FIELD OF THE INVENTION

[0003] The present invention relates to compositions, methods and processes for the design, preparation, manufacture, use and/or formulation of adeno-associated virus capsids for improved biodistribution.

BACKGROUND OF THE INVENTION

[0004] Adeno-associated viral (AAV) vectors are a promising candidate for therapeutic gene delivery and have proven safe and efficacious in clinical trial.

[0005] Delivery of AAV to some systems in the body has proven to be particularly challenging, requiring invasive surgeries for sufficient levels of gene transfer. For some body systems, intravenous delivery has historically resulted in limited gene transfer, in part due to inefficient transduction into cells. There remains a need in the art for AAV vectors that may be administered by intravenous delivery and yet are able to efficiently target regions critical for treating a multitude of diseases.

[0006] One example of a system where delivery is challenging is the central nervous system. Delivery of AAV to regions of the central nervous system (CNS) has proven to be particularly challenging, requiring invasive surgeries for sufficient levels of gene transfer (See e.g., Bevan et al. Mol Ther. 2011 Nov; 19(11): 1971–1980). Intravenous delivery has

historically resulted in limited gene transfer to the CNS, in part due to the presence of the blood brain barrier (BBB). There remains a need in the art for AAV vectors that may be administered by intravenous delivery and yet are able to efficiently cross the blood brain barrier and target regions of the CNS critical for treating a multitude of CNS diseases.

[0007] Another example of a system where delivery is challenging is the cardiovascular system. Delivery of AAV to the cardiovascular system has proven to be particularly challenging, requiring invasive surgeries for sufficient levels of gene transfer. Intravenous delivery has historically resulted in limited gene transfer to the cardiovascular system, in part due to inefficient transduction into cardiomyocytes. There remains a need in the art for AAV vectors that may be administered by intravenous delivery and yet are able to efficiently target regions of the cardiovascular system critical for treating a multitude of diseases.

[0008] The present invention addresses this need by providing novel AAV particles with engineered capsid proteins that allow for efficient transduction of CNS tissues following intravenous delivery. Further, the viral genomes of these AAV particles may be altered to suit the needs of any number of CNS diseases, providing platform capsids for crossing the blood brain barrier and targeting of CNS tissues.

I. COMPOSITIONS OF THE INVENTION

Adeno-associated viruses (AAVs) and AAV particles

[0028] Viruses of the Parvoviridae family are small non-enveloped icosahedral capsid viruses characterized by a single stranded DNA genome. Parvoviridae family viruses consist of two subfamilies: Parvovirinae, which infect vertebrates, and Densovirinae, which infect invertebrates. Due to its relatively simple structure, easily manipulated using standard molecular biology techniques, this virus family is useful as a biological tool. The genome of the virus may be modified to contain a minimum of components for the assembly of a functional recombinant virus, or viral particle, which is loaded with or engineered to express or deliver a desired payload, which may be delivered to a target cell, tissue, organ, or organism.

[0029] The parvoviruses and other members of the Parvoviridae family are generally described in Kenneth I. Berns, "Parvoviridae: The Viruses and Their Replication," Chapter 69 in FIELDS VIROLOGY (3d Ed. 1996), the contents of which are incorporated by reference in their entirety.

[0030] The Parvoviridae family comprises the Dependovirus genus which includes adeno-associated viruses (AAV) capable of replication in vertebrate hosts including, but not limited to, human, primate, bovine, canine, equine, and ovine species.

[0031] The AAV viral genome is a linear, single-stranded DNA (ssDNA) molecule approximately 5,000 nucleotides (nt) in length. The AAV viral genome can comprise a payload region and at least one inverted terminal repeat (ITR) or ITR region. ITRs traditionally flank the coding nucleotide sequences for the non-structural proteins (encoded by Rep genes) and the structural proteins (encoded by capsid genes or Cap genes). While not wishing to be bound by theory, an AAV viral genome typically comprises two ITR sequences. The AAV vector genome comprises a characteristic T-shaped hairpin structure defined by the self-complementary terminal 145 nt of the 5' and 3' ends of the ssDNA which form an energetically stable double stranded region. The double stranded hairpin structures comprise multiple functions including, but not limited to, acting as an origin for DNA replication by functioning as primers for the endogenous DNA polymerase complex of the host viral replication cell.

[0032] In addition to the encoded heterologous payload, AAV particles may comprise the viral genome, in whole or in part, of any naturally occurring and/or recombinant AAV serotype nucleotide sequence or variant. AAV variants may have sequences of significant homology at the nucleic acid (genome or capsid) and amino acid levels (capsids), to produce

constructs which are generally physical and functional equivalents, replicate by similar mechanisms, and assemble by similar mechanisms. Chiorini et al., J. Vir. 71: 6823-33(1997); Srivastava et al., J. Vir. 45:555-64 (1983); Chiorini et al., J. Vir. 73:1309-1319 (1999); Rutledge et al., J. Vir. 72:309-319 (1998); and Wu et al., J. Vir. 74: 8635-47 (2000), the contents of each of which are incorporated herein by reference in their entirety.

[0033] In one embodiment, AAV particles of the present invention are recombinant AAV viral vectors which are replication defective, lacking sequences encoding functional Rep and Cap proteins within their viral genome. These defective AAV particles may lack most or all parental coding sequences and essentially carry only one or two AAV ITR sequences and the nucleic acid of interest for delivery to a cell, a tissue, an organ or an organism.

[0034] In one embodiment, the viral genome of the AAV particles of the present invention comprise at least one control element which provides for the replication, transcription and translation of a coding sequence encoded therein. Not all of the control elements need always be present as long as the coding sequence is capable of being replicated, transcribed and/or translated in an appropriate host cell. Non-limiting examples of expression control elements include sequences for transcription initiation and/or termination, promoter and/or enhancer sequences, efficient RNA processing signals such as splicing and polyadenylation signals, sequences that stabilize cytoplasmic mRNA, sequences that enhance translation efficacy (e.g., Kozak consensus sequence), sequences that enhance protein stability, and/or sequences that enhance protein processing and/or secretion.

[0035] According to the present invention, AAV particles for use in therapeutics and/or diagnostics comprise a virus that has been distilled or reduced to the minimum components necessary for transduction of a nucleic acid payload or cargo of interest. In this manner, AAV particles are engineered as vehicles for specific delivery while lacking the deleterious replication and/or integration features found in wild-type viruses.

[0036] AAV particles of the present invention may be produced recombinantly and may be based on adeno-associated virus (AAV) parent or reference sequences. As used herein, a "vector" is any molecule or moiety which transports, transduces or otherwise acts as a carrier of a heterologous molecule such as the nucleic acids described herein.

[0037] In addition to single stranded AAV viral genomes (e.g., ssAAVs), the present invention also provides for self-complementary AAV (scAAVs) viral genomes. scAAV vector genomes contain DNA strands which anneal together to form double stranded DNA. By skipping second strand synthesis, scAAVs allow for rapid expression in the cell.

[0038] In one embodiment, the AAV particle of the present invention is an scAAV.

[0039] In one embodiment, the AAV particle of the present invention is an ssAAV.

[0040] Methods for producing and/or modifying AAV particles are disclosed in the art such as pseudotyped AAV particles (PCT Patent Publication Nos. WO200028004; WO200123001; WO2004112727; WO 2005005610 and WO 2005072364, the contents of each of which are incorporated herein by reference in their entirety).

[0041] AAV particles may be modified to enhance the efficiency of delivery. Such modified AAV particles can be packaged efficiently and be used to successfully infect the target cells at high frequency and with minimal toxicity. In some embodiments the capsids of the AAV particles are engineered according to the methods described in US Patent Application Publication NO.US 20130195801, the contents of which are incorporated herein by reference in their entirety.

[0042] In one embodiment, the AAV particles comprising a payload region encoding the polypeptides of the invention may be introduced into mammalian cells.

[0043] AAV serotypes

Viral Genome Component: Inverted Terminal Repeats (ITRs)

[0104] The AAV particles of the present invention comprise a viral genome with at least one ITR region and a payload region. In one embodiment, the viral genome has two ITRs. These two ITRs flank the payload region at the 5' and 3' ends. The ITRs function as origins of replication comprising recognition sites for replication. ITRs comprise sequence regions which can be complementary and symmetrically arranged. Low expression in all brain regions was found by Xu et al. (Gene Therapy 2001, 8, 1323-1332; the contents of which are herein incorporated by reference in their entirety) when NFL and NFH promoters were used as compared to the CMV-lacZ, CMV-luc, EF, GFAP, hENK, nAChR, PPE, PPE + wpre, NSE (0.3 kb), NSE (1.8 kb) and NSE (1.8 kb + wpre). [0140] In one embodiment, the viral genome comprises an engineered promoter.

[0141] In another embodiment, the viral genome comprises a promoter from a naturally expressed protein.

[0142] Viral Genome Component: Untranslated Regions (UTRs)

[0143] By definition, wild type untranslated regions (UTRs) of a gene are transcribed but not translated. Generally, the 5' UTR starts at the transcription start site and ends at the start codon and the 3' UTR starts immediately following the stop codon and continues until the termination signal for transcription.

[0144] Features typically found in abundantly expressed genes of specific target organs may be engineered into UTRs to enhance the stability and protein production. As a non-limiting example, a 5' UTR from mRNA normally expressed in the liver (e.g., albumin,

serum amyloid A, Apolipoprotein A/B/E, transferrin, alpha fetoprotein, erythropoietin, or Factor VIII) may be used in the viral genomes of the AAV particles of the invention to enhance expression in hepatic cell lines or liver.

[0145] While not wishing to be bound by theory, wild-type 5′ untranslated regions (UTRs) include features which play roles in translation initiation. Kozak sequences, which are commonly known to be involved in the process by which the ribosome initiates translation of many genes, are usually included in 5' UTRs. Kozak sequences have the consensus CCR(A/G)CCAUGG, where R is a purine (adenine or guanine) three bases upstream of the start codon (ATG), which is followed by another 'G'.

[0146] In one embodiment, the 5'UTR in the viral genome includes a Kozak sequence.

[0147] In one embodiment, the 5'UTR in the viral genome does not include a Kozak sequence.

[0148] While not wishing to be bound by theory, wild-type 3′ UTRs are known to have stretches of Adenosines and Uridines embedded therein. These AU rich signatures are particularly prevalent in genes with high rates of turnover. Based on their sequence features and functional properties, the AU rich elements (AREs) can be separated into three classes (Chen et al, 1995, the contents of which are herein incorporated by reference in its entirety): Class I AREs, such as, but not limited to, c-Myc and MyoD, contain several dispersed copies of an AUUUA motif within U-rich regions. Class II AREs, such as, but not limited to, GM-CSF and TNF-a, possess two or more overlapping UUAUUUA(U/A)(U/A) nonamers. Class III ARES, such as, but not limited to, c-Jun and Myogenin, are less well defined. These U rich regions do not contain an AUUUA motif. Most proteins binding to the AREs are known to destabilize the messenger, whereas members of the ELAV family, most notably HuR, have been documented to increase the stability of mRNA. HuR binds to AREs of all the three classes. Engineering the HuR specific binding sites into the 3′ UTR of nucleic acid molecules will lead to HuR binding and thus, stabilization of the message *in vivo*.

[0149] Introduction, removal or modification of 3′ UTR AU rich elements (AREs) can be used to modulate the stability of polynucleotides. When engineering specific polynucleotides, e.g., payload regions of viral genomes, one or more copies of an ARE can be introduced to make polynucleotides less stable and thereby curtail translation and decrease production of the resultant protein. Likewise, AREs can be identified and removed or mutated to increase the intracellular stability and thus increase translation and production of the resultant protein.

[0150] In one embodiment, the 3' UTR of the viral genome may include an oligo(dT) sequence for templated addition of a poly-A tail.

[0151] In one embodiment, the viral genome may include at least one miRNA seed, binding site or full sequence. microRNAs (or miRNA or miR) are 19-25 nucleotide noncoding RNAs that bind to the sites of nucleic acid targets and down-regulate gene expression either by reducing nucleic acid molecule stability or by inhibiting translation. A microRNA sequence comprises a "seed" region, i.e., a sequence in the region of positions 2-8 of the mature microRNA, which sequence has perfect Watson-Crick complementarity to the miRNA target sequence of the nucleic acid.

[0152] In one embodiment, the viral genome may be engineered to include, alter or remove at least one miRNA binding site, full sequence or seed region.

[0153] Any UTR from any gene known in the art may be incorporated into the viral genome of the AAV particle. These UTRs, or portions thereof, may be placed in the same orientation as in the gene from which they were selected or they may be altered in orientation or location. In one embodiment, the UTR used in the viral genome of the AAV particle may be inverted, shortened, lengthened, made with one or more other 5′ UTRs or 3′ UTRs known in the art. As used herein, the term "altered" as it relates to a UTR, means that the UTR has been changed in some way in relation to a reference sequence. For example, a 3′ or 5′ UTR may be altered relative to a wild type or native UTR by the change in orientation or location as taught above or may be altered by the inclusion of additional nucleotides, deletion of nucleotides, swapping or transposition of nucleotides.

[0154] In one embodiment, the viral genome of the AAV particle comprises at least one artificial UTR which is not a variant of a wild type UTR.

[0155] In one embodiment, the viral genome of the AAV particle comprises UTRs which have been selected from a family of transcripts whose proteins share a common function, structure, feature or property.

The nature of the polypeptides and variants

[0214] Amino acid sequences encoded by payload regions of the viral genomes of the invention may be translated as a whole polypeptide, a plurality of polypeptides or fragments of polypeptides, which independently may be encoded by one or more nucleic acids, fragments of nucleic acids or variants of any of the aforementioned. As used herein, "polypeptide" means a polymer of amino acid residues (natural or unnatural) linked together

most often by peptide bonds. The term, as used herein, refers to proteins, polypeptides, and peptides of any size, structure, or function. In some instances, the polypeptide encoded is smaller than about 50 amino acids and the polypeptide is then termed a peptide. If the polypeptide is a peptide, it will be at least about 2, 3, 4, or at least 5 amino acid residues long. Thus, polypeptides include gene products, naturally occurring polypeptides, synthetic polypeptides, homologs, orthologs, paralogs, fragments and other equivalents, variants, and analogs of the foregoing. A polypeptide may be a single molecule or may be a multi-molecular complex such as a dimer, trimer or tetramer. They may also comprise single chain or multichain polypeptides and may be associated or linked. The term polypeptide may also apply to amino acid polymers in which one or more amino acid residues are an artificial chemical analogue of a corresponding naturally occurring amino acid.

[0215] The term “polypeptide variant” refers to molecules which differ in their amino acid sequence from a native or reference sequence. The amino acid sequence variants may possess substitutions, deletions, and/or insertions at certain positions within the amino acid sequence, as compared to a native or reference sequence. Ordinarily, variants will possess at least about 50% identity (homology) to a native or reference sequence, and preferably, they will be at least about 80%, more preferably at least about 90% identical (homologous) to a native or reference sequence.

[0216] In some embodiments “variant mimics” are provided. As used herein, the term “variant mimic” is one which contains one or more amino acids which would mimic an activated sequence. For example, glutamate may serve as a mimic for phosphoro-threonine and/or phosphoro-serine. Alternatively, variant mimics may result in deactivation or in an inactivated product containing the mimic, e.g., phenylalanine may act as an inactivating substitution for tyrosine; or alanine may act as an inactivating substitution for serine.

[0217] The term "amino acid sequence variant" refers to molecules with some differences in their amino acid sequences as compared to a native or starting sequence. The amino acid sequence variants may possess substitutions, deletions, and/or insertions at certain positions within the amino acid sequence. “Native” or “starting” sequence should not be confused with a wild type sequence. As used herein, a native or starting sequence is a relative term referring to an original molecule against which a comparison may be made. “Native” or “starting” sequences or molecules may represent the wild-type (that sequence found in nature) but do not have to be the wild-type sequence.

[0218] Ordinarily, variants will possess at least about 70% homology to a native sequence, and preferably, they will be at least about 80%, more preferably at least about 90% homologous to a native sequence. "Homology" as it applies to amino acid sequences is defined as the percentage of residues in the candidate amino acid sequence that are identical with the residues in the amino acid sequence of a second sequence after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent homology. Methods and computer programs for the alignment are well known in the art. It is understood that homology depends on a calculation of percent identity but may differ in value due to gaps and penalties introduced in the calculation.

[0219] By "homologs" as it applies to amino acid sequences is meant the corresponding sequence of other species having substantial identity to a second sequence of a second species.

[0220] "Analogs" is meant to include polypeptide variants which differ by one or more amino acid alterations, e.g., substitutions, additions or deletions of amino acid residues that still maintain the properties of the parent polypeptide.

[0221] Sequence tags or amino acids, such as one or more lysines, can be added to the peptide sequences of the invention (e.g., at the N-terminal or C-terminal ends). Sequence tags can be used for peptide purification or localization. Lysines can be used to increase peptide solubility or to allow for biotinylation. Alternatively, amino acid residues located at the carboxy and amino terminal regions of the amino acid sequence of a peptide or protein may optionally be deleted providing for truncated sequences. Certain amino acids (e.g., C-terminal or N-terminal residues) may alternatively be deleted depending on the use of the sequence, as for example, expression of the sequence as part of a larger sequence which is soluble, or linked to a solid support.

[0222] "Substitutional variants" when referring to proteins are those that have at least one amino acid residue in a native or starting sequence removed and a different amino acid inserted in its place at the same position. The substitutions may be single, where only one amino acid in the molecule has been substituted, or they may be multiple, where two or more amino acids have been substituted in the same molecule.

[0223] As used herein the term "conservative amino acid substitution" refers to the substitution of an amino acid that is normally present in the sequence with a different amino acid of similar size, charge, or polarity. Examples of conservative substitutions include the substitution of a non-polar (hydrophobic) residue such as isoleucine, valine and leucine for

another non-polar residue. Likewise, examples of conservative substitutions include the substitution of one polar (hydrophilic) residue for another such as between arginine and lysine, between glutamine and asparagine, and between glycine and serine. Additionally, the substitution of a basic residue such as lysine, arginine or histidine for another, or the substitution of one acidic residue such as aspartic acid or glutamic acid for another acidic residue are additional examples of conservative substitutions. Examples of non-conservative substitutions include the substitution of a non-polar (hydrophobic) amino acid residue such as isoleucine, valine, leucine, alanine, methionine for a polar (hydrophilic) residue such as cysteine, glutamine, glutamic acid or lysine and/or a polar residue for a non-polar residue.

[0224] "Insertional variants" when referring to proteins are those with one or more amino acids inserted immediately adjacent to an amino acid at a particular position in a native or starting sequence. "Immediately adjacent" to an amino acid means connected to either the alpha-carboxy or alpha-amino functional group of the amino acid.

[0225] "Deletional variants" when referring to proteins, are those with one or more amino acids in the native or starting amino acid sequence removed. Ordinarily, deletional variants will have one or more amino acids deleted in a particular region of the molecule.

[0226] As used herein, the term "derivative" is used synonymously with the term "variant" and refers to a molecule that has been modified or changed in any way relative to a reference molecule or starting molecule. In some embodiments, derivatives include native or starting proteins that have been modified with an organic proteinaceous or non-proteinaceous derivatizing agent, and post-translational modifications. Covalent modifications are traditionally introduced by reacting targeted amino acid residues of the protein with an organic derivatizing agent that is capable of reacting with selected side-chains or terminal residues, or by harnessing mechanisms of post-translational modifications that function in selected recombinant host cells. The resultant covalent derivatives are useful in programs directed at identifying residues important for biological activity, for immunoassays, or for the preparation of anti-protein antibodies for immunoaffinity purification of the recombinant glycoprotein. Such modifications are within the ordinary skill in the art and are performed without undue experimentation.

[0227] Certain post-translational modifications are the result of the action of recombinant host cells on the expressed polypeptide. Glutaminyl and asparaginyl residues are frequently post-translationally deamidated to the corresponding glutamyl and aspartyl residues.

Alternatively, these residues are deamidated under mildly acidic conditions. Either form of these residues may be present in the proteins used in accordance with the present invention.

[0228] Other post-translational modifications include hydroxylation of proline and lysine, phosphorylation of hydroxyl groups of seryl or threonyl residues, methylation of the alpha-amino groups of lysine, arginine, and histidine side chains (T. E. Creighton, Proteins: Structure and Molecular Properties, W.H. Freeman & Co., San Francisco, pp. 79-86 (1983)).

[0229] "Features" when referring to proteins are defined as distinct amino acid sequence-based components of a molecule. Features of the proteins of the present invention include surface manifestations, local conformational shape, folds, loops, half-loops, domains, half-domains, sites, termini or any combination thereof.

[0230] As used herein when referring to proteins the term "surface manifestation" refers to a polypeptide based component of a protein appearing on an outermost surface.

[0231] As used herein when referring to proteins the term "local conformational shape" means a polypeptide based structural manifestation of a protein which is located within a definable space of the protein.

[0232] As used herein when referring to proteins the term "fold" means the resultant conformation of an amino acid sequence upon energy minimization. A fold may occur at the secondary or tertiary level of the folding process. Examples of secondary level folds include beta sheets and alpha helices. Examples of tertiary folds include domains and regions formed due to aggregation or separation of energetic forces. Regions formed in this way include hydrophobic and hydrophilic pockets, and the like.

[0233] As used herein the term "turn" as it relates to protein conformation means a bend which alters the direction of the backbone of a peptide or polypeptide and may involve one, two, three or more amino acid residues.

[0234] As used herein when referring to proteins the term "loop" refers to a structural feature of a peptide or polypeptide which reverses the direction of the backbone of a peptide or polypeptide and comprises four or more amino acid residues. Oliva et al. have identified at least 5 classes of protein loops (J. Mol Biol, 266 (4): 814-830; 1997).

[0235] As used herein when referring to proteins the term "half-loop" refers to a portion of an identified loop having at least half the number of amino acid residues as the loop from which it is derived. It is understood that loops may not always contain an even number of amino acid residues. Therefore, in those cases where a loop contains or is identified to comprise an odd number of amino acids, a half-loop of the odd-numbered loop will comprise

the whole number portion or next whole number portion of the loop (number of amino acids of the loop/2+/-0.5 amino acids). For example, a loop identified as a 7 amino acid loop could produce half-loops of 3 amino acids or 4 amino acids (7/2=3.5+/-0.5 being 3 or 4).

[0236] As used herein when referring to proteins the term "domain" refers to a motif of a polypeptide having one or more identifiable structural or functional characteristics or properties (e.g., binding capacity, serving as a site for protein-protein interactions).

[0237] As used herein when referring to proteins the term "half-domain" means portion of an identified domain having at least half the number of amino acid residues as the domain from which it is derived. It is understood that domains may not always contain an even number of amino acid residues. Therefore, in those cases where a domain contains or is identified to comprise an odd number of amino acids, a half-domain of the odd-numbered domain will comprise the whole number portion or next whole number portion of the domain (number of amino acids of the domain/2+/-0.5 amino acids). For example, a domain identified as a 7 amino acid domain could produce half-domains of 3 amino acids or 4 amino acids (7/2=3.5+/-0.5 being 3 or 4). It is also understood that sub-domains may be identified within domains or half-domains, these subdomains possessing less than all of the structural or functional properties identified in the domains or half domains from which they were derived. It is also understood that the amino acids that comprise any of the domain types herein need not be contiguous along the backbone of the polypeptide (i.e., nonadjacent amino acids may fold structurally to produce a domain, half-domain or subdomain).

[0238] As used herein when referring to proteins the terms "site" as it pertains to amino acid based embodiments is used synonymous with "amino acid residue" and "amino acid side chain". A site represents a position within a peptide or polypeptide that may be modified, manipulated, altered, derivatized or varied within the polypeptide based molecules of the present invention.

[0239] As used herein the terms "termini or terminus" when referring to proteins refers to an extremity of a peptide or polypeptide. Such extremity is not limited only to the first or final site of the peptide or polypeptide but may include additional amino acids in the terminal regions. The polypeptide based molecules of the present invention may be characterized as having both an N-terminus (terminated by an amino acid with a free amino group (NH2)) and a C-terminus (terminated by an amino acid with a free carboxyl group (COOH)). Proteins of the invention are in some cases made up of multiple polypeptide chains brought together by disulfide bonds or by non-covalent forces (multimers, oligomers). These sorts of proteins will

have multiple N- and C-termini. Alternatively, the termini of the polypeptides may be modified such that they begin or end, as the case may be, with a non-polypeptide based moiety such as an organic conjugate.

[0240] Once any of the features have been identified or defined as a component of a molecule of the invention, any of several manipulations and/or modifications of these features may be performed by moving, swapping, inverting, deleting, randomizing or duplicating. Furthermore, it is understood that manipulation of features may result in the same outcome as a modification to the molecules of the invention. For example, a manipulation which involves deleting a domain would result in the alteration of the length of a molecule just as modification of a nucleic acid to encode less than a full length molecule would.

[0241] Modifications and manipulations can be accomplished by methods known in the art such as site directed mutagenesis. The resulting modified molecules may then be tested for activity using in vitro or in vivo assays such as those described herein or any other suitable screening assay known in the art.

Payloads: Modulatory Polynucleotides as Payloads

[0277] The AAV particles of the present disclosure comprise at least one payload region comprising one or more modulatory polynucleotides, e.g., RNA or DNA molecules as therapeutic agents. Exemplary modulatory polynucleotides may be miRNAs, dsRNA and siRNA duplexes. RNA interference mediated gene silencing can specifically inhibit targeted gene expression. The present invention then provides small double stranded RNA (dsRNA) molecules (small interfering RNA, siRNA) targeting a gene of interest, pharmaceutical compositions comprising such siRNAs, as well as processes of their design. The present invention also provides methods of their use for inhibiting gene expression and protein production of gene of interest, for treating a neurological disease.

[0278] The present invention provides small interfering RNA (siRNA) duplexes (and modulatory polynucleotides encoding them) that target the mRNA of a gene of interest to interfere with the gene expression and/or protein production.

[0279] In one embodiment, the siRNA duplexes of the present invention may target the gene of interest along any segment of their respective nucleotide sequence.

[0280] In one embodiment, the siRNA duplexes of the present invention may target the gene of interest at the location of a single-nucleotide polymorphism (SNP) or variant within the nucleotide sequence.

[0281] In some embodiments, a nucleic acid sequence encoding such siRNA molecules, or a single strand of the siRNA molecules, is inserted into the viral genome of the AAV particle and introduced into cells, specifically cells in the central nervous system.

[0282] AAV particles have been investigated for siRNA delivery because of several unique features. Non-limiting examples of the features include (i) the ability to infect both dividing and non-dividing cells; (ii) a broad host range for infectivity, including human cells; (iii) wild-type AAV has not been associated with any disease and has not been shown to replicate in infected cells; (iv) the lack of cell-mediated immune response against the vector and (v) the non-integrative nature in a host chromosome thereby reducing potential for long-term expression. Moreover, infection with AAV particles has minimal influence on changing the pattern of cellular gene expression (Stilwell and Samulski et al., *Biotechniques*, 2003, 34, 148-150; the contents of which are incorporated herein by reference in their entirety).

[0283] The encoded siRNA duplex of the present invention contains an antisense strand and a sense strand hybridized together forming a duplex structure, wherein the antisense strand is complementary to the nucleic acid sequence of the targeted gene, and wherein the sense strand is homologous to the nucleic acid sequence of the targeted gene. In some

aspects, the 5'end of the antisense strand has a 5' phosphate group and the 3'end of the sense strand contains a 3'hydroxyl group. In other aspects, there are none, one or 2 nucleotide overhangs at the 3'end of each strand.

[0284] According to the present invention, each strand of the siRNA duplex targeting a gene of interest is about 19 to 25, 19 to 24 or 19 to 21 nucleotides in length, preferably about 19 nucleotides, 20 nucleotides, 21 nucleotides, 22 nucleotides, 23 nucleotides, 24 nucleotides, or 25 nucleotides in length. In some aspects, the siRNAs may be unmodified RNA molecules.

[0285] In other aspects, the siRNAs may contain at least one modified nucleotide, such as base, sugar or backbone modification.

[0286] In one embodiment, an siRNA or dsRNA includes at least two sequences that are complementary to each other. The dsRNA includes a sense strand having a first sequence and an antisense strand having a second sequence. The antisense strand includes a nucleotide sequence that is substantially complementary to at least part of an mRNA encoding the target gene, and the region of complementarity is 30 nucleotides or less, and at least 15 nucleotides in length. Generally, the dsRNA is 19 to 25, 19 to 24 or 19 to 21 nucleotides in length. In some embodiments, the dsRNA is from about 15 to about 25 nucleotides in length, and in other embodiments the dsRNA is from about 25 to about 30 nucleotides in length. In some embodiments, the dsRNA is about 15 nucleotides in length, 16 nucleotides in length, 17 nucleotides in length, 18 nucleotides in length, 19 nucleotides, 20 nucleotides, 21 nucleotides, 22 nucleotides, 23 nucleotides, 24 nucleotides in length, 25 nucleotides in length, 26 nucleotides in length, 27 nucleotides in length, 28 nucleotides in length, 29 nucleotides in length, or 30 nucleotides in length.

[0287] The dsRNA, whether directly administered or encoded in an expression vector upon contacting with a cell expressing the target protein, inhibits the expression of the protein by at least 10%, at least 20%, at least 25%, at least 30%, at least 35% or at least 40% or more, such as when assayed by a method as described herein.

[0288] According to the present invention, the siRNA duplexes or dsRNA molecules s are designed and tested for their ability in reducing expression of the target gene (e.g., mRNA levels of the target gene) in cultured cells. siRNA design tools are available in the art. Any commercial softwares may be used to design the siRNA duplexes against a gene of interest.

[0289] According to the present invention, AAV particles comprising a payload region having the nucleic acids of the siRNA duplexes, one strand of the siRNA duplex or the dsRNA targeting a gene of interest are produced, the AAV particle serotypes may be or may

siRNA Molecules

[0308] The present invention relates to RNA interference (RNAi) induced inhibition of gene expression for treating neurological disorders. Provided herein are siRNA duplexes or encoded dsRNA that target a gene of interest (referred to herein collectively as "siRNA molecules"). Such siRNA duplexes or encoded dsRNA can reduce or silence target gene expression in cells, for example, astrocytes or microglia, cortical, hippocampal, entorhinal, thalamic, sensory or motor neurons, thereby, ameliorating symptoms of neurological disease.

[0309] RNAi (also known as post-transcriptional gene silencing (PTGS), quelling, or co-suppression) is a post-transcriptional gene silencing process in which RNA molecules, in a sequence specific manner, inhibit gene expression, typically by causing the destruction of specific mRNA molecules. The active components of RNAi are short/small double stranded RNAs (dsRNAs), called small interfering RNAs (siRNAs), that typically contain 15-30 nucleotides (e.g., 19 to 25, 19 to 24 or 19-21 nucleotides) and 2 nucleotide 3' overhangs and that match the nucleic acid sequence of the target gene. These short RNA species may be

naturally produced *in vivo* by Dicer-mediated cleavage of larger dsRNAs and they are functional in mammalian cells.

[0310] Naturally expressed small RNA molecules, named microRNAs (miRNAs), elicit gene silencing by regulating the expression of mRNAs. The miRNAs containing RNA Induced Silencing Complex (RISC) targets mRNAs presenting a perfect sequence complementarity with nucleotides 2-7 in the 5' region of the miRNA which is called the seed region, and other base pairs with its 3' region. miRNA mediated down regulation of gene expression may be caused by cleavage of the target mRNAs, translational inhibition of the target mRNAs, or mRNA decay. miRNA targeting sequences are usually located in the 3'-UTR of the target mRNAs. A single miRNA may target more than 100 transcripts from various genes, and one mRNA may be targeted by different miRNAs.

[0311] siRNA duplexes or dsRNA targeting a specific mRNA may be designed and synthesized *in vitro* and introduced into cells for activating RNAi processes. Elbashir et al. demonstrated that 21-nucleotide siRNA duplexes (termed small interfering RNAs) were capable of effecting potent and specific gene knockdown without inducing immune response in mammalian cells (Elbashir SM et al., *Nature*, 2001, 411, 494-498). Since this initial report, post-transcriptional gene silencing by siRNAs quickly emerged as a powerful tool for genetic analysis in mammalian cells and has the potential to produce novel therapeutics.

[0312] *In vitro* synthetized siRNA molecules may be introduced into cells in order to activate RNAi. An exogenous siRNA duplex, when it is introduced into cells, similar to the endogenous dsRNAs, can be assembled to form the RNA Induced Silencing Complex (RISC), a multiunit complex that facilitates searching through the genome for RNA sequences that are complementary to one of the two strands of the siRNA duplex (i.e., the antisense strand). During the process, the sense strand (or passenger strand) of the siRNA is lost from the complex, while the antisense strand (or guide strand) of the siRNA is matched with its complementary RNA. In particular, the targets of siRNA containing RISC complex are mRNAs presenting a perfect sequence complementarity. Then, siRNA mediated gene silencing occurs, cleaving, releasing and degrading the target.

[0313] The siRNA duplex comprised of a sense strand homologous to the target mRNA and an antisense strand that is complementary to the target mRNA offers much more advantage in terms of efficiency for target RNA destruction compared to the use of the single strand (ss)-siRNAs (e.g. antisense strand RNA or antisense oligonucleotides). In many cases

it requires higher concentration of the ss-siRNA to achieve the effective gene silencing potency of the corresponding duplex.

[0314] Any of the foregoing molecules may be encoded by an AAV particle or viral genome.

Design and Sequences of siRNA duplexes

[0320] Some guidelines for designing siRNAs have been proposed in the art. These guidelines generally recommend generating a 19-nucleotide duplexed region, symmetric 2-3 nucleotide 3'overhangs, 5-phosphate and 3-hydroxyl groups targeting a region in the gene to be silenced. Other rules that may govern siRNA sequence preference include, but are not limited to, (i) A/U at the 5′ end of the antisense strand; (ii) G/C at the 5′ end of the sense strand; (iii) at least five A/U residues in the 5′ terminal one-third of the antisense strand; and (iv) the absence of any GC stretch of more than 9 nucleotides in length. In accordance with such consideration, together with the specific sequence of a target gene, highly effective siRNA molecules essential for suppressing mammalian target gene expression may be readily designed.

[0321] According to the present invention, siRNA molecules (e.g., siRNA duplexes or encoded dsRNA) that target a gene of interest are designed. Such siRNA molecules can specifically, suppress target gene expression and protein production. In some aspects, the siRNA molecules are designed and used to selectively "knock out" target gene variants in cells, i.e., transcripts that are identified in neurological disease. In some aspects, the siRNA molecules are designed and used to selectively "knock down" target gene variants in cells.

[0322] In one embodiment, an siRNA molecule of the present invention comprises a sense strand and a complementary antisense strand in which both strands are hybridized together to form a duplex structure. The antisense strand has sufficient complementarity to the target mRNA sequence to direct target-specific RNAi, i.e., the siRNA molecule has a sequence sufficient to trigger the destruction of the target mRNA by the RNAi machinery or process.

[0323] In some embodiments, the antisense strand and target mRNA sequences have 100% complementarity. The antisense strand may be complementary to any part of the target mRNA sequence.

[0324] In other embodiments, the antisense strand and target mRNA sequences comprise at least one mismatch. As a non-limiting example, the antisense strand and the target mRNA sequence have at least 30%, 40%, 50%, 60%, 70%, 80%, 81%, 82%, 83%, 84%, 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98% or 99% or at least 20-30%, 20-40%, 20-50%, 20-60%, 20-70%, 20-80%, 20-90%, 20-95%, 20-99%, 30-40%, 30-50%, 30-60%, 30-70%, 30-80%, 30-90%, 30-95%, 30-99%, 40-50%, 40-60%, 40-70%, 40-80%, 40-90%, 40-95%, 40-99%, 50-60%, 50-70%, 50-80%, 50-90%, 50-95%, 50-99%, 60-70%, 60-80%, 60-90%, 60-95%, 60-99%, 70-80%, 70-90%, 70-95%, 70-99%, 80-90%, 80-95%, 80-99%, 90-95%, 90-99% or 95-99% complementary.

[0325] According to the present invention, the siRNA molecule has a length from about 10-50 or more nucleotides, i.e., each strand comprising 10-50 nucleotides (or nucleotide analogs). Preferably, the siRNA molecule has a length from about 15-30, e.g., 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, or 30 nucleotides in each strand, wherein one of the strands is sufficiently complementary to a target region. In one embodiment, the siRNA molecule has a length from about 19 to 25, 19 to 24 or 19 to 21 nucleotides.

[0326] In some embodiments, the siRNA molecules of the present invention can be synthetic RNA duplexes comprising about 19 nucleotides to about 25 nucleotides, and two overhanging nucleotides at the 3'-end. In some aspects, the siRNA molecules may be unmodified RNA molecules. [0328] DNA expression plasmids can be used to stably express the siRNA duplexes or dsRNA of the present invention in cells and achieve long-term inhibition of the target gene. In one aspect, the sense and antisense strands of a siRNA duplex are typically linked by a

short spacer sequence leading to the expression of a stem-loop structure termed short hairpin RNA (shRNA). The hairpin is recognized and cleaved by Dicer, thus generating mature siRNA molecules.

[0329] In other embodiments, the siRNA molecules of the present invention can be encoded in AAV particles for delivery to a cell. In one embodiment, the siRNA may be inserted to an AAV viral genome, flanked by the ITRs.

[0365] In some embodiments, the loop comprises at least one UGUG motif. In some embodiments, the UGUG motif is located at the 5' terminus of the loop.

[0366] Spacer regions may be present in the modulatory polynucleotide to separate one or more modules from one another. There may be one or more such spacer regions present.

[0367] In one embodiment, a spacer region of between 8-20, i.e., 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, or 20 nucleotides may be present between the sense sequence and a flanking sequence.

[0368] In one embodiment, the spacer is 13 nucleotides and is located between the 5' terminus of the sense sequence and a flanking sequence. In one embodiment, a spacer is of sufficient length to form approximately one helical turn of the sequence.

[0369] In one embodiment, a spacer region of between 8-20, i.e., 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, or 20 nucleotides may be present between the antisense sequence and a flanking sequence.

[0370] In one embodiment, the spacer sequence is between 10-13, i.e., 10, 11, 12 or 13 nucleotides and is located between the 3' terminus of the antisense sequence and a flanking sequence. In one embodiment, a spacer is of sufficient length to form approximately one helical turn of the sequence.

[0371] In one embodiment, the modulatory polynucleotide comprises in the 5' to 3' direction, a 5' flanking sequence, a 5' arm, a loop motif, a 3' arm and a 3' flanking sequence. As a non-limiting example, the 5' arm may comprise a sense sequence and the 3' arm comprises the antisense sequence. In another non-limiting example, the 5' arm comprises the antisense sequence and the 3' arm comprises the sense sequence.

[0372] In one embodiment, the 5' arm, payload (e.g., sense and/or antisense sequence), loop motif and/or 3' arm sequence may be altered (e.g., substituting 1 or more nucleotides, adding nucleotides and/or deleting nucleotides). The alteration may cause a beneficial change in the function of the construct (e.g., increase knock-down of the target sequence, reduce degradation of the construct, reduce off target effect, increase efficiency of the payload, and reduce degradation of the payload).

[0373] In one embodiment, the molecular scaffold of the modulatory polynucleotides is aligned in order to have the rate of excision of the guide strand be greater than the rate of excision of the passenger strand. The rate of excision of the guide or passenger strand may be, independently, 1%, 2%, 3%, 4%, 5%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, 99% or more than 99%. As a non-

limiting example, the rate of excision of the guide strand is at least 80%. As another non-limiting example, the rate of excision of the guide strand is at least 90%.

[0374] In one embodiment, the rate of excision of the guide strand is greater than the rate of excision of the passenger strand. In one aspect, the rate of excision of the guide strand may be at least 1%, 2%, 3%, 4%, 5%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, 99% or more than 99% greater than the passenger strand.

[0375] In one embodiment, the efficiency of excision of the guide strand is at least 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, 99% or more than 99%. As a non-limiting example, the efficiency of the excision of the guide strand is greater than 80%.

[0376] In one embodiment, the efficiency of the excision of the guide strand is greater than the excision of the passenger strand from the molecular scaffold. The excision of the guide strand may be 2, 3, 4, 5, 6, 7, 8, 9, 10 or more than 10 times more efficient than the excision of the passenger strand from the molecular scaffold.

[0377] In one embodiment, the molecular scaffold comprises a dual-function targeting modulatory polynucleotide. As used herein, a "dual-function targeting" modulatory polynucleotide is a polynucleotide where both the guide and passenger strands knock down the same target or the guide and passenger strands knock down different targets.

[0378] In one embodiment, the molecular scaffold of the modulatory polynucleotides described herein comprise a 5' flanking region, a loop region and a 3' flanking region. Non-limiting examples of the sequences for the 5' flanking region, loop region and the 3' flanking region which may be used in the molecular scaffolds described herein are shown in Tables 10-12.

Introduction into cells

[0389] siRNA molecules may be delivered to target cells for targeting the gene of interest inside the target cells. In some embodiments, the cells may include, but are not limited to, cells of mammalian origin, cells of human origins, embryonic stem cells, induced pluripotent stem cells, neural stem cells, neural progenitor cells, and differentiated neural cells.

[0390] In some embodiments, the siRNA molecules (e.g., siRNA duplexes) of may be introduced into target cells using viral vectors such as AAV particles. These AAV particles are engineered and optimized to facilitate the entry of siRNA molecule into cells that are not readily amendable to transfection, e.g., neurons. Also, some synthetic viral vectors possess an ability to integrate the shRNA into the cell genome, thereby leading to stable siRNA expression and long-term knockdown of a target gene. In this manner, viral vectors are engineered as vehicles for specific delivery while lacking the deleterious replication and/or integration features found in wild-type virus.

[0391] In some embodiments, the siRNA molecules are introduced into a cell by contacting the cell with a composition comprising a lipophilic carrier and an AAV particle comprising a nucleic acid sequence encoding the siRNA molecules. In other embodiments, the siRNA molecule is introduced into a cell by transfecting or infecting the cell with an AAV particle comprising nucleic acid sequences capable of producing the siRNA molecule when transcribed in the cell. In some embodiments, the siRNA molecule is introduced into a cell by injecting into the cell an AAV particle comprising a nucleic acid sequence capable of producing the siRNA molecule when transcribed in the cell.

[0392] In some embodiments, an AAV particle comprising a nucleic acid sequence encoding the siRNA molecules of the present invention may be transduced into cells.

[0393] In other embodiments, the AAV particles comprising the nucleic acid sequence encoding the siRNA molecules may be delivered into cells by electroporation (e.g. U.S. Patent Application Publication No. 20050014264; the contents of which are herein incorporated by reference in their entirety).

[0394] Other methods for introducing AAV particles comprising the nucleic acid sequence for the siRNA molecules described herein may include photochemical

internalization as described in U. S. Patent Application Publication No. 20120264807; the contents of which are herein incorporated by reference in their entirety.

[0395] In one embodiment, the AAV particles from any relevant species, such as, but not limited to, human, dog, mouse, rat or monkey may be introduced into cells.

[0396] In one embodiment, the AAV particles may be introduced into cells which are relevant to the disease to be treated. As a non-limiting example, the disease is a tauopathy and/or Alzheimer's Disease and the target cells are entorhinal cortex, hippocampal or cortical neurons.

[0397] In one embodiment, the AAV particles may be introduced into cells which have a high level of endogenous expression of the target sequence.

[0398] In another embodiment, the AAV particles may be introduced into cells which have a low level of endogenous expression of the target sequence.

[0399] In one embodiment, the cells may be those which have a high efficiency of AAV transduction.

[0400] In other embodiments, AAV particles comprising a nucleic acid sequence encoding the siRNA molecules of the present invention may be used to deliver siRNA molecules to the central nervous system (e.g., U.S. Pat. No. 6,180,613; the contents of which are herein incorporated by reference in their entirety).

[0401] In some aspects, the AAV particles comprising a nucleic acid sequence encoding the siRNA molecules of the present invention may further comprise a modified capsid including peptides from non-viral origin. In other aspects, the AAV particle may contain a CNS specific (e.g., tropism for CNS or CNS tissues) chimeric capsid to facilitate the delivery of encoded siRNA duplexes into the brain and the spinal cord. For example, an alignment of cap nucleotide sequences from AAV variants exhibiting CNS tropism may be constructed to identify variable region (VR) sequence and structure.

[0437] Pharmaceutical composition formulations of AAV particles disclosed herein may include cations or anions. In one embodiment, the formulations include metal cations such as, but not limited to, Zn2+, Ca2+, Cu2+, Mn2+, Mg+ and combinations thereof. As a non-limiting example, formulations may include polymers and complexes with a metal cation (*See e.g.*, U.S. Pat. Nos. 6,265,389 and 6,555,525, the contents of each of which are herein incorporated by reference in their entirety).

[0438] Formulations of the invention may also include one or more pharmaceutically acceptable salts. As used herein, "pharmaceutically acceptable salts" refers to derivatives of the disclosed compounds wherein the parent compound is modified by converting an existing acid or base moiety to its salt form (e.g., by reacting the free base group with a suitable

organic acid). Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. Representative acid addition salts include acetate, acetic acid, adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzene sulfonic acid, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptonate, glycerophosphate, hemisulfate, heptonate, hexanoate, hydrobromide, hydrochloride, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, toluenesulfonate, undecanoate, valerate salts, and the like. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like, as well as nontoxic ammonium, quaternary ammonium, and amine cations, including, but not limited to ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, ethylamine, and the like. [0439] The pharmaceutically acceptable salts of the present disclosure can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, Pa., 1985, p. 1418, Pharmaceutical Salts: Properties, Selection, and Use, P.H. Stahl and C.G. Wermuth (eds.), Wiley-VCH, 2008, and Berge et al., Journal of Pharmaceutical Science, 66, 1-19 (1977); the contents of each of which are incorporated herein by reference in their entirety.

[0440] The term "pharmaceutically acceptable solvate," as used herein, means a compound of the invention wherein molecules of a suitable solvent are incorporated in the crystal lattice. A suitable solvent is physiologically tolerable at the dosage administered. Solvates may be prepared by crystallization, recrystallization, or precipitation from a solution

that includes organic solvents, water, or a mixture thereof. Examples of suitable solvents are ethanol, water (for example, mono-, di-, and tri-hydrates), *N*-methylpyrrolidinone (NMP), dimethyl sulfoxide (DMSO), *N,N'*-dimethylformamide (DMF), *N,N'*-dimethylacetamide (DMAC), 1,3-dimethyl-2-imidazolidinone (DMEU), 1,3-dimethyl-3,4,5,6-tetrahydro-2-(1H)-pyrimidinone (DMPU), acetonitrile (ACN), propylene glycol, ethyl acetate, benzyl alcohol, 2-pyrrolidone, benzyl benzoate, and the like. When water is the solvent, the solvate is referred to as a "hydrate."

Parenteral and injectable administration

[0488] In some embodiments, pharmaceutical compositions, AAV particles of the present invention may be administered parenterally. Liquid dosage forms for oral and parenteral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups, and/or elixirs. In addition to active ingredients, liquid dosage forms may comprise inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, oral compositions can include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and/or perfuming agents. In certain embodiments for parenteral administration, compositions are mixed with solubilizing agents such as CREMOPHOR®, alcohols, oils, modified oils, glycols, polysorbates, cyclodextrins, polymers, and/or combinations thereof. In other embodiments, surfactants are included such as hydroxypropylcellulose.

[0489] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing agents, wetting agents, and/or suspending agents. Sterile injectable preparations may be sterile injectable solutions, suspensions, and/or emulsions in nontoxic parenterally acceptable diluents and/or solvents, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P., and isotonic sodium chloride solution. Sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil can be employed including synthetic mono- or diglycerides. Fatty acids such as oleic acid can be used in the preparation of injectables.

[0490] Injectable formulations may be sterilized, for example, by filtration through a bacterial-retaining filter, and/or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

[0491] In order to prolong the effect of active ingredients, it is often desirable to slow the absorption of active ingredients from subcutaneous or intramuscular injections. This may be accomplished by the use of liquid suspensions of crystalline or amorphous material with poor water solubility. The rate of absorption of active ingredients depends upon the rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

Depot administration

[0492] As described herein, in some embodiments, pharmaceutical compositions, AAV particles of the present invention are formulated in depots for extended release. Generally, specific organs or tissues ("target tissues") are targeted for administration.

[0493] In some aspects of the invention, pharmaceutical compositions, AAV particles of the present invention are spatially retained within or proximal to target tissues. Provided are methods of providing pharmaceutical compositions, AAV particles, to target tissues of mammalian subjects by contacting target tissues (which comprise one or more target cells) with pharmaceutical compositions, AAV particles, under conditions such that they are substantially retained in target tissues, meaning that at least 10, 20, 30, 40, 50, 60, 70, 80, 85, 90, 95, 96, 97, 98, 99, 99.9, 99.99 or greater than 99.99% of the composition is retained in the target tissues. Advantageously, retention is determined by measuring the amount of pharmaceutical compositions, and AAV particles that enter one or more target cells. For example, at least 1%, 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, 99%, 99.9%, 99.99% or greater than 99.99% of pharmaceutical compositions, AAV particles, administered to subjects are present intracellularly at a period of time following administration. For example, intramuscular injection to mammalian subjects may be performed using aqueous compositions comprising pharmaceutical compositions, AAV particles of the present invention and one or more transfection reagents,

and retention is determined by measuring the amount of pharmaceutical compositions, AAV particles, present in target cells.

[0494] Certain aspects of the invention are directed to methods of providing pharmaceutical compositions, AAV particles of the present invention to target tissues of mammalian subjects, by contacting target tissues (comprising one or more target cells) with pharmaceutical compositions, AAV particles under conditions such that they are substantially retained in such target tissues. Pharmaceutical compositions, AAV particles comprise enough active ingredient such that the effect of interest is produced in at least one target cell. In some embodiments, pharmaceutical compositions, AAV particles generally comprise one or more cell penetration agents, although "naked" formulations (such as without cell penetration agents or other agents) are also contemplated, with or without pharmaceutically acceptable carriers.

Pulmonary administration

[0495] In some embodiments, pharmaceutical compositions, AAV particles of the present invention may be prepared, packaged, and/or sold in formulations suitable for pulmonary administration. In some embodiments, such administration is via the buccal cavity. In some embodiments, formulations may comprise dry particles comprising active ingredients. Generally, propellants may constitute 50% to 99.9% (w/w) of the composition, and active ingredient may constitute 0.1% to 20% (w/w) of the composition. Propellants may further comprise additional ingredients such as liquid non-ionic

Such formulations are administered in the manner in which snuff is taken, *i.e.* by rapid inhalation through the nasal passage from a container of the powder held close to the nose.

[0499] Formulations suitable for nasal administration may, for example, comprise from about as little as 0.1% (w/w) and as much as 100% (w/w) of active ingredient, and may comprise one or more of the additional ingredients described herein. A pharmaceutical composition may be prepared, packaged, and/or sold in a formulation suitable for buccal administration. Such formulations may, for example, be in the form of tablets and/or lozenges made using conventional methods, and may, for example, comprise 0.1% to 20% (w/w) active ingredient, the balance comprising an orally dissolvable and/or degradable composition and, optionally, one or more of the additional ingredients described herein. Alternately, formulations suitable for buccal administration may comprise powders and/or an aerosolized and/or atomized solutions and/or suspensions comprising active ingredients. Such powdered, aerosolized, and/or aerosolized formulations, when dispersed, may comprise

average particle and/or droplet sizes in the range of from about 0.1 nm to about 200 nm, and may further comprise one or more of any additional ingredients described herein.

The pharmaceutical, diagnostic, or prophylactic AAV particles and compositions of the present invention may be administered to a subject using any amount and any route of administration effective for preventing, treating, managing, or diagnosing diseases, disorders and/or conditions. The exact amount required will vary from subject to subject, depending on the species, age, and general condition of the subject, the severity of the disease, the particular composition, its mode of administration, its mode of activity, and the like. The subject may be a human, a mammal, or an animal. Compositions in accordance with the invention are typically formulated in unit dosage form for ease of administration and uniformity of dosage. It will be understood, however, that the total daily usage of the compositions of the present invention may be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective, prophylactically effective, or appropriate diagnostic dose level for any particular individual will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific payload employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific AAV particle employed; the duration of the treatment; drugs used in combination or coincidental with the specific AAV particle employed; and like factors well known in the medical arts.

[0502] In one embodiment, delivery of the AAV particles of the present invention results in minimal serious adverse events (SAEs) as a result of the delivery of the AAV particles.

[0514] In certain embodiments, the desired dosage may be delivered using multiple administrations (*e.g.*, two, three, four, five, six, seven, eight, nine, ten, eleven, twelve, thirteen, fourteen, or more administrations). When multiple administrations are employed, split dosing regimens such as those described herein may be used. As used herein, a "split dose" is the division of "single unit dose" or total daily dose into two or more doses, *e.g.*, two

or more administrations of the "single unit dose". As used herein, a "single unit dose" is a dose of any therapeutic administered in one dose/at one time/single route/single point of contact, i.e., single administration event.

[0515] The desired dosage of the AAV particles of the present invention may be administered as a "pulse dose" or as a "continuous flow". As used herein, a "pulse dose" is a series of single unit doses of any therapeutic administered with a set frequency over a period of time. As used herein, a "continuous flow" is a dose of therapeutic administered continuously for a period of time in a single route/single point of contact, i.e., continuous administration event. A total daily dose, an amount given or prescribed in 24 hour period, may be administered by any of these methods, or as a combination of these methods, or by any other methods suitable for a pharmaceutical administration.

[0516] In one embodiment, delivery of the AAV particles of the present invention to a subject provides regulating activity of a target gene in a subject. The regulating activity may be an increase in the production of the target protein in a subject or the decrease of the production of target protein in a subject. The regulating activity can be for at least 1 month, 2 months, 3 months, 4 months, 5 months, 6 months, 7 months, 8 months, 9 months, 10 months, 11 months, 1 year, 13 months, 14 months, 15 months, 16 months, 17 months, 18 months, 19 months, 20 months, 20 months, 21 months, 22 months, 23 months, 2 years, 3 years, 4 years, 5 years, 6 years, 7 years, 8 years, 9 years, 10 years or more than 10 years.

[0517] In some embodiments, the AAV particle of the present invention may be administered to a subject using a single dose, one-time treatment. The dose of the one-time treatment may be administered by any methods known in the art and/or described herein. Measurement of Expression

[0531] Expression of payloads from viral genomes may be determined using various methods known in the art such as, but not limited to immunochemistry (e.g., IHC), *in situ* hybridization (ISH), enzyme-linked immunosorbent assay (ELISA), affinity ELISA, ELISPOT, flow cytometry, immunocytology, surface plasmon resonance analysis, kinetic exclusion assay, liquid chromatography-mass spectrometry (LCMS), high-performance liquid chromatography (HPLC), BCA assay, immunoelectrophoresis, Western blot, SDS-PAGE, protein immunoprecipitation, and/or PCR.

Bioavailability

[0532] The AAV particles, when formulated into a composition with a delivery agent as described herein, can exhibit an increase in bioavailability as compared to a composition lacking a delivery agent as described herein. As used herein, the term "bioavailability" refers to the systemic availability of a given amount of AAV particle or expressed payload administered to a mammal. Bioavailability can be assessed by measuring the area under the curve (AUC) or the maximum serum or plasma concentration (C_{max}) of the composition following. AUC is a determination of the area under the curve plotting the serum or plasma concentration of a compound (e.g., AAV particles or expressed payloads) along the ordinate (Y-axis) against time along the abscissa (X-axis). Generally, the AUC for a particular compound can be calculated using methods known to those of ordinary skill in the art and as described in G. S. Banker, Modern Pharmaceutics, Drugs and the Pharmaceutical Sciences, v. 72, Marcel Dekker, New York, Inc., 1996, the contents of which are herein incorporated by reference in its entirety.

[0533] The C_{max} value is the maximum concentration of the AAV particle or expressed payload achieved in the serum or plasma of a mammal following administration of the AAV particle to the mammal. The C_{max} value can be measured using methods known to those of ordinary skill in the art. The phrases "increasing bioavailability" or "improving the pharmacokinetics," as used herein mean that the systemic availability of a first AAV particle or expressed payload, measured as AUC, C_{max}, or C_{min} in a mammal is greater, when co-administered with a delivery agent as described herein, than when such co-administration does not take place. In some embodiments, the bioavailability can increase by at least about 2%, at least about 5%, at least about 10%, at least about 15%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about

70%, at least about 75%, at least about 80%, at least about 85%, at least about 90%, at least about 95%, or about 100%.

Therapeutic Window

[0534] As used herein "therapeutic window" refers to the range of plasma concentrations, or the range of levels of therapeutically active substance at the site of action, with a high probability of eliciting a therapeutic effect. In some embodiments, the therapeutic window of the AAV particle as described herein can increase by at least about 2%, at least about 5%, at least about 10%, at least about 15%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, at least about 80%, at least about 85%, at least about 90%, at least about 95%, or about 100%.

Volume of Distribution

[0535] As used herein, the term "volume of distribution" refers to the fluid volume that would be required to contain the total amount of the drug in the body at the same concentration as in the blood or plasma: V_{dist} equals the amount of drug in the body/concentration of drug in blood or plasma. For example, for a 10 mg dose and a plasma concentration of 10 mg/L, the volume of distribution would be 1 liter. The volume of distribution reflects the extent to which the drug is present in the extravascular tissue. A large volume of distribution reflects the tendency of a compound to bind to the tissue components compared with plasma protein binding. In a clinical setting, V_{dist} can be used to determine a loading dose to achieve a steady state concentration. In some embodiments, the volume of distribution of the AAV particles as described herein can decrease at least about 2%, at least about 5%, at least about 10%, at least about 15%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%.

Biological Effect

[0536] In one embodiment, the biological effect of the AAV particles delivered to the animals may be categorized by analyzing the payload expression in the animals. The payload expression may be determined from analyzing a biological sample collected from a mammal administered the AAV particles of the present invention. For example, a protein expression of 50-200 pg/ml for the protein encoded by the AAV particles delivered to the mammal may be seen as a therapeutically effective amount of protein in the mammal.

Tauopathies

[0547] Tauopathies are a group of neurodegenerative diseases characterized by the dysfunction and/or aggregation of the microtubule associated protein tau. Tau is normally a very soluble protein known to associate with microtubules based on the extent of its phosphorylation. Tau is considered a critical component of intracellular trafficking processes, particularly in neuronal cells, given their unique structure. Hyperphosphorylation of tau depresses its binding to microtubules and microtubule assembly activity. Further, hyperphosphorylation of tau renders it prone to misfolding and aggregation. In tauopathies,

the tau becomes hyperphosphorylated, misfolds and aggregates as NFT of paired helical filaments (PHF), twisted ribbons or straight filaments. These NFT are largely considered indicative of impending neuronal cell death and thought to contribute to widespread neuronal cell loss, leading to a variety of behavioral and cognitive deficits.

[0548] The first genetically defined tauopathy was described when mutations in the tau gene were shown to lead to an autosomal dominantly inherited tauopathy known as frontemporal dementia and parkinsonism linked to chromosome 17 (FTDP-17). This was the first causal evidence that changes in tau could lead to neurodegenerative changes in the brain. These molecules are considered to be more amyloidogenic, meaning they are more likely to become hyperphosphorylated and more likely to aggregate into NFT (Hutton, M. et al., 1998, Nature 393(6686):702-5).

[0549] Other known tauopathies include, but are not limited to, Alzheimer's disease (AD), frontotemporal dementia (FTD), Frontotemporal lobar degeneration (FTLD), chronic traumatic encephalopathy (CTE), Progressive Supranuclear Palsy (PSP), Down's syndrome, Pick's disease, Corticobasal degeneration (CBD), Amyotrophic lateral sclerosis (ALS), Prion diseases, Creutzfeldt-Jakob disease (CJD), Multiple system atrophy, Tangle-only dementia, and Progressive subcortical gliosis.

[0550] Though tauopathies are predominantly associated with tau protein malfunction and aggregation, much like in AD, ApoE is also considered to play a role in the pathogenesis of this group of diseases. ApoE, a cholesterol trafficking molecule, was first suspected to have a role in tauopathy when it was discovered that NFT are also immunoreactive for ApoE. Investigation of the correlations between tau and ApoE in tauopathies have shown contradictory results but suggest a link between ApoE4 and increased NFT load. However, the correlation to cognitive decline has not been shown. Work in this area is still actively being pursued.

[0551] Treatments for tauopathies have yet to be identified, though some symptomatic relief may be provided. Delivery of AAV particles of the invention may be used to treat subjects suffering from tauopathy. In some cases, methods of the present invention may be used to treat subjects suspected of developing a tauopathy. Delivery of AAV particles of the invention may result in decreased accumulation of NFT. Further, these decreases in NFT load may or may not be associated with improvements in cognitive, language or behavioral arenas.

[0553] In one embodiment, delivery of AAV particles of the invention comprising modulatory polynucleotides for the silencing of ApoE2, ApoE3 or ApoE4 gene and/or protein expression may be used to treat subjects suffering from tauopathy.

[0556] In one embodiment, delivery of AAV particles of the invention comprising a nucleic acid encoding an anti-tau antibody may be used to treat subjects suffering from tauopathy.

[0557] In one embodiment, the compositions described herein are used in combination with one or more known or exploratory treatments for tauopathy. Non-limiting examples of such treatments include inhibitors of tau aggregation, such as Methylene blue, phenothiazines, anthraquinones, n-phenylamines or rhodamines, microtubule stabilizers such as NAP, taxol or paclitaxel, kinase or phosphatase inhibitors such as those targeting GSK3β (lithium) or PP2A, and/or immunization with tau phospho-epitopes or treatment with anti-tau antibodies.

Alzheimer's Disease

[0558] Alzheimer Disease (AD) is a debilitating neurodegenerative disease and the leading cause of dementia in the elderly today, currently afflicting an estimated 5 million people in the United States and more than 35 million people worldwide. AD is largely a disease of extreme forgetfulness, wherein the ability to lead a normal life is incredibly impaired. Clinical manifestations of the disease include progressive declines in memory, executive function (decision making) and language. Individuals with AD often die from secondary illnesses such as cachexia, pneumonia or sepsis.

[0559] AD is likely the most well-known tauopathy, though it is often characterized as an amyloid based disorder. The AD brain is characterized by the presence of two forms of pathological aggregates, the extracellular plaques composed of β-amyloid (Aβ) and the intracellular neurofibrillary tangles (NFT) comprised of hyperphosphorylated microtubule

associated protein tau. Based on early genetic findings, β-amyloid alterations were thought to initiate disease, with changes in tau considered downstream. For this reason, most clinical trials have been Aβ-centric.

[0560] In addition to the traditional hallmarks of the disease (Aβ and tau), apolipoprotein E has proven to be an important risk factor in the pathogenesis of late onset AD (the form of AD that is not genetically linked to alterations in Aβ processing or production and accounts for 99% of the AD population). ApoE, like other apolipoproteins, contributes to the structure of specific lipoprotein particles and directs lipoprotein trafficking to specific cell surface receptors, and is an important cholesterol transporter. ApoE is expressed in a variety of cell types with highest expression levels evident in the liver and brain. In the brain, ApoE is predominantly expressed in astrocytes and microglia, and is thought to contribute to maintenance of synaptic connections and synaptogenesis. ApoE is thought to contribute to AD pathogenesis through its roles in the blood brain barrier, the innate immune system, synaptic function and accumulation of Aβ.

[0561] The three most common variants of ApoE are ApoE2, ApoE3 and ApoE4, with ApoE2 and ApoE4 carrying differential risks associated with development of AD. ApoE2 is considered to be a protective allele, decreasing risk of AD and delaying the age of onset, whereas ApoE4 has the opposite effect, significantly increasing risk of developing AD and reducing the age of onset of disease. Further, ApoE2 is associated with a decreased burden of accumulated Aβ, whereas ApoE4 is associated with increased Aβ load.

[0562] Early onset forms of AD (before 65 years, which accounts for <5% of AD cases), may be caused by familial mutations in amyloid beta precursor protein (APP), presenilin 1 (PS1 or PSEN1) or presenilin 2 (PS2 or PSEN2). Common symptoms include progressive delcine in memory, executive function, language, and other areas of cognition. These symptoms are often caused by amyloid plaques and/or neurofibrillary tangles in the brain, neuronal loss, synaptic loss, brain atrophy, and/or inflammation.

[0563] Symptomatic treatments for AD have been available for many years, but none are able to alter the course of the disease. Delivery of AAV particles of the invention may be used to treat subjects suffering from AD and other tauopathies. In some cases, methods of the present invention may be used to treat subjects suspected of developing AD or other tauopathies. Delivery of AAV particles of the invention may result in decreased Aβ burden both in the brain and in the cardiovascular system of the subject or in decreased accumulation

of NFT. Further, these decreases in Aβ or NFT load, may or may not be associated with improvements in cognitive, language or behavioral arenas.

[0564] In one embodiment, delivery of AAV particles of the invention, comprising ApoE2, ApoE3 or ApoE4 polynucleotides, may be used to treat subjects suffering from AD and other tauopathies.

[0565] In one embodiment, delivery of AAV particles of the invention comprising modulatory polynucleotides for the silencing of the ApoE2, ApoE3 or ApoE4 gene and/or protein may be used to treat subjects suffering from AD and other tauopathies.

[0566] In one embodiment, delivery of AAV particles of the invention comprising modulatory polynucleotides for the silencing of the tau gene and/or protein may be used to treat subjects suffering from AD and other tauopathies.

[0567] In one embodiment, the modulatory polynucleotides are siRNA duplexes or nucleic acids encoding siRNA duplexes or encoded dsRNA.

[0568] In one embodiment, delivery of AAV particles of the invention comprising a nucleic acid encoding an anti-tau antibody may be used to treat subjects suffering from AD and other tauopathies.

[0569] In one embodiment, the compositions described herein are used in combination with one or more known or exploratory treatments for AD or tauopathy. Non-limiting examples of such treatments include cholinesterase inhibitors (donepezil, rivastigmine, galantamine), NMDA receptor antagonists such as memantine, anti-psychotics, anti-depressants, anti-convulsants, secretase inhibitors, amyloid aggregation inhibitors, copper or zinc modulators, BACE inhibitors, inhibitors of tau aggregation, such as Methylene blue, phenothiazines, anthraquinones, n-phenylamines or rhodamines, microtubule stabilizers such as NAP, taxol or paclitaxel, kinase or phosphatase inhibitors such as those targeting GSK3β (lithium) or PP2A, and/or immunization with Aβ peptides or tau phospho-epitopes or treatment with anti-tau or anti-amyloid antibodies.

[0570] In one embodiment, the compositions described herein are evaluated using mammalian models, such as, but not limited to, mouse models of tauopathy and/or Alzheimer's Disease. A great number of mouse models are available that mimic the phenotypes of tauopathies and/or Alzheimer's Disease. However, no existing mouse model exhibits all features of human tauopathies and/or Alzheimer's Disease. Therefore, in some cases, more than one mouse model, or a mouse model cross of one or more of these models, may be used to evaluate the activities of the compositions of the present invention.

Exemplary mouse models of tauopathies and/or Alzheimer's Disease include, but are not limited to, 3XTg-AD, 5XFAD, J20, Tg-SwDI, Tg-SwDI/Nos2, Tg2576, R1.40, APPPS1, APP23, PDAPP, APP NL-G-F, TgCRND8, TASD-41, BRI-Aβ42A, PSAPP (Tg2576xPS1), APPswe/PSEN1dE9, 2xKI, TAPP (Tg2576xJNPL3), hTau, PS1M146V, rTg4510, rTg4510xCamk2a-tTA, PS19, rTg4510xNop-tTA, GFAP-apoE4, Apoe$^{tm3(APOE*4)}$, APP.PS1/TRE4 and ApoE knock-out or knock-in mouse lines. (See Onos et al., Brain Res Bull. 2016;122:1-11; Hall and Roberson., Brain Res Bull. 2012; 88(1): 3–12; Elder et al., Mt Sinai J Med. 2010; 77(1): 69–81, the contents of which are herein incorporated by reference in their entirety).

[0571] Tau transgenic mouse models overexpress wild-type or mutant human tau protein. More than 20 lines have been generated that contain different tau mutations (See Table 2 of Denk and Wade-Martins, Neurobiol Aging. 2009; 30(1): 1–13, the contents of which are herein incorporated by reference in their entirety). These are mutations present in patients with tauopathies and/or Alzheimer's Disease, including G272V, P301L, P301S, N297K, V337M, and R406W. The P301S transgenic mice express the human tau protein containing the P301S mutation. One P301S model (4R/0N tau under the control of the Thy1.2 promoter), created by Allen et al., exhibits similar characteristics to human tauopathies including filament accumulation of hyperphosphorylated tau, neuronal degeneration, and neuroinflammation. In addition, these mice develop a pronounced motor phenotype by 5-6 months of age (Allen et al., J Neurosci. 2002;22(21):9340-51; Bellucci et al., Am J Pathol. 2004;165(5):1643-52, the contents of which are herein incorporated by reference in their entirety). Another P301S mouse line (4R/1N tau under the control of the mouse prion promoter), created by Yoshiyama et al., displays hippocampal synapse loss, impaired synaptic function and concomitant microglial activation by 3–6 months of age. The animals also showed pathological hyperphosphorylated tau accumulations, neuronal loss, as well as hippocampal and entorhinal cortical atrophy by 9-12 months of age (Yoshiyama et al., Neuron. 2007;53(3):337-51, the contents of which are herein incorporated by reference in their entirety).

[0572] APOE knock-in mice express human isoforms of APOE. In some cases, the human APOE genes were engineered in to replace the endogenous mouse APOE alleles (targeted replacement). These targeted placement (TR) models of ApoE2, ApoE3 or ApoE4 were developed in the laboratory of Nobuya Maeda (Sullivan et al., J Clin Invest. 1998;102(1):130-5; Sullivan et al., J Biol Chem. 1997;272(29):17972-80; Knouff et al., J

Clin Invest. 1999;103(11):1579-86, the contents of which are herein incorporated by reference in their entirety) and characterized in many studies. The ApoE TR mice differ on spatial memory performance and avoidance behavior. ApoE4-TR mice show cognitive and synaptic plasticity impairment compared to ApoE3-TR mice. In addition, ApoE4-TR mice exhibit anatomical and functional abnormalities in the hippocampus and the amygdala (Grootendorst, Behav Brain Res. 2005;159(1):1-14; Bour et al., Behav Brain Res. 2008;193(2):174-82, the contents of which are herein incorporated by reference in their entirety).

[0573] In one embodiment, an AAV-ApoE2 particle may be administered to PDAPP or APP.PS1/TRE4 mice as described in Zhao et al 2016 Neurobiol Aging 159-172, the contents of which are herein incorporated by reference in their entirety. Intracerebral or intrathalamic administration of AAV-ApoE2 (AAV9-CAG-APOE2 or AAVrh.10-CAG-APOE2) showed significant decreases in brain Aβ (oligomeric, soluble and insoluble), amyloid deposition and amyloid pathology, as determined by immunohistochemistry, ELISA or Western blot. More specifically, AAV preparations (2μL, 1.0×10^{10} vg) were bilaterally injected by stereotactic surgery into either the hippocampus or the thalamus of adult mice at a rate of 0.2 μL/min and allowed to express for 8 weeks prior to tissue collection for post-mortem analysis. Lower doses of AAV-ApoE2, or delivery at a late stage of pathology, proved to be less effective.

Frontotemporal Dementia (FTD)

[0574] Frontotemporal Demenia (FTD), also known as frontotemporal degenerations or Pick's disease, refers to a group of disorders which are caused by progressive nerve cell loss in the brain. This nerve cell loss can cause a loss of unction in the frontal and/or temporal lobes of the brain. There are about 45,000 people in the United States who have FTD and the majority are between 45 and 65.

[0575] There are three subtypes of FTD, behavrior variant frontotemporal dementia (bvFTD), primary progressive aphasia (PPA) and distrubances of motor function. Subjects with bvFTD tend to have major changes in personality, interpersonal relationships and conduct and the nerve loss is most prominent in areas that control conduct, empathy, foresight, and judgment. PPA affects language skills, speaking, writing, and comprehension. Both bvFTD and PPA are less common than AD in those over the age of 65, however bvFTD and PPA are nearly as common as AD in those between 45 and 65.

[0576] A mutation of tau is genetically associated with those subjects who have FTD.

Amyotrophic Lateral Sclerosis (ALS)

[0577] Amyotrophic Lateral Sclerosis (ALS), also known as Lou Gehrig's disease or classical motor neuron disease, is a rapidly progressive and fatal neurological disease. ALS is associated with cell degeneration and death of upper and lower motor neurons, leading to disablement of muscle movement, weakening, wasting and loss of control over voluntary muscle movement. Early symptoms include muscle weakness of hands, legs and swallowing muscles, eventually progressing to inability to breathe due to diaphragm failure. According to Centers for Disease Control and Prevention (CDC), ALS affects an estimated 12, 000-15, 000 individuals in the US. About 5-10% of cases are familial.

[0578] ALS, as other non-infectious neurodegenerative diseases, has been characterized by presence of misfolded proteins, including, but not limited to, tau, amyloid- beta (A beta), alpha- synuclein, HTT (huntingtin) or SOD1 (superoxide dismutase 1 protein), and myelin associated inhibitors and their receptors, (see, e.g., Krishnamurthy and Sigurdsson, 2011, *N Biotechnol.* 28(5):511-7, and Musaro, 2013, FEBS J.;280(17):4315-22, and references therein). Familial ALS has been associated with mutations of TAR DNA-binding protein 43 (TDP-43) and RNA-binding protein FUS/TLS. Some proteins have been identified to slow down progression of ALS, such as, but not limited, to growth factors, e.g. insulin-like growth factor 1 (IGF-1), glial cell line-derived growth factor, brain-derived growth factor, vascular endothelial growth factor and ciliary neurotrophic factor, or growth factors promoting muscle growth, e.g. myostatin.

[0579] As of today, there is no prevention or cure for ALS. FDA approved drug niluzole has been approved to prolong life expectancy, but does not have an effect on symptoms. Additionally, drugs and medical devices are available to tolerate pain and attacks associated with ALS. There remains a need for therapy affecting the underlying pathophysiology.

[0580] In some embodiment, methods of the present invention may be used to treat subjects suffering from ALS. In some cases, methods of the present invention may be used to treat subjects suspected of developing ALS.

[0581] AAV Particles and methods of using the AAV particles described in the present invention may be used to prevent, manage and/or treat ALS. As non-limiting examples, the AAV particles of the present invention that may be used for the treatment, prevention or management of ALS may comprise modulatory polynucleotides targeting SOD1, HTT and/or Tau.

Huntington's disease

[0582] Huntington's disease (HD) is a rare, inherited disorder causing degeneration of neurons in the motor control region of the brain, as well as other areas. Typical symptoms of the disease include uncontrolled movements (chorea), abnormal postures, impaired coordination, slurred speech and difficulty of feeding and swallowing accompanied by changes in behavior, judgment and cognition. HD is caused by mutations in the gene associated with the huntingtin (HTT) protein. The mutation causes the (CAG) blocks of DNA to repeat abnormally. HD affects approximately 30, 000 individuals in the US.

[0583] HD is characterized by mutations of the huntingtin (HTT) protein with abnormal expansions of polyglutamine tracts, e.g. expansion of the length of glutamine residues encoded by CAG repeats. The expansion threshold for occurrence of the disease is considered to be approximately 35-40 residues. HD is also associated with beta sheet rich aggregates in striatal neurons formed by N-terminal regions of HTT. The expansions and aggregates lead to gradual loss of neurons as HD progresses. Additionally, the cell death in HD is associated with death receptor 6 (DR6) which is known to induce apoptosis.

[0584] As of today, there is no therapy or cure, to prevent the progression of the disease. Drug therapies available are aimed at management of the symptoms. For example, the FDA has approved tetrabenezine to be prescribed for prevention of chorea. Additionally, e.g. antipsychotic drugs may help to control delusions, hallucinations and violent outbursts. There remains a need for therapy affecting the underlying pathophysiology.

[0585] In some embodiment, methods of the present invention may be used to treat subjects suffering from HD. In some cases, methods of the present invention may be used to treat subjects suspected of developing HD.

[0586] AAV particles and methods of using the AAV particles described in the present invention may be used to prevent, manage and/or treat HD. As a non-limiting example, the AAV particles of the present invention used to treat, prevent and/or manage HD may comprise modulatory polynucleotides targeting HTT, wherein the modulatory polynucleotides are siRNA duplexes or nucleic acids encoding siRNA duplexes or encoded dsRNA.

Parkinson's Disease

[0587] Parkinson's Disease (PD) is a progressive disorder of the nervous system affecting especially the substantia nigra of the brain. PD develops as a result of the loss of dopamine producing brain cells. Typical early symptoms of PD include shaking or trembling of a limb, e.g. hands, arms, legs, feet and face. Additional characteristic symptoms are stiffness of the

limbs and torso, slow movement or an inability to move, impaired balance and coordination, cognitive changes, and psychiatric conditions e.g. depression and visual hallucinations. PD has both familial and idiopathic forms and it is suggested to be linked to genetic and environmental causes. PD affects more than 4 million people worldwide. In the US, approximately 60, 000 cases are identified annually. Generally, PD begins at the age of 50 or older. An early-onset form of the condition begins at age younger than 50, and juvenile-onset PD begins before the age of 20.

[0588] Death of dopamine producing brain cells related to PD has been associated with aggregation, deposition and dysfunction of alpha-synuclein protein (see, e.g. Marques and Outeiro, 2012, *Cell Death Dis.* 3:e350, Jenner, 1989, *J Neurol Neurosurg Psychiatry.* Special Supplement, 22-28, and references therein). Studies have suggested that alpha-synuclein has a role in presynaptic signaling, membrane trafficking and regulation of dopamine release and transport. Alpha-synuclein aggregates, e.g. in forms of oligomers, have been suggested to be species responsible for neuronal dysfunction and death. Mutations of the alpha-synuclein gene (SNCA) have been identified in the familial forms of PD, but also environmental factors, e.g. neurotoxin affect alpha-synuclein aggregation. Other suggested causes of brain cell death in PD are dysfunction of proteosomal and lysosomal systems, reduced mitochondrial activity.

[0589] PD is related to other diseases related to alpha-synuclein aggregation, referred to as "synucleinopathies." Such diseases include, but are not limited to, Parkinson's Disease Dementia (PDD), multiple system atrophy (MSA), dementia with Lewy bodies, juvenile-onset generalized neuroaxonal dystrophy (Hallervorden-Spatz disease), pure autonomic failure (PAF), neurodegeneration with brain iron accumulation type-1 (NBIA-1) and combined Alzheimer's and Parkinson's disease.

[0590] As of today, no cure or preventative therapy for PD has been identified. A variety of drug therapies available provide symptomatic relief. Non-limiting examples of symptomatic medical treatments include carbidopa and levodopa combination reducing stiffness and slow movement, and anticholinergics to reduce trembling and stiffness. Other optional therapies include e.g. deep brain stimulation and surgery. There remains a need for therapy affecting the underlying pathophysiology.

[0591] In some embodiment, methods of the present invention may be used to treat subjects suffering from PD and other synucleinopathies. In some cases, methods of the

present invention may be used to treat subjects suspected of developing PD and other synucleinopathies.

Friedreich's Ataxia

[0592] Friedreich's Ataxia (FA) is an autosomal recessive inherited disease that causes progressive damage to the nervous system. See, Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117, the contents of which are herein incorporated by reference in their entirety. Onset usually occurs at puberty, and always by age 25. See, Campuzano, et al., Science, 271.5254 (Mar 8, 1996): 1423, the contents of which are herein incorporated by reference in their entirety. FA results from the degeneration of nervous tissue in the spinal cord due to reduced expression of the mitochondrial protein frataxin (FXN) in sensory neurons that are essential (through connections with the cerebellum) for directing muscle movement of the arms and legs. See, Koeppen, Arnulf; *J Neurol Sci.*, 2011, April 15; 303(1-2): 1–12, the contents of which are herein incorporated by reference in their entirety. Initial symptoms include poor coordination such as gait disturbance, poor balance, leg weakness, decreased walking, impaired coordination, dysarthria, nystagmus, impaired sensation, kyphoscoliosis, and foot deformities. See, Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117. The disease generally progresses until a wheelchair is required for mobility. Incidence of FA among the Caucasian populations is between about 1 in 20,000 and about 1 in 50,000, with a deduced carrier frequency of about 1 in 120 in European populations. See, Nageshwaran and Festenstein, *Frontiers in Neurology*, Vol. 6, Art. 262 (2015); Campuzano, et al., Science, 271.5254 (Mar 8, 1996): 1423, the contents of each of which are herein incorporated by reference in their entirety.

[0593] The expansion of an intronic GAA triplet repeat in the FXN gene is the genetic cause of reduced expression of frataxin resulting in FA. See, Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117. Over time the deficiency causes the aforementioned symptoms, as well as frequent fatigue due to effects on cellular metabolism.

[0594] Currently, no effective treatments exist for FA and patients are most often simply monitored for symptom management. Consequently, there remains a long felt need in the art to develop pharmaceutical compositions and methods for the treatment of FXN related disorders and to ameliorate deficiencies of the protein in patients afflicted with FA.

[0595] Delivery of AAV particles of the invention may be used to treat subjects suffering from Friedreich's Ataxia. In some cases, methods of the present invention may be used to treat subjects suspected of developing Friedreich's Ataxia. Delivery of AAV particles of the

invention may result in increased frataxin protein. Further, this increase in frataxin protein may or may not be associated with improvements in mobility.

[0596] In one embodiment, delivery of AAV particles of the invention, comprising frataxin polynucleotides, may be used to treat subjects suffering from Friedreich's Ataxia.

[0597] In one embodiment, the AAV particles of the invention, comprising frataxin polynucleotides, may be delivered to the dentate nucleus of the cerebellum, brainstem nuclei and/or Clarke's column of the spinal cord. Delivery to one or more of these regions may treat and/or reduce the effects of Friedreich's Ataxia in a subject.

[0598] In one embodiment, the AAV particles of the invention, comprising frataxin polynucleotides, may be delivered by intravenous administration to the central nervous system, peripheral nervous system, and/or peripheral organs for the treatment of Friedreich's Ataxia in a subject.

Cardiovascular Disease

[0599] Cardiovascular disease, also called heart disease or heart and blood vessel disease, is a general term describing many diseases or disorders of the heart and/or blood vessels. Many of the diseases or disorders in cardiovascular disease are related to atherosclerosis where plaque builds up in the walls of the arteries. This buildup narrows the arteries making it harder for blood to flow through. Non-limiting examples of cardiovascular disease include, heart failure (when the heart is not pumping blood as well as it should be), arrhythmia (abnormal rhythm of the heart, e.g., bradycardia (heart rate of less than 60 beats per minute) or tachycardia (heart rate of more than 100 beats per minute)), heart valve problems (e.g., stenosis (valves don't open enough to allow blood to flow through as it should), regurgitation (valves do not close properly), and prolapse (valve leaflets bulge or prolapse back into the upper chamber)), stroke (e.g., an ischemic stroke when there is a blockage of the blood vessel that feeds to the brain), and heart attack (when the blood flow is blocked to the heart).

[0600] The AAV particles of the invention may be used to treat subjects suffering from cardiovascular disease.

Heart Failure

[0601] Heart failure is the leading cause of mortality in the United States with approximately 5.8 million patients and 300,000 deaths per year. Heart failure is the common endpoint of cardiac disease caused by various factors including, but not limited to, diet, smoking, hypertension or genetics. Heart failure may be cause by the dysregulation of calcium handling which leads to impaired heart muscle contractility. Current treatments for

heart failure include, but are not limited to, symptomatic therapy (e.g., diuretics, β-adrenergic blockers, and/or angiotensin-converting enzyme (ACE) inhibitors), and device or surgery therapy (e.g., left ventricular assist device (LVAD), valve replacement, and/or angioplasty). These currently therapies do not directly correct heart contractility but provide only a short term solution to the disease. A long term therapeutic option to treat heart failure is gene therapy using AAV delivery.

[0602] A majority of cardiac AAV gene therapeutic approaches have focused on the β-adrenergic system (βARKct, Adenylyl Cyclase 6) or calcium handling proteins (SERCA2a, PP1, S100A1) to rescue cardiac contractility. See e.g., Hulot et al., 2016 and Zouein & Booz 2013, the contents of each of which are incorporated by reference in their entireties. However, increased transduction of cardiomyocytes by systemic or targeted delivery of the AAV capsids described herein, provides the best opportunity for the treatment of heart failure.

[0603] The New York Heart Association (NYHA) created a functional classification system to categorize subjects with heart failure. NYHA provides 4 classes of patient symptom assessment and 4 classes of objective assessments based on how much a subject is limited during physical activity. Class I patient symptom assessment means a subject has no limit of physical activity as ordinary physical activity does not cause a subject undue fatigue, palpitation, or shortness of breath. Class II patient symptom assessment means a subject has a slight limitation of physical activity as they are comfortable at rest but ordinary physical activity results in fatigue, palpitation, and shortness of breath. Class III patient symptom assessment means a subject has a limitation of physical activity as the subject is comfortable at rest but activity other than normal activity causes fatigue, palpitation, or shortness of breath. Class IV patient symptom assessment means a subject is unable to carry on any physical activity without discomfort. An objective assessment means that a subject has no objective evidence of cardiovascular disease and there are no symptoms nor limitation to ordinary physical activity. A Class B objective assessment means that there is objective evidence of minimal cardiovascular disease with mild symptoms and a slight limitation during ordinary activity but the subject is comfortable at rest. A Class C objective assessment means that there is objective evidence of moderately severe cardiovascular disease, the subject is only comfortable at rest and has marked limitation activity due to symptoms even during activity which is less than ordinary. A Class D objective assessment

means that there is objective evidence of severe cardiovascular disease, the subject has symptoms even at rest, and has severe activity limitations.

[0604] In one embodiment, delivery of the AAV particles of the invention may be used to treat subjects who has heart failure.

[0605] In one embodiment, delivery of the AAV particles of the present invention occurs after a myocardial injury. In one embodiment, delivery of the AAV particles of the present invention occurs after a subject has depressed ventricular performance. In one embodiment, delivery of the AAV particles of the present invention occurs after administration of digoxin to a subject. In one embodiment, delivery of the AAV particles of the present invention occurs at the same time as administration of digoxin to a subject. In one embodiment, delivery of the AAV particles of the present invention occurs after a subject has depressed ventricular performance but prior to a subject having reduced cardiac output. In one embodiment, delivery of the AAV particles of the present invention occurs prior to administration of beta-blockers to a subject.

[0606] In one embodiment, the AAV particles of the present invention are administered in combination with digoxin, beta-blockers, ACE1, aRB, spironolactone, diuretics, and/or vasodilators.

[0607] In one embodiment, the AAV particles of the present invention, comprising ATP2A2 (also called SERCA2a) polynucleotides, are administered to treat a subject who has heart failure. While not wishing to be bound by theory, ATPase Sarcoplasmic/Endoplasmic Reticulum Ca2+ Transporting 2 (also called Sarcoplasmic Reticulum Ca2+ ATPase (SERCA2a) is a component of calcium cycling in cardiomyocytes. Decreased function of proteins responsible for calcium transport (Ca2+) in the sarcoplasmic reticulum (SR) may cause the contraction/relaxation defect seen after heart failure. Decreased expression and activity of ATP2A2 has been observed in human tissue after heart failure (see Arai et al. Circulation Research 72(2) February 2013; the contents of which are herein incorporated by reference in their entirety). The calcium cycle and contractility may be restored by ATP2A2 overexpression in a subject.

[0608] In one embodiment, delivery of the AAV particles of the present invention comprising ATP2A2 polynucleotides increases the expression of ATP2A2 in a subject. The expression may be increased in a cell, tissue and/or organ of interest. As a non-limiting example, the expression of ATP2A2 is increased in the heart. As a non-limiting example, the expression of ATP2A2 is increased in cardiomyocytes.

[0609] In one embodiment, the AAV particles of the present invention, comprising S100A1 polynucleotides, are administered to treat a subject who has heart failure. While not wishing to be bound by theory, S100 Calcium Binding Protein A1 enhances the activity of ATP2A2, RyR, mitochondrial ATP production and/or titin-mediated contraction. Increased activity of ATP2A2, protein responsible for calcium transport (Ca2+) in the sarcoplasmic reticulum (SR), may correct the contraction/relaxation defect seen after heart failure.

[0610] In one embodiment, delivery of the AAV particles of the present invention comprising S100A1 polynucleotides increases the expression of S100A1 in a subject. The expression may be increased in a cell, tissue and/or organ of interest. As a non-limiting example, the expression of S100A1 is increased in the heart. As a non-limiting example, the expression of S100A1 is increased in cardiomyocytes.

[0611] In one embodiment, delivery of the AAV particles of the present invention comprising S100A1 polynucleotides increases the expression of ATP2A2in a subject. The expression may be increased in a cell, tissue and/or organ of interest. As a non-limiting example, the expression of ATP2A2is increased in the heart. As a non-limiting example, the expression of ATP2A2is increased in cardiomyocytes.

Methods of Treatment of Neurological Disease

AAV Particles Encoding protein payloads

[0612] Provided in the present invention are methods for introducing the AAV particles of the present invention into cells, the method comprising introducing into said cells any of the vectors in an amount sufficient for an increase in the production of target mRNA and protein to occur. In some aspects, the cells may be muscle cells, stem cells, neurons such as but not limited to, motor, hippocampal, entorhinal, thalamic or cortical neurons, and glial cells such as astrocytes or microglia.

[0613] Disclosed in the present invention are methods for treating neurological disease associated with insufficient function/presence of a target protein (e.g., ApoE, FXN) in a subject in need of treatment. The method optionally comprises administering to the subject a therapeutically effective amount of a composition comprising AAV particles of the present invention. As a non-limiting example, the AAV particles can increase target gene expression, increase target protein production, and thus reduce one or more symptoms of neurological disease in the subject such that the subject is therapeutically treated.

[0614] In some embodiments, the AAV particle of the present invention comprising a nucleic acid encoding a protein payload comprise an AAV capsid that allows for transmission

[0759] Unless stated otherwise, the following terms and phrases have the meanings described below. The definitions are not meant to be limiting in nature and serve to provide a clearer understanding of certain aspects of the present invention.

[0760] *About:* As used herein, the term "about" means +/- 10% of the recited value.

[0761] *Adeno-associated virus*: The term "adeno-associated virus" or "AAV" as used herein refers to members of the dependovirus genus comprising any particle, sequence, gene, protein, or component derived therefrom.

[0762] *AAV Particle*: As used herein, an "AAV particle" is a virus which comprises a capsid and a viral genome with at least one payload region and at least one ITR region. In addition, the AAV particle may be replication defective and/or targeted.

[0763] *Activity:* As used herein, the term "activity" refers to the condition in which things are happening or being done. Compositions of the invention may have activity and this activity may involve one or more biological events.

[0764] *Administering:* As used herein, the term "administering" refers to providing a pharmaceutical agent or composition to a subject.

[0765] *Administered in combination:* As used herein, the term "administered in combination" or "combined administration" means that two or more agents are administered to a subject at the same time or within an interval such that there may be an overlap of an effect of each agent on the patient. In some embodiments, they are administered within about 60, 30, 15, 10, 5, or 1 minute of one another. In some embodiments, animals include, but are not limited to, mammals, birds, reptiles, amphibians, fish, and worms. In some embodiments, the animal is a transgenic animal, genetically-engineered animal, or a clone.

[0768] *Antisense strand:* As used herein, the term "the antisense strand" or "the first strand" or "the guide strand" of a siRNA molecule refers to a strand that is substantially complementary to a section of about 10-50 nucleotides, e.g., about 15-30, 16-25, 18-23 or 19-22 nucleotides of the mRNA of the gene targeted for silencing. The antisense strand or first strand has sequence sufficiently complementary to the desired target mRNA sequence to direct target-specific silencing, e.g., complementarity sufficient to trigger the destruction of the desired target mRNA by the RNAi machinery or process.

[0769] *Approximately:* As used herein, the term "approximately" or "about," as applied to one or more values of interest, refers to a value that is similar to a stated reference value. In certain embodiments, the term "approximately" or "about" refers to a range of values that fall within 25%, 20%, 19%, 18%, 17%, 16%, 15%, 14%, 13%, 12%, 11%, 10%, 9%, 8%, 7%, 6%, 5%, 4%, 3%, 2%, 1%, or less in either direction (greater than or less than) of the stated reference value unless otherwise stated or otherwise evident from the context (except where such number would exceed 100% of a possible value).

[0770] *Associated with:* As used herein, the terms "associated with," "conjugated," "linked," "attached," and "tethered," when used with respect to two or more moieties, means that the moieties are physically associated or connected with one another, either directly or via one or more additional moieties that serves as a linking agent, to form a structure that is sufficiently stable so that the moieties remain physically associated under the conditions in which the structure is used, *e.g.*, physiological conditions. An "association" need not be strictly through direct covalent chemical bonding. It may also suggest ionic or hydrogen bonding or a hybridization based connectivity sufficiently stable such that the "associated" entities remain physically associated.

[0771] *Bifunctional:* As used herein, the term "bifunctional" refers to any substance, molecule or moiety which is capable of or maintains at least two functions. The functions

may affect the same outcome or a different outcome. The structure that produces the function may be the same or different.

[0772] *Biocompatible*: As used herein, the term "biocompatible" means compatible with living cells, tissues, organs or systems posing little to no risk of injury, toxicity or rejection by the immune system.

[0773] *Biodegradable*: As used herein, the term "biodegradable" means capable of being broken down into innocuous products by the action of living things.

[0774] *Biologically active*: As used herein, the phrase "biologically active" refers to a characteristic of any substance that has activity in a biological system and/or organism. For instance, a substance that, when administered to an organism, has a biological effect on that organism, is considered to be biologically active. In particular embodiments, an AAV particle of the present invention may be considered biologically active if even a portion of the encoded payload is biologically active or mimics an activity considered biologically relevant.

[0775] *Capsid*: As used herein, the term "capsid" refers to the protein shell of a virus particle.

[0776] *Complementary and substantially complementary:* As used herein, the term "complementary" refers to the ability of polynucleotides to form base pairs with one another. Base pairs are typically formed by hydrogen bonds between nucleotide units in antiparallel polynucleotide strands. Complementary polynucleotide strands can form base pair in the Watson-Crick manner (e.g., A to T, A to U, C to G), or in any other manner that allows for the formation of duplexes. As persons skilled in the art are aware, when using RNA as opposed to DNA, uracil rather than thymine is the base that is considered to be complementary to adenosine. However, when a U is denoted in the context of the present invention, the ability to substitute a T is implied, unless otherwise stated. Perfect complementarity or 100% complementarity refers to the situation in which each nucleotide unit of one polynucleotide strand can form hydrogen bond with a nucleotide unit of a second polynucleotide strand. Less than perfect complementarity refers to the situation in which some, but not all, nucleotide units of two strands can form hydrogen bond with each other. For example, for two 20-mers, if only two base pairs on each strand can form hydrogen bond with each other, the polynucleotide strands exhibit 10% complementarity. In the same example, if 18 base pairs on each strand can form hydrogen bonds with each other, the polynucleotide strands exhibit 90% complementarity. As used herein, the term "substantially complementary" means that the siRNA has a sequence (e.g., in the antisense strand) which is

sufficient to bind the desired target mRNA, and to trigger the RNA silencing of the target mRNA.

[0777] *Compound:* Compounds of the present disclosure include all of the isotopes of the atoms occurring in the intermediate or final compounds. "Isotopes" refers to atoms having the same atomic number but different mass numbers resulting from a different number of neutrons in the nuclei. For example, isotopes of hydrogen include tritium and deuterium.

[0778] The compounds and salts of the present disclosure can be prepared in combination with solvent or water molecules to form solvates and hydrates by routine methods.

[0779] *Conditionally active:* As used herein, the term "conditionally active" refers to a mutant or variant of a wild-type polypeptide, wherein the mutant or variant is more or less active at physiological conditions than the parent polypeptide. Further, the conditionally active polypeptide may have increased or decreased activity at aberrant conditions as compared to the parent polypeptide. A conditionally active polypeptide may be reversibly or irreversibly inactivated at normal physiological conditions or aberrant conditions.

[0780] *Conserved*: As used herein, the term "conserved" refers to nucleotides or amino acid residues of a polynucleotide sequence or polypeptide sequence, respectively, that are those that occur unaltered in the same position of two or more sequences being compared. Nucleotides or amino acids that are relatively conserved are those that are conserved amongst more related sequences than nucleotides or amino acids appearing elsewhere in the sequences.

[0781] In some embodiments, two or more sequences are said to be "completely conserved" if they are 100% identical to one another. In some embodiments, two or more sequences are said to be "highly conserved" if they are at least 70% identical, at least 80% identical, at least 90% identical, or at least 95% identical to one another. In some embodiments, two or more sequences are said to be "highly conserved" if they are about 70% identical, about 80% identical, about 90% identical, about 95%, about 98%, or about 99% identical to one another. In some embodiments, two or more sequences are said to be "conserved" if they are at least 30% identical, at least 40% identical, at least 50% identical, at least 60% identical, at least 70% identical, at least 80% identical, at least 90% identical, or at least 95% identical to one another. In some embodiments, two or more sequences are said to be "conserved" if they are about 30% identical, about 40% identical, about 50% identical, about 60% identical, about 70% identical, about 80% identical, about 90% identical, about 95% identical, about 98% identical, or about 99% identical to one another. Conservation of

sequence may apply to the entire length of an polynucleotide or polypeptide or may apply to a portion, region or feature thereof.

[0782] *Control Elements:* As used herein, "control elements", "regulatory control elements" or "regulatory sequences" refers to promoter regions, polyadenylation signals, transcription termination sequences, upstream regulatory domains, origins of replication, internal ribosome entry sites ("IRES"), enhancers, and the like, which provide for the replication, transcription and translation of a coding sequence in a recipient cell. Not all of these control elements need always be present as long as the selected coding sequence is capable of being replicated, transcribed and/or translated in an appropriate host cell.

[0783] *Controlled Release:* As used herein, the term "controlled release" refers to a pharmaceutical composition or compound release profile that conforms to a particular pattern of release to effect a therapeutic outcome.

[0784] *Cytostatic*: As used herein, "cytostatic" refers to inhibiting, reducing, suppressing the growth, division, or multiplication of a cell (*e.g.*, a mammalian cell (*e.g.*, a human cell)), bacterium, virus, fungus, protozoan, parasite, prion, or a combination thereof.

[0785] *Cytotoxic*: As used herein, "cytotoxic" refers to killing or causing injurious, toxic, or deadly effect on a cell (*e.g.*, a mammalian cell (*e.g.*, a human cell)), bacterium, virus, fungus, protozoan, parasite, prion, or a combination thereof.

[0786] *Delivery:* As used herein, "delivery" refers to the act or manner of delivering an AAV particle, a compound, substance, entity, moiety, cargo or payload.

[0788] *Destabilized:* As used herein, the term "destable," "destabilize," or "destabilizing region" means a region or molecule that is less stable than a starting, wild-type or native form of the same region or molecule.

[0789] *Detectable label:* As used herein, "detectable label" refers to one or more markers, signals, or moieties which are attached, incorporated or associated with another entity that is readily detected by methods known in the art including radiography, fluorescence, chemiluminescence, enzymatic activity, absorbance and the like. Detectable labels include radioisotopes, fluorophores, chromophores, enzymes, dyes, metal ions, ligands such as biotin, avidin, streptavidin and haptens, quantum dots, and the like. Detectable labels may be located at any position in the peptides or proteins disclosed herein. They may be within the amino acids, the peptides, or proteins, or located at the N- or C- termini.

[0790] *Digest*: As used herein, the term "digest" means to break apart into smaller pieces or components. When referring to polypeptides or proteins, digestion results in the production of peptides.

[0791] *Distal:* As used herein, the term "distal" means situated away from the center or away from a point or region of interest.

[0792] *Dosing regimen*: As used herein, a "dosing regimen" is a schedule of administration or physician determined regimen of treatment, prophylaxis, or palliative care.

[0795] *Effective Amount:* As used herein, the term "effective amount" of an agent is that amount sufficient to effect beneficial or desired results, for example, clinical results, and, as such, an "effective amount" depends upon the context in which it is being applied. For example, in the context of administering an agent that treats cancer, an effective amount of an agent is, for example, an amount sufficient to achieve treatment, as defined herein, of cancer, as compared to the response obtained without administration of the agent.

[0796] *Expression*: As used herein, "expression" of a nucleic acid sequence refers to one or more of the following events: (1) production of an RNA template from a DNA sequence (*e.g.*, by transcription); (2) processing of an RNA transcript (*e.g.*, by splicing, editing, 5′ cap formation, and/or 3′ end processing); (3) translation of an RNA into a polypeptide or protein; and (4) post-translational modification of a polypeptide or protein.

[0797] *Feature:* As used herein, a "feature" refers to a characteristic, a property, or a distinctive element.

[0798] *Formulation*: As used herein, a "formulation" includes at least one AAV particle and a delivery agent.

[0799] *Fragment:* A "fragment," as used herein, refers to a portion. For example, fragments of proteins may comprise polypeptides obtained by digesting full-length protein isolated from cultured cells.

[0800] *Functional*: As used herein, a "functional" biological molecule is a biological molecule in a form in which it exhibits a property and/or activity by which it is characterized.

[0801] *Gene expression*: The term "gene expression" refers to the process by which a nucleic acid sequence undergoes successful transcription and in most instances translation to produce a protein or peptide. For clarity, when reference is made to measurement of "gene expression", this should be understood to mean that measurements may be of the nucleic acid product of transcription, e.g., RNA or mRNA or of the amino acid product of translation, e.g., polypeptides or peptides. Methods of measuring the amount or levels of RNA, mRNA, polypeptides and peptides are well known in the art.

[0802] *Homology*: As used herein, the term "homology" refers to the overall relatedness between polymeric molecules, *e.g.* between polynucleotide molecules (*e.g.* DNA molecules and/or RNA molecules) and/or between polypeptide molecules. In some embodiments, polymeric molecules are considered to be "homologous" to one another if their sequences are at least 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, or 99% identical or similar. The term "homologous" necessarily refers to a comparison between at least two sequences (polynucleotide or polypeptide sequences). In accordance with the invention, two polynucleotide sequences are considered to be homologous if the polypeptides they encode are at least about 50%, 60%, 70%, 80%, 90%, 95%, or even 99% for at least one stretch of at least about 20 amino acids. In some embodiments, homologous polynucleotide sequences are characterized by the ability to encode a stretch of at least 4–5 uniquely specified amino acids. For polynucleotide sequences less than 60 nucleotides in length, homology is determined by the ability to encode a stretch of at least 4–5 uniquely specified amino acids. In accordance with the invention, two protein sequences are considered to be homologous if the proteins are at least about 50%, 60%, 70%, 80%, or 90% identical for at least one stretch of at least about 20 amino acids.

[0803] *Heterologous Region*: As used herein the term "heterologous region" refers to a region which would not be considered a homologous region.

[0804] *Homologous Region:* As used herein the term "homologous region" refers to a region which is similar in position, structure, evolution origin, character, form or function.

[0805] *Identity*: As used herein, the term "identity" refers to the overall relatedness between polymeric molecules, *e.g.*, between polynucleotide molecules (*e.g.* DNA molecules and/or RNA molecules) and/or between polypeptide molecules. Calculation of the percent identity of two polynucleotide sequences, for example, can be performed by aligning the two sequences for optimal comparison purposes (*e.g.*, gaps can be introduced in one or both of a first and a second nucleic acid sequences for optimal alignment and non-identical sequences

can be disregarded for comparison purposes). In certain embodiments, the length of a sequence aligned for comparison purposes is at least 30%, at least 40%, at least 50%, at least 60%, at least 70%, at least 80%, at least 90%, at least 95%, or 100% of the length of the reference sequence. The nucleotides at corresponding nucleotide positions are then compared. When a position in the first sequence is occupied by the same nucleotide as the corresponding position in the second sequence, then the molecules are identical at that position. The percent identity between the two sequences is a function of the number of identical positions shared by the sequences, taking into account the number of gaps, and the length of each gap, which needs to be introduced for optimal alignment of the two sequences. The comparison of sequences and determination of percent identity between two sequences can be accomplished using a mathematical algorithm. For example, the percent identity between two nucleotide sequences can be determined using methods such as those described in Computational Molecular Biology, Lesk, A. M., ed., Oxford University Press, New York, 1988; Biocomputing: Informatics and Genome Projects, Smith, D. W., ed., Academic Press, New York, 1993; Sequence Analysis in Molecular Biology, von Heinje, G., Academic Press, 1987; Computer Analysis of Sequence Data, Part I, Griffin, A. M., and Griffin, H. G., eds., Humana Press, New Jersey, 1994; and Sequence Analysis Primer, Gribskov, M. and Devereux, J., eds., M Stockton Press, New York, 1991; each of which is incorporated herein by reference. For example, the percent identity between two nucleotide sequences can be determined using the algorithm of Meyers and Miller (CABIOS, 1989, 4:11-17), which has been incorporated into the ALIGN program (version 2.0) using a PAM120 weight residue table, a gap length penalty of 12 and a gap penalty of 4. The percent identity between two nucleotide sequences can, alternatively, be determined using the GAP program in the GCG software package using an NWSgapdna.CMP matrix. Methods commonly employed to determine percent identity between sequences include, but are not limited to those disclosed in Carillo, H., and Lipman, D., SIAM J Applied Math., 48:1073 (1988); incorporated herein by reference. Techniques for determining identity are codified in publicly available computer programs. Exemplary computer software to determine homology between two sequences include, but are not limited to, GCG program package, Devereux, J., *et al.*, *Nucleic Acids Research*, 12(1), 387 (1984)), BLASTP, BLASTN, and FASTA Altschul, S. F. *et al.*, *J. Molec. Biol.*, 215, 403 (1990)).

[0806] *Inhibit expression of a gene:* As used herein, the phrase "inhibit expression of a gene" means to cause a reduction in the amount of an expression product of the gene. The

expression product can be an RNA transcribed from the gene (*e.g.*, an mRNA) or a polypeptide translated from an mRNA transcribed from the gene. Typically a reduction in the level of an mRNA results in a reduction in the level of a polypeptide translated therefrom. The level of expression may be determined using standard techniques for measuring mRNA or protein.

[0807] *In vitro*: As used herein, the term "*in vitro*" refers to events that occur in an artificial environment, *e.g.*, in a test tube or reaction vessel, in cell culture, in a Petri dish, *etc.*, rather than within an organism (*e.g.*, animal, plant, or microbe).

[0808] *In vivo*: As used herein, the term "*in vivo*" refers to events that occur within an organism (*e.g.*, animal, plant, or microbe or cell or tissue thereof).

[0809] *Isolated*: As used herein, the term "isolated" refers to a substance or entity that has been separated from at least some of the components with which it was associated (whether in nature or in an experimental setting). Isolated substances may have varying levels of purity in reference to the substances from which they have been associated. Isolated substances and/or entities may be separated from at least about 10%, about 20%, about 30%, about 40%, about 50%, about 60%, about 70%, about 80%, about 90%, or more of the other components with which they were initially associated. In some embodiments, isolated agents are more than about 80%, about 85%, about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, or more than about 99% pure. As used herein, a substance is "pure" if it is substantially free of other components.

[0810] *Substantially isolated*: By "substantially isolated" is meant that a substance is substantially separated from the environment in which it was formed or detected. Partial separation can include, for example, a composition enriched in the substance or AAV particles of the present disclosure. Substantial separation can include compositions containing at least about 50%, at least about 60%, at least about 70%, at least about 80%, at least about 90%, at least about 95%, at least about 97%, or at least about 99% by weight of the compound of the present disclosure, or salt thereof. Methods for isolating compounds and their salts are routine in the art.

[0811] *Linker:* As used herein "linker" refers to a molecule or group of molecules which connects two molecules. A linker may be a nucleic acid sequence connecting two nucleic acid sequences encoding two different polypeptides. The linker may or may not be translated. The linker may be a cleavable linker.

[0840] *RNA interfering or RNAi:* As used herein, the term "RNA interfering" or "RNAi" refers to a sequence specific regulatory mechanism mediated by RNA molecules which results in the inhibition or interfering or "silencing" of the expression of a corresponding protein-coding gene. RNAi has been observed in many types of organisms, including plants, animals and fungi. RNAi occurs in cells naturally to remove foreign RNAs (e.g., viral RNAs). Natural RNAi proceeds via fragments cleaved from free dsRNA which direct the degradative mechanism to other similar RNA sequences. RNAi is controlled by the RNA-induced silencing complex (RISC) and is initiated by short/small dsRNA molecules in cell cytoplasm, where they interact with the catalytic RISC component argonaute. The dsRNA molecules can be introduced into cells exogenously. Exogenous dsRNA initiates RNAi by activating the ribonuclease protein Dicer, which binds and cleaves dsRNAs to produce double-stranded fragments of 21-25 base pairs with a few unpaired overhang bases on each end. These short double stranded fragments are called small interfering RNAs (siRNAs).

VII. EXAMPLES

EXAMPLE 1. Production and Purification of AAV particles

[0870] AAV particles described herein may be produced using methods known in the art, such as, for example, triple transfection or baculovirus mediated virus production. Any suitable permissive or packaging cell known in the art may be employed to produce the vectors. Mammalian cells are often preferred. Also preferred are trans-complementing packaging cell lines that provide functions deleted from a replication-defective helper virus, e.g., 293 cells or other E1a trans-complementing cells.

[0871] The gene cassette may contain some or all of the parvovirus (e.g., AAV) cap and rep genes. Preferably, however, some or all of the cap and rep functions are provided in trans by introducing a packaging vector(s) encoding the capsid and/or Rep proteins into the cell. Most preferably, the gene cassette does not encode the capsid or Rep proteins. Alternatively, a packaging cell line is used that is stably transformed to express the cap and/or rep genes

[0872] Recombinant AAV virus particles are, in some cases, produced and purified from culture supernatants according to the procedure as described in US20160032254, the contents of which are incorporated by reference. Production may also involve methods known in the art including those using 293T cell, sf9 insect cells, triple transfection or any suitable production method.

[0873] In some cases, 293 cells are transfected with CaPO4 with plasmids required for production of AAV, i.e., AAV2 rep, an adenoviral helper construct and a ITR flanked transgene cassette. The AAV2 rep plasmid also contains the cap sequence of the particular virus being studied. Twenty-four hours after transfection, which occurs in serum containing DMEM, the medium is replaced with fresh medium with or without serum. Three (3) days after transfection, a sample is taken from the culture medium of the 293 adherent cells. Subsequently cells are scraped and transferred into a receptacle. After centrifugation to remove cellular pellet, a second sample is taken from the supernatant after scraping. Next, cell lysis is achieved by three consecutive freeze-thaw cycles (-80C to 37C). Cellular debris is removed and sample 3 is taken from the medium. The samples are quantified for AAV particles by DNase resistant genome titration by Taqman.TM. PCR. The total production yield from such a transfection is equal to the particle concentration from sample 3.

[0874] AAV particle titers are measured according to genome copy number (genome particles per milliliter). Genome particle concentrations are based on Taqman.RTM. PCR of the vector DNA as previously reported (Clark et al. (1999) Hum. Gene Ther., 10:1031-1039; Veldwijk et al. (2002) Mol. Ther., 6:272-278).

EXAMPLE 2. Tissue specific expression

[0875] To evaluate the expression of various encoded payloads in tissues, a series of AAV particles carrying the encoded sequences driven by a panel of ubiquitous and tissue-specific promoters are made. These particles are administered to the specific tissue, e.g., systemically, via an appropriate route, e.g., a single intravenous injection and expression is monitored to determine the relative expression potential of the payload as well as of each promoter in this target tissue. Measurement of payload production is performed using standard techniques, for example by ELISA.

[0876] In some cases, the cytomegalovirus immediate early promoter (CMV), chimeric chicken-beta-actin (CAG), and ubiquitin C (UBC), CBA, H1, αMHC, cTnT, and CMV-MLC2k promoters provide robust expression.

EXAMPLE 3. *In Vivo* Mouse Biodistribution and Expression Levels Following Intravenous Treatment with VOY101-GFP vector

[0877] An adeno-associated capsid variant (VOY101) was engineered for widespread gene transfer into the brain and heart. A viral genome comprising AAV2 wild-type inverted terminal repeats (ITR), a synthetic promoter composed of CMV enhancer and chicken beta-actin promoter (CBA), an enhanced green fluorescent protein variant (eGFP) and a rabbit globin polyadenylation sequence was used to generate AAV particles, having a capsid serotype of either VOY101 or AAV9, by triple transfection into HEK293T cells. The ITR to ITR sequence of the viral genome is provided as SEQ ID NO: 1799.

[0878] The single-stranded AAV particles were purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68, and then administered to adult C57Bl/6J mice at 6-7 weeks of age via lateral tail vein injection at ~4 ml/kg, with a vector concentration of 5.0×10^{12} vg/mL. The total dose was 2.0×10^{13} VG/kg. A control group was treated with vehicle (PBS with 0.001% F-68).

[0879] Approximately 28 days following administration, several tissue samples were collected. Tissue samples allocated for GFP protein quantification or vector genome quantification were flash-frozen in liquid nitrogen. Tissue samples allocated for anti-GFP immunohistochemistry were post-fixed in 4% paraformaldehyde overnight. Analysis of the tissue samples by immuno-histochemical staining with an anti-GFP antibody and subsequent DAB substrate development showed that systemic injection with VOY101-GFP particles resulted in increased GFP levels throughout the brain and spinal cord as compared to the administered AAV9-GFP particles.

[0880] GFP protein levels were measured by ELISA and reported in ng GFP/mg of total protein and the results are shown in Table 13. Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host TFRC (transferrin receptor protein 1) and expressed in vector genome per diploid cell (VG/DC) and the results are shown in Tables 14 and 15. In Tables 13, 14 and 15, "BLLQ" means below lower limit of quantification.

A. In Vivo Mouse Biodistribution and Expression Levels Following Intravenous Treatment with VOY101-FXN AAV particles

[0882] Widespread gene transfer into the brain and heart was also observed when using a viral genome with macaca fascicularis (cynomolgus monkey) frataxin (cFXN) transgene. A viral genome comprising AAV2 wild-type ITRs, a synthetic promoter composed of CMV enhancer and chicken beta-actin promoter (CBA), macaca fascicularis frataxin (cFXN) and a human growth hormone polyadenylation sequence was used to generate AAV particles, having a capsid serotype of either VOY101 or AAV9, by triple transfection into HEK293T cells. The ITR to ITR sequence of the viral genome is provided as SEQ ID NO: 1801.

[0883] The single-stranded AAV particles were purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68, and then administered to adult C57Bl/6J mice at 9 weeks of age via lateral tail vein injection ~4 ml/kg, with a vector concentration of 1.0 × 10^{12} vg/mL. The total dose was 4.2 × 10^{12} VG/kg. A control group was treated with vehicle (PBS with 0.001% F-68).

[0884] Seven days following AAV particle or vehicle administration, several tissue samples were collected. Tissue samples were flash-frozen in liquid nitrogen. Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host TFRC, and expressed in vector genome per diploid cell (VG/DC). cFXN protein levels were measured by ELISA and reported in ng cFXN/mg of total protein. cFXN protein levels and vector genome distribution are shown in Tables 16 and 17. B. In Vivo Study in Non-Human Primate of cFXN Expression after Treatment with VOY101-FXN-HA AAV Particles

[0888] A study in cynomolgus monkeys (macaca fascicularis) was conducted to evaluate cFXN expression within the CNS after IV dosing of VOY101-cFXN-HA.

[0889] A viral genome comprising HA-tagged cynomolgus frataxin (cFXN-HA) was engineered into a single stranded expression vector. A viral genome comprising AAV2 wild-type ITRs, a synthetic promoter composed of CMV enhancer and chicken beta-actin promoter (CBA), macaca fascicularis frataxin (cFXN) with 3' sequence for HA-tag and a human growth hormone polyadenylation sequence was used to generate AAV particles, having a capsid serotype of VOY101, by triple transfection into HEK293T cells. The ITR to ITR sequence of the viral genome is provided as SEQ ID NO: 1801.

[0890] The single-stranded AAV particles (VOY101-cFXN-HA) were purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68, and then administered to non-human primate (*Macaca* fascicularis) via saphenous vein injection at 5 ml/kg, with a vector concentration of 1.34×10^{12} vg/mL and a total dose of 6.7×10^{12} VG/kg. In addition, a single-stranded AAV9 with a CBA promoter and a viral genome comprising cFXN-HA (AAV9-cFXN-HA) was tested by intravenous injection at a dose of 2×10^{13} VG/kg.

[0891] Approximately 28 days following AAV particle administration, several tissue samples were collected. Tissue samples allocated for cFXN-HA protein quantification or vector genome quantification were snap-frozen. Tissue samples allocated for anti-HA immunohistochemistry were post-fixed in 4% paraformaldehyde for 12 to 72 hours at 2-8°C. Tissue sections (20 μm thickness) were stained with a rabbit monoclonal antibody to HA tag (1:1000 or 1:2000), followed by a goat-anti-rabbit IgG biotinylated secondary antibody (1:1000), and then developed with DAB plus nickel. cFXN-HA staining was observed in multiple CNS regions after IV dosing of VOY101-cFXN. These regions include but are not limited to, the spinal cord (cervical, thoracic and lumbar segments), brainstem nuclei, cerebellum (including cerebellar dentate nucleus), thalamus, caudate nucleus, and cerebral cortex. Homogeneous HA staining was observed along the entire rostral-caudal extent of the spinal cord, particularly in ventral horn motor neurons, after IV dosing of VOY101-cFXN-HA at 6.7×10^{12} VG/kg. The spinal cord and especially ventral horn motor neurons were labeled to a much greater degree with VOY101-cFXN-HA than with AAV9-cFXN-HA, despite the 3-fold lower dose of VOY101-cFXN-HA. Vehicle-treated control non-human primates exhibited essentially no detectable background staining.

[0892] HA staining in the lumbar ventral horn, including motor neurons, was similar after IV VOY101-cFXN-HA (6.7×10^{12} VG/kg) compared with IT administration of a similar dose of a single-stranded rh10 vector and a viral genome comprising cFXN-HA (AAVrh10-FXN-HA).

[0893] Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host RnaseP and expressed in vector genome per diploid cell (VG/DC). cFXN-HA protein levels were measured by ELISA. cFXN-HA protein levels (in ng cFXN-HA/mg of total protein) and vector genome distribution (VG/DC) are shown in Table 18. In Table 18, "BLLQ" means below lower limit of quantification and "NA" means not analyzed.

[0894] These results show that in non-human primates (NHPs) 28 days after intravenous injection of 6.7 x 10^{12} VG/kg, VOY101-cFXN-HA resulted in brain transduction. Significant levels of cFXN-HA protein were detected in many CNS regions including the spinal cord (cervical, thoracic and lumbar segments) and brainstem. Significant levels of vector genomes were detected in many CNS regions including the spinal cord (cervical and thoracic segments), brainstem, and cortex, after IV dosing.

C. In Vivo Biodistribution and Expression Levels of cFXN Expression in Non-Human Primates after Treatment with PHP.B-FXN-HA AAV Particles

[0895] A dose-response study in cynomolgus monkeys (macaca fascicularis) was conducted to evaluate cFXN expression within the CNS after IV dosing of PHP.B-cFXN-HA.

[0896] A viral genome comprising HA-tagged cynomolgus frataxin (cFXN-HA) was engineered into a single stranded expression vector. A viral genome comprising AAV2 wild-type ITRs, a synthetic promoter composed of CMV enhancer and chicken beta-actin promoter (CBA), macaca fascicularis frataxin (cFXN) with 3' sequence for HA-tag, triple repeat of a miR-122 target sequence (to reduce transgene liver expression), and a human growth hormone polyadenylation sequence was used to generate AAV particles, having a capsid serotype of PHP.B, by triple transfection into HEK293T cells. The ITR to ITR sequence of the viral genome is provided as SEQ ID NO: 1802.

[0897] The single-stranded AAV particles were purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68, and then administered to non-human primate (*Macaca* fascicularis) via saphenous vein injection at 5 ml/kg, with a vector concentration of 1.54×10^{11} to 4.75×10^{12} vg/mL. Animals were dosed at 6.32×10^{11}, 2.0×10^{12}, or 2.0×10^{13}, VG/kg.

[0898] Approximately 28 days following AAV particle administration, several tissue samples were collected. Tissue samples allocated for cFXN-HA protein quantification or vector genome quantification were snap frozen. Tissue samples allocated for anti-HA immunohistochemistry were post-fixed in 4% paraformaldehyde for 12 to 72 hours at 2-8 °C. For single labeling, tissue sections (20 μm thickness) were stained with a rabbit monoclonal antibody to HA tag (1:1000 or 1:2000), followed by a goat-anti-rabbit IgG biotinylated secondary antibody (1:1000), and then developed with DAB plus nickel. HA staining was observed in multiple CNS regions after IV dosing of PHP.B-cFXN-HA at 2×10^{13} vg/kg. These regions include but are not limited to, the spinal cord (cervical, thoracic and lumbar segments), cerebellum (including dentate nucleus), thalamus, striatum, substantia nigra, and sensory and motor cortex. Furthermore, HA staining showed transduction of large numbers of neurons in multiple CNS regions, including those of neuronal morphology in the substantia nigra, dentate nucleus and thalamus. In addition, cells of neuronal morphology in the spinal cord, motor and sensory cortices, and striatum were HA-immunoreactive.

[0899] Double labeling for the HA tag and the neuronal marker NeuN was carried out using a chromogenic method. Tissue sections (20 μm thickness) were stained with a rabbit monoclonal antibody to HA tag (1:1000), followed by a goat-anti-rabbit IgG biotinylated secondary antibody (1:1000), and then developed with DAB (without nickel). The sections were then stained with a mouse monoclonal to NeuN second primary antibody, followed by a goat-anti-mouse IgG biotinylated secondary antibody. The NeuN signal was then detected with a green chromogen. Multiple HA+ cells were double-labeled with the neuronal marker NeuN. These results demonstrate that neurons of the cerebellar dentate nucleus were labeled for the HA tag after intravenous injection of PHP.B-cFXN-HA at 2×10^{13} VG/kg. Therefore, after an intravenous dose of 2×10^{13} vg/kg in cynomolgus monkeys, neurons of the cerebellar dentate nucleus are transduced and express the transgene.

[0900] Expression of the HA tag in lumbar dorsal root ganglia was present in both large (>40 um) and small sensory neurons, with the labeling increasing in a dose-dependent

manner with IV injection of PHP.B-cFXN-HA at 6.32×10^{11}, 2.0×10^{12}, or 2.0×10^{13}, VG/kg.

[0901] Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host RnaseP and expressed in vector genome per diploid cell (VG/DC). cFXN-HA protein levels were measured by ELISA. cFXN-HA protein levels (in ng cFXN-HA/mg of total protein) and vector genome distribution (VG/DC) for the PHP.B capsid serotype are shown in Table 19. In Table 19, "BLLQ" means below lower limit of quantification and "NA" means not analyzed.

[0902] In summary, in non-human primates (NHPs) 28 days after intravenous injection of PHP.B-cFXN-HA, all three dose levels resulted in brain transduction. Significant levels of cFXN-HA protein were detected in many CNS regions including the spinal cord (cervical, thoracic and lumbar segments), brainstem, and cerebellum. Significant levels of vector genome were detected in many CNS regions including the spinal cord (cervical, thoracic and lumbar segments), striatum, brainstem, cerebellum and frontal cortex after IV dosing. Substantial gene transfer to the NHP CNS was observed, including regions such as spinal cord, brain stem, sensory cortex, motor cortex, cerebellum, thalamus, and substantia nigra, with cells of neuronal morphology in these regions exhibiting transgene expression. In addition, the dorsal root ganglia and the heart showed dose-dependent transgene expression, with sensory neurons of the dorsal root ganglia exhibiting transduction.

D. In Vivo Dose Dependent Study in Non-Human Primate of cFXN Expression after Treatment with VOY101-FXN-HA AAV Particles

[0903] A study in cynomolgus monkeys (macaca fascicularis) was conducted to evaluate cFXN expression within the CNS after two different IV dose levels of single stranded VOY101-cFXN-HA.

[0904] A viral genome comprising HA-tagged cynomolgus frataxin (cFXN-HA) was engineered into a single stranded expression vector. A viral genome comprising AAV2 wild-type ITRs, a synthetic promoter composed of CMV enhancer and chicken beta-actin promoter (CBA), macaca fascicularis frataxin (cFXN) with 3' sequence for HA-tag and a human growth hormone polyadenylation sequence was used to generate AAV particles, having a capsid serotype of VOY101. The ITR to ITR sequence of the viral genome is provided as SEQ ID NO: 1801.

[0905] The single-stranded AAV particles were purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68, and then administered to non-human primate (*Macaca* fascicularis) via saphenous vein injection at 5 ml/kg, with a total dose of 6.7×10^{12} VG/kg or 4.9×10^{13} VG/kg VOY101-cFXN-HA. A vehicle negative control group was also evaluated.

[0906] Approximately 28 days following AAV particle administration, several tissue samples were collected. Tissue samples allocated for cFXN-HA protein quantification or vector genome quantification were snap-frozen. Tissue samples allocated for anti-HA immunohistochemistry were post-fixed in 4% paraformaldehyde for 12 to 72 hours at 2-8 °C. Tissue sections (20 μm thickness) were stained with a rabbit monoclonal antibody to HA tag (1:1000 or 1:2000), followed by a goat-anti-rabbit IgG biotinylated secondary antibody (1:1000), and then developed with DAB plus nickel.

[0907] Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host TFRC, and expressed in vector genome per cell (VG/Cell). Vector genome distribution (mean ± standard deviation) is shown in Table 20 for VOY101-cFXN-HA. In Table 20, SC-C is the cervical spinal cord and SC-L is the lumbar spinal cord.

Table 20. Vector Genome Distribution in NHP after Intravenous Injection of VOY101-cFXN-HA

[0908] Homogeneous HA staining was observed along the entire rostral-caudal extent of the spinal cord, particularly in ventral horn motor neurons after IV dosing of VOY101-cFXN-HA. HA staining in the cervical (C5), thoracic (T12) and lumbar (L4) spinal cord of animals receiving a dose of 4.9×10^{13} VG/kg of VOY101-cFXN-HA revealed robust HA staining at all rostral-caudal levels of the spinal cord, particularly in ventral horn motor neurons (Figure 5). Numerous HA+ cells were observed in animals receiving a dose of 4.9×10^{13} VG/kg of VOY101-cFXN-HA including those of neuronal morphology in the motor cortex, the brainstem including the olivary nucleus, hippocampus, the substantia nigra and lateral geniculate nucleus, and the deep cerebellar nuclei including the dentate nucleus. Vehicle-treated control exhibited essentially no detectable or very low background staining.

EXAMPLE 5. VOY101-FXN for the treatment of Friedreich's Ataxia

A. In Vivo Distribution, Expression and Efficacy Study with Intravenous Dosing of VOY101-FXN in a Mouse Model of Friedreich's Ataxia

[0909] Selected viral genomes comprising a nucleic acid encoding human frataxin are designed and packaged into a single stranded VOY101 capsid.

[0910] The viral genome from ITR to ITR, recited 5' to 3', comprises a wild type ITR, a promoter (which includes a CMVie enhancer, a CBA, or a CMV, or a frataxin promoter, or a truncated CBA or a truncated CMV promoter, and a human beta globin intron), hFXN cDNA sequence, a human growth hormone polyA sequence, a fragment of human albumin as a stuffer sequence, and wild type ITR. The viral genomes are packaged into VOY101 capsids, purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68.

[0911] Six groups of approximately 10 mice/group, at 7 weeks of age, and balanced for gender and litter, receive vehicle (PBS with 0.001% F-68; two groups), or VOY101-FXN vector at either low (2 groups) or high dose (2 groups) levels (approximately 6.3×10^{12} vg/kg – 2×10^{13} vg/kg body weight) via intravenous injection.

[0912] To test the efficacy, distribution and expression of VOY101-FXN in mice, any test known in the art may be utilized. Non-limiting examples include limb electromyography, notched bar walking test, string hanging test, rotarod test, body weight, and/or survival. Other readouts include FXN protein and mRNA expression in tissues (e.g. dorsal root ganglia, heart, cerebellum, spinal cord) by ELISA, PCR, immunohistochemistry and *in situ* hybridization, and in situ assessment of mitochondrial enzyme function in tissue (dorsal root ganglia) sections. Vector genome levels in different tissues are determined by PCR and ISH.

[0991] Selected pri-miRNA cassettes containing guide strands targeting Tau and passenger strands are engineered into scAAV-miRNA viral genomes and packaged into a VOY101 capsid.

[0992] The viral genome from ITR to ITR, recited 5' to 3', comprises a wild type ITR, a promoter, the pri-miRNA cassette containing guide sequence targeting Tau and passenger sequence, a polyA sequence, a stuffer sequence, and a wild type ITR. The viral genomes are packaged into VOY101 capsids, purified and formulated. The VOY101-Tau miRNA particles are formulated in phosphate buffered saline (PBS) with 0.001% F-68.

[0993] Non-human primates (NHPs) (Cynomolgus macaques, adult male, prescreened for AAV neutralizing antibodies) in three groups are administered the scVOY101-Tau miRNA with one group a vehicle only control (PBS with 0.001% F-68). The NHPs are administered either high or low dose levels of VOY101-Tau miRNA (approximately 4×10^{12} vg/kg – 4×10^{13} vg/kg) using intravenous delivery. 4 weeks post-administration, a saline perfusion is performed and the brain sectioned into 3 mm coronal blocks and snap-frozen.

[0994] To test the distribution and expression of VOY101-Tau miRNA in NHP, any test known in the art may be utilized. Non-limiting examples include measurement of expression of tau mRNA by qRT-PCR, expression of tau protein as assessed by immunohistochemistry and enzyme-linked immunosorbent assay, and vector genome levels as assessed by digital droplet PCR.

[0995] One might expect expression data to show that tau protein and mRNA is reduced widely in the brain. Brain regions likely to demonstrate significant tau reduction include areas important for tauopathy related disease, including the entorhinal cortex, hippocampus, and cortex. Consistent with the expression data, PCR would likely demonstrate widespread distribution of vector genome through the brain.

EXAMPLE 12. VOY101-ATP2A2 for the treatment of Cardiovascular Disease (e.g., Heart Failure)

A. In Vivo Distribution, Expression and Efficacy Study with Intravenous Dosing of VOY101-ATP2A2 in a Mouse Model of Cardiovascular Disease

[0996] Selected viral genomes comprising a nucleic acid encoding human ATP2A2 are designed and packaged into a single stranded VOY101 capsid.

[0997] The viral genome from ITR to ITR, recited 5' to 3', comprises a wild type ITR, a promoter, hATP2A2 cDNA sequence, a human growth hormone polyA sequence, a fragment of human albumin as a stuffer sequence, and a wild type ITR. The viral genomes are packaged into VOY101 capsids, purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68.

[0998] Six groups of approximately 10 mice/group, at 7 weeks of age, and balanced for gender and litter, receive vehicle (PBS with 0.001% F-68; two groups), or VOY101-ATP2A2 vector at either low (2 groups) or high dose (2 groups) levels (approximately 6.3×10^{12} vg/kg – 2×10^{13} vg/kg body weight) via intravenous injection.

[0999] To test the efficacy, distribution and expression of VOY101-ATP2A2 in mice, any test known in the art may be utilized. Non-limiting examples include limb electromyography, notched bar walking test, string hanging test, rotarod test, body weight, and/or survival. Other readouts include ATP2A2 protein and mRNA expression in tissues (e.g. dorsal root ganglia, heart (e.g., cardiomyocytes), cerebellum, spinal cord) by ELISA, PCR, immunohistochemistry and in situ hybridization, and in situ assessment of mitochondrial enzyme function in tissue (dorsal root ganglia) sections. Vector genome levels in different tissues are determined by PCR and ISH.

[1000] Three groups of animals (vehicle, low dose, high dose) are euthanized by 18 weeks. Three remaining groups of animals (vehicle, low dose, high dose) are maintained for 6 months or longer to assess effect on survival. Control groups (n=10/ group) include wild type mice and disease model mice dosed with a reference vector.

[1001] The distribution and expression of human ATP2A2 and vector genome distribution in target tissues such as, but not limited to, DRGs, cerebellum, spinal cord and heart in animals receiving the hATP2A2 vector, is measured by ELISA, PCR, ISH, IHC for hATP2A2 expression and PCR and ISH for vector genome analysis. Human ATP2A2 analysis (by ELISA, PCR, ISH, IHC) demonstrate that upon the delivery of the hATP2A2 vector, expression in target tissues e.g., heart occurs with distribution of the viral genome to target tissues. *In situ* assessment of mitochondrial enzyme activity shows that upon delivery of the hATP2A2 vector, increased activity in slices of heart occurs. Electromyography, notched bar, string hanging and rotarod tests demonstrate improved performance over vehicle control animals.

[1002] Selected viral genomes comprising a nucleic acid sequence encoding human ATP2A2 are designed and packaged in a single stranded (ss) VOY101 capsid.

[1003] The single stranded viral genome from ITR to ITR, recited 5' to 3', comprises a wild type ITR, a promoter, hATP2A2 cDNA sequence, a human growth hormone polyA sequence, a fragment of human albumin as a stuffer sequence, and a wild type ITR. The viral genomes are packaged into VOY101 capsids, purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68.

[1004] Eight groups of approximately 3 cynomolgus monkeys/group, approximately 3 years of age or older, with at least one animal of each gender per group, receive vehicle (PBS with 0.001% F-68; two groups), or VOY101-ATP2A2 vector at either low (2 groups) or high dose (2 groups) levels (approximately 6.7×10^{12} vg/kg – 6×10^{13} vg/kg body weight) via intravenous injection.

[1005] To test the efficacy, distribution and expression of VOY101-ATP2A2 in NHP, any test known in the art may be utilized. Non-limiting examples include measurement of body weight over time, clinical monitoring, histopathology and blood safety panel testing. Other readouts include ATP2A2 protein and mRNA expression in tissues (e.g. heart) as assessed by ELISA, PCR, immunohistochemistry and in situ hybridization. Vector genome levels in different tissues are determined by PCR and ISH.

[1006] Three groups of animals (vehicle, low dose, high dose) are euthanized by 4 weeks. Three remaining groups of animals (vehicle, low dose, high dose) are maintained for 12 weeks to assess long term gene expression.

[1007] The distribution and expression of human ATP2A2 (hATP2A2) and vector genome distribution in target tissues such as, but not limited to, heart in animals receiving the hATP2A2 vector, is measured by ELISA, PCR, ISH, IHC for hATP2A2 expression and PCR and ISH for vector genome analysis. The primate ATP2A2 expression data are compared to the ATP2A2 expression level which resulted in rescue of the cardiovascular disease phenotype in a genetic mouse model of cardiovascular disease. Based on these results, efficacious doses for human trials are calculated.

EXAMPLE 14. Anti-tau antibody delivery for the treatment of Alzheimer's Disease and other tauopathies

A. In Vivo Distribution, Expression and Efficacy Study of Intravenous Dosing of VOY101 or VOY201-anti-Tau antibody

[1020] A nucleic acid encoding the monoclonal antibody PHF-1 targeting tau was engineered into an AAV viral genome and produced in the VOY101 capsid (capsid sequence provided as SEQ ID NO: 1809) or VOY201 capsid (capsid sequence provided as SEQ ID NO: 1810).

[1021] The viral genome, recited 5' to 3' from ITR to ITR, comprised a wild type ITR, a promoter, the nucleic acid encoding the monoclonal antibody PHF-1 targeting tau (kozak, heavy chain, linker region, light chain and stop codon provided as SEQ ID NO: 1816), a polyA sequence, and a wild type ITR. The viral genomes were packaged into VOY101 or VOY201 capsids, purified and formulated. The VOY101 or VOY201-anti Tau antibody particles were formulated in phosphate buffered saline (PBS) with 0.001% F-68.

[1022] Three groups of wild type (WT) mice, approximately 5 mice/group, at 2 months of age, were administered vehicle (PBS with 0.001% F-68), VOY101-anti Tau antibody vector at 1.4 x 10^{13} vg/kg, or VOY201-anti Tau antibody vector at 1.4 x 10^{13} vg/kg via intravenous tail vein injection.

[1023] Approximately 28 days following AAV particle administration, several tissue samples were collected. Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host TFRC, and expressed in vector genome per cell (VG/Cell). Vector genome distribution is shown in Table 21 for VOY101.PHF-1 and VOY201.PHF-1. In Table 21, Hp is the hippocampus, SC-C is the cervical spinal cord, SC-T is the thoracic spinal cord, and SC-L is the lumbar spinal cord.

Table 21. Viral Genome Distribution in WT Mice after Intravenous Injection

Vector (Dose: 1.4 × 10^{13} VG/kg)	VG/Cell Distribution (Standard Dev. in Parenthesis)				
	Hp	SC-C	SC-T	SC-L	Brainstem
Vehicle	0.06 (0.54)	0.01 (0.13)	0.01 (0.14)	0.003 (0.002)	0.02 (0.19)
VOY101.PHF-1	11.01 (6.22)	15.45 (8.20)	17.82 (9.67)	18.59 (9.49)	29.80 (14.68)
VOY201.PHF-1	4.68 (1.48)	9.30 (2.42)	7.42 (2.6)	9.52 (2.2)	16.16 (4.76)

[1024] The expression levels of PHF-1, present in the soluble fraction of tissue lysates, were also measured in collected tissues by detecting the interaction with PHF tau coated on an ELISA plate. The antibody-antigen complex was visualized and quantified using HRP labeled anti-mouse IgG and its substrate TMB, followed by reading at OD450 on a plate reader and normalized to input tissue protein quantity. PHF1 expression from AAV

transduced cells is shown in Table 22 for VOY101.PHF-1 and VOY201.PHF-1. In Table 22, Hp is the hippocampus and SC spinal cord.

Table 22. PHF-1 Expression Distribution in WT Mice after Intravenous Injection

Vector (Dose: 1.4×10^{13} VG/kg)	PHF-1 Expression (ng/mg protein, Standard Dev. in Parenthesis)			
	Hp	Cortex	SC	Brainstem
Vehicle	0 (0)	0 (0)	0 (0)	0 (0)
VOY101.PHF-1	82 (36.4)	94 (35.6)	718 (440.8)	394.0 (301.3)
VOY201.PHF-1	96 (35.1)	66 (19.6)	361 (147.4)	207.0 (116.3)

[1025] IV dosing of PHF-1 in VOY201 resulted in up to 15-fold higher anti-tau antibody levels in mouse CNS as compared to passive immunization. The passive immunization level of antibody in brain is 20-40 ng/mg of protein, and VOY201 provided 2-5x fold above passive in the hippocampus, 5-10x fold above passive in the brain stem, and 8-16x fold above passive in the spinal cord. IV dosing of VOY101 and VOY201 resulted in widespread CNS biodistribution and transduction of vectorized antibodies.

[1026] Mouse brains were hemisected and tissue samples allocated for antibody immunohistochemistry then post-fixed in 4% paraformaldehyde overnight. PHF-1 antibody was detected by immunohistochemistry using anti-mouse IgG1 antibody (PHF-1 is a mouse IgG1 antibody). In animals dosed with 1.4×10^{13} vg/kg via intravenous tail vein injection of VOY101.PHF-1 or VOY201.PHF-1, staining was observed throughout the brain, including in the hippocampus, cortex, striatum, and thalamus. Numerous PHF1+ cells were observed, including those with neuronal and astroglial morphology. Vehicle-treated control exhibited essentially no detectable background staining

[1027] PHF-1 expression within the CNS after administration of 1.4×10^{13} vg/kg via intravenous tail vein injection of VOY101.PHF-1 or VOY201.PHF-1 was evaluated by mouse anti-IgG1 and anti-NeuN double labeling immunofluorescent staining. PHF-1 is a mouse IgG1 antibody, and is therefore detected by anti-IgG1 antibody staining. Colocalization studies showed multiple PHF1+ cells including those double-labeled with the neuronal marker (NeuN).

[1028] PHF-1 expression within the CNS after administration of 1.4×10^{13} vg/kg via intravenous tail vein injection of VOY101.PHF-1 was evaluated by mouse anti-IgG1 and anti-GFAP (glial fibrillary acidic protein) double labeling immunofluorescent staining. PHF-1 is a mouse IgG1 antibody, and is therefore detected by anti-IgG1 antibody staining.

Colocalization studies showed multiple PHF1+ cells including those double-labeled with the astrocytic marker (GFAP).

B. In Vivo Distribution, Expression and Efficacy Study of Intravenous Dosing of VOY101 or VOY201-anti-Tau antibody in a Mouse Model

[1029] Three groups of P301S mice, approximately 20 mice/group, at 2 months of age, were administered vehicle (PBS with 0.001% F-68), VOY101-anti Tau antibody vector (VOY101.PHF-1) at 1.4 x 10^{13} vg/kg, or VOY201-anti Tau antibody vector (VOY201.PHF-1) at 5.0 x 10^{13} vg/kg via intravenous tail vein injection.

[1030] Approximately 3 months following AAV particle administration, several tissue samples were collected. Vector genome digital PCR quantification was performed using a probe set against the CMV enhancer region of the CBA promoter, normalized to host TFRC, and expressed in vector genome per cell (VG/Cell). Vector genome distribution is shown in Table 23 for VOY101.PHF-1 and VOY201.PHF-1. In Table 23, Hp is the hippocampus and SC is the spinal cord.

[1031] The expression levels of PHF1, present in the soluble fraction of tissue lysates, were also measured in collected tissues by detecting the interaction with PHF tau coated on an ELISA plate. The antibody-antigen complex was visualized and quantified using HRP labeled anti- mouse IgG and its substrate TMB, followed by reading at OD450 on a plate reader and normalized to input tissue protein quantity. PHF1 expression from AAV transduced cells is shown in Table 24 for VOY101.PHF-1 and VOY201.PHF-1. In Table 24, Hp is the hippocampus and SC spinal cord.

[1032] IV dosing of VOY101 and VOY201 resulted in high levels of antibody to the CNS of P301 tauopathy mice. AT8 immunoreactivity (IR) is significantly reduced in the PHF1-

treated mice. IV dosing using VOY101 and VOY201 resulted in widespread CNS biodistribution and transduction of vectorized antibodies in P301S tauopathy mice.
