CROSS-REFERENCE TO RELATED APPLICATIONS
[0001] The present application claims priority benefit of U.S. provisional application Ser. No. 60/811,995, filed June 8, 2006, which is incorporated by reference herein.

FIELD OF THE INVENTION
[0002] The present invention provides novel benzamide derivatives, and analogues thereof, which are selective inhibitors of the serine protease blood coagulation factor VIIa. This invention also relates to pharmaceutical compositions comprising these compounds and methods of using the same.

BACKGROUND OF THE INVENTION
[0003] Factor VII is a plasma serine protease involved in the initiation of the coagulation cascade. It is present in human blood at a concentration of approximately 500 ng/mL, with about 1% of the total amount in the proteolytically active form Factor VIIa (Morrissey, J. H. et al. Blood 1993, 81, 734-744). Factor VIIa binds with high affinity to its cofactor, tissue factor, in the presence of calcium ions to form a complex with significantly enhanced proteolytic activity (Carson, S.D. and Brozna, J.P. Blood Coag. Fibrinol. 1993, 4, 281-292). Tissue factor is normally expressed in cells surrounding the vasculature and within the vessel wall, and is exposed to factor VIIa in blood by vessel injury or atherosclerotic plaque rupture. Once formed, the tissue factor/factor VIIa complex initiates blood coagulation by proteolytic cleavage of factor X to factor Xa, factor IX to factor IXa and autoactivation of additional factor VII to VIIa. Factor Xa, generated either directly by tissue factor/factor VIIa or indirectly through action of factor IXa, catalyzes the conversion of prothrombin to thrombin. Thrombin coverts fibrinogen to fibrin, which polymerizes to form the structural framework of a blood clot, and activates platelets, which are a key cellular component of coagulation (Hoffman, M. Blood Reviews 2003, 17, S1-S5). In addition, there is evidence that tissue factor is present in blood, likely in an encrypted

While blood coagulation is essential to the regulation of an organism's hemostasis, it is also involved in many pathological conditions. In thrombosis, a blood clot, or thrombus, may form and obstruct circulation locally, causing ischemia and organ damage. Alternatively, in a process known as embolism, the clot may dislodge and subsequently become trapped in a distal vessel, where it again causes ischemia and organ damage. Diseases arising from pathological thrombus formation are collectively referred to as thrombotic or thromboembolic disorders and include acute coronary syndrome, unstable angina, myocardial infarction, ischemic stroke, deep vein thrombosis, peripheral occlusive arterial disease, transient ischemic attack, and pulmonary embolism. In addition, thrombosis occurs on artificial surfaces in contact with blood, including catheters and artificial heart valves. Therefore, drugs that inhibit blood coagulation, or anticoagulants, are "pivotal agents for prevention and treatment of thromboembolic disorders" (Hirsh, J. et al. Blood 2005, 105, 453-463).

Because of its key role in the coagulation cascade, researchers have postulated that inhibition of factor Vila could be used to treat or prevent thrombotic or thromboembolic disease. (Girard, T. J.; Nicholson, N. S. Curr. Opin. Pharmacol. 2001, 1, 159-163; Lazarus, R. A., et al. Curr. Med. Chem. 2004, 11, 2275-2290; Frederick, R. et al. Curr. Med. Chem. 2005, 12, 397-417.) Several studies have confirmed that various biological and small molecule inhibitors of factor Vila have in vivo antithrombotic efficacy with a low bleeding liability. For instance, it has been demonstrated that a biological factor Vila inhibitor XK1, comprising a hybrid of Factor X light chain and tissue factor pathway inhibitor first kunitz domain, prevents thrombus formation in a rat model of arterial thrombosis, with no change in bleeding time or total blood loss (Szalony, J. A. et al. J. Thrombosis and Thrombolysis 2002,

Work has accordingly been performed to identify and optimize factor Vila inhibitors. For example, US 5,866,542 describes recombinant nematode anticoagulant proteins which inhibit factor Vila. US 5,843,442 discloses monoclonal antibodies or antibody fragments possessing factor Vila inhibitory activity, and US 5,023,236 presents tripeptides and tripeptide derivatives that inhibit factor Vila.

While a number of factor Vila inhibitors have been discussed in the art, improved inhibitors, especially non-peptide inhibitors, for the treatment of thromboembolic disorders are always desirable. The present invention discloses benzamides and analogues thereof as inhibitors of coagulation factor Vila, which, as such, are useful in the treatment of thromboembolic disorders.

In addition, it is also desirable to find new compounds with improved pharmacological characteristics compared with known factor Vila inhibitors. For example, it is preferred to find new compounds with improved factor Vila inhibitory activity and improved selectivity for factor Vila versus other serine proteases. Also, it is preferred to find new compounds with improved activity in in vitro clotting assays, such as the prothrombin time (PT) assay. (For a description of the PT assay see, Goodnight, S. H.; Hathaway, W. E. Screening Tests of Hemostasis. Disorders of Thrombosis and Hemostasis: a clinical guide, 2nd edition, McGraw-Hill: New York, 2001 pp. 41-51). It is also desirable and preferable to find compounds with
advantageous and improved characteristics in one or more of the following categories, which are given as examples and are not intended to be limiting: (a) pharmacokinetic properties, including oral bioavailability; (b) pharmaceutical properties; (c) dosage requirements; (d) factors which decrease blood concentration peak-to-trough characteristics; (e) factors that increase the concentration of active drug at the receptor; (f) factors that decrease the liability for clinical drug-drug interactions; (g) factors that decrease the potential for adverse side-effects; and (h) factors that improve manufacturing costs or feasibility.

DEFINITIONS

The compounds herein described may have asymmetric centers. Compounds of the present invention containing an asymmetrically substituted atom may be isolated in optically active or racemic forms. It is well known in the art how to prepare optically active forms, such as by resolution of racemic forms or by synthesis using optically active starting materials or optically active catalysts. Geometric isomers of double bonds such as olefins and C=N double bonds can also be present in the compounds described herein, and all such stable isomers are contemplated in the present invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. All chiral, (enantiomeric and diastereomeric) racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomeric form is specifically indicated. When no specific mention is made of the configuration (cis, trans or R or S) of a compound (or of an asymmetric carbon), then any one of the isomers or a mixture of more than one isomer is intended. The processes for preparation can use racemates, enantiomers, or diastereomers as starting materials. All processes used to prepare compounds of the present invention and intermediates made therein are considered to be part of the
present invention. When enantiomeric or diastereomeric products are prepared, they can be separated by conventional methods, for example, by chromatography or fractional crystallization. Compounds of the present invention, and salts thereof, may exist in multiple tautomeric forms, in which hydrogen atoms are transposed to other parts of the molecules and the chemical bonds between the atoms of the molecules are consequently rearranged. It should be understood that all tautomeric forms, insofar as they may exist, are included within the invention. The inventive compounds may be in the free or hydrate form.

[0060] Preferably, the molecular weight of compounds of the present invention is less than about 500, 550, 600, 650, 700, 750, or 800 grams per mole. Preferably, the molecular weight is less than about 800 grams per mole. More preferably, the molecular weight is less than about 750 grams per mole. Even more preferably, the molecular weight is less than about 700 grams per mole.

[0061] The term "substituted," as used herein, means that any one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency is not exceeded, and that the substitution results in a stable compound. When a substituent is keto (i.e., \( \text{C}^\text{=O} \)), then 2 hydrogens on the atom are replaced. When a ring system (e.g., carbocyclic or heterocyclic) is said to be substituted with a carbonyl group or a double bond, it is intended that the carbon atom of the carbonyl group or one carbon atom of the double bond be part of (i.e., within) the ring. Ring double bonds, as used herein, are double bonds that are formed between two adjacent ring atoms (e.g., \( \text{C}^\text{=} \), \( \text{C}^\text{=N} \), or \( \text{N}^=\text{N} \)).

[0062] In cases wherein there are nitrogen atoms (e.g., amines) on compounds of the present invention, these may be converted to N-oxides by treatment with an oxidizing agent (e.g., mCPBA and/or hydrogen peroxides) to afford other compounds of this invention. Thus, shown and claimed nitrogen atoms are considered to cover both the shown nitrogen and its N-oxide (N-O) derivative. In cases wherein there are quarternary carbon atoms on compounds of the present invention, these may be replaced by silicon atoms, provided they do not form Si-N or Si-O bond.

[0063] When any variable occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be
substituted with 0-3 R\textsuperscript{f}, then said group may optionally be substituted with up to three R\textsuperscript{f} groups and R\textsuperscript{f} at each occurrence is selected independently from the definition of R\textsuperscript{f}. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom via which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the
appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 18th ed., Mack Publishing Company, Easton, PA, 1990, the disclosure of which is hereby incorporated by reference.

[0091] Isotopically labeled compounds of the present invention, i.e., wherein one or more of the atoms described are replaced by an isotope of that atom (e.g., C replaced by $^{13}$C or by $^{14}$C; and isotopes of hydrogen include tritium and deuterium), are also provided herein. Such compounds have a variety of potential uses, e.g., as standards and reagents in determining the ability of a potential pharmaceutical to bind to target proteins or receptors, or for imaging compounds of this invention bound to biological receptors in vivo or in vitro.

[0092] Compounds of the present invention are, subsequent to their preparation, preferably isolated and purified to obtain a composition containing an amount by weight equal to or greater than 98%, preferably 99%, compound of the present invention ("substantially pure"), which is then used or formulated as described herein. Such "substantially pure" compounds are also contemplated herein as part of the present invention.

[0093] "Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent. It is preferred that compounds of the present invention do not contain a N-halo, S(O)^H, or S(O)H group.

[0094] In addition, compounds of formula I may have prodrug forms. Any compound that will be converted in vivo to provide the bioactive agent (i.e., a compound of formula I) is a prodrug within the scope and spirit of the invention.

Various forms of prodrugs are well known in the art. For examples of such prodrug derivatives, see:

5 c) H. Bundgaard, Advanced Drug Delivery Reviews, Vol. 8, p. 1-38 (1992);

Compounds containing a carboxy group can form physiologically hydrolyzable esters which serve as prodrugs by being hydrolyzed in the body to yield formula I compounds per se. Such prodrugs are preferably administered orally since hydrolysis in many instances occurs principally under the influence of the digestive enzymes. Parenteral administration may be used where the ester per se is active, or in those instances where hydrolysis occurs in the blood. Examples of physiologically hydrolyzable esters of compounds of formula I include C^alkyl, C^alkylbenzyl, 4-methoxybenzyl, indanyl, phthalyl, methoxymethyl, Ci-6 alkanoyloxy-C^alkyl, e.g. acetoxymethyl, pivaloyloxymethyl or propionyloxymethyl, C^alkoxycarbonyloxy-C^alkyl, e.g. methoxycarbonyloxymethyl or ethoxycarbonyloxymethyl, glycyloxymethyl, phenylglycyloxymethyl, (5-methyl-2-oxo-1,3-dioxolen-4-yl)-methyl and other well known physiologically hydrolyzable esters used, for example, in the penicillin and cephalosporin arts. Such esters may be prepared by conventional techniques known in the art.

Preparation of prodrugs is well known in the art and described in, for example, Medicinal Chemistry: Principles and Practice, ed. F. D. King, The Royal Society of Chemistry, Cambridge, UK, 1994, which is incorporated herein by reference in its entirety.

The term "solvate" means a physical association of a compound of this invention with one or more solvent molecules, whether organic or inorganic. This physical association includes hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolable solvates. Exemplary solvates include hydrates,
ethanolates, methanolates, isopropanolates and the like. Methods of solvation are generally known in the art.

As used herein, the term "patient" encompasses all mammalian species.

As used herein, "treating" or "treatment" cover the treatment of a disease-state in a mammal, particularly in a human, and include: (a) preventing the disease-state from occurring in a mammal, in particular, when such mammal is predisposed to the disease-state but has not yet been diagnosed as having it; (b) inhibiting the disease-state, i.e., arresting its development; and/or (c) relieving the disease-state, i.e., causing regression of the disease state.

"Therapeutically effective amount" is intended to include an amount of a compound of the present invention that is effective when administered alone or in combination with other active ingredients to inhibit factor VIIa or to treat the disorders listed herein. When applied to a combination, the term refers to combined amounts of the active ingredients that result in the therapeutic effect, whether administered in combination, serially or simultaneously. The combination of compounds is preferably a synergistic combination. Synergy, as described, for example, by Chou and Talalay, *Adv. Enzyme Regul.* 1984, 22, 27-55, occurs when the effect (in this case, e.g., prevention of thrombosis) of the compounds when administered in combination is greater than the additive effect of the compounds when administered alone as a single agent. In general, a synergistic effect is most clearly demonstrated at sub-optimal concentrations of the compounds. Synergy can be in terms of increased antithrombotic effect, lower toxicity, or some other beneficial effect of the combination compared with the individual components.

The term "pharmaceutical composition" means a composition comprising a compound of the invention in combination with at least one additional pharmaceutical acceptable carrier. A "pharmaceutically acceptable carrier" refers to media generally accepted in the art for the delivery of biologically active agents to animals, in particular, mammals, including, i.e., adjuvant, excipient or vehicle, such as diluents, preserving agents, fillers, flow regulating agents, disintegrating agents, wetting agents, emulsifying agents, suspending agents, sweetening agents, flavoring agents, perfuming agents, antibacterial agents, antifungal agents, lubricating agents
and dispensing agents, depending on the nature of the mode of administration and dosage forms. Pharmaceutically acceptable carriers are formulated according to a number of factors well within the purview of those of ordinary skill in the art. These include, without limitation: the type and nature of the active agent being formulated; the subject to which the agent-containing composition is to be administered; the intended route of administration of the composition; and, the therapeutic indication being targeted. Pharmaceutically acceptable carriers include both aqueous and non-aqueous liquid media, as well as a variety of solid and semi-solid dosage forms. Such carriers can include a number of different ingredients and additives in addition to the active agent, such additional ingredients being included in the formulation for a variety of reasons, e.g., stabilization of the active agent, binders, etc., well known to those of ordinary skill in the art. Descriptions of suitable pharmaceutically acceptable carriers, and factors involved in their selection, are found in a variety of readily available sources such as, for example, Remington's Pharmaceutical Sciences, 18th ed., 1990, which is incorporated herein by reference in its entirety.

SYNTHESIS

The compounds of the present invention can be prepared in a number of ways known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or by variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformations being effected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify
the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention.

[00104] A particularly useful compendium of synthetic methods which may be applicable to the preparation of compounds of the present invention may be found in Larock, R. C. *Comprehensive Organic Transformations*, VCH: New York, 1989.

Preferred methods include, but are not limited to, those described below. All references cited herein are hereby incorporated in their entirety herein by reference.

[00105] It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for protection of the reactive functional groups present in the compounds described in this invention. An authoritative account describing the many alternatives to the trained practitioner is Greene and Wuts (Protective Groups In Organic Synthesis, Wiley-Interscience, 3nd Edition, 1999). All references cited herein are hereby incorporated in their entirety herein by reference.

[00106] Compounds having the general Formula (I):

\[
\text{R}^8\text{W}\text{A} \quad \text{Y} \quad \text{Z} \quad \text{R}^9
\]

wherein A, W, Y, Z, R^8, and R^9 are each as defined above, can be prepared by coupling an acid of Formula (Ia):

\[
\text{Y} \quad \text{W} \quad \text{H} \quad \text{O}
\]

(Ia)

with an amine of Formula (Ib):

\[
\text{H} \quad \text{N} \quad \text{A} \quad \text{R}^8 \quad \text{R}^9
\]

(Ib)

under conditions suitable for forming an amide bond between the acid and the amine. Coupling conditions can be found in Bodanszky, "Principles of Peptide Synthesis, Second Edition" Springer Verlag Ed, Berlin (1993). Coupling reagents include CDI, DIC, and EDCI. Optionally, an intermediate activated ester can be prepared by
adding one equivalent of 1-hydroxybenzotriazole or 1-hydroxy-7-azabenzotriazole. Other coupling reagents include HATU, HBTU, and Py-Brop which are usually reacted in the presence of one equivalent of a tertiary base such as DIEA or TEA. Protection and deprotection of functional groups may be required before or after the amide formation step to afford a compound of Formula (I).

The intermediate acid of Formula (Ia) can be prepared in several different ways. For example, it can be prepared according to the steps described in Scheme 1. Thus, amines 1 (prepared following the methods shown in later Schemes and in the Examples) react with phenyl or pyridyl acetate derivatives 2 (Y is substituted phenyl or pyridyl) under basic conditions to give 3. X is a leaving group such as Cl, Br, OSC^Me or OSO2CF3 and P is a protecting group such as methyl or benzyl. Deprotection of P in 3 by hydrolysis or hydrogenation gives acid intermediates Ia.

Scheme 1

<Diagram>

Acids Ia with Y as substituted phenyl and W as NH can be prepared by a Petasis boronic acid Mannich reaction (J. Am. Chem. Soc. 1997, 119, 445-446) shown in Scheme 2. Amines 1 react with phenyl boronic acid derivatives 4 and glyoxylic acid 5 in a suitable solvent such as 1,2-dichloroethane and toluene or acetonitrile and DMF to give the acids 6 directly. Many phenyl boronic acid derivatives are commercial available. They can also be prepared by methods known in the art.
Acids 6 can also be prepared by reductive amination (Tetrahedron, 1996, 52, 9777-9784) of α-keto acids 7 with amines 1 as shown in Scheme 3.

Alternatively to Schemes 2 and 3, as exemplified in Scheme 4, acids 6 can be prepared from amino-esters 9. Amino-esters 9 can be accessed through a Strecker type synthesis, by condensation of aldehydes 8 with trimethylsilyl cyanide in presence of ammonia, followed by treatment with hydrochloric acid in MeOH. Compounds 9 can be converted to 11 via coupling with aryl halides or sulfonates 10 by methods known in the art (Huang, X. et al. J. Am. Chem. Soc. 2003, 125, 6653 - 6655). For example, amino-esters 9 may be coupled to aryl halides 10 in the presence of a palladium catalyst, an appropriate ligand, for example, BINAP, and a base such as cesium carbonate to provide esters 11. Hydrolysis of 11 under controlled condition gives 6.
Amines of Formula (Ib) may be prepared in different ways depending on the ring size and substituents. A general method to prepare N-heterocycles of formula Ib may be via palladium catalyzed coupling of lactam-derived ketene aminal with aryl boronic acids, as shown in Scheme 5. Thus, treatment of properly protected lactam 12 with base such as LDA at low temperature and trapping the enolate with diphenylphosphoryl chloride gives the ketene aminal diphenylphosphate 13.

Diphenylphosphate 13 undergoes palladium catalyzed coupling with arylboronic acid 14 to give the coupled intermediate 15. Hydrogenation of the double bond in 15 and removal of the protecting group in 16 should give rise to α-aryl substituted N-heterocycle 17. The sequences described in scheme 5 are particularly useful for preparation of 5-, 6-, 7- and 8-membered N-heterocycles.
Scheme 5 illustrate another general method to prepare N-heterocycles of Formula (Ib), particularly for the preparation of α-aryl substituted pyrrolidine and piperidine. Condensation of benzylamine 18 with diphenylketone gives Shiff base 19. Treatment of the Shiff base 19 with 1.0 equivalent of base such as LDA and mono-alkylation with a dielectrophile 20 gives intermediate amine 21 after acid hydrolysis. Intramolecular cyclization of 21 in the presence of base such as K2CO3 should give rise to α-aryl substituted N-heterocycle 22.
Functionalized phenylpyrrolidines can be prepared by the procedures described in Schemes 7-11. In Scheme 7, palladium catalyzed coupling of Boc protected 2-pyrrole boronic acid 23 with substituted phenyl halide 24 (X = Br or I) gives α-aryl pyrrole 25. Aryl pyrrole 25 can be hydrogenated with a catalyst such as Pt/C, PtO₂/C and Pd(OH)₂/C in a solvent such as MeOH to Boc-protected aryl pyrrolidine 26. At this stage, the R¹⁰a and R¹⁰b groups can be manipulated to the desired functional groups. Treatment of the Boc protected 2-aryl pyrrolidine 26 with acid such as HCl in dioxane or TFA gives the pyrrolidine 27.
In Scheme 8, reduction of chloro ketone 28 gives hydroxy chlorides 29. Hydroxy chloride 29 can be converted to azides 30, e.g. by the action of DPPA/DBU. Reduction of the azides with PPI13 to amines 31, followed by base-promoted intramolecular cyclization gives the functionalized phenylpyrrolidines 27.

It is known that the reduction of the aryl ketones like 28 can be achieved enantioselectively with chiral boranes, e.g. B-chlorodiisopinocamphenyl borane (Dip-Cl, Brown, H. C. et al, Tetrahedron Lett. 1994, 35, 2141-2144). It is possible that both enantiomers of 27 can be prepared with the proper choice of chiral borane reagent.

Scheme 8

![Scheme 8](image)

Scheme 9 illustrate the preparation of arylpyrroolidine carboxylate.

Condensation of aryl aldehyde 32 with γ-aminobutyric ester 33 (R = Me, Et) gives imine 34. Intramolecular cyclization of 34 in the presence of catalyst such as TiCl₄ and base Et3N gives rise to arylpyrrolidine carboxylate 35.
Scheme 9

Scheme 10 illustrates a ring closing metathesis (RCM) route to functionalized phenylpyrrolidine derivative 43. Condensation of aldehyde 32 with sulfinamide 36 (racemic or chiral, R is tert-butyl or para-tolyl) in the presence of titanium tetraethoxide gives activated imine 37. Sulfinimine 37 is then treated with vinyl Grignard reagent to give intermediate 38. High diastereoselectivity towards 38 may be achieved with a chiral sulfinamide 36 and with a proper choice of reaction condition. N-allylation of 38 with a substituted allylbromide 39 gives a diene intermediate 40 which can undergo ring closing metathesis (RCM) to give dihydropyrrole 41. Sulfinamide in 41 can be removed under acidic condition and the dihydropyrrole re-protected with a more common protecting group, e.g. a Boc to intermediate 42. Hydrogenation and deprotection of 42 gives rise to functionalized phenylpyrrolidine 43.
Scheme 10

[00117] Scheme 11 illustrate a variation of scheme 10 using RCM to the synthesis of phenylpyrrolidine derivative 50 from Baylis-Hillman adduct 46. Thus three component condensation of aldehyde 32, sulfonamide 44 (R is tert-butyl or p-tolyl) and acrylate or vinyl ketone 45 in the presence of a base, e.g. DABCO, gives Baylis-Hillman adduct 46. N-allylation of 46 with allylbromide gives a diene intermediate 47 which can undergo ring closing metathesis (RCM) to give dihydropyrrole 48. Sulfonamide in 48 can be removed and the dihydropyrrole re-protected with a more common protecting group, e.g. a Boc to intermediate 49. Hydrogenation and deprotection of 49 gives rise to functionalized phenylpyrrolidine 50.
The compound of the instant invention herein described may have asymmetric centers. For example, the chiral carbon atoms in Formula (I) as indicated below, exist in either an S or R configuration.

Thus, the stereoisomeric configurations of each compound of the present invention are considered part of the invention. For example, but not limited to therein, in compounds of Formula (III), the following four stereoisomeric configurations are possible:
They are collectively, as well as individually, considered part of the invention. In a preferred stereoisomeric embodiment the present invention provides for a stereoisomeric configuration of isomer-1 for all embodiments of Formula (I), (II) or (III), or tautomer, pharmaceutically acceptable salt, solvate, or prodrug form thereof.
In the following experimental procedures, solution ratios express a volume relationship, unless stated otherwise. NMR chemical shifts (δ) are reported in parts per million.

EXAMPLES

[00122] The following Examples have been prepared, isolated and characterized using the methods disclosed herein. The following Examples demonstrate a partial scope of the invention and are not meant to be limiting of the scope of the invention.

General Coupling Procedure

[00123] Most of the final compounds described in the Examples were made according to the following general coupling scheme:

A mixture of intermediate acid (1 eq, preparation given in examples), amine (1.2-1.75 eq, preparation given in examples), EDCI (1.5-2.5 eq), HOAT (0.4-1.0 eq), DIEA (0-5 eq) in CH$_2$Cl$_2$ (0.01M) or CH$_2$Cl$_2$/DMF (0.03 M, 10:1) was stirred at rt for 4 h to overnight. The reaction product was concentrated and purified via preparative HPLC (MeOH/H$_2$O/TFA or CH$_3$CN/H$_2$O/TFA) to provide the desired amide. When the amine used was enantiomerically pure, the coupling gave a mixture of two diastereoisomers which were separated in chirally pure fractions by prep HPLC. In each case of examples where diastereomers were obtained, the more effective FVIIa inhibitor is listed first. In some cases, the less active diastereomer is actually inactive vs FVIIa, and is included to enable accurate identification of the more active diastereomer through comparison of spectroscopic data.

(2R,3S)-Ethyl 1-((R)-2-(5-carbamoyl-2-fluorophenylamino)-2-(4-fluoro-3-methoxyphenyl)acetyl)-2-(2-(cycloproplylsulfonfonyl)-5-(methoxycarbonylamino)phenyl)pyrrolidine-3-carboxylate
76A: 2-(Cyclopropylthio)-5-nitrobenzaldehyde

Freshly prepared cyclopropyl thiol in THF/diethyl ether (J. Am. Chem. Soc. 1992, 114(9), 3497) was added to 2-fluro-5-nitrobenzaldehyde (3.4 g, 20 mmol, 1.0 eq.) and K2CO3 (4.83 g, 35 mmol) in DMF (20 mL). The mixture was stirred at 45 °C for 1.0 h and at rt over night. It was diluted with EtOAc and washed with water. The aqueous was extracted with EtOAc and the combined organic layers were washed with brine and dried over Na2SO4. After evaporation of solvent, the crude was triturated with EtOAc/hexanes (70/120). The solid was collected to give 76A (3.2 g). The filtrate was condensed and triturated again to give a second crop of 76A (0.5 g, total yield 85%). 1H NMR (400 MHz, CDCl3) δ ppm 0.74 - 0.83 (m, 2 H) 1.20 - 1.28 (m, 2 H) 2.13 - 2.19 (m, 1 H) 7.95 (d, J=9.23 Hz, 1 H) 8.33 (dd, J=8.79, 2.64 Hz, 1 H) 8.62 (d, J=2.64 Hz, 1 H) 10.15 (s, 1 H).

76B: (E)-Ethyl 4-(2-(cyclopropylthio)-5-nitrobenzylideneamino)butanoate

To the ethyl aminobutyric ester (5.26 g, 31.3 mmol) in dichloromethane (120 mL) was added triethylamine (6.0 mL, 43 mmol) and then 76A (7.0 g, 23.4 mmol) and 4A molecular sieves (5.0 g). The reaction was stirred over
night at rt. The reaction mixture was filtered to remove the molecular sieves and the solvent was evaporated to give a solid 76B together with triethylamine HCl salt. \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) ppm: 1.18 (m, 5 H) 1.94 - 2.04 (m, 2 H) 2.07 - 2.16 (m, 1 H) 2.38 (t, \(J=7.25\) Hz, 2 H) 3.64 (t, \(J=6.59\) Hz, 2 H) 4.07 (q, \(J=7.32\) Hz, 2 H) 7.76 (d, \(J=8.79\) Hz, 1 H) 8.11 (dd, \(J=9.01, 2.42\) Hz, 1 H) 8.45 (s, 1 H) 8.49 (d, \(J=2.64\) Hz, 1 H).

[00279] To 76B (ca 31 mmol) in CH\(_2\)Cl\(_2\) (150 mL) at -15 \(^0\)C was added Et\(_3\)N (5.94 mL, 43 mmol) followed by TiCl\(_4\) (1.0 M in CH\(_2\)Cl\(_2\), 37.2 mL, 37.2 mmol). The mixture was stirred from -15 \(^0\)C to rt over 3.0 h before it was quenched with sat. K\(_2\)CO\(_3\) (200 mL) at 0 \(^0\)C and stirred at rt for 1.0 h. CH\(_2\)Cl\(_2\) was removed under vaccuo and EtOAc was added to the crude (for better filtration). The mixture was filtered through a pad of wet Celite\(^\text{®}\), extracted with EtOAc (3X100 mL). The organic layer was washed with water, dried over Na\(_2\)SO\(_4\). The crude was purified by silica gel flash column chromatography using gradient CH\(_2\)Cl\(_2\) in hexanes to give 76C (3.77 g, 56% yield) and retrieved 76A (2.8 g). LC-MS indicated a mixture of cis and trans isomer in ca. 1:1 ratio. LC-MS 337 (M + H).

[00280] To 76C (3.77 g, 11.2 mmol) in THF (10 mL) was added Et$_3$N (1.95 mL, 14 mmol) and di-tert-butyl dicarbonate (1.0 M in THF, 14 mL, 14 mmol). The mixture was stirred at rt for 3.0 h before it was quenched with 0.5 N HCl (50 mL). The organic layer was washed with brine, dried (Na$_2$SO$_4$), filtered and concentrated. The crude product was first triturated with EtOAc/hexanes (50/125), the precipitate was collected by filtration and washed with EtOAc/hexanes (50/125) to give trans 76D (1.35 g). The filtrate was concentrated and further purified by flash silica gel column chromatography using gradient EtOAc in hexane to give predominantly cis isomer 76E. To this cis isomer was added mixture of EtOAc/hexane (1:3), the precipitate was collected and washed with the same mixture of EtOAc/hexanes (1:3) to give a second crop of the trans 76D (0.4 g). nitrophenylboronic acid (900 mg, 4.0 mmol) in tetrahydrofuran (16 mL) was added to a round bottom flask charged with palladium acetate (27 mg, 0.12 mmol), tri-1-naphthylphosphine (112 mg, 0.27 mmol), potassium phosphate (1.70 g, 8.00 mmol), and methyl iodide (0.370 mL, 5.9 mmol) under nitrogen atmosphere. Water (0.14 mL, 7.8 mmol) was added and the mixture was stirred overnight at rt. The reaction mixture was diluted with water and extracted with ethyl acetate (3X). The combined organics were washed with water and brine, dried, and concentrated in vacuo. The residue was purified by silica gel chromatography ( gradient from 0 to 40% ethyl acetate in hexanes) to give 89A (0.36 g, 46%) as a white solid. \( ^1H \) NMR (400 MHz, CDCl\(_3\)) \( \delta \) ppm 2.54 (s, 3 H) 3.98 (s, 3 H) 8.19 (s, 1 H) 8.23 (s, 1 H) 8.67 (s, 1 H).

UTILITY
[00344] The compounds of the present invention are inhibitors of factor Vila
and are useful as anticoagulants for the prevention or treatment of thromboembolic
disorders in mammals. In general, a thromboembolic disorder is a circulatory disease
caused by blood clots (i.e., diseases involving fibrin formation, platelet activation,
and/or platelet aggregation). The term "thromboembolic disorders (or conditions)" as
used herein includes arterial or venous cardiovascular or cerebrovascular
thromboembolic disorders, and thromboembolic disorders in the chambers of the
heart or in the peripheral circulation. The term "thromboembolic disorders" as used
herein also includes specific disorders selected from, but not limited to, unstable
angina or other acute coronary syndromes, atrial fibrillation, first or recurrent
myocardial infarction, ischemic sudden death, transient ischemic attack, ischemic
stroke, atherosclerosis, peripheral occlusive arterial disease, venous thrombosis, deep
vein thrombosis, thrombophlebitis, arterial embolism, coronary and cerebral arterial
thrombosis, cerebral embolism, kidney embolisms, pulmonary embolisms, and
thrombosis resulting from medical implants, devices, or procedures in which blood is
exposed to an artificial surface that promotes thrombosis. The medical implants or
devices include, but are not limited to: prosthetic valves, artificial valves, indwelling
catheters, stents, blood oxygenators, shunts, vascular access ports, and vessel grafts.
The procedures include, but are not limited to: cardiopulmonary bypass, percutaneous
coronary intervention, and hemodialysis.

[00345] It is noted that thrombosis includes vessel occlusion (e.g. after a
bypass) and reocclusion (e.g., during or after percutaneous transluminal coronary
angioplasty). The thromboembolic disorders may result from conditions including
but not limited to atherosclerosis, surgery or surgical complications, prolonged
immobilization, atrial fibrillation, congenital thrombophilia, cancer, diabetes, effects
of medications or hormones, and complications of pregnancy. The anticoagulant or
antithrombotic effect of compounds of the present invention is believed to be due to inhibition of coagulation factor Vila.

[00346] The term "thrombosis", as used herein, refers to formation or presence of a thrombus (pi. thrombi); clotting within a blood vessel which may cause ischemia or infarction of tissues supplied by the vessel. The term "embolism", as used herein, refers to sudden blocking of an artery by a clot or foreign material which has been brought to its site of lodgment by the blood current. The term "thromboembolism", as used herein, refers to obstruction of a blood vessel with thrombotic material carried by the blood stream from the site of origin to plug another vessel. The term "stroke", as used herein, refers to embolic stroke or atherothrombotic stroke arising from occlusive thrombosis in the carotid communis, carotid interna, or intracerebral arteries.

[00347] The effectiveness of compounds of the present invention as inhibitors of the coagulation factors Vila, IXa, Xa, XIa, or thrombin, can be determined using a relevant purified serine protease, respectively, and an appropriate synthetic substrate. The rate of hydrolysis of the chromogenic substrate by the relevant serine protease was measured both in the absence and presence of compounds of the present invention. Hydrolysis of the substrate resulted in the release of para-nitroaniline (pNA), which was monitored spectrophotometrically by measuring the increase in absorbance at 405 nM, or the release of aminomethylcoumarin (AMC), which was monitored spectrofluorometrically by measuring the increase in emission at 460 nM with excitation at 380 nM. A decrease in the rate of absorbance change at 405 nM in the presence of inhibitor is indicative of enzyme inhibition. Such methods are known to one skilled in the art. The results of this assay are expressed as inhibitory constant, Ki.

[00348] Factor Vila determinations were made in 0.005 M calcium chloride, 0.15 M sodium chloride, 0.05 M HEPES buffer containing 1.1 % PEG 8000 at a pH of 7.4. Determinations were made using purified human Factor Vila (Haematologic Technologies) or recombinant human Factor Vila (Novo Nordisk) at a final assay concentration of 1-5 nM, recombinant soluble tissue factor at a concentration of 10-40 nM and the synthetic substrate H-D-Ile-Pro-Arg-pNA (S-2288; Chromogenix or BMPM-2; AnaSpec) at a concentration of 0.001-0.01 nM.
In general, preferred compounds of the present invention have been identified to be active and exhibit Kj's of equal to or less than 15 μM in the Factor Vila assay, thereby demonstrating the utility of the compounds of the present invention as especially effective inhibitors of coagulation Factor Vila. More preferred compounds have Kj's of equal to or less than 5 μM, preferably equal to or less than 1 μM, more preferably equal to or less than 0.5 μM, even more preferably equal to or less than 0.1 μM.

Factor IXa determinations were made in 0.005 M calcium chloride, 0.1 M sodium chloride, 0.0001 \% Rofludan, 0.05 M TRIS base and 0.5% PEG 8000 at pH 7.4. The assay was used to inhibit the activity of thrombin in the presence of purified Factor IXa. Determinations were made using purified human Factor IXa (Haematologic Technologies) at a final assay concentration of 20-100 nM and the synthetic substrate PCIXA2100-B (CenterChem) or Pefafluor IXa 3688 (H-D-Leu-Phe-Gly-Arg-AMC; CenterChem) at a concentration of 0.0004-0.0005 M. In general, compounds tested in the Factor IXa assay are considered to be active if they exhibit a Kj of equal to or less than 15 μM.

Factor Xa determinations were made in 0.1 M sodium phosphate buffer at a pH of 7.5 containing 0.2 M sodium chloride and 0.5% PEG 8000. Determinations were made using purified human Factor Xa (Haematologic Technologies) at a final assay concentration of 150-1000 pM and the synthetic substrate S-2222 (Bz-Ile-Glu (gamma-OMe, 50%)-Gly-Arg-pNA; Chromogenix) at a concentration of 0.0002-0.00035 M. In general, compounds tested in the Factor Xa assay are considered to be active if they exhibit a Kj of equal to or less than 15 μM.

Factor XIa determinations were made in 50 mM HEPES buffer at pH 7.4 containing 145 mM NaCl, 5 mM KCl, and 0.1% PEG 8000 (polyethylene glycol; JT Baker or Fisher Scientific). Determinations were made using purified human Factor XIa at a final concentration of 75-200 pM (Haematologic Technologies) and the synthetic substrate S-2366 (pyroGlu-Pro-Arg-pNA; Chromogenix or \(aS|xe\) at a concentration of 0.0002-0.001 M. In general, compounds tested in the Factor XIa assay are considered to be active if they exhibit a Kj of equal to or less than 15 μM.

Thrombin determinations were made in 0.1 M sodium phosphate buffer at a pH of 7.5 containing 0.2 M sodium chloride and 0.5% PEG 8000.
Determinations were made using purified human alpha thrombin (Haematologic Technologies or Enzyme Research Laboratories) at a final assay concentration of 200-250 pM and the synthetic substrate S-2366 (pyroGlu-Pro-Arg-pNA; Chromogenix) at a concentration of 0.0002-0.00025 M. In general, compounds tested in the thrombin assay are considered to be active if they exhibit a \( K_i \) of equal to or less than 15 \( \mu \)M.

[00354] The selectivity of a compound may be evaluated by taking the ratio of the \( K_i \) value for a given protease with the \( K_i \) value for the protease of interest (i.e., selectivity for FVIIa versus protease P = \( K_i \) for protease P/\( K_i \) for FVIIa).

Compounds with selectivity ratios >20 are considered selective. Compounds with selectivity ratios >100 are preferred, and compounds with selectivity ratios >500 are more preferred.

[00355] The Michaelis constant, \( K_m \), for substrate hydrolysis by each protease was determined at 25°C using the method of Lineweaver and Burk. Values of \( K_i \) were determined by allowing the protease to react with the substrate in the presence of the inhibitor. Reactions were allowed to go for periods of 20-180 minutes (depending on the protease) and the velocities (rate of absorbance change vs time) were measured. The following relationship was used to calculate \( K_i \) values:

\[
\frac{v_o - v_s}{v_s} = \frac{1}{(K_i (1 + S/K_m))}
\]

for a competitive inhibitor with one binding site; or

\[
v_s/v_o = A + ((B-A)A + ((IC_{50}/(I^n)))
\]

and

\[
K_i = IC_{50}/(1 + S/K_m)
\]

for a competitive inhibitor where:

- \( V_0 \) is the velocity of the control in the absence of inhibitor;
- \( v_s \) is the velocity in the presence of inhibitor;
- \( I \) is the concentration of inhibitor;
- \( A \) is the minimum activity remaining (usually locked at zero);
- \( B \) is the maximum activity remaining (usually locked at 1.0);
- \( n \) is the Hill coefficient, a measure of the number and cooperativity of potential inhibitor binding sites;
- \( IC_{50} \) is the concentration of inhibitor that produces 50% inhibition under the assay conditions;
- \( K_i \) is the dissociation constant of the enzyme: inhibitor complex;
S is the concentration of substrate; and

\( K_m \) is the Michaelis constant for the substrate.

[00356] The effectiveness of compounds of the present invention as antithrombotic agents can be determined using relevant \textit{in vivo} thrombosis models, including \textit{In Vivo} Electrically-induced Carotid Artery Thrombosis Models and \textit{In Vivo} Rabbit Arterio-venous Shunt Thrombosis Models.

**In Vivo** Electrically-induced Carotid Artery Thrombosis (ECAT) Model:

[00357] The rabbit ECAT model, described by Wong et al. (\textit{J Pharmacol Exp Ther} 2000, 295, 212-218), can be used in this study. Male New Zealand White rabbits are anesthetized with ketamine (50 mg/kg + 50 mg/kg/h IM) and xylazine (10 mg/kg + 10 mg/kg/h IM). These anesthetics are supplemented as needed. An electromagnetic flow probe is placed on a segment of an isolated carotid artery to monitor blood flow. Test agents or vehicle will be given (Lv., Lp., s.c., or orally) prior to the initiation of thrombosis. Thrombus formation is induced by electrical stimulation of the carotid artery for 3 min at 4 mA using an external stainless-steel bipolar electrode. Carotid blood flow is measured continuously over a 90-min period to monitor thrombus-induced occlusion. Total carotid blood flow over 90 min is calculated by trapezoidal rule. Average carotid flow over 90 min is then determined by converting total carotid blood flow over 90 min to percent of total control carotid blood flow, which would result if control blood flow had been maintained continuously for 90 min. The ED50 (dose that increased average carotid blood flow over 90 min to 50\% of the control) of compounds are estimated by a nonlinear least square regression program using the Hill sigmoid \( E_{\text{max}} \) equation (DeltaGraph; SPSS Inc., Chicago, IL).

**In Vivo** Rabbit Arterio-venous (AV) Shunt Thrombosis Model

[00358] The rabbit AV shunt model, described by Wong et al. (Wong, P. C. et al. \textit{J Pharmacol Exp Ther} 2000, 292, 351-357), can be used in this study. Male New Zealand White rabbits are anesthetized with ketamine (50 mg/kg + 50 mg/kg/h IM) and xylazine (10 mg/kg + 10 mg/kg/h IM). These anesthetics are supplemented as
needed. The femoral artery, jugular vein and femoral vein are isolated and catheterized. A saline-filled AV shunt device is connected between the femoral arterial and the femoral venous cannulae. The AV shunt device consists of an outer piece of tygon tubing (length = 8 cm; internal diameter = 7.9 mm) and an inner piece of tubing (length = 2.5 cm; internal diameter = 4.8 mm). The AV shunt also contains an 8-cm-long 2-0 silk thread (Ethicon, Somerville, NJ). Blood flows from the femoral artery via the AV-shunt into the femoral vein. The exposure of flowing blood to a silk thread induces the formation of a significant thrombus. Forty minutes later, the shunt is disconnected and the silk thread covered with thrombus is weighed. Test agents or vehicle will be given (Lv., Lp., s.c, or orally) prior to the opening of the AV shunt. The percentage inhibition of thrombus formation is determined for each treatment group. The ID50 values (dose which produces 50% inhibition of thrombus formation) are estimated by a nonlinear least square regression program using the Hill sigmoid $E_{max}$ equation (DeltaGraph; SPSS Inc., Chicago, IL).

The compounds of the present invention can be administered alone or in combination with one or more additional therapeutic agents. These other agents include, but are not limited to, other anti-coagulant or coagulation inhibitory agents, anti-platelet or platelet inhibitory agents, or thrombolytic or fibrinolytic agents.

By "administered in combination" or "combination therapy" it is meant that the compound of the present invention and one or more additional therapeutic agents are administered concurrently to the mammal being treated. When administered in combination each component may be administered at the same time or sequentially in any order at different points in time. Thus, each component may be administered separately but sufficiently closely in time so as to provide the desired therapeutic effect.

The term thrombin inhibitors (or anti-thrombin agents), as used herein, denotes inhibitors of the serine protease thrombin. By inhibiting thrombin, various thrombin-mediated processes, such as thrombin-mediated platelet activation (that is, for example, the aggregation of platelets, and/or the secretion of platelet granule contents including serotonin) and/or fibrin formation are disrupted. A number of thrombin inhibitors are known to one of skill in the art and these inhibitors are contemplated to be used in combination with the present compounds. Such inhibitors
include, but are not limited to, boroarginine derivatives, boropeptides, heparins, hirudin, argatroban, dabigatran, AZD-0837, and those disclosed in WO 98/37075 and WO 02/044145, and pharmaceutically acceptable salts and prodrugs thereof. Boroarginine derivatives and boropeptides include N-acetyl and peptide derivatives of boronic acid, such as C-terminal a-aminoboronic acid derivatives of lysine, ornithine, arginine, homoarginine and corresponding isothiouronium analogs thereof. The term anistreplase, as used herein, refers to anisoylated plasminogen streptokinase activator complex, as described, for example, in European Patent Application No. 028,489, the disclosure of which is hereby incorporated herein by reference herein. The term urokinase, as used herein, is intended to denote both dual and single chain urokinase, the latter also being referred to herein as prourokinase.

It is preferred that at least one of the therapeutic agents is administered in a sub-therapeutic dose. It is even more preferred that all of the therapeutic agents be administered in sub-therapeutic doses. Sub-therapeutic is intended to mean an amount of a therapeutic agent that by itself does not give the desired therapeutic effect for the condition or disease being treated. Synergistic combination is intended to mean that the observed effect of the combination is greater than the sum of the individual agents administered alone.

[00383] The compounds of the present invention are also useful as standard or reference compounds, for example as a quality standard or control, in tests or assays involving the inhibition of factor Vila. Such compounds may be provided in a commercial kit, for example, for use in pharmaceutical research involving factor Vila. For example, a compound of the present invention could be used as a reference in an assay to compare its known activity to a compound with an unknown activity. This would ensure the experimenter that the assay was being performed properly and provide a basis for comparison, especially if the test compound was a derivative of the reference compound. When developing new assays or protocols, compounds according to the present invention could be used to test their effectiveness.

[00384] The compounds of the present invention may also be used in diagnostic assays involving plasma factor Vila. For example, the presence of factor Vila in an unknown sample could be determined by addition of the relevant chromogenic substrate, for example, S2288, to a series of solutions containing test sample and optionally one of the compounds of the present invention. If production
of pNA is observed in the solutions containing test sample, but not in the presence of a compound of the present invention, then one would conclude factor Vila was present.

[00385] The present invention also encompasses an article of manufacture. As used herein, article of manufacture is intended to include, but not be limited to, kits and packages. The article of manufacture of the present invention, comprises: (a) a first container; (b) a pharmaceutical composition located within the first container, wherein the composition, comprises: a first therapeutic agent, comprising: a compound of the present invention or a pharmaceutically acceptable salt form thereof; and, (c) a package insert stating that the pharmaceutical composition can be used for the treatment of a thromboembolic disorder (as defined previously). In another embodiment, the package insert states that the pharmaceutical composition can be used in combination (as defined previously) with a second therapeutic agent to treat a thromboembolic disorder. The article of manufacture can further comprise: (d) a second container, wherein components (a) and (b) are located within the second container and component (c) is located within or outside of the second container. Located within the first and second containers means that the respective container holds the item within its boundaries.

[00386] The first container is a receptacle used to hold a pharmaceutical composition. This container can be for manufacturing, storing, shipping, and/or individual/bulk selling. First container is intended to cover a bottle, jar, vial, flask, syringe, tube (e.g., for a cream preparation), or any other container used to manufacture, hold, store, or distribute a pharmaceutical product.

[00387] The second container is one used to hold the first container and, optionally, the package insert. Examples of the second container include, but are not limited to, boxes (e.g., cardboard or plastic), crates, cartons, bags (e.g., paper or plastic bags), pouches, and sacks. The package insert can be physically attached to the outside of the first container via tape, glue, staple, or another method of attachment, or it can rest inside the second container without any physical means of attachment to the first container. Alternatively, the package insert is located on the outside of the second container. When located on the outside of the second container, it is preferable that the package insert is physically attached via tape, glue, staple, or
another method of attachment. Alternatively, it can be adjacent to or touching the
outside of the second container without being physically attached.

[00388] The package insert is a label, tag, marker, etc. that recites information
relating to the pharmaceutical composition located within the first container. The
information recited will usually be determined by the regulatory agency governing the
area in which the article of manufacture is to be sold (e.g., the United States Food and
Drug Administration). Preferably, the package insert specifically recites the
indications for which the pharmaceutical composition has been approved. The
package insert may be made of any material on which a person can read information
contained therein or thereon. Preferably, the package insert is a printable material
(e.g., paper, plastic, cardboard, foil, adhesive-backed paper or plastic, etc.) on which
the desired information has been formed (e.g., printed or applied).

**DOSAGE AND FORMULATION**

[00389] The compounds of this invention can be administered in such oral
dosage forms as tablets, capsules (each of which includes sustained release or timed
release formulations), pills, powders, granules, elixirs, tinctures, suspensions, syrups,
and emulsions. They may also be administered in intravenous (bolus or infusion),
intraperitoneal, subcutaneous, or intramuscular form, all using dosage forms well
known to those of ordinary skill in the pharmaceutical arts. They can be administered
alone, but generally will be administered with a pharmaceutical carrier selected on the
basis of the chosen route of administration and standard pharmaceutical practice.

[00390] The dosage regimen for the compounds of the present invention will,
of course, vary depending upon known factors, such as the pharmacodynamic
characteristics of the particular agent and its mode and route of administration; the
species, age, sex, health, medical condition, and weight of the recipient; the nature
and extent of the symptoms; the kind of concurrent treatment; the frequency of
treatment; the route of administration, the renal and hepatic function of the patient,
and the effect desired. A physician or veterinarian can determine and prescribe the
effective amount of the drug required to prevent, counter, or arrest the progress of the
thromboembolic disorder.
By way of general guidance, the daily oral dosage of each active ingredient, when used for the indicated effects, will range between about 0.001 to 1000 mg/kg of body weight, preferably between about 0.01 to 100 mg/kg of body weight per day, and most preferably between about 0.1 to 20 mg/kg/day.

Intravenously, the most preferred doses will range from about 0.001 to about 10 mg/kg/minute during a constant rate infusion. Compounds of this invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three, or four times daily.

Compounds of this invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using transdermal skin patches. When administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

The compounds are typically administered in admixture with suitable pharmaceutical diluents, excipients, or carriers (collectively referred to herein as pharmaceutical carriers) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixirs, syrups and the like, and consistent with conventional pharmaceutical practices.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic, pharmaceutically acceptable, inert carrier such as lactose, starch, sucrose, glucose, methyl cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, mannitol, sorbitol and the like; for oral administration in liquid form, the oral drug components can be combined with any oral, non-toxic, pharmaceutically acceptable inert carrier such as ethanol, glycerol, water, and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents, and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth, or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate,
sodium acetate, sodium chloride, and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum, and the like.

[00395] The compounds of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, or phosphatidylethanolamines.

[00396] Compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide-phenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyglycolic acid, copolymers of polylactic and polyglycolic acid, polyglycolides, polyglycerides, polyorthoesters, polyacetas, polydihydropyranas, polycyanoacylates, and crosslinked or amphipathic block copolymers of hydrogels.

[00397] Dosage forms (pharmaceutical compositions) suitable for administration may contain from about 1 milligram to about 1000 milligrams of active ingredient per dosage unit. In these pharmaceutical compositions the active ingredient will ordinarily be present in an amount of about 0.1-95% by weight based on the total weight of the composition.

[00398] Gelatin capsules may contain the active ingredient and powdered carriers, such as lactose, starch, cellulose derivatives, magnesium stearate, stearic acid, and the like. Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained release products to provide for continuous release of medication over a period of hours. Compressed tablets can be sugar coated or film coated to mask any unpleasant taste and protect the tablet from the atmosphere, or enteric coated for selective disintegration in the gastrointestinal tract.

[00399] Liquid dosage forms for oral administration can contain coloring and flavoring to increase patient acceptance.
In general, water, a suitable oil, saline, aqueous dextrose (glucose), and related sugar solutions and glycols such as propylene glycol or polyethylene glycols are suitable carriers for parenteral solutions. Solutions for parenteral administration preferably contain a water soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, buffer substances. Antioxidizing agents such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or combined, are suitable stabilizing agents. Also used are citric acid and its salts and sodium EDTA. In addition, parenteral solutions can contain preservatives, such as benzalkonium chloride, methyl-or propyl-paraben, and chlorobutanol.

Suitable pharmaceutical carriers are described in Remington's Pharmaceutical Sciences, Mack Publishing Company, a standard reference text in this field.

Where the compounds of this invention are combined with other anticoagulant agents, for example, a daily dosage may be about 0.1 to 100 milligrams of the compound of the present invention and about 0.1 to 7.5 milligrams of the second anticoagulant, per kilogram of patient body weight. For a tablet dosage form, the compounds of this invention generally may be present in an amount of about 5 to 100 milligrams per dosage unit, and the second anti-coagulant in an amount of about 1 to 50 milligrams per dosage unit.

Where the compounds of the present invention are administered in combination with an anti-platelet agent, by way of general guidance, typically a daily dosage may be about 0.01 to 25 milligrams of the compound of the present invention and about 50 to 150 milligrams of the anti-platelet agent, preferably about 0.1 to 1 milligrams of the compound of the present invention and about 1 to 3 milligrams of antiplatelet agents, per kilogram of patient body weight.

Where the compounds of the present invention are administered in combination with thrombolytic agent, typically a daily dosage may be about 0.1 to 1 milligrams of the compound of the present invention, per kilogram of patient body weight and, in the case of the thrombolytic agents, the usual dosage of the thrombolytic agent when administered alone may be reduced by about 50-80% when administered with a compound of the present invention.
[00405] Where two or more of the foregoing second therapeutic agents are administered with the compound of the present invention, generally the amount of each component in a typical daily dosage and typical dosage form may be reduced relative to the usual dosage of the agent when administered alone, in view of the additive or synergistic effect of the therapeutic agents when administered in combination.

[00406] Particularly when provided as a single dosage unit, the potential exists for a chemical interaction between the combined active ingredients. For this reason, when the compound of the present invention and a second therapeutic agent are combined in a single dosage unit they are formulated such that although the active ingredients are combined in a single dosage unit, the physical contact between the active ingredients is minimized (that is, reduced). For example, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the gastrointestinal tract such that one of these components is not released in the stomach but rather is released in the intestines. One of the active ingredients may also be coated with a material that affects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients.

Furthermore, the sustained-released component can be additionally enteric coated such that the release of this component occurs only in the intestine. Still another approach would involve the formulation of a combination product in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a low viscosity grade of hydroxypropyl methylcellulose (HPMC) or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to form an additional barrier to interaction with the other component.

[00407] These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time by the same manner, will be readily apparent to those skilled in the art, once armed with the present disclosure.
