MORPHOLINONE COMPOUNDS AS FACTOR IXA INHIBITORS

FIELD OF THE INVENTION

The invention relates to novel compounds of the Formula (I) having antithrombotic activity which, in particular, inhibit blood clotting factor IXa, to processes for their preparation and to use thereof as medicaments.

BACKGROUND OF THE INVENTION

Factor IXa is a plasma serine protease involved in the regulation of blood coagulation. While blood coagulation is a necessary and important part of the regulation of an organism’s homeostasis, abnormal blood coagulation can also have deleterious effects. For instance, thrombosis is the formation or presence of a blood clot inside a blood vessel or cavity of the heart. Such a blood clot can lodge in a blood vessel blocking circulation and inducing a heart attack or stroke. Thromboembolic disorders are the largest cause of mortality and disability in the industrialized world.

Blood clotting is a process of control of the blood stream essential for the survival of mammals. The process of clotting, as shown in the Patent Document 1, and the subsequent dissolution of the clot after wound healing has taken place commences after vascular damage and can be divided into four phases:

1. The phase of vasoconstriction or vasoconstriction. By means of this the blood loss in the damaged area is decreased.

2. The next phase is platelet activation by thrombin. The platelets attach to the site of the vessel wall damage and form a platelet aggregate. The protein fibrinogen is responsible here for the crosslinkage of the platelets by means of appropriate surface receptors. Platelets also bind to exposed collagen of the extracellular matrix of the damaged vessel wall and are activated by this means. After activation of the platelets, a
number of messenger substances are secreted, which induce the activation of further platelets. At the same time, a membrane lipid, phosphatidylserine, is transported from the inside of the membrane of the platelets to the outside, on which complexes of clotting factors can accumulate. The platelets accelerate blood clotting by means of this mechanism.

3 The formation of these clotting complexes leads to the massive formation of thrombin, which converts soluble fibrinogen to fibrin by cleavage of two small peptides. Fibrin monomers spontaneously form threadlike strands, from which, after crosslinkage by clotting factor XIII, a stable protein network forms. The initially even looser platelet aggregate is stabilized by this fibrin network. Platelet aggregates and fibrin network are the two essential constituents of a thrombus.

4 After wound healing, the thrombus is dissolved by the action of the key enzyme of the endogenous fibrinolysis system, plasmin.

Two alternative pathways can lead to the formation of a fibrin clot, the intrinsic and the extrinsic pathway. These pathways are initiated by different mechanisms, but in the later phase they converge to give a common final path of the clotting cascade. In this final path of clotting, clotting factor X is activated. The activated factor X is responsible for the formation of thrombin from the inactive precursor prothrombin circulating in the blood. The formation of a thrombus on the bottom of a vessel wall abnormality without a wound is the result of the intrinsic pathway. Fibrin clot formation as a response to tissue damage or an injury is the result of the extrinsic pathway. Both pathways comprise a relatively large number of proteins, which are known as clotting factors.

The intrinsic pathway requires the clotting factors V, VIII, IX, X, XI and XII and also prekallikrein, high molecular weight kininogen, calcium ions and...
phospholipids from platelets.

The intrinsic pathway is initiated when prekallikrein, high molecular weight kininogen factor XI and XII bind to a negatively charged surface. This point in time is designated as the contact phase. Exposure to vessel wall collagen is the primary stimulus of the contact phase. The result of the processes of the contact phase is the conversion of prekallikrein to kallikrein, which in turn activates factor XII. Factor XHa hydrolyzes further prekallikrein to kallikrein, such that activation is the result. With increasing activation of factor XII, activation of factor XI occurs, which leads to a release of bradykinin, a vasodilator. As a result, the ending of the initial phase of vasoconstriction occurs. Bradykinin is formed from high molecular weight kininogen in the presence of Ca²⁺ ions. Factor Xla activates factor IX. Factor IX is a proenzyme, which contains vitamin K-dependent, γ-carboxyglutamic acid (GLA) residues. The serine protease activity becomes noticeable after binding of Ca²⁺ to these GLA residues. A number of the serine proteases of the blood clotting cascade (factors II, VII, IX and X) contain such vitamin K-dependent GLA residues. Factor IXa cleaves factor X and leads to activation to factor Xa. The prerequisite for the formation of factor IXa is the formation of a tenase complex from Ca²⁺ and the factors Villa, IXa and X on the surface of activated platelets. One of the reactions of activated platelets is the presentation of phosphatidylserine and phosphatidylinositol along the surfaces. The exposure of these phospholipids first makes the formation of the tenase complex possible. Factor VIII in this process has the function of a receptor for the factors IXa and X. Factor VIII is therefore a cofactor in the clotting cascade. The activation of factor Viπ with formation of factor Villa, the actual receptor, needs only a minimal amount of thrombin. With increase in the concentration of thrombin, factor Villa is finally cleaved further and inactivated by thrombin. This dual activity of thrombin in
relation to factor VIII leads to a self-restriction of tenase complex formation and thus to a limitation of blood clotting.

The extrinsic pathway requires a tissue factor (TF) and clotting factors V, VII, VIII, IX, and X. In the case of a vessel injury, the tissue factor (TF) accumulates with the clotting factor Vn and the latter is activated. The complex of TF and clotting factor VII has two substrates, clotting factors X and IX.

Clotting factor IX can be activated by means of the intrinsic pathway and the extrinsic pathway. The activation of factor IXa is thus a central point of intersection between the two pathways of activation of clotting.

Factor IXa has an important role in blood clotting. Defects in factor IXa lead to hemophilia B, while increased concentrations of factor IXa in the blood lead to a significantly increased risk of thrombosis formation (Weltermann A., et al., J Thromb Haemost 2003, 1:28-32). The regulation of factor IXa activity can reduce thrombus formation in animal models (Feuerstein GZ, et al., Thromb Haemost 1999, 82:1443-1445).

Recently, compounds having a Factor IXa antagonism are being studied. Known compounds each having an amide bond are disclosed in, for example, PCT Publication No 08/031508 pamphlet (Patent Document 1), PCT Publication No 08/031509 pamphlet (Patent Document 2). However, these patent documents do not disclose cyclic morphohmone derivatives.

In the development of pharmaceuticals, it is required to satisfy strict criteria for not only target pharmacological activity but also absorption, distribution, metabolism, excretion, and the like. With respect to drug interactions, desensitization or tolerance, digestive absorption in oral administration, the rate of transfer to a small intestine, the rate of absorption and first-pass effect, an organ barrier, protein binding,
induction of a drug-metabolizing enzyme, an excretion pathway and body clearance, a
method of administration (an application site, a method, and purpose), and the like,
various agenda are required. However, a drug that satisfies these requirements is
described.

These comprehensive problems in drug development might also exist for
Factor IXa antagonists, and Factor IXa antagonists have not yet been released onto the
market. More specifically, known compounds having a Factor IXa antagonism may
also include problems in terms of usefulness and safety. For example, these compounds
may have low absorption, and oral administration of these compounds may be difficult,
these compounds also may exhibit inhibitory activity of the human ether-a-go-go
related gene (hERG) channel, which may cause arrhythmia, and pharmacokinetics of
these compounds might not satisfactory.

Accordingly, a compound in which these problems are solved and which has
high activity has been desired.

When any variable (e.g., aryl, R1, etc.) occurs more than one time in any constituent or in Formula (I) or (I)(A)-(I)(D), its definition on each occurrence is independent of its definition at every other occurrence.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

In the embodiments described below in [1-1] to [8-1] of the present invention, unless otherwise noted, R1, R2, R3, R4, R5, G, W, X, m, n or other definitions, for example, R6, R7, R8, V, Y, Z, T, U, etc. in the substituents as well as D, E, F, J, K, L, M, o or p etc. in the sub-formulae, shown in the each descriptions are the same as defined above for the Formula (I) or (I)(A)-(I)(D).

In the embodiments, compounds having Factor IXa antagonistic activity (determined by, for example, pharmacological examples described below a measurement of fluorescence value using microtiter plate reader, ARVO 1420 Multilabel Counter) of 30 µM or less, preferably 1 µM or less, more preferably 100 nM or less, and the most preferably 50 nM or less in terms of an IC50 value are preferably used.

In the embodiments described in this description, "agent" or "drug" means a material which is used for improvement of disease or symptom, not only for treatment of disease or symptom.
In all the above embodiments, when the term "compound" is used, the term also refers to pharmaceutically acceptable salts thereof. The compounds of the present invention have asymmetric carbon atoms. Accordingly, the compounds of the present invention include mixtures of various stereoisomers, such as geometrical isomers, tautomers, such as keto- and enol-tautomers, or amidino- and imidno-tautomers, and optical isomers, and isolated isomers, for example, (R, R), (S, S), (R, S) and (S, R) isomers. (R, R) isomer is preferred. Specific example of (R,R) isomer compound is, for example, (2R)-N-(4-amidinophenyl)-2-hydroxy-2-[(2R)-3-oxo-4-p-tolylmorpholin-2-yl] acetamide hydrochloride (EXAMPLE 7). The isolation and the purification of such stereoisomers can be performed by those skilled in the art with a known technique such as optical resolution using preferential crystallization or column chromatography, or asymmetric synthesis.

The compounds represented by Formula (I) or (I)(A)-(I)(D) of the present invention may form acid addition salts. Alternatively, these compounds may form salts with a base according to the type of substituent. These salts are not particularly limited as long as the salts are pharmaceutically acceptable salts. Specific examples of the salts include acid addition salts with a mineral acid such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, nitric acid, or phosphoric acid, an organic carboxylic acid such as an aliphatic monocarboxylic acid, e.g., formic acid, acetic acid, trifluoroacetic acid (TFA), propionic acid, butyric acid, valeric acid, enanthic acid, capric acid, myristic acid, palmitic acid, stearic acid, lactic acid, sorbic acid, or mandelic acid, an aromatic monocarboxylic acid, e.g., benzoic acid or salicylic acid, an aliphatic dicarboxylic acid, e.g., oxalic acid, malonic acid, succinic acid, fumaric acid, maleic acid, malic acid, or tartaric acid, and an aliphatic tricarboxylic acid e.g., citric acid, an organic sulfonic acid such as an aliphatic sulfonic acid, e.g., methanesulfonic acid.
acid, ethanesulfonic acid, trifluororaethanesulfonic acid, or 2-hydroxyethanesulfonic acid, or an aromatic sulfonic acid, e.g., benzenesulfonic acid or p-toluenesulfonic acid, or an acidic amino acid, e.g., aspartic acid or glutamic acid, salts with a metal such as an alkali metal, e.g., sodium or potassium, or an alkaline earth metal, e.g., magnesium or calcium, salts with an organic base such as methylvamine, ethylamine, ethanolamine, pyridine, lysine, arginine, or ornithine, and ammonium salts.

These salts can be obtained by a known method, for example, by mixing a compound of the present invention with an equivalent amount and a solution containing a desired acid, base, or the like, and then collecting the desired salt by filtering the salt or distilling off the solvent.

The compounds of the present invention and salts thereof can form solvates with a solvent such as water, ethanol, or glycerol.

The salts of a compound of the present invention include monosalts and di-salts. The compounds of the present invention can form an acid addition salt and a salt with a base at the same time according to the type of substituent of the side chain.

Furthermore, the present invention includes hydrates, pharmaceutically acceptable various solvates, and crystal polymorphism of the compounds represented by Formula (I) or (I)(A)-(I)(D) of the present invention. The present invention is not limited to the compounds described in examples below and includes all compounds represented by Formula (I) or (I)(A)-(I)(D) of the present invention and pharmaceutically acceptable salts thereof.

Prodrugs and solvates of the compounds of the invention are also contemplated herein. A discussion of prodrugs is provided in T. Higuchi and V. Stella, Prodrugs as Novel Delivery Systems, 14, 1987, of the ACS Symposium Series, and in Bioreversible Carriers in Drug Design, 1987, Edward B. Roche, ed., American
Pharmaceutical Association and Pergamon Press. The term "prodrug" means a compound (e.g., a drug precursor) that is transformed in vivo to yield a compound of Formula (I) or (I)(A)-(I)(D) or a pharmaceutically acceptable salt, hydrate or a solvate of the compound. The transformation may occur by various mechanisms (e.g., by metabolic or chemical processes), such as, for example, through hydrolysis in blood.

For example, if a compound of Formula (I) or (I)(A) (I)(D) or a pharmaceutically acceptable salt, hydrate or a solvate of the compound contains an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as, for example,

- (C1-C6)alkanoyloxyethyl,
- 1-methyl-1-((C1-C6)alkanoyloxy)ethyl,
- (C1-C6)alkoxyxycarbonyloxyethyl,
- N-((C1-C6)alkoxycarbonylaminomethyl), succinoyl, (C1-C6)alkanoyl,
- N-((C1-C6)alkoxycarbonylaminomethyl), succinoyl, (C1-C6)alkanoyl,
- α-amino(C1-C4)alkyl, arylacyl and α-aminoacyl, or α-aminoacyl α-aminoacyl, where each α-aminoacyl group is independently selected from the naturally occurring L amino acids, P(O)(OH)2, P(O)(O)(C1-C6)alkyl)2 or glycosyl (the radical resulting from the removal of a hydroxyl group of the hemiacetal from of a carbohydrate), and the like.

If a compound of Formula (I) or (I)(A) (I)(D) incorporates an amine functional group or an imine functional group, for example, such as a part of amidino group, a prodrug can be formed by the replacement of a hydrogen atom of the amine group or imine group with a group such as, for example, hydroxyl group, RO, R-carbonyl, RO-carbonyl, NRR' carbonyl where R and R' are each independently hydrogen atom.
(C₁⁻C₁₀)alkyl, (C₃⁻C₇)cycloalkyl, benzyl, or R-carbonyl is a natural α-aminoacyl or natural β-aramoacyl, -CH(OY₂)Y₃ wherein Y₂ is (C₁⁻C₄)alkyl and Y₃ is (C₁⁻C₆)alkyl, carboxy (C₁⁻C₃)alkyl, amino(C₁⁻GOalkyl or mono-N-or di-N,N-(C₁⁻C₆)alkylaminoalkyl, -CH(Y₄)Y₅ wherein Y₄ is H or methyl and Y₅ is mono-N or di-N,N-(C₁⁻C₆)alkylammonio morpholmo, piperidm-1yl or pyrrolidin-1-yl and the like.

Methods for Making the Compounds of Present Invention

General Methods

The compounds represented by Formula (I) and salts thereof, which are the compounds of the present invention can be readily produced from known compounds or commercially available compounds by, for example, known processes described in published documents, and produced by production processes described below. The present invention is not limited to the production processes described below.

Unless otherwise noted, R₁, R₂, R₃, R₄, R₅, Q, W, X, m, and n in the formulae shown in the description of the production method are as defined above for the Formula (I). The alkylen group in the side chain or ring of the compound may be substituted with the substituents defined for the Formula (I). R₄' and R in the formulae shown in the description of the production method are defined in the corresponding part.

Unless otherwise noted, each of P¹, P², P³, P⁴ or P⁵ in the production method independently designate protecting group, and exemplary appropriate protecting groups include typical an arylmethyl group such as benzyl group, para methoxy benzyl group or triphenylmethyl group, acyl protecting groups, namely, an alkanoyl group such as acetyl group, an alkoxy carbonyl group such as methoxycarbonyl group, ethoxycarbonyl group, or t-butoxycarbonyl group, an arylmethoxycarbonyl group such as benzyloxycarbonyl group, para methoxybenzyloxycarbonyl group, or para(ortho)mtrobenzyloxycarbonyl group, or an aryl group such as benzoyl group.

The method used for deprotecting such protecting group differs depending on the chemical nature of the protecting group employed, and in the case of an arylmethyl group such as para methoxy benzyl group or benzyl group, the deprotection can be accomplished by hydrogenation using a palladium-carbon catalyst for conversion into nitrogen-hydrogen bond, or alternatively, by Birch reduction using metal sodium in
liquid ammonia, or by oxidative condition using such as CAN (ceric ammonium nitrate) or DDQ (2,3-dichloro-5,6-dicyano-p-benzoquinone) The triphenylmethyl group can be removed by using an appropriate acid such as acetic acid, hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, trifluoroacetic acid, trifluoromethanesulfonic acid, or a combination thereof, or alternatively, or by Birch reduction using metal sodium in liquid ammonia

In the case of an acyl protecting group such as an alkanoyl group, an alkoxy carbonyl group, or an aroyl group, the deprotection can be accomplished by the hydrolysis using an appropriate base such as an alkaline metal hydroxide such as lithium hydroxide, sodium hydroxide, or potassium hydroxide

The substituted methoxy carbonyl protecting group such as t-butoxycarbonyl group or paramethoxy benzyl oxy carbonyl group can be removed by an appropriate acid such as acetic acid, hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, trifluoroacetic acid, trifluoromethanesulfonic acid, or a combination thereof

The aryl methoxy carbonyl group such as benzyl oxycarbonyl group, paramethoxybenzyl oxy carbonyl group, or para(ortho) nitrobenzyl oxy carbonyl group can be removed by the hydrolysis using a palladium-carbon catalyst. The protecting groups P₁, P₂, P₃, P₄ or P₅ of the imino group (-NH-) can be independently or simultaneously deprotected by adequately selecting the type of the protecting group and deprotection conditions, and if desired, the protecting group can be re-introduced

Unless otherwise noted, each of Li, L₁, L₂, L₃, L₄, L₅, L₆, or L₇ in the production method designates a leaving group such as a halogen atom (for example, fluorine, chlorine, bromine, or iodine), methanesulfonyloxy group, or p-toluensulfonyloxy group, or a replaceable substituent such as hydroxy group or an alkoxy group

It should be noted that, when the derivative of the Formula (I) of the present
invention synthesized has a reactive group such as hydroxy group, amino group, carboxyl group, or thiol group as its substituent, such group may be adequately protected with a protective group in each reaction step and the protective group may be removed at an adequate stage. The process of such introduction and removal of the protective group may be adequately determined depending on the group to be protected and the type of the protective group, and such introduction and removal are conducted, for example, by the process described in the review section of Greene, TW, et al., "Protective Groups in Organic Synthesis", 2007, 4th Ed., Wiley, New York, or Kocienski, P, "Protecting Groups" 1994, Thieme. The required starting materials, such as (i-a), (i-b), (i-c), (i-d), (i-e), (i-f), (i-g), (u-a), (in a), (in b), (v-a), (viu-a), (vin-c), (vin-d), (viri-e), (ix-a), (xvi-a), or (xvii-a) are either commercially available, or capable of being readily synthesized by the method commonly used in the organic chemistry from commercially available products. Unless otherwise noted, the reaction conditions employed in the production method are as described below:

Reaction temperature is in the range of -78°C to the solvent reflux temperature, and reaction time is the time sufficient for required progress of the reaction. Solvent which is not involved in the reaction may be any of the aromatic hydrocarbon solvents such as toluene and benzene, polar solvents such as water, methanol, DMF, and DMSO, basic solvents such as triethylamine and pyridine, halogen solvents such as chloroform, methylene chloride, and 1,2-dichloroethane, ethereal solvent such as diethyl ether, tetrahydrofuran, and dioxane, and mixed solvents thereof, and the solvent used may be adequately selected depending on the reaction conditions. Base may be any of inorganic bases such as potassium carbonate, cesium carbonate, sodium hydroxide, potassium hydroxide, and sodium hydride, and organic bases such as triethylamine, pyridine, N,N dialkylamline, lithium n-dimethylamide and lithium.
hexamethyldisilazide, and acid may be any of mineral acids such as hydrochloric acid, and sulfuric acid, and organic acids such as methanesulfonic acid, trifluoroacetic acid and p-toluenesulfonic acid. The base and the acid are not necessarily limited to those mentioned above. The production processes will now be described in detail.
Scheme 1 Synthetic route of the key intermediate (iii-a)

A compound represented by formula (n-a) can be produced by allowing a compound represented by formula (i-a) to react with a commercially available ammonoalcohol or ammothiol (i-g), readily prepared aminoalcohol or ammothiol from known compounds by a process similar to that described in published documents, for example, Organic Synthesis, Collective Vol5, pp 88 1973, in the presence of a base such as potassium tenn buthoxide, sodium hydride, lithium hydroxide, sodium
hydroxide, potassium hydroxide, lithium carbonate, sodium carbonate, or potassium carbonate using a solvent which is inactive to the reaction, such as methanol, ethanol, acetone, N,N-dimethylformamide, dioxane or tetrahydrofuran, or a mixed solvent thereof at a temperature in the range of room temperature to the solvent reflux temperature.

Alternatively, a compound represented by formula (ii-a) can be produced by conducting a reaction using a compound represented by formula (i-b) by a process of reductive animation. After a compound represented by formula (i-b) is converted to an imine with a suitable aminoalcohol (i-g), an ammochiol (i-g) using a solvent which is inactive to the reaction, such as a halogenated solvent, e.g., dichloromethane or chloroform, an ethereal solvent, e.g., diethyl ether, tetrahydrofuran, 1,2-dimethoxyethane, 1,4-dioxane, or an aromatic hydrocarbon solvent, e.g., toluene or benzene or a mixed solvent thereof at a temperature in the range of 0°C to the solvent reflux temperature, a compound represented by formula (ii a) can be produced by a process similar to that described in published documents, for example, Journal of Medical Chemistry, 23(12), pp. 1405-1410, 1980 in the presence of a reductive reagent such as sodium borohydride using a solvent which is inactive to the reaction, such as an alcoholic solvent, e.g., methanol, ethanol, 2 propanol, an ethereal solvent, e.g., diethyl ether, tetrahydrofuran, 1,2-dimethoxyethane, 1,4 dioxane, or an aromatic hydrocarbon solvent, e.g., toluene or benzene or a mixed solvent thereof at a temperature in the range of 0°C to the solvent reflux temperature.

Alternatively, hydrogen gas can be used to an imine with a suitable process similar to that described in published documents, for example, Jikken Kagaku Koza (Experimental Chemistry Series), 4th edition, 26, Organic synthesis VIII, Asymmetric...
synthesis, reduction, sugar, and labeled compound, pp 251-266, 1992, Maruzen Co., Ltd., in the presence of a catalyst such as palladium-carbon (Pd C), Raney-Ni, or platinum oxide (PtO2) in a solvent which is inactive to the reaction, such as an alcoholic solvent, e.g., methanol, ethanol, or 2-propanol, a halogenated solvent, e.g., dichloromethane or chloroform, an ethereal solvent, e.g., diethyl ether or tetrahydrofuran, a polar solvent, e.g., ethyl acetate or acetonitrile, an aromatic hydrocarbon solvent, e.g., toluene or benzene, or an acid solvent, e.g., acetic acid at a temperature in the range of room temperature to the solvent reflux temperature, thereby producing a compound represented by formula (u-a).

Alternatively, a compound represented by formula (u-a) can be produced by conducting a reaction using a compound represented by formula (i-c) by a process similar to that of <step 1-1> with a suitable alcohol or thiol in the presence of copper iodide and cesium carbonate using a solvent which is inactive to the reaction, such as acetonitrile.

A compound represented by formula (u-b) can be produced by conducting a reaction using a compound represented by formula (n-c) and a compound represented by formula (i-c) (for example, a known amine) as follows: When a compound represented by formula (u-c) is a carboxylic acid, a compound represented by formula (n-b) can be produced by allowing a compound represented by formula (ii-c) to react with a compound represented by formula (i-c) by a process similar to that described in published documents, for example, Jikken Kagaku Koza (Experimental Chemistry Series), 4th edition, 22, Organic synthesis IV, Acids, amino acids, and peptides, pp 191-309, 1992, Maruzen Co., Ltd., in the presence of a condensing agent such as...

Furthermore, in the case of some of the compounds according to the invention the possibility arises of employing diastereomERICally or enantiomERICally pure starting products for the preparation of the ring structures. By this means, other or simplified processes can be employed for the purification of the final products. These starting products were prepared beforehand in enantiomERICally or diastereomERICally pure form according to processes known from the literature. This can mean, in particular, that in the synthesis of the scaffold structures either enantioselective processes are used, or else an enantiomERIC (or diastereomERIC) separation is carried out at an earlier stage of the synthesis and not only at the stage of the final products. Likewise, a simplification of the separations can be achieved by proceeding in two or more stages.

Pharmacologically acceptable salts are preferred, for example alkali metal or alkaline earth metal salts such as hydrochlorides, hydrobromides, sulfates, hemisulfates, all possible phosphates, and salts of the amino acids, natural bases or carboxylic acids.

The preparation of pharmacologically acceptable salts from compounds of the Formula (I) capable of salt formation, including their stereoisomeric forms is carried out in a manner known per se. If the compounds of the Formula (I) have basic groups, stable acid addition salts can also be prepared using strong acids. For this, inorganic and organic acids such as hydrochloric, hydrobromic, sulfuric, hemisulfuric, phosphoric, methanesulfonic, benzenesulfonic, p-toluensulfonic, 4-bromobenzenesulfonic, cyclohexylamidosulfonic, trifluoromethylsulfonic, 2-hydroxyethanesulfonic, acetic, oxalic, tartaric, succinic, glycerolphosphoric, lactic, malic, adipic, citric, fumaric, maleic, gluconic, glucuronic, palmitic or trifluoroacetic acid are suitable.

Synthesis of N-O-aminoisoquinolin-6-yl^-hydroxy^-p-oxo^-p-tolylmorphohn^-yliacetamide trifluoroacetate

[Step i-i]

Synthesis of ethyl 2-hydroxy-2-(3-oxo-4-p-tolylmorpholn-2-yl)acetate (compound 1-1 (LP) and compound 1-1 (MP))

To a solution of 4-(4-Methylphenyl)-3-morpholinone (Zhurnal Organicheskoi Khimii, 6(6), 1305-8, 1970) (1.08 g) in THF (21.6 ml), was added 1 M lithium hexamethyldisilazide solution (7.34 ml) in THF at -78 °C. The mixture was stirred at -78 °C for 15 minutes then 0 °C for 1 hour. Then the reaction mixture was cooled down at -78 °C and ethyl glyoxylate solution (1.84 ml) in toluene was added into the reaction mixture. The reaction mixture was stirred at 0 °C overnight. At the end of the reaction, saturated NH₄Cl aqueous solution was added into the reaction mixture. The mixture was concentrated in vacuo and the resulting mixture was extracted with AcOEt. The organic layer was washed with brine and dried with anhydrous Na₂SO₄. The solvent was removed under reduced pressure and the resulting residue was purified by silica gel flash column chromatography (eluent n-Hex/AcOEt = 50/50 - 0/100) to obtain two
diastereomers, compound 1-1 (LP) (405 mg, Rf value = 0.36 on TLC (n-Hex/AcOEt=1/2)) as a pale yellow amorphous solid and 1-1 (MP) (287 mg, Rf value = 0.27 on TLC (n-Hex/AcOEt=1/2)) as yellow oil. LP indicates a less polar spot on TLC, MP indicates a more polar spot on TLC.

[Step 1-2]
Synthesis of 2-hydroxy-2-(3-oxo-4-p-tolylmorpholin-2-yl)acetic acid (compound 1-2)

To a solution of compound 1-1 (LP) (100 mg) in EtOH (1 mL), was added 1 N NaOH aqueous solution (1 mL) at 0 °C. The reaction mixture was stirred at room temperature for 1 hour. Then DowEx®-50Wx8-200 was added into the reaction mixture, then the mixture was filtered to remove DowEx®-50Wx8-200. The filtrate was concentrated in vacuo to obtain compound 1-2 (90 mg) as a colorless amorphous solid. Compound 1-2 was used in the next step without further purification.

[Step 1-3]
Synthesis of N-[N,N-bis(tert-butoxycarbonyl)-1-aminoisoquinoline-6-yl]-2-hydroxy-2-(3-oxo-4-p-tolylmorpholin-2-yl)acetamide (compound 1-3)

To a solution of compound 1-2 (90 mg) in THF (2 mL), were added activated-charcoal (4.5 mg) and triphosgene (403 mg) at 0 °C. The reaction mixture was stirred at room temperature for 15 hours. Then activated-charcoal was removed by filtration and the filtrate was concentrated in vacuo. The resulting residue was resolved in CH2Cl2 (2 mL). 6-Amino-1-bis(tert-butoxyl carbonyl)aminoisoquinolone (146 mg) was added into the CH2Cl2 solution at 0°C. The reaction mixture was stirred at room temperature for 4 hours. The reaction mixture was concentrated in vacuo and a half volume of the resulting residue was purified by LC/MS to obtain compound 1-3 (30.6 mg) as a colorless amorphous solid.
[Step 1-4]
Synthesis of
N-(1-aminoisoquinolin-6-yl)-2-hydroxy-2-(3-oxo-4-p-tolylmorpholin-2-yl)acetamide trifluoroacetate (EXAMPLE 1)

To a solution of compound 1-3 (30.6 mg) in CHCl₃ (15 ml), was added trifluoroacetic acid (0.5 ml) at 0 °C. The reaction mixture was stirred at room temperature for 1 hour and the mixture was concentrated in vacuo. The resulting residue, Et₂O was added and the residue was triturated. Then the precipitate was collected by filtration to obtain EXAMPLE 1 (19.3 mg) as a colorless amorphous solid.

[Step 2-1]
Synthesis of

After the addition was complete, the batch was held at 20-25 °C for 2 hours until formation of the imine intermediate was deemed complete by 1H NMR analysis (DMSO-d6, aldehyde peak at 9.8 ppm not observed). The batch was cooled to 0-5 °C and sodium borohydride (1050 g, 27.8 mol, Aldrich lot # 10106TC) was added portionwise over 2.8

Utility

The invention also relates to medicaments which contain an efficacious amount of at least one compound of the Formula (I) and/or of a pharmaceutically acceptable salt of the compound of the Formula (I) and/or an optionally stereoisomers form of the compound of the Formula (I), together with a pharmaceutically suitable and pharmaceutically acceptable vehicle, additive and/or other active substances and auxiliaries.

On account of their pharmacological properties, the compounds according to the invention are suitable, for example, for the prophylaxis, secondary prevention and therapy of all those diseases which are treatable by inhibition of blood clotting factor IXa. Thus, the compounds according to the invention are suitable as inhibitors both for prophylactic and for therapeutic administration to humans. They are suitable both for acute treatment and for long term therapy. The compounds of the Formula (I) can be employed in patients who are suffering from disorders of well being or diseases which accompany thromboses, embolisms, hypercoagulability or fibrotic changes.

These include myocardial infarct, angina pectoris and all other forms of acute coronary syndrome, stroke, peripheral vascular diseases, deep vein thrombosis, pulmonary embolism, embolic or thrombotic events caused by cardia arrhythmias, cardiovascular events such as restenosis after revascularization, angioplasty and similar interventions such as stent implantations and bypass operations. Furthermore, the compounds of the Formula (I) can be employed in all interventions which lead to contact of the blood with foreign surfaces, as in dialysis patients and patients with indwelling catheters. Compounds of the Formula (I) can also be employed in order to reduce the risk of thrombosis after surgical interventions such as in knee and hip joint operations.
Compounds of the Formula (I) are suitable for the treatment of patients with disseminated intravascular coagulation, sepsis and other intravascular events which accompany inflammation. Furthermore, compounds of the Formula (I) are suitable for the prophylaxis and treatment of patients with atherosclerosis, diabetes and the metabolic syndrome and their sequelae. Disorders of the hemostatic system (for example fibrin deposits) have been implicated in mechanisms which lead to tumor growth and tumor metastasis, and in the inflammatory and degenerative joint diseases such as rheumatoid arthritis and arthrosis. Compounds of the Formula (I) are suitable for the retardation or prevention of such processes.

Further indications for the use of the compounds of the Formula (I) are fibrotic changes of the lungs such as chronic obstructive pulmonary disease, adult respiratory distress syndrome (ARDS) and of the eye, such as fibrin deposits after eye operations. Compounds of the Formula (I) are also suitable for the prevention and/or treatment of scar formation.

The medicaments according to the invention can be administered by oral, inhalative, rectal or transdermal administration or by subcutaneous, intraarticular, intraperitoneal or intravenous injection. Oral administration is preferred. Coating of stents with compounds of the Formula (I) and other surfaces which come into contact with blood in the body is possible.

The invention also relates to a process for the production of a medicament, which comprises bringing at least one compound of the Formula (I) into a suitable administration form using a pharmaceutically suitable and pharmaceutically acceptable carrier and optionally further suitable active substances, additives or auxiliaries.

Suitable solid or galenical preparation forms are, for example, granules, powders, coated tablets, tablets, (micro)capsules, suppositories, syrups, juices,
suspensions, emulsions, drops or injectable solutions and preparations having prolonged release of active substance, in whose preparation customary excipients such as vehicles, disintegrants, binders, coating agents, swelling agents, gdhants or lubricants, flavorings, sweeteners and solubihzers are used. Frequently used auxiliaries which may be mentioned are magnesium carbonate, titanium dioxide, lactose, mannitol and other sugars, talc, lactose, gelatin, starch, cellulose and its derivatives, animal and plant oils such as cod liver oil, sunflower, peanut or sesame oil, polyethylene glycol and solvents such as, for example, sterile water and mono- or polyhydric alcohols such as glycerol.

Preferably, the pharmaceutical preparations are prepared and administered in dose units, where each unit contains as active constituent a certain dose of the compound of the Formula (I) according to the invention. In the case of solid dose units such as tablets, capsules, coated tablets or suppositories, this dose can be approximately 1000 mg, but preferably approximately 50 to 300 mg and in the case of injection solutions in ampoule form approximately 300 mg, but preferably approximately 10 to 100 mg.

For the treatment of an adult patient weighing approximately 70 kg, depending on the efficacy of the compound according to Formula (I), daily doses of approximately 2 mg to 1000 mg of active substance, preferably approximately 50 mg to 500 mg, are indicated. Under certain circumstances, however, higher or lower daily doses may also be appropriate. The daily dose can be administered both by single administration in the form of an individual dose unit or else of a number of smaller dose units and by multiple administration of subdivided doses at certain intervals.

Compounds of the Formula (I) can be administered both as a monotherapy and in combination or together with all antithrombotics (anticoagulants and platelet
aggregation inhibitors), thrombolytics (plasminogen activators of any type), other profibrinolytically active substances, hypotensives, blood sugar regulators, lipid-lowering agents and antiarrhythmics

The inhibitory effectiveness of compounds of the present invention to the coagulation factors Xla, Vila, IXa, Xa, plasma kallkrein or thrombin, can be determined using a relevant purified serine protease, respectively, and an appropriate synthetic substrate

Pharmacological examples

Determination of inhibitory activity against factor IXa

Inhibitory activity against factor IXa was tested using the substrate SPECTROFLUOR FIXa (amencan diagnostica inc., 500 West Avenue, Stamford, CT 06902 USA, Pr No 299F) and human factor IXa (amencan diagnostica inc., Pr No 449b) Test substances dissolved in buffer A (50 mM ααα-α-tris (hydroxymethyl) methylamine (Tris), 100 mM NaCl, 5 mM CaCU, 15 % (v/v) ethylene glycol, pH 8.0) were mixed with factor IXa (2.0 µg/ml final concentration) The enzyme reaction was started by addition of SPECTROFLUOR FIXa (100 µM final concentration) After incubation for 60 minutes at room temperature, the reaction was stopped by the addition of 20 % (v/v) acetic acid solution, and then measured the fluorescence value (Excitation Wavelength 355nm, Emission Wavelength 460nm) in a microtiter plate reader (ARVO 1420 Multilabel Counter, PerkinElmer)

The IC₅₀ was calculated from a dilution series of the test substance with the aid of the software, Symix Assay Explorer (Symyx Technologies, Inc.)

Table 5 shows the results
In one embodiment, the compounds of the present invention were selective factor IXa inhibitors, i.e., selective for factor IXa over other coagulation factors, such as factor Xa.

Determination of inhibitory activity against factor Xa

This measuring was performed as well as Factor IXa method excluding the following conditions. As substrate and enzyme, SPECTROFLUOR FXa (American Diagnostica ME, Pr No 222F, 100 µM final concentration) and human factor Xa (American Diagnostica Inc., Pr No 526, 44 ng/ml final concentration) were used respectively. Test substances dissolved in buffer B (20 mM Tris, 200 mM NaCl, 2.5 mM CaCl\(_2\), pH 8.0)

Selectivity calculation

Selectivity for Factor IXa activity over Factor Xa activity can be determined by the following calculation (IC\(_{50}\) Factor Xa) / (IC\(_{50}\) Factor IXa). Similar calculations can be made for selectivity of compounds for Factor IXa compared to other coagulation factors.

These as well as other ways of minimizing contact between the components of

combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time by the same manner, will be readily apparent to those skilled in the art, once armed with the present disclosure.

The present invention is not to be limited in scope by the specific embodiments disclosed in the examples which are intended as illustrations of a few aspects of the invention and any embodiments that are functionally equivalent are within the scope of this invention. Indeed, various modifications of the invention in addition to those shown and described herein will become apparent to those skilled in the relevant art and are intended to fall within the scope of the appended claim.

A number of references have been cited, the entire disclosures of which have been incorporated herein in their entirety.

The compounds of the present invention may also be useful as inhibitors of additional serine protease, notably human thrombin, human plasma kalikrein and human plasmin. Because of their inhibitory action, these compounds are indicated for use in the prevention or treatment of physiological reactions, as it were "Conditions" including thromboembolic disorder (arterial cardiovascular thromboembolic disorders, venous cardiovascular thromboembolic disorders, thromboembolic disorders in the chambers of the heart, unstable angina, an acute coronary syndrome, atrial fibrillation, first myocardial infarction, recurrent myocardial infarction ischemic sudden death, transient ischemic attack, stroke, atherosclerosis, peripheral occlusive arterial disease, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, coronary arterial thrombosis, cerebral arterial thrombosis, cerebral embolism, kidney embolism, pulmonary embolism, and thrombosis resulting from (a) prosthetic valves or other implants, (b) indwelling catheters, (c) stents, (d) cardiopulmonary bypass, (e) hemodialysis, or (f) other procedures in which blood is exposed to an artificial surface.
that promotes thrombosis), blood coagulation, fibrinolysis, blood pressure regulation and inflammation, and wound healing catalyzed by the aforesaid class of enzymes. Specifically, the compounds have utility as drugs for the treatment of diseases arising from elevated thrombin activity of the aforementioned serine proteases, such as myocardial infarction, and as reagents used as anticoagulants in the processing of blood to plasma for diagnostic and other commercial purposes.

The compounds of the present invention can be administered alone or in combination with one or more additional therapeutic agents. These include other anti-coagulant or coagulation inhibitory agents, anti-inflammatory agents, thrombin inhibitors, thrombolytic or fibrinolytic agents, thrombin receptor (PAR-1) antagonist, a factor Vila inhibitor, factor Villa inhibitor, a factor IXa inhibitor different from the compound of claim 1, a factor Xa inhibitor, a factor XIa inhibitor, TAFI, and fibrinogen inhibitors.

The compounds are administered to a mammal in a therapeutically effective amount. By "therapeutically effective amount" it is meant an amount of a compound of the present invention that, when administered alone or in combination with an additional therapeutic agent to a mammal, is effective to treat (i.e., prevent, inhibit or ameliorate) the thromboembolic and/or inflammatory disease condition or treat the progression of the disease in a host.

The compounds of the invention are preferably administered alone to a mammal in a therapeutically effective amount. However, the compounds of the invention can also be administered in combination with an additional therapeutic agent, as defined below, to a mammal in a therapeutically effective amount. When administered in a combination, the combination of compounds in preferably, but not necessarily, a synergistic combination. Synergy, as described for example by Chou and Talalay, Adv...
Enzyme Regul 1984, 22, 27-55, occurs when the effect (in this case, inhibition of the
desired target) of the compounds when administered in combination is greater than the
additive effect of the compounds when administered alone as a single agent. In general,
a synergistic effect is most clearly demonstrated at suboptimal concentrations of the
compounds. Synergy can be in terms of lower cytotoxicity, increased anticoagulant
effect, or some other beneficial effect of the combination compared with the individual
components.

By "administered in combination" or "combination therapy" it is meant that
the compound of the present invention and one or more additional therapeutic agents
are administered concurrently to the mammal being treated. When administered in
combination each component may be administered at the same time or sequentially in
any order at different points in time. Thus, each component may be administered
separately but sufficiently closely in time so as to provide the desired therapeutic effect.

Compounds which can be administered in combination with the compounds of
the present invention include, but are not limited to, anticoagulants, anti-thrombin
agents, anti-platelet agents, fibrinolytics, hypolipidemic agents, antihypertensive agents,
and anti-ischemic agents.

Other anticoagulant agents (or coagulation inhibitory agents) that may be used
in combination with the compounds of this invention include warfarin, heparin (either
unfractionated heparin or any commercially available low molecular weight heparin,
for example LOVANO), aprotinin, synthetic pentasaccharide, direct acting thrombin
inhibitors including hirudin and argatroban, as well as other factor Vila inhibitor, Villa
inhibitor, IXa inhibitor, Xa inhibitor, Xla inhibitor, thrombin inhibitor, fibrinogen
inhibitors, TAFI, and known in the art Factor IXa inhibitors different from the
compounds of Formula (I) include synthetic active-site blocked competitive inhibitors,
oral inhibitors and RNA aptamers These are described in the previously cited Howard et al reference (Howard, EL, Becker KC, Rusconi, CP, Becker RC Factor IXa Inhibitors as Novel Anticoagulents *Arterioscler Thromb Vase Biol* 2007, 27 722-727 )

The term anti-platelet agents (or platelet inhibitory agents), as used herein, denotes agents that inhibit platelet function, for example, by inhibiting the aggregation, adhesion or granular secretion of platelets. Such agents include, but are not limited to, the various known non-steroidal anti-inflammatory drugs (NSAIDs) such as aspirin, ibuprofen, naproxen, sulindac, indomethacin, mefenamate, d Roximac, diclofenac, sulfinpyrazone, and piroxicam, including pharmaceutically acceptable salts or prodrugs thereof. Of the NSAIDs, aspirin (acetylsalicylic acid or ASA), and piroxicam are preferred. Other suitable platelet inhibitory agents include IIb/IIIa antagonists (e.g., tirofiban, eptifibatide, and abciximab), thromboxane-A2-receptor antagonists (e.g., etroban), thromboxane-A2-synthetase inhibitors, phosphodiesterase-III (PDE-III) inhibitors (e.g., dipyridamole, cilostazol), and PDE V inhibitors (such as sildenafil), and pharmaceutically acceptable salts or prodrugs thereof.

The term anti-platelet agents (or platelet inhibitory agents), as used herein, is also intended to include ADP (adenosine diphosphate) receptor antagonists, preferable antagonists of the purinergic receptors P2Y1 and P2Y12 with P2Y12 being even more preferred. Preferred P2Y12 receptor antagonists include ticlopidine and clopidogrel, including pharmaceutically acceptable salts or prodrugs thereof. Clopidogrel is an even more preferred agent. Ticlopidine and clopidogrel are also preferred compounds since they are known to be gentle on the gastro-intestinal tract in use. The compounds of the present invention may also be dosed in combination with aprotinin.

The term thrombin inhibitors (or anti-thrombin agents), as used herein, denotes
inhibitors of the serine protease thrombin. By inhibiting thrombin, various thrombin-mediated processes, such as thrombin-mediated platelet activation (that is, for example, the aggregation of platelets, and/or the granular secretion of plasminogen activator inhibitor-1 and/or serotonin), endothelial cell activation, inflammatory reactions, and/or fibrin formation are disrupted. A number of thrombin inhibitors are known to one of skill in the art and these inhibitors are contemplated to be used in combination with the present compounds. Such inhibitors include, but are not limited to, boroarginine derivatives, boropeptides, heparins, hirudin and argatroban, including pharmaceutically acceptable salts and prodrugs thereof. Boroarginine derivatives and boropeptides include N-acetyl and peptide derivatives of boronic acid, such as C-terminal alpha-aminoboronic acid derivatives of lysine, ornithine, arginine, homoarginine and corresponding isothiourometh analogs thereof. The term “hirudin,” as used herein, includes suitable derivatives or analogs of hirudin, referred to herein as hirulogs, such as disulfatohirudin.

The term “thrombin receptor antagonists,” also known as protease activated receptor (PAR) antagonists or PAR-1 antagonists, are useful in the treatment of thrombotic, inflammatory, atherosclerotic and fibroproliferative disorders, as well as other disorders in which thrombin and its receptor play a pathological role.

Thrombin receptor antagonist peptides have been identified based on structure-activity studies involving substitutions of amino acids on thrombin receptors. In Bernatowicz et al, *J Med Chem.*, vol 39, pp 4879-4887 (1996), tetra-and pentapeptides are disclosed as being potent thrombin receptor antagonists, for example N-trans-cinnamoyl-p-fluoroPhe-p-guanidinoPhe-Leu-Arg-NH2 and N-trans-cinnamoyl-p-fluoroPhe-p guanidinoPhe Leu-Arg-Arg-NH2. Peptide thrombin receptor antagonists are also disclosed in WO 94/03479, published Feb 17.
Substituted tricyclic thrombin receptor antagonists are disclosed in U.S. Pat Nos 6,063,847, 6,326,380 and WO 01/96330 and 10/271,715.

The term thrombolytic (or fibrinolytic) agents (or thrombolytics or fibrinolytics), as used herein, denotes agents that lyse blood clots (thrombi). Such agents include tissue plasminogen activator (TPA, natural or recombinant) and modified forms thereof, anistreplase, urokinase, streptokinase, tenecteplase (TNK), lanoteplase (nPA), factor Vila inhibitors, PAI-I inhibitors (i.e., macOvators of tissue plasminogen activator inhibitors), alpha-2-antiplasmin inhibitors, and amsoylated plasminogen streptokinase activator complexes, including pharmaceutically acceptable salts or prodrugs thereof. The term amstreplase, as used herein, refers to amsoylated plasminogen streptokinase activator complexes, as described, for example, in European Patent Application No 028,489, the disclosure of which is hereby incorporated herein by reference herein. The term urokinase, as used herein, is intended to denote both dual and single chain urokinase, the latter also being referred to herein as prourokinase.

Examples of suitable anti-arrhythmic agents for use in combination with the present compounds include Class I agents (such as propafenone), Class II agents (such as carvedilol and propranolol), Class III agents (such as sotalol, doftelide, aminodarone, azimilide and ibutilide), Class IV agents (such as ditzazem and verapamil), K+ channel openers such as IAc inhibitors, and IKur inhibitors (e.g., compounds such as those disclosed in WOO 1/40231).

The term antihypertensive agents, as used herein, include alpha adrenergic
