogues.

The synthesis of the curcumin analogues of the present invention can be carried out according to general scheme 1. The R groups designate any number of generic substituents.

The starting material is provided by 2,4-pentanedione, which is substituted at the 3-carbon (see compound a). The desired substituted 2,4-pentanedione may be purchased from commercial sources or it may be synthesized using conventional functional group transformations well-known in the chemical arts, for
example, those set forth in Organic Synthesis, Michael B. Smith, (McGraw-Hill) Second ed. (2001) and March's Advanced Organic Chemistry: Reactions, Mechanisms, and Structure, Michael B. Smith and Jerry March, (Wiley) Sixth ed. (2007), and specifically by Bingham and Tyman (45) and in the case of 3-aryl-aminocarbonyl compounds by Dieckman, Hoppe and Stein (46), the contents of which are hereby incorporated by reference. 2,4-pentanedione a is reacted with boron trioxide to form boron enolate complex b.

Boron enolate complex b is a complex formed by coordination of the enolate of compound a with boron. It is understood by those having ordinary skill in the art that the number of compound a enolates that may coordinate to boron as well as the coordination mode, i.e. monodentate versus bidentate, are variable so long as reaction, such as Knoevenagel condensation, at the C-3 carbon of the 2,4-pentanedione is suppressed.

Boron enolate complex b is then exposed to a benzaldehyde compound in the presence of a base catalyst and a water scavenger to form curcumin analogue c via aldol condensation. The ordinarily skilled artisan will appreciate that the benzaldehyde may possess various substituents on the phenyl ring so long as reactivity at the aldehyde position is not hindered. Substituted benzaldehyde compounds may be purchased from commercial sources or readily synthesized using aryl substitution chemistry that is well-known in the art. Suitable base catalysts for the aldol step include, but are not limited to, secondary amines, such as n-butylamine and n-butylamine acetate, and tertiary amines. Suitable water scavengers include, but are not limited to, alkyl borates, such as trimethyl borate, alkyl phosphates, and mixtures thereof. Other suitable reaction parameters have also been described by Krackov and Bellis in U.S. Patent 5,679,864, the content of which is hereby incorporated by reference. Additional methods of
All combinations of the various elements described herein are within the scope of the invention.

Herein, where chemical substituents are disclosed in the alternative, it is intended that each such substituent can be used or combined with one or more other substituents disclosed in the alternative.

This invention will be better understood by reference to the Experimental Details which follow, but those skilled in the art will readily appreciate that the specific experiments detailed are only illustrative of the invention as described more fully in the claims which follow thereafter.
**Experimental Details**

**Example 1. Synthesis of chemically modified curcumin analogues**

The synthetic methods for the preparation of Compound 4 and several homologues of curcumin, confirmation of their structure, and a summary of the in vitro screening against a series of MMPs is described hereinbelow in Table 1.

**Methods:**

All reagents and solvents employed in the experimental work were of reagent grade and were used as such unless otherwise specified. Melting points were taken in a Thomas-Hoover open-capillary melting-point apparatus and are uncorrected. $^1$H NMR spectra were recorded on a Varian Gemini 300 spectrometer. Samples prepared for NMR analysis were dissolved in CDC13 or DMSO-d6. Chemical shifts are reported in parts per million (ppm) relative to TMS. Mass spectra were recorded on either a Thermo Electron DSQ GC/MS equipped with a solid probe inlet and EI ionization or an Agilent 1100LC (API-ES)/MSD-VL (m/z=50-1500) using electrospray ionization. Thin-layer chromatography (TLC) was performed on silica gel sheets (Tiedel-delfaeri, Sleeze, Germany). After appropriate purification all new products showed a single spot on TLC analysis in the following solvent system: 25% EtOAc in hexanes. Components were visualized by UV light (λ=254 nm). Flash column chromatographic separations were carried out on 60A ° (230-400 mesh) silica gel (TSI Chemical Co., Cambridge, MA). All experiments dealing with moisture or air-sensitive compounds were conducted under dry nitrogen.
Chemicals | Grade | Supplier
--- | --- | ---
2,4-Pentanedione (Acetoacetone) | 99% | Alfa Aesar
Magnesium chloride | Anhydrous | Sigma-Aldrich
Pyridine | 99.0% min | Alfa Aesar
Methyl Chloroformate | 97% | Acros Organics
Phenyl Isocyanate | 98+% | Sigma-Aldrich
Boron Oxide | 99.98%, metals basis | Alfa Aesar
Vanillin | 99% | Sigma-Aldrich
4-Hydroxybenzaldehyde | 96% | Sigma-Aldrich
Trimethyl Borate | 99% | Alfa Aesar

Methylene chloride | 99.9% | Fisher Scientific
Ethyl acetate | 99.9% | Fisher Scientific
Sodium Sulfate | Anhydrous | EMD

Reagents:

General Procedures for the Synthesis of Curcumin Analogues:

5 Step A. 3-Acylated 2,4-Pentanediones
Acetylacetone (1.00g, 10mmol) was added to a suspension of magnesium chloride (1.35g, 1.2eq) in 20mL methylene chloride, followed by pyridine (2.13mL, 2.5eq), and the mixture was stirred at 0°C for 1h, then an alkyl chloroformate or a phenyl isocyanate (1.0eq) was added dropwise to the mixture at 0°C. The reaction mixture was allowed to warm up to room temperature during 8 hours, and then was poured into 3N aqueous HCl solution (10mL) and extracted with methylene chloride (20mL). The organic layer was washed with brine (20mL), dried over sodium sulfate and the solvent was removed under vacuo. The product was then distilled or recrystallized from an appropriate solvent depending on the physical state at RT.

1. 3-(Methoxycarbonyl)acetylacetone: colorless liquid, 68.1% yield. Distilled at 45°C, 0.5mmHg. ESI (-ve) MS m/z 157.1

\[ [\text{M-H}]^-. \]\n
\[^1\text{H} \text{NMR} \ (\text{DMSO-d}_6, \ 300 \ \text{MHz}) : \delta \ 2.999 \ (s, \ 6H), \ 3.730 \ (s, \ 3H), \ 17.760 \ (s, \ 1H).\]

2. 3-(Ethoxycarbonyl)acetylacetone: colorless liquid, 60.5% yield. Distilled at 60°C, 1.4mmHg. ESI (-ve) MS m/z 171.2

\[ [\text{M-H}]^-. \]\n
\[^1\text{H} \text{NMR} \ (\text{DMSO-d}_6, \ 300 \ \text{MHz}) : \delta \ 1.253 \ (t, \ 3H), \ 2.303 \ (s, \ 6H), \ 4.164-4.236 \ (m, \ 2H), \ 17.747 (s, \ 1H).\]
3. 3-(Phenylaminocarbonyl)acetylacetone: white solid, 72.0% yield, mp 118-119°C. ESI (-ve) MS m/z 218.1 [M-H]. \( ^1H \) NMR (DMSO-\(d_6 \), 300 MHz): \( \delta \ 2.154 (s, \ 6H) \), \( 7.084 (t, \ 1H) \), \( 7.324 (t, \ 2H) \), \( 7.640 (d, \ J=8.1Hz, \ 2H) \), \( 10.355 (s, \ 1H) \), \( 16.463 (s, \ 1H) \).

Step B. Curcumin Analogues

Acetylacetone or a 3-substituted acetylacetone (10mmol) and boron oxide (0.49 g, 7 mmol, 0.7 eq) were placed in a 50 mL flask and heated to 120°C for 5 min to form a pale-yellow suspension. The appropriate aldehyde (20 mmol, 2.0 eq) and trimethyl borate (4.16 g, 40 mmol, 4.0 eq) were dissolved in ethyl acetate (10 mL) and gradually added to reaction mixture. Thereafter, with stirring, 0.05 mL of butylamine and 0.2 mL of butylammonium acetate in dimethylf ormamide solution (0.136 g/mL) were added. After 1 hour, a red-colored precipitate started to form. The whole reaction mixture was stirred at room temperature for 48 hours. The precipitate was filtered and dried, then dissolved in methanol (50 mL) and boiled for 30 min at 60°C. Methanol was removed by rotary evaporation and the crystalline crude product was purified by recrystallization from dichloromethane (20 mL) and methanol (20 mL).

1. Curcumin (Compound 1): 1,7-Bis (4-hydroxy-3-methoxyphenyl) hepta-1E,6E-dien-3,5-dione derived from vanillin and acetylacetone: orange crystals, 77.0% yield, mp 175-176 °C. ESI (-ve) MS m/z 367.2 [M-H]. \( ^1H \) NMR (DMSO-\(d_6 \), 300 MHz): \( \delta \ 3.335 (s, \ 6H) \), \( 5.556 (s, \ 1H) \), \( 6.256 (d, \ J=15.6Hz, \ 2H) \), \( 6.320 (d, \ J=7.8Hz, \ 2H) \), \( 6.647 (d, \ J=8.4Hz, \ 1H) \), \( 6.653 (d, \ J=8.1Hz, \ 1H) \), \( 6.822 (d, \ J=2.1Hz, \ 2H) \), \( 7.044 (d, \ J=15.9Hz, \ 2H) \), \( 9.162 (s, \ 2H) \), \( 15.889 (s, \ 1H) \).

2. 4-Methoxycarbonylcurcumin (Compound 2): 1,7-Bis (4-hydroxy-3-methoxyphenyl)-4-methoxycarbonylhepta-1E, 6E-dien-3,5-dione derived from vanillin and 3-methoxycarbonyl-2,4-pentandione: yellow crystals, 72.0% yield, mp 175-176 °C. ESI (-ve) MS m/z 425.2 [M-H]. \( ^1H \) NMR (DMSO-\(d_6 \), 300 MHz): \( \delta \ 3.819 (s, \ 3H) \), \( 3.903 (s, \ 6H) \), \( 6.834 (d, \ J=7.2Hz, \ 2H) \),
7.019 (d, J = 15.6, 2H), 7.189 (d, J=8.1Hz, 1H), 7.195 (d, J=8.4Hz, 1H), 7.272 (d, J=1.5 Hz, 2H), 7.722 (d, J=15.6 Hz, 2H), 9.840 (s, 2H), 18.294 (s, 1H);

3. 4-Ethoxycarbonylcurcumin. (Compound 5): 1,7-Bis (4-hydroxyphenyl)-4-methoxycarbonylhepta-1E, 6E-dien-3, 5-dione derived from 4-hydroxybenzaldehyde and 3-methoxycarbonyl-2,4-pentandione: yellow crystals, 49.2% yield, mp 214-216 °C. ESI (-ve) MS m/z 365.0 [M-H]⁻. ¹H NMR (DMSO-d₆, 300 MHz): δ 3.900 (s, 3H), 6.831 (d, J=8.4Hz, 4H), 6.986 (d, J=15.6 Hz, 2H), 7.576 (d, J=8.7 Hz, 4H), 7.729 (d, J=15.6 Hz, 2H), 10.172 (s, 2H), 18.267 (s, 1H);

4. (Compound 3): 1,7-Bis (4-hydroxy-3-methoxyphenyl)-4-2V-phenylaminocarbonylhepta-1E, 6E-dien-3, 5-dione derived from vanillin and 3-phenylaminocarbonyl-2,4-pentandione: orange crystals, 46.6% yield, mp 193-194 °C. ESI (-ve) MS m/z 486.0 [M-H]⁻. ¹H NMR (DMSO-d₆, 300 MHz): δ 3.701 (s, 6H), 6.730 (d, J=15.6 Hz), 6.787 (d, J=8.1 Hz), 7.082-7.152 (m, 5H), 7.371 (t, 2H), 7.685 (d, J=3.9 Hz, 2H), 7.723 (d, J=3.9 Hz, 2H), 9.788 (s, 2H), 10.586 (s, 1H), 17.556 (s, 1H);

5. Compound 4: 1,7-Bis (4-hydroxyphenyl)-4-2V-phenylaminocarbonylhepta-1E, 6E-dien-3, 5-dione derived from 4-hydroxybenzaldehyde and 3-phenylaminocarbonyl-2,4-pentandione: yellow crystals, 46.2% yield, mp 220-221 °C. ESI (-ve) MS m/z 426.0 [M-H]⁻. ¹H NMR (DMSO-d₆, 300 MHz): δ 6.681 (d, J=15.6 Hz, 4H), 6.787 (d, J=8.7 Hz, 4H), 7.133 (t, 1H), 7.375 (t, 2H), 7.453 (d, J=9.0 Hz, 2H), 7.695 (d, J=6.3Hz, 2H), 7.723 (d, J=9.0 Hz, 2H), 10.144 (s, 2H), 10.605 (s, 1H), 17.559 (s, 1H);

Large Scale Procedure for Synthesis of Compound 4

[Diagram of synthesis process]

(COMPound 4)
**Step A**

Acetylacetone (140 g, 1.40 mol, 1.0 eq) was added to a suspension of anhydrous magnesium chloride (153 g, 1.61 mol, 1.15 eq) in dichloromethane (2.5 L) followed by pyridine (188 g, 2.38 mol, 1.7 eq) while stirring at -5°C. After 45 minutes, phenyl isocyanate (142 mL, 1.4 mol, 1.0 eq) was added to the reaction mixture and stirring continued for 2 hours at -5°C. The reaction was quenched with 5% citric acid (1 L) and extracted with dichloromethane (3 x 500 mL). The organic layer was concentrated and triturated/recrystallized from 5% acetone in hexanes to obtain the desired product (261 g, 86%).

$^1$H NMR CDCl$_3$: 18.564, 16.422 (s, 1H, enolate OH), 12.024 (s, 1H, NH), 7.55 (m, 2H), 7.38 (m, 2H), 7.17 (m, 1H), 2.52 (s, 6H). mp 72-73°C.

**Step B**

N-Phenylaminocarbonyl-pentane-2,4-dione (35.14 g, 160.5 mmol, 1.0 eq) and finely powdered boron trioxide (6.74 g, 96.3 mmol, .60 eq) were finely ground and mixed together then placed into a 1 L flask. This was heated to 145°C and stirred vigorously for 1 hr to form the boron complex. The temperature was lowered to 65-70°C when a mixture of 4-hydroxybenzaldehyde (43.1 g, 353 mmol, 2.2 eq) and trimethyl borate (69.9, 641.8 mmol, 4.0 eq) in dry ethyl acetate (450 mL) which was previously stirred for 1 hour at room temperature was added slowly. While stirring and after addition at this temperature, a catalyst of butylamine (0.75 mL) and butylammonium acetate (3.0 mL) in dimethylformamide solution (0.136 g/mL) were added. The reaction mixture was stirred for 2 days at 65-70°C. Afterwards, the reaction was cooled to room temperature and the precipitate was filtered and washed with diethyl ether. The solid was dissolved in 1.5:1 mixture of 1,2-dichloroethane/methanol (300 mL/200 mL) and heated for 30 minutes and then the methanol was distilled. The process was repeated twice and then the solution was concentrated to remove solvent and the product (Compound 4) was recrystallized.
from 1:1 dichloromethane/ methanol to obtain the pure material. (45%, 30.8 g)

**Compound 4**

\[ ^1H \text{NMR DMSO-}d_6: 17.564 (s, 1H, enolate OH), 10.608 (s, 1H, NH), 10.151 (s, 2H, OH), 7.707 (m, 4H), 7.46 (d, 4H), 7.37 (t, 2H), 7.133 (t, 1H), 6.801 (d, 4H), 6.7 (d, 2H) \]

mp 220-221 °C.

**Example 2. Compound 4 is Highly Effective at Inhibiting MMPs and is Well Tolerated**

Curcumin (Compound 1) has a long history as an herbal medication and has been recommended at one time or another for the treatment of almost every human ailment from simple wound-healing to cancer (48). However, its lack of solubility in physiological fluid has all but precluded its use as a medicinal substance. There is an identity of the simple 1, 3-diketo array in curcumin with that of the useful drug substance doxycycline (the basis of the drug substances Periostat and Oracea) (4). This is the active-site in doxycycline, at positions 11, 11a, and 12, that can chelate zinc and calcium in MMP enzymes. The compounds of the invention are more effective at inhibiting MMP enzymes than curcumin. Additionally, the compounds of the invention, and in particular, homologues of Compound 4, are well tolerated in animals, and in human subjects. As disclosed herein, curcumin-like substances, containing an additional electron-withdrawing carbonyl-based residue at the 4-position, have enhanced zinc-binding properties. Additionally, Compound 4 and its homologues have an enhanced ability to bind to the zinc/calcium-based catalytic site in MMP enzymes compared to other curcumin homologues which are notCompound 4 homologues.
Initially compounds with an ester function at the 4-position represented by structure 2 were studied. Although these compounds showed useful anti-MMP activity, they were not judged to be active enough or more importantly, soluble enough to be effective medications. With this lead however, Compound 3 was synthesized and found to be highly active, but to have some toxicity at elevated levels. The lower homologue 4 (Compound 4) has proved to be the best lead compound. Compound 4 was highly active against a battery of MMPs (see, e.g. Table 1), yet showed virtually no toxic effects at 30mg/kg body weight in diabetic rats. Its spectrum of activity was wide-ranging and it may be a very useful drug substance.
Table 1. In Vitro potency of curcumin and selected chemically-modified curcumins (CMCs) as inhibitors of nine different human MMPs. In this experiment, a fluorimetric assay of MMP activity was used.

**1, 10-phenanthroline, a Zinc cation binding agent traditionally used to quench in vitro MMP activity reactions, was used as the positive control for the experiment.

IC_{50} were measured using a synthetic fluorescent peptide substrate (Mca-Lys-Pro-Leu-Gly-Leu-Dpa-Ala-Arg-NH\_2), an excellent substrate for MMPs with cleavage site between Gly and Leu.

**Example 3. A Novel Chemically Modified Curcumin (Compound 4) Improves Wound-Healing Impaired by Diabetes**

**Methods**

*Diabetes Induction and Wounding*

Diabetes was induced in 12 adult male rats (300-325 g. body weight) by streptozotocin (STZ) injection (70 mg/kg) into the tail vein as previously described (34, 37, 49), and all 15 rats (including three non-diabetic control rats not treated with streptozotocin) were given unlimited access to food and water; all STZ-injected rats exhibited pathologically elevated glucose levels in their urine. Three weeks after inducing diabetes, the back skin of all the rats was shaved and a series of 6 standard wounds per rat, each 6mm in diameter, was made using a surgical trephine.
Formulation of Composition for Topical Treatment

A finely-ground sample (0.1g) of Compound 4 [4-(phenylaminocarbonyl)-1, 7-bis (4-hydroxyphenyl) heptalene, 6e-diene-3, 5-dione] was added to petrolatum jelly (9g) and the mixture was homogenized for 15 minutes at 25°C, then allowed to settle for 5 minutes. This procedure was repeated nine times, producing a homogeneous product having a cream-like consistency. This was then used in topical application to wounds.

Administration

The following five experimental groups (n=3 rats per group) were established: Non-diabetic control rats (NDC) treated by daily application of white petrolatum jelly ("vehicle") for 7 days, diabetic rats (D group) treated daily with vehicle alone; diabetics treated by daily topical application of either a 1% (D+1%) or a 3% (D+3%) suspension of Compound 4 in the vehicle; and diabetics treated systemically by daily oral intubation of a 1ml suspension of Compound 4 (in carboxymethylcellulose) at a dose of 30 mg/kg over the 7-day treatment protocol (D+30mg/kg). At the end of this time period, the circular wounds were clinically assessed by measuring diameter of the wound in millimeters, blood samples were collected, the rats were sacrificed, and skin samples collected for histological/histochemical, and biochemical assessment as described below.

1) On day 7 after inducing wound healing, the animals were anesthetized and blood samples collected for blood glucose (one Touch Ultra Glucometer; Johnson & Johnson, New Brunswick, N.J.) and Hemoglobin Ale (Ale Now +; Bayer Health Care, Sunnyvale, CA) measurements.

2) Photographs were taken for clinical observations to assess wound closure. The % reduction of the wound surface
was calculated by measuring the diameter (in millimeters) of each wound before and after the treatment protocol.

3) Wound tissues on day 7 were excised from 3 sites per rat and pooled for biochemical analysis. Each pool of tissue was homogenized, extracted at 4°C with 5M urea in 50 mM Tris-HCl buffer (pH7.8) containing 0.2M NaCl and 5mM CaCl2 overnight, then centrifuged for 1 hour at 11,000 x g, as described by us previously (50,51). The supernates were then dialyzed against the Tris-HCl, NaCl, CaCl2 buffer, and the proteinases partially purified by ammonium sulfate precipitation and examined for levels of MMP-2 (72kD gelatinse) and MMP-9 (92kD gelatinase) by gelatin zymography using denatured type I collagen (gelatin) as the substrate (6).

4) The remaining wounds were assessed histologically & histochemically by Dr. Steve McClain (McClain Labs, Smithtown, NY) as follows: Biopsies of each wound site were taken and included both the wound tissue and surrounding non-wounded tissue. Each biopsy was fixed in 10% neutral buffered formalin for 24 hours, then in 50% ethanol before paraffin sectioning. Each section was stained with H & E and Masson's Trichrome.

Results
As expected, all four groups of diabetic rats (including vehicle only-treated diabetic animals plus those diabetics treated either topically or systemically with Compound 4) showed dramatically elevated blood glucose & HbA1c levels compared to the non-diabetic control (NDC) rats (Figure 2); note that all blood samples were collected from non-fasted rats. Moreover, none of the topical or systemic treatments with Compound 4 demonstrated any effect on the severity of hyperglycemia in these diabetics.

However, in spite of this lack of effect on severity of diabetes, all three treatments (two topical and one systemic)
dramatically enhanced and accelerated wound healing in vivo. The clinical benefits of these studies are described hereinbelow.

**Example 4. Clinical assessment and measurements.**

A comparison of the data shown in Figure 1, which shows a standard series of 6 wounds, 6mm in diameter, on the backskin of a control non-diabetic or diabetic rat at the time of circular biopsy on day "0". Figure 3 shows the clinical appearance of diabetic wounds after 7 days of treatment with Compound 4, indicating that the induction of diabetes (D) appeared to delay/retard wound healing compared to the non-diabetic control rats (NDC). Interestingly, all three Chemically Modified Curcumin (CMC)-treated groups of diabetic rats appeared to show improved wound healing compared to the vehicle (placebo) treated diabetics. Furthermore, the CMC-treated diabetic rats, particularly those treated topically with 1% Compound 4 showed better wound healing than the non-diabetic control rats (Figure 3). Quantitative measurements of the diameter of each wound (6 wounds/rat) before and after the 7-day treatment with Compound 4 revealed that the healing exhibited by vehicle-treated diabetic rats (D group) was suppressed by about 80% compared to the healing in the non-diabetic control rats (NDC) (Figure 4). Based on the data in Figure 4, which shows the percent reduction of the diameter of the skin wounds over the 7-day protocol for each group of rats, the most effective treatment was the 1% topical Compound 4 as evidenced by an 35% reduction in wound diameter when compared to the 30% reduction in wound diameter for the non-diabetic control group; followed by systemic treatment with Compound 4, which returned wound healing characteristics to that seen in the non-diabetic control group; and the 3% topical application of Compound 4 that exhibited a significant increase in wound healing over that of the untreated diabetic control (D) but failed to equal the wound healing characteristics of the non-diabetic control samples.
Example 5. Biochemical assessment

On day 7, after sacrificing the rats, 3 of the 6 wounds per rat were dissected, pooled, and extracted in standard Tris/HCl (pH 7.8), NaCl, CaCl2 buffer. The wound extracts for each rat were then partially purified by ammonium sulfate precipitation, and aliquots were examined for MMP-2 (72kDa gelatinase) and MMP-9 (92kDa gelatinase) by gelatin zymography using denatured type I collagen or gelatin as substrate as previously described (4-6). Representative data are shown in Figure 5. Briefly, extracts of skin wounds from each of the 5 groups of rats revealed the presence of active forms of MMP-2 (< 72kDa, compared to 72kDa standards). Interestingly, the most striking difference among the Compound 4 treated rats was the reduction of 92kDa gelatinase or pro-MMP-9, as well as reductions in the lower molecular weight activated MMP-9. Clearly, Figure 5 indicates that inducing diabetes (Dland D2) increased the level of pro-MMP-9 (and activated MMP-9), a connective tissue-destructive proteinase, when compared to the level seen in the non-diabetic controls (N), and all three treatments with Compound 4 attenuated this diabetic effect. Again, ranking the efficacy of the three treatment regimens, topical 1% Compound 4 was slightly more effective than systemic (oral gavage), which was more effective than topical treatment with 3% Compound 4. The same ranking was seen when the zymograms were scanned densitometrically (Figure 6). Taken together, and without wishing to be bound by any scientific theory, these findings imply that treatment with 1% Compound 4 is attenuating MMP-9, which is associated with inflammatory cells, better than either 3% topical treatment of Compound 4 or systemic treatment of Compound 4, but treatment with 1% Compound 4 does not suppress, and perhaps even enhances, MMP-2 which is associated with fibroblasts and connective tissue regeneration and remodeling. Thus, treatment with 1% Compound 4 may be accelerating both the resolution of the inflammatory phase of wound healing, and the regeneration of connective tissue (Figure 11).
**Example 6. Histological assessment and histomorphometric measurements**

A histological analysis of skin tissue in control and diabetic wound rat models yielded results consistent with the clinical and biochemical data discussed hereinabove. Induction of diabetes (D) suppressed healing of both the epithelium and the underlying connective tissue compared to the normal, non-diabetic control rats (NDC). Furthermore, topical treatment with 1% Compound 4 and systemic Compound 4 were more effective than treatment with topical 3% Compound 4 (Figures 7-10). Of interest, the histologic measurement of wound diameter in millimeters, shown in Figure 10, taken seven days after creating the wounds, exhibited a very similar pattern of change when compared to the clinical measurement of wound healing presented in Figure 4, and to a lesser extent Figures 1-10. These data indicate that Compound 4, when applied topically, and to a lesser extent systemically, is a very potent medication to promote wound healing associated with diabetes.

Compound 4 enhances wound healing in medically-healthy animals and in normal humans as well, and is well tolerated following topical (e.g., 1% Compound 4) or systemic administration.

**Example 7. Compound 4 Attenuates The Prolonged Inflammatory Response During Diabetes**

Materials & Methods (for peritoneal macrophages)

Adult male Sprague-Dawley rats (body weight 300 - 350g) were injected through the tail vein with either 0.9% saline (non-diabetic control) or with the same solution containing streptozotocin (70mg/kg body weight) to induce diabetes. Non-diabetic rats served as normal controls. The diabetic rats were distributed into 2 experimental groups (3 rats per group). Urine glucose levels were measured weekly with Tes-Tape (Eli Lilly Inc.). One group of rats was treated by oral gavage of Compound 4 (30mg/kg body weight) daily for 21 days; the Compound 4 was suspended in 2% carboxymethyl cellulose and
The normal & diabetic vehicle-treated (control) groups were oral gavaged with vehicle alone daily.

Rat peritoneal macrophages were harvested with 10ml RPMI 4 days after intraperitoneal injection of 10ml of thioglycolate (3% wt/vol). Macrophages were then purified by density gradient centrifugation (lymphoprep) and cell numbers were counted in a hemocytometer. The cells were then tested in a cell migration assay (Cell BioLabs, Inc, CytoSelect 96-well with 5um fluorometric format) using conditioned medium containing inflammatory mediators including MCP-1 from LPS-macrophages as a chemoattractant. The macrophages from different groups of rats were also plated onto 24 well-plates with and without p.g.LPS challenge for 24 hours in 37°C, 5% CO₂. Conditioned medium were harvested for measurement of cytokine levels (IL-6 and IL-1β) & MMPs (gelatin zymography).

Results
Oral administration of Compound 4 decreased pathologically excessive macrophage accumulation in peritoneal exudates of diabetic rats but did not affect the severity of hyperglycemia in the diabetics (Figure 12). Additionally, oral administration of Compound 4 decreased excessive inflammatory cytokine (IL-6 IL-1β) production (Figures 13 and 14), and MMP-9 levels in the peritoneal macrophages of diabetic rats (Figure 15). Macrophages in normal rats showed normal chemotactic activity. In diabetic rats, the chemotactic activity of macrophages was suppressed. Oral administration of Compound 4 counteracted the suppression of macrophage chemotactic activity in diabetic rats (Figure 16).

Example 8. Compound 4 Homologues are well Tolerated and Effective
The experiments described hereinabove in Examples 2-7 are also performed using Compound 4 homologues. Compound 4 homologues are defined hereinabove at the beginning of the Detailed Description of the Invention. The Compound 4 homologues are
highly active against MMPs 1, 2, 3, 7, 8, 9, 12, 13 and 14, yet show virtually insignificant toxic effects in diabetic rats.

5 Skin Wound Healing
Both oral and topical administration of a Compound 4 homologue enhances wound healing in normal and diabetic rats.

Inflammatory Response
Compound 4 homologues attenuate the prolonged inflammatory response in diabetic rats. Oral administration of a Compound 4 homologue decreases pathologically excessive macrophage accumulation in peritoneal exudates of diabetic rats but does not affect the severity of hyperglycemia in the diabetics.

Additionally, oral administration of a Compound 4 homologue decreases pathologically excessive IL-6 IL-1β production, and MMP-9 levels in the peritoneal macrophages of diabetic rats. Oral administration of a Compound 4 homologue also counteracted the suppression of macrophage chemotactic activity in diabetic rats.

Example 9. Compound 4 and Compound 4 Homologues are Effective to Treat Contact Dermatitis and Insect Bites
The leaves of a poison ivy plant are applied to equally sized areas of the left and right arms of a human subject. After contact dermatitis presents with itching on each arm as a result of contact with the poison ivy, Compound 4 or a Compound 4 homologue is topically administered to the contact dermatitis on one arm, and Compound 2 is applied to the contact dermatitis on the other arm. The contact dermatitis that is treated with Compound 4 or a Compound 4 homologue stops itching sooner and heals quicker than the contact dermatitis that is treated with Compound 2.

Mosquitoes are presented with and allowed to bite the left and right arms of a human subject. After the bites begin to itch, Compound 4 or a Compound 4 homologue is topically administered
Example 10. Effect of Compound 4 on Newly-Synthesized Collagen in Wounds of Diabetic Rats

Biochemical measurements were made on wound tissue 6 days after creating the standardized 6mm diameter wounds in the various groups of rats including: (1) non-diabetic controls (NDC); (2) Diabetic (DM) rats treated topically with 0.25% curcumin; (3) DM treated with 1% curcumin; (4) DM treated with 0.25% Compound 4, and (5) DM rats treated with 1% Compound 4.

The wound tissues from these five different groups were then hydrolyzed (after extraction; see below) to degrade the collagen to individual amino acids, and the amino acid unique to collagen, hydroxyproline, was measured by a commercial colorimetric assay. Prior to hydrolysis, the wound tissues were extracted (at 4°C to maintain the triple-helical conformation of the collagen molecules) to obtain first the salt-soluble fraction, then the acid-soluble fraction, leaving the insoluble fraction. Based on the collagen literature, the salt-soluble fraction (SSF) represents the newly-synthesized uncrosslinked collagen molecules; the acid-soluble fraction (ASF) is an older fraction which begins to exhibit Schiff-base intramolecular crosslinks; and the insoluble fraction (IF) is the oldest fraction characterized by greater numbers of intramolecular as well as intermolecular covalent crosslinks.

Results

As shown in Table 2, inducing diabetes decreased the proportion (%) of the collagen in the wound tissue, in the "SSF", compared to the non-diabetic control rats. This indicated that diabetes decreases the relative amount of newly-synthesized collagen in the wound tissue (consistent with previous publications) compared to the levels of this...
poorly-crosslinked collagen in the wounds of the NDC/normal rats. Moreover, all of the topical treatments in this experiment, including both curcumin and Compound 4, dramatically increased the proportion of salt-soluble newly-synthesized collagen in the wound tissue of the diabetic rats. However, consistent with previous data on these two compounds, the 0.25% and 1% preparations of Compound 4 were more effective, than the same concentrations of curcumin, in their ability to increase the levels of newly-synthesized collagen in the tissue of this animal model of impaired wound healing.

Discussion

Skin Wounds

In vitro cell and tissue culture data, and in vivo data collected after administering Compound 4 systemically once/day by oral intubation was found to exhibit greater efficacy as a matrix metalloproteinase-and cytokine-modulator than other related zinc-binding inhibitor compounds (Chemically Modified Curcumins and BAMs/bis-aroyl methanes). See, e.g. Table 1. Furthermore, Compound 4 was well tolerated and not toxic compared to related compounds such as Compound 3. The objective of the studies exemplified hereinabove was to administer the "lead" compound, Compound 4, topically and systemically to a rat model of type I diabetes to determine whether these treatments improved impaired wound healing in skin, a well-known complication of diabetes and other inflammatory diseases.

Of significant interest is that the therapeutic benefit of the ability of topical Compound 4 to increase the levels of newly-synthesized collagen in the wounded skin occurred even in diabetic rats which showed extremely high blood glucose levels (i.e., very severe diabetes) throughout the experimental protocol (see, e.g. Table 2).

Conclusions and Proposed Mechanisms

The clinical, biochemical and histologic data generated in the examples all indicate that Compound 4, particularly when topically applied as a 1% suspension, promotes wound healing, including in diseases such as poorly-controlled diabetes.

Without wishing to be bound by any scientific theory, Compound 4 appears to produce this beneficial effect by "resolving" (rather than inhibiting) the inflammatory phase of wound healing which could contribute to an accelerated connective tissue (collagen) -restoration phase. The former may reflect the ability of the compound to "normalize" the suppressed function of macrophages and other inflammatory cells resulting from the hyperglycemic diabetic state. Moreover, the latter
may reflect an attenuation of the excessive MMP activity seen in the wounds and produced by macrophages from the peritoneal exudates in the diabetic rats (excessive MMP activity would be expected to preferentially degrade the newly synthesized, poorly cross-linked collagen, rather than the older more polymerized collagen fibrils which would inhibit the repair of the connective tissues of the dermis). Again, without wishing to be bound by any scientific theory, a proposed model illustrates these events in Figure 11.

**Oral Wounds**

The present invention provides novel compounds which can inhibit tissue destructive enzymes (proteinases) and inflammatory mediators (cytokines) involved in inflammatory and other conditions in the oral cavity and skin. However, some of these zinc-binding compounds may be relatively insoluble. The present invention also provides a method to solubilize these compounds with a non-toxic organic solvent, such as N-methyl glucamine, which is related to a non-sugar sweetener (glucitol).

A compound of the invention and N-methyl glucamine can be formulated into a pleasant-tasting non-cariogenic mouthrinse which does not require alcohol (alcohol can increase susceptibility to oral cancer) and which could be an effective treatment for a variety of oral conditions including (but not limited to) periodontitis, root caries, mucositis, and blistering lesions. Other formulations could be useful as a toothpaste orally, or to enhance wound healing or the healing of other conditions in skin.

What is claimed is:

1. A compound having the structure,

wherein

bond a and β are each, independently, present or absent;
A is an aromatic or heteroaromatic ring; B is an aromatic or heteroaromatic ring;
R1 is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, Ci-i₉ alkyl, C₂-i₉ alkenyl, C₂-i₉ alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein

R₁₁, R₁₄, R₁₅, R₁₆, and R₁₇ are each independently, H, halogen, -OC₃, -CZ₃, -
OCH₂CH(ΟΗ)CH₂OH, -OCH₂(CH₂OH)₂, -NO₂, OCH₃, -CN, -
Nₐ₁₂R₁₉, -SR₁₈, -CO₂R₁₈, -OR₂₀, -COR₂₀, -CSR₂₀, -NHCOR₁₈,
-SOR₁₈, -POR₁₈, -(=S)R₁₉, -(=NR₁₈)R₁₉, -(=N)R₁₈, -POR₁₈, -P(=0) (OR₁₉) (OR₁₉), -P(OR₁₈) (OR₁₉), -
C(=S)R₁₈, -NHR₁₈Rᵢ₉, -C(=0) -heterocyclyl , Ci₁₀ alkyl,
C₂-i₉ alkenyl, C₂-i₉ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and

R₁₁, R₁₈, and R₂₀ are each independently, H, Ci₁₀ alkyl, C₂-i₉ alkenyl, C₂-i₉ alkynyl, aryl, heteroaryl, or heterocyclyl;
R₂ is H, -CH₃, -OR₂₁, -CO₂R₂₁, -CF₃, Ci₅ alkyl, C₂₅ alkenyl,
C₂₅ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein R₂₁ is, H, -CF₃, -CH₃, Ci₅ alkyl, C₂₅ alkenyl,
C₂₅ alkynyl, or -C(=0) -heterocyclyl ; and
R₃ and R₄ are each independently, halogen, -NO₂, -NR₂₂R₂₃, -NHR₂₂R₂₃, -SR₂₂, -SO₂R₂₂, -SO₃R₂₂, -OR₂₂, -CO₂R₂₂, -CF₃, -POR₂₂, \(-P(=O)(OR₂₂)(OR₂₃)\), or \(-P(OR₂₂)(OR₂₃)\).

wherein R₂₂ and R₂₃ are each, H, -CF₃, -CH₃, C₅₋₇ alkyl, C₅₋₇ alkenyl, C₇₋₁₀ alkynyl, aryl, heteroaryl, heterocyclyl, or \(-C(=O)\)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted; and

when a and ß are present, A is phenyl with R₅ at the para position, B is phenyl with R₄ at the para position, R₂ is H, R₃ is -OH or \(-N(CH₃)₂\), and R₄ is -OH or \(-N(CH₃)₂\), then R₁ is other than unsubstituted phenyl,

or a salt thereof.

2. The compound of claim 1 having the structure

![Chemical Structure](image)

wherein bond a and ß are each, independently, present or absent; X is -CH, -CR₃ or N; Y is -CH, -CR₄ or N;
R₁ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, C₁₋₁₀ alkyl, C₂₋₁₀ alkenyl, C₂₋₁₀ alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein R₁₃, R₁₄, R₁₅, R₁₆, and R₁₇ are each independently, H, halogen, -OCZ₃, -CZ₃, -
OCH₂CH(OR)₂CH₃, -OCH₂CH₂OH, -NO₂, OCH₃, -CN, -NR₁R₂, -SR₁₈, -COR₂₀, -CSR₂₀, -NHCOᵣᵮ₈, -SOR₁₈, -P(ORie)₂, -C(=S)Rᵰ₈, -C(=NH)Rᵰ₈, C(=NR₁₈)Rᵰ₈, -C(=N)Rᵰ₈, -POR₁₈, -P(=0)(ORie)(OR₁₉), -P(ORie)(OR₁₉), -C(=S)Rᵰ₈, -NHRᵰ₈, -H, Ciᵰ₈ alkyl, C₂ᵰ₈ alkenyl, C₂ᵰ₈ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and

Rᵰ₄, Rig, and R₂₀ are each, independently, H, Ciᵰ₁₀ alkyl, C₂ᵰ₁₀ alkenyl, C₂ᵰ₁₀ alkynyl, aryl, heteroaryl, or heterocyclyl;

R₂ is H, -CH₃, -OR₂₁, -CO₂R₂₁, -CF₃, Ci₅ alkyl, C₂₅ alkyl, alkenyl, or alkynyl, wherein R₂₅ is H, -CF₃, -CH₃, Ci₅ alkyl, C₂₅ alkyl, alkenyl, or alkynyl,

C₂₅ alkynyl, aryl, heteroaryl, or heterocyclyl;

R₃ and R₄ are each independently, H, Ci₅ alkyl, or alkynyl, wherein R₃₅ is H, -CF₃, -CH₃, Ci₅ alkyl, or alkynyl, and

C₂₅ alkynyl, aryl, heteroaryl, or heterocyclyl, or -C(=S)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted; and

when a and β are present, X is -CH, Y is -CH, R₂ is H, R₃ is -OH or -N(CH₃)₂ at the para position, and R₄ is -OH or -N(CH₃)₂ at the para position, then R₁ is other than unsubstituted phenyl,

or a salt thereof.

3. The compound of claim 2, wherein X is N, or a salt thereof.
4. The compound of claim 2 or 3, wherein α and β are both present, or a salt thereof.

5. The compound of claim 2 having the structure

\[
\begin{align*}
\text{R}_3 & \quad \text{O} \quad \text{R}_2 \\
\text{O} & \quad \text{R}_1 \\
\text{R}_4 & \quad \text{N} \quad \text{R}_2
\end{align*}
\]

wherein

\(\text{Ri}\) is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, \(\text{C}_{1-10}\) alkyl, \(\text{C}_{2-10}\) alkenyl, \(\text{C}_{2-10}\) alkyl, aryl, heteroaryl, heterocyclyl, or

wherein \(\text{Ri}_3, \text{Ri}_4, \text{Ri}_5, \text{Ri}_6\) and \(\text{Ri}_7\) and are each independently, \(\text{H}, \text{halogen}, -\text{OC}_3\text{Z}, -\text{C}_3\text{Z}, -\text{OCH}_2\text{CH(OH)CH}_2\text{OH}, -\text{OCH(}\text{CH}_2\text{OH)}_2, -\text{NO}_2, \text{OCH}_3, -\text{CN}, -\text{NR}_1\text{Ri}_2\text{Ri}_3, -\text{SR}_1\text{Ri}_2, -\text{O}_2\text{Ri}_2, -\text{COR}_2, -\text{CSR}_2, -\text{NHCORi}_2, -\text{SOR}_1\text{Ri}_2, -\text{POR}_1\text{Ri}_2, -\text{C(S)Ri}_2, -\text{C(=NH)Ri}_2, -\text{C(=NR}_1\text{Ri}_2)\text{Ri}_2, -\text{C(=S)Ri}_2, -\text{POR}_1\text{Ri}_2, -\text{P(=O)(OR}_1\text{Ri}_2)(\text{OR}_1\text{Ri}_2), -\text{P(OR}_1\text{Ri}_2)(\text{OR}_1\text{Ri}_2), -\text{C(=S)Ri}_2, -\text{NHR}_1\text{Ri}_2\text{Ri}_3, -\text{C(=O)heterocyclyl, C}_1\text{i}_{-10}\text{alkyl, C}_2\text{i}_{-10}\text{alkenyl, C}_2\text{i}_{-10}\text{alkynyl, aryl, heteroaryl, or heterocyclyl,}

wherein \(Z\) is halogen, and

\(\text{Ri}_6, \text{Ri}_7, \text{Ri}_8\) are each, independently, \(\text{H}, \text{Cl}_{-10}\) alkyl, \(\text{C}_{1-10}\) alkenyl, \(\text{C}_{1-10}\) alkynyl, aryl, heteroaryl, or heterocyclyl;

\(\text{Ri}_2\) is \(\text{H}\) or \(-\text{CH}_3\); and

\(\text{Ri}_3\) and \(\text{Ri}_4\) are each \(-\text{OR}_2\).

wherein \(\text{Ri}_2\) is \(\text{H}, -\text{CF}_3, -\text{CH}_3, \text{Cl}_{-5}\) alkyl, \(\text{C}_{2-6}\) alkenyl, \(\text{C}_{2-5}\) alkynyl, aryl, heteroaryl, heterocyclyl, or \(-\text{C(=O)heterocyclyl, and}\)}
wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,
or a salt thereof.

6. The compound of claim 5 having the structure

wherein

R_i is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, C_1-10 alkyl, C_2-10 alkenyl, C_2-10 alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein R_{13}, R_{14}, R_{15}, R_{16} and R_{17} and are each independently, H, halogen, -OC\_3, -C\_3, -O\_3CH\_2OH, -O\_3(CH\_2OH)\_2, -NO\_2, OCH\_3, -CN, -NR_{18}R_{19}, -SR_{18}, -CO\_3R_{18}, -OR_{20}, -COR_{20}, -CSR_{20}, -NHCOR_{18}, -S\_OR_{18}, -P(-O)R_{18}, -C(-S)R_{18}, -C(-NH)R_{18}, C(-NR_{18})R_{18}, -C(-N)R_{18}, -P(=O)(OR_{19})(OR_{19}), -P(OR)_{18}, C(-S)R_{18}, -NH\_2R_{18}, -C(-N)R_{18}, -C(-O)heterocyclyl, C_{1-10} alkyl, C_{2-10} alkenyl, C_{2-10} alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and

R_{18}, R_{19}, and R_{20} are each independently, H, C_{1-10} alkyl, C_{2-10} alkenyl, C_{2-10} alkynyl, aryl, heteroaryl, or heterocyclyl; and

R_3 and R_4 are each -OR_{22},

wherein R_{22} is H, -CF\_3, -CH\_3, C_{1-5} alkyl, C_{2-5} alkenyl, C_{2-5} alkynyl, aryl, heteroaryl, heterocyclyl, or -C(-O)heterocyclyl, and
wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

7. The compound of claim 5 or 6, wherein \( R_{22} \) is \( H \), \( \text{C}_{1-5} \) alkyl, \( C_{1-5} \) alkenyl, \( C_{2-5} \) alkynyl, aryl, heteroaryl, heterocyclyl, or \( -C(-O)- \)heterocyclyl, wherein each occurrence of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

8. The compound of claim 2 having the structure

![Chemical Structure](image)

wherein
- \( X \) is \(-\text{CH}, -\text{CR}_3 \) or \( \text{N} \); \( Y \) is \(-\text{CH}, -\text{CR}_4 \) or \( \text{N} \);
- \( R_1 \) is pyridine, imidazol, oxazole, thazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, \( \text{C}_{1-6} \) alkyl, \( C_{2-6} \) alkenyl, \( C_{2-6} \) alkynyl, aryl, heteroaryl, or heterocyclyl;
- \( R_2 \) is \( H \) or \(-\text{CH}_3 \); and
- \( R_3 \) and \( R_4 \) are each independently, halogen, \(-\text{NO}_2 \), \(-\text{NR}_{22}R_{23} \), \(-\text{NHR}_{22}R_{23}^+ \), \(-\text{SR}_{22} \), \(-\text{SO}_2R_{22} \), \(-\text{SO}_3R_{22} \), \(-\text{OR}_{22} \), \(-\text{CO}_2R_{22} \), \(-\text{CF}_3 \), \(-\text{POR}_{22} \), \(-P(=\text{O})\text{(OR}_{22}\text{)(OR}_{23}) \), or \(-P(\text{OR}_{22}\text{})(\text{OR}_{23}) \),
  wherein \( R_{22} \) and \( R_{23} \) are each, \( H \), \(-\text{CF}_3 \), \(-\text{CH}_3 \), \( \text{C}_{1-5} \) alkyl, \( C_{2-6} \) alkenyl, \( C_{2-6} \) alkynyl, aryl, heteroaryl, heterocyclyl, or \(-C(-0)- \)heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,
or a salt thereof.

9. The compound of claim 2 having the structure

\[
\text{\begin{align*}
\text{R}_3 & \quad \text{O} \quad \text{R}_4 \\
\text{R}_1 & \quad \text{O} \quad \text{R}_2 \\
\text{X} & \quad \text{-CH, -CR}_3 \quad \text{or N; Y is -CH, -CR}_4 \quad \text{or N;}

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,
or a salt thereof.
12. The compound of any of claims 8-11, wherein R₃ and R₄ are each -OR₂₂, wherein R₂₂ is H, -CF₃, -CH₃, Cl₅ alkyl, C₂-₅ alkenyl, C₂-₅ alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=O)-heterocyclyl, and wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

13. The compound of claim 7 or 12, wherein R₂₂ is H.

14. The compound of claim 13, having the structure

![Chemical Structure]

or a salt thereof.

15. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and the compound of any one of claims 1-14.

16. A method of accelerating the healing of a wound in a subject having a wound, comprising administering to the subject a compound having the structure

![Chemical Structure]
bond α and β are each, independently, present or absent; A is an aromatic or heteroaromatic ring; B is an aromatic or heteroaromatic ring; Ri is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, C1-i0 alkyl, C2-i0 alkenyl, C2-i0 alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein R13, R14, R15, R16, and R17 are each independently, H, halogen, -OC Z1, -CZ3, -OCH2CH(OR1)2, -OCH(CH2OH)2, -NO2, OCH3, -CN, -NR1-Rig, -SR18, -COR18, -OR20, -COR20, -CSR20, -NHCORi8, -SOR18, -POR17, -C(=S)R18, -C(=NH)R8, C(=NR1)R8, -C(=N)R18, -POR18, -P(=0)(OR18)(OR19), -P(=0)(OR18)(OR13), -C(=S)R18, -NHR18R19+, -C(=0)-heterocyclyl, ClR10 alkyl, C2-i0 alkenyl, C2-i0 alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and

Rie, Rig, and Rig are each independently, H, Ci-i0 alkyl, C2-i0 alkenyl, C2-i0 alkynyl, aryl, heteroaryl, or heterocyclyl;

R2 is H, -CH3, -OR21, -COR21, -CF3, Cl-i5 alkyl, C2-i5 alkenyl, C2-i5 alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein R21 is H, -CF3, -CH3, Cl-i5 alkyl, C2-i5 alkenyl, C2-i5 alkynyl, or -C(=0)-heterocyclyl; and

R3 and R4 are each independently, halogen, -NO2, -NR22R23, -NHR22R23+, -SR22, -SOR22, -SO2R22, -SOR22, -CO2R22, -CF3, -POR22, -P(=0)(OR22)(OR23), or -P(=0)(OR22)(OR23)

wherein R22 and R23 are each, H, -CF3, -CH3, Cl-i5 alkyl, C2-i5 alkenyl, C2-i5 alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-heterocyclyl; and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,
or a salt thereof.

17. The method of claim 16, wherein the compound has the structure

![Chemical Structure](image)

wherein

bond α and β are each, independently, present or absent;

X is -CH, -CR₃ or N; Y is -CH, -CR₄ or N;

Rᵢ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, Ci₁₀ alkyl, C₃⁻⁵ alkenyl, C₂⁻¹₀ alkynyl, aryl, heteroaryl,

heterocyclyl, or

wherein R₁₃, R₁₄, R₁₅, R₁₆, and R₁₇ are each independently, H, halogen, -OC₂, -C₂, -OCH₂CH(OH)CH₂OH, -OCH₂(CH₂OH)₂, -NO₂, OCH₃, -CN, -Nₐ₆R₁₈, -SR₁₈, -CO₂R₁₈, -OR₂₀, -COR₂₀, -CSR₂₀, -NH₉ₐR₁₈, -SOR₁₈, -POR₁₇, -C(S)R₁₈, -C(NH)R₁₈, -C(N=NR₁₈)R₁₈, -C=N=R₁₈, -POR₁₈, -P(=O)(OR₁₈)(OR₁₉), -P(OR₁₈)(OR₁₉), -C(S)R₁₈, -NHR₁₈, -C(=O)heterocyclyl, Cl₁₀ alkyl, C₂⁻¹₀ alkenyl, C₂⁻¹₀ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and

R₁₉, R₂₀, and R₂₁ are each, independently, H, Ci₁₀ alkyl, C₂⁻¹₀ alkenyl, C₂⁻¹₀ alkynyl, aryl, heteroaryl, or heterocyclyl;

R₂ is H, -CH₃, -OR₂₁, -CO₂R₂₁, -CF₃, Cl⁻₅ alkyl, C₂⁻₅ alkenyl, C₂⁻₅ alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein R₂₁ is H, -CF₃, -CH₃, Cl⁻₅ alkyl, C₂⁻₅ alkenyl, C₂⁻₅ alkynyl, or C(=O)heterocyclyl; and
R₃ and R₄ are each independently, halogen, -NO₂, -NR₂₂R₂₃, -NHR₂₂R₂₃, -SR₂₂, -S₂O₂R₂₂, -SO₂R₂₂, -OR₂₂, -CC─₂R₂₃, -CF₃, -POR₂₂, -P(=0)(OR₂₂)(OR₂₃), or -P(OR₂₂)(OR₂₃), wherein R₂₂ and R₂₃ are each, H, -CF₃, -CH₃, C₆₋₅ alkyl, C₃₋₁₀ alkenyl, C₃₋₁₀ alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

18. The method of claim 17, wherein when a and β are present, X is -CH, Y is -CH, R₂ is H, R₃ is -N(CH₃)₂ and R₄ is -N(CH₃)₂, then R₁ is other than unsubstituted phenyl.

19. The method of claim 17 or 18, wherein the compound has the structure

wherein Rᵢ is pyridine, imidazol, oxazole, thiazole, pyridine, pyridazine, pyrazine, pyrimidine, morpholine, C₁₋₁₀ alkyl, C₂₋₁₀ alkenyl, C₂₋₁₀ alkynyl, aryl, heteroaryl, heterocyclyl, or

wherein R₁₃, R₁₄, R₁₅, R₁₆ and R₁₇ and are each independently, H, halogen, -OCZ₃, -CZ₃, -OCH₂CH(OR₁₈)CH₂OH, -OCH(CH₂OH)₂, -NO₂, -OCH₃, -CN, -NRᵢ₉₋ᵢ₁₉, -SR₁₈, -CO₂R₁₈, -OR₂₀, -COR₂₀, -CSR₂₀, -NHCOR₁₈, -SOR₁₈, -POR₁₇, -C(=S)R₁₈, -C(=NH)R₁₈, C(=NR₁₈)R₁₈, -C(=N)R₁₈, -POR₁₈, -P(=0)(OR₁₈)(OR₁₉), -P(OR₁₈)(OR₁₉), -
C(=S)Ri₈, -NHRi₈Ri₉⁺, -C(=0) -heterocyclyl , Clᵢ₀ alkyl, C₂⁻io alkenyl, C₂⁻io alkynyl, aryl, heteroaryl, or heterocyclyl ,

wherein Z is halogen, and

Ri₈, Ri₉, and R₂₀ are each, independently, H, Clᵢ₁₀ alkyl, C₂⁻io alkenyl, C₂⁻io alkynyl, aryl, heteroaryl, or heterocyclyl; and

R₃ and R₄ are each -OR₂₂,

wherein R₂₂ is H, -CF₃, -CH₃, Clᵢ₅ alkyl, C₂⁻io alkenyl, Cᵢ₅ alkyl, aryl, heteroaryl, heterocyclyl, or - C(=0) -heterocyclyl , and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,

or a salt thereof.

20. The method of claim 17 or 18, wherein the compound has the structure

wherein

R₃

R₃ is

wherein R₁₃, R₁₄, or R₁₅ is H, halogen, -OCZ₃, -CZ₃, - OCH₂(CH(OM)CH₂OH, -OCH(CH₂OH)₂, -NO₂, OCH₃, -CN, -NHR₁₈R₁₉, -SR₁₈, -COR₁₈, -SOR₁₈, -POR₁₇, -C(=S)R₁₈, -C(=N)R₁₈, C(=NR₁₈)R₁₈, -C(=O) -heterocyclyl , Clᵢ₀ alkyl,
C_{2-10} alkenyl, C_{2-10} alkynyl, aryl, heteroaryl, or heterocyclyl,
wherein Z is halogen, and
R_i, R_{ig}, and R_{20} are each, independently, H, C_{1-10} alkyl, C_{2-10} alkenyl, C_{2-10} alkynyl, aryl,
heteroaryl, or heterocyclyl; and
R_3 and R_4 are each independently, halogen, -NO_2, -NR_{22}R_{23}, -
-NHCR_{22}R_{23}, -SO_2R_{22}, -S_2OR_{22}, -OR_{22}, -C(O)R_{22}, -CO_2R_{22}, -CF_3, -POR_{22}, -
P(-O)(OR_{22})(OR_{23}), or -P(O)(OR_{22})(OR_{23}),
wherein R_{22} and R_{23} are each, H, -CF_3, -CH_3, C_{1-6} alkyl, C_{2-6} alkenyl, C_{2-6} alkynyl, aryl, heteroaryl,
heterocyclyl, or -C(-O)-heterocyclyl, and

wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted,
or a salt thereof.

21. The method of claim 20, wherein

R_{i} is

wherein R_{15} is H, halogen, -OCH_3, -OCH(CH_2OH), -OCH_2OH, -OCH(CH_2OH)_2, -NO_2, -OCH_3, -CN, -
-NHR_{18}R_{ig}, -SR_{18}, -C(O)R_{18}, -OR_{20}, -COR_{20}, -CSR_{20}, -NHCONR_{18},
-SOR_{18}, -POR_{18}, -C(=S)R_{18}, -C(=NH)R_{18}, C(=NR_{18})R_{18}, -
C(=N)R_{18}, -POR_{18}, -P(-O)(OR_{15})(OR_{13}), -P(O)(OR_{15})(OR_{13}), -
C(=S)R_{i8}, -NHR_{18}R_{19'}, -C(-O)-heterocyclyl, C_{1-10} alkyl,
C_{2-10} alkenyl, C_{2-10} alkynyl, aryl, heteroaryl, or heterocyclyl,

wherein Z is halogen, and
R_{ie}, R_{ig}, and R_{20} are each, independently, H, C_{1-10} alkyl, C_{2-10} alkenyl, C_{2-10} alkynyl, aryl,
heteroaryl, or heterocyclyl; and
R\textsubscript{3} and R\textsubscript{4} are each independently, halogen, -NO\textsubscript{2}, -NR\textsubscript{2}, -NHR\textsubscript{2}, -SR\textsubscript{2}, -SO\textsubscript{2}R\textsubscript{2}, -SO\textsubscript{3}R\textsubscript{2}, -OR\textsubscript{2}, -CC\textsubscript{=}CR\textsubscript{2}, -CF\textsubscript{3}, -POR\textsubscript{2}, -P(=O)(OR\textsubscript{2})(OR\textsubscript{3}), or -P(OR\textsubscript{2})(OR\textsubscript{3}), wherein R\textsubscript{22} and R\textsubscript{23} are each, H, -CF\textsubscript{3}, -CH\textsubscript{3}, C\textsubscript{1-5} alkyl, C\textsubscript{2-5} alkenyl, C\textsubscript{2-5} alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-heterocyclyl, and wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

22. The method of claim 20 or 21, wherein R\textsubscript{3} and R\textsubscript{4} are each -OR\textsubscript{2}, wherein R\textsubscript{22} is H, -CF\textsubscript{3}, -CH\textsubscript{3}, C\textsubscript{1-5} alkyl, C\textsubscript{2-5} alkenyl, C\textsubscript{2-5} alkynyl, aryl, heteroaryl, heterocyclyl, or -C(=0)-heterocyclyl, wherein each occurrence in the compound of alkyl, alkenyl, or alkynyl is branched or unbranched, unsubstituted or substituted, or a salt thereof.

23. The method of any of claims 17-22, wherein the compound has the structure

or a salt thereof.
24. The method of any of claims 17-22, wherein the compound has the structure

![Structure Image]

or a salt thereof.

25. The method of any of claims 17-24, wherein the wound is a skin wound.

26. The method of any of claims 25, wherein the compound is administered to the subject topically.

27. The method of claim 26, wherein the compound is in a carrier which comprises a concentration of the compound.

28. The method of claim 27, wherein the concentration of the compound in the carrier is less than about 5% (w/w).

29. The method of claim 28, wherein the concentration of the compound in the carrier is less than about 3% (w/w).

30. The method of claim 29, wherein the concentration of the compound in the carrier is about 1.5% (w/w).

31. The method of claim 30, wherein the concentration of the compound in the carrier is about 1% (w/w).

32. The method of claim 31, wherein the concentration of the compound in the carrier is about 0.5% (w/w).

33. The method of any of claims 27-32, wherein the carrier is petrolatum jelly.

34. The method of any of claims 17-24, wherein the compound is administered to the subject orally.
35. The method of claim 34, wherein the amount of the compound administered is between about 0.1 and about 15.0 mg/kg body weight of the subject/day.

36. The method of claim 35, wherein the amount of the compound administered is about 4.0 mg/kg body weight of the subject/day.

37. The method of any of claims 17-36, wherein the compound is administered to the subject once per day for a period of 7 days.

38. The method of any of claims 34-37, wherein the wound is a skin wound.

39. The method of claim 38, wherein the compound is administered to the subject after the skin wound has begun to heal.

40. The method of any of claims 25-39, wherein the skin wound is a cut in the skin, an abrasion of the skin, a puncture of the skin, a burn, contact dermatitis, or an insect bite.

41. The method of any of claims 25-40, wherein the skin wound is itching.

42. The method of any of claims 25-41, wherein the skin wound is an insect bite.

43. The method of claim 42, wherein the insect is a mosquito, chigger, bed bug, horse fly, or sand fly.

44. The method of any of claims 25-41, wherein the skin wound is contact dermatitis.
45. The method claim 44, wherein the contact dermatitis is caused by contact with poison ivy, poison oak, or poison sumac.

46. The method of any of claims 34-37, wherein the wound is in the oral cavity of the subject.

47. The method of claim 46, wherein the compound is solubilized in a non-toxic organic solubilizing agent.

48. The method of claim 47, wherein the non-toxic organic solubilizing agent is N-methyl glucamine.

49. The method of any of claims 46-48, wherein the wound is periodontitis, gingivitis, root caries, a canker sore, mucositis, pemphigoid, lichen planus, ulcer or a blistering lesion.

50. The method of any of claims 16-49, wherein the accelerating of the healing of the wound comprises increasing levels of newly synthesized collagen.

51. The method of claim 50, wherein the wound is a skin wound.

52. The method of claim 51, wherein the levels of newly synthesized collagen in the wounded skin are increased.

53. The method of any of claims 16-52, wherein the subject is diabetic.

54. The method of any of claims 16-52, wherein the subject is hyperglycemic.
