(wherein all symbols have the same meanings as described hereinafter) or a pharmaceutically acceptable salt thereof, an N-oxide thereof, a solvate thereof, or a prodrug thereof, use of such compounds in treatment and/or prevention of a thromboembolic disease and processes for the preparation of said compounds.

BACKGROUND OF THE INVENTION

Thromboembolism is an important cause of morbidity and mortality. It occurs when a blood clot breaks free and is carried by the blood stream to obstruct a blood vessel at another site. Thromboembolic disease includes venous thromboembolism, for example deep vein thrombosis or pulmonary embolism, arterial thrombosis, stroke and myocardial infarction.

Thromboembolic diseases may be treated using anticoagulants. One approach has been to target the inhibition of factor XIa (FXIa). Factor XIa is a plasma serine protease involved in the regulation of blood coagulation. Factor XIa is an activated form of factor XI, which is activated by factor X\text{II}a, thrombin, and it is also autocatalytic. FXIa is a member of the "contact pathway" and activates factor IX by selectively cleaving Arg-Ala and Arg-Val peptide bonds. Factor IX\text{a}, in turn, activates factor X. The safety of this target is supported by the observations that FXI deficiency in humans (hemophilia C) results in a mild bleeding disorder. In addition to this, the
efficacy and side effects of this target have been shown using experimental thrombosis and bleeding models in mice lacking FXI, and in baboons and rabbits treated with anti-FXI neutralizing antibodies. These results suggest that FXIa inhibitors will show a potent anti-thrombotic effect without bleeding. Therefore, factor XIa is an attractive target for anti-thrombotic therapy without any bleeding side effect.

It has been described in Patent literature 1 that compounds of formula (A):

DISCLOSURE OF THE INVENTION

It is desirable to find new compounds which may be more effective in treating thromboembolic diseases. Advantageous compounds desirably have good inhibitory activity and selectivity for factor XLa (and preferably also for plasma kallikrein) with potent anticoagulant activity and/or good oral bioavailability.

The present inventors have made extensive studies to find a compound that can become a therapeutic agent for thromboembolic diseases. As a result, we have found that the object is achieved by a compound represented by formula (I), a salt thereof, an N-oxide thereof, a solvate thereof, or a prodrug thereof (hereinafter, which may be abbreviated to compounds of the present invention) with good factor XLa inhibitory activity, selectivity for factor XLa, potent anticoagulant activity and/or good oral bioavailability, and then we have completed the present invention.

(3) The reaction procedure with use of a condensing agent is carried out, for example, by reacting a carboxylic acid with an amine in an organic solvent (e.g., chloroform, dichloromethane, dimethylformamide, diethyl ether, tetrahydrofuran, etc.) or solvent-free in the presence or absence of a base (e.g., pyridine, triethylamine, dimethylaniline, dimethylaminopyridine, etc.), with use of a condensing agent (e.g., 1,3-dicyclohexylcarbodiimide (DCC), 1-ethyl-3-[3-(dimethylamino)propyl]carbodiimide (EDC), 1,1'-carbonyldiimidazole (CDI), 2-chloro-l-methylpyrididmm iodide, 1,1'-propylphosphonic acid anhydride (1-propanephosphonic acid cyclic anhydride, PPA), etc.) and with or without use of 1-hydroxybenzotriazole (HOBt), at a temperature of about 0 to 40 °C.

(4) The deprotection reaction of a silyl group is, for example, carried out in a water-miscible organic solvent (tetrahydrofuran, acetonitrile, etc.) using tetrabutylammonium fluoride at a temperature of 0 to 40 °C.

(5) The deprotection reaction using a metal is carried out, for example, in an acidic solvent (acetic acid, a buffer of pH 4.2 to 7.2 or a mixture of the solution thereof and an organic solvent such as tetrahydrofuran etc.) in the presence of zinc powder at a temperature of 0 to 40 °C optionally under sonication.

(6) The deprotection reaction using a metal complex is carried out, for example, in an organic solvent (dichloromethane, N,N-dimethylformamide, tetrahydrofuran, ethyl acetate, acetonitrile, dioxane, ethanol, etc.), water or a mixture thereof, in the presence of a trapping reagent (tributyltin hydride, triethysilane, dimedone, morpholine, diethylamine, pyrrolidine, 1,3-dimethylbarbituric acid, etc.), an organic acid (acetic acid, formic acid, 2-ethylhexanecarboxylic acid, etc.) and/or a salt of an organic acid (sodium...
2-ethylhexanoate, potassium 2-ethylhexanoate, etc.) in the presence or absence of a phosphine reagent (triphenylphosphine etc.) using a metal complex (tetrakis(triphenylphosphine)palladium (0), palladium(II) bis(triphenylphosphine) dichloride, palladium(II) acetate, rhodium(I) tris(triphenylphosphine) chloride, etc.) at a temperature of 0 to 40 °C.

In addition to the above, deprotection reactions may be carried out by the methods, for example, described in T. W. Greene, Protective Groups in Organic Synthesis, Wiley, New York, 1999.

PHARMACOLOGICAL ACTIVITIES
The compounds of the present invention possess Factor XIa inhibitory activity and oral bioavailability, for example, such an effect of the compounds of the present invention was confirmed by the following tests.

All the procedures were conducted by conventionally used techniques on the basis of basic biological methods. Furthermore, the measuring method of the present invention was modified to improve the accuracy and/or sensitivity of measurement for evaluating the compound of the present invention. The detailed experimental method was as follows.

**EXPERIMENTAL METHOD**

1) **In Vitro Assay**

Inhibitory activities of compounds of the present invention against factor XIa, Xa, Xlla, IXa, Vila, plasma kallikrein or thrombin were evaluated using appropriate purified proteases and synthetic substrates. The rate of hydrolysis of the chromogenic substrate by the relevant protease was continuously measured at 405 nm. Inhibitory activity against each enzyme was calculated as % inhibition using the equation described below.

\[
% \text{ Inhibition} = \frac{[(\text{rate without compound})-(\text{rate with compound})]}{\text{(rate without compound)}} \times 100\%.
\]

Each half maximal inhibitory concentration (IC50) value was determined by plotting the concentration of compound of the invention against the % inhibition.

(1-1) **Factor XIa enzyme activity**

Human Factor XIa (Haematologic Technologies Inc.) activity was measured at an enzyme concentration of 0.1 U/mL in 150 mM NaCl, 5 mM KC1, 1 mg/mL PEG6000, 50 mM HEPES-NaOH (pH7.4) with 300 µM S-2366 (pyroGlu-Pro-Arg-pNA, Chromogenix).

(1-2) **Plasma kallikrein enzyme activity**

Human plasma kallikrein (Enzyme Research Laboratories Ltd) activity was measured at an enzyme concentration of 0.605 mU/mL in 200 mM NaCl, 5 mg/mL PEG6000, 100 mM Phosphate-NaOH (pH7.4) with 150 µM S-2302 (H-D-Pro-Phe-Arg-pNA, Chromogenix).
(1-3) Factor Xa and thrombin enzyme activity

Human Factor Xa (American Diagnostica Inc.) and human thrombin (Sigma) activities were measured at the enzyme concentrations of 0.18 U/mL and 0.12 U/mL, respectively in the same buffer containing 150 mM NaCl, 2 mg/mL PEG6000, 50 mM Tris-HCl (pH7.4), except that the reactions were started with 300 μM S-2222 (phenyl-Ile-Glu-Gly-Arg-pNA, Chromogenix) and 300 μM S-2366, respectively.

(1-4) Factor XIIa enzyme activity

Human Factor a-XIIa (Enzyme Research Laboratories Ltd) activity was measured at an enzyme concentration of 0.17 U/mL in 150 mM NaCl, 50 mM Tris-HCl (pH7.4) with 300 μM S-2302 (H-D-Pro-Phe-Arg-pNA, Chromogenix).

(1-5) Factor IXa enzyme activity

Human Factor IXa (American Diagnostica Inc.) activity was measured at an enzyme concentration of 13 U/mL in 100 mM NaCl, 5 mM CaCl₂, 30% ethylene glycol, 50 mM Tris-HCl (pH7.4) with 3 mM Pefachrome IXa 3960 (Leu-Ph'Gly-Arg-pNA, Pentapharm).

(1-6) Factor Vila enzyme activity

Human Factor Vila activity was measured using recombinant human Factor Vila (American Diagnostica Inc.) in the presence of recombinant human tissue factor which was produced according to the method described in the literature (Protein expression and purification, 3, 453-460 (1992) in a buffer containing 150 mM NaCl, 5 mM CaCl₂, 0.5 mg/mL PEG6000, 50 mM HEPES-NaCl (pH7.4) with 3 mM S-2288 (Ile-Pro-Arg-pNA, Chromogenix).

(1-7) APTT, PT measurement

Activated partial thromboplastin time (APTT) and prothrombin time (PT) were measured using automatic coagulation analyzer (CA-1500, Sysmex Corporation). For the APTT or PT measurement, standard human plasma (Siemens Healthcare Diagnostics GmbH) were mixed with each compound dilutions followed by the automatic addition of APTT reagent (Siemens Healthcare Diagnostics GmbH) and 0.02
M calcium chloride or PT reagent (Siemens Healthcare Diagnostics GmbH) to start clot formation. The anticoagulant activities (APTT2 or PT2) of the compounds of the invention were expressed as the concentrations necessary to double the clotting time in vehicle (1% DMSO) group. APTT2 or PT2 was determined by plotting the concentration of compound of the invention against the fold increase of clotting time.

(2) Rat oral administration test

Each compound of the present invention in a solution of 20% wellsolve (celeste) was given to fasted male Crj:CD(SD)IGS rats as a single 3 mg/kg, p.o. dose by gavage. Blood samples were drawn from jugular vein into syringes containing 3.2% sodium citrate (the volume ratio of blood to anticoagulant = 9:1) after oral administration at 0.5, 1, 2, 4 and 6 hours. Plasma was harvested by centrifugation and stored at -20°C until measurement of plasma concentration.

To measure plasma concentrations of the compounds of the present invention, plasma samples were deproteinized with acetonitrile, followed by evaporation of the acetonitrile to dryness. The residual was then re-dissolved with DMSO and its FXIa inhibitory activity was measured by enzyme assay described above. Plasma concentrations of each compound of the present invention were quantitated by generating a standard curve of known compound concentration in rat plasma.

The compounds of the present invention were tested in the Factor XIa assay and the rat oral administration test described above, and found to have a good Factor XIa inhibitory activity and good oral bioavailability. Table 1 described below lists Factor XIa IC50 values measured for the following examples.

As a result, the compounds of the present invention showed good oral bioavailability compared with the comparative compounds described above.

Therefore, the results indicated that the compounds of the present invention possess Factor XIa inhibitory activity, with good oral bioavailability.

Additionally, the good oral bioavailability of compounds of the present invention can be determined using the following experimental methods.

(3-1) Pharmacokinetic (PK) study in rat

Each compound of the present invention in a solution of 20% wellsolve (celeste) was given to fasted male Crj:CD(SD) rats as a single 3 mg/kg, p.o. dose by gavage. Blood samples were drawn from jugular vein into syringes containing 3.2% sodium citrate (the volume ratio of blood to anticoagulant = 9:1) or heparinized syringes at 0.5, 1, 3, 7 hours after oral administration. Additionally, enzymatic hydrolysis of an ester group in the compound of the present invention can be determined using the following experimental methods.

(4-1) Analysis of enzymatic hydrolysis of an ester group(s) in the compounds of the present invention using hepatocytes prepared from various species (rat, dog, monkey, human).

A typical assay procedure was conducted by using cryopreserved hepatocytes prepared from various species. A mixture of hepatocytes, buffer (pH 7.4), and each test compound were incubated. The final test compound concentration was typically 100 ng/mL, with a usual cell density of 1,000,000 cells/ml for all species. The incubation was at 37°C, with time-points taken over 120 minutes. Reaction termination was achieved by addition of an aliquot of the hepatocyte / test compound mixture to acetonitrile/ethanol (7/3) to effect protein precipitation, followed by centrifugation. Then the sample was diluted with distilled water and analyzed by LC/MS/MS. An analytical column (Shim-pack XR-ODS II, 2.0 mm X 75 mm, 2.2 µm) and mobile phase (0.1% formic acid in water and 0.1% formic acid in acetonitrile, flow rate of 0.5 mL/min) were used. The system was used in multiple reaction monitoring (MRM) mode with positive ion detection.
(4-2) Analysis of enzymatic hydrolysis of the compound which has an ester group(s) using blood from various species (rat, dog, monkey, human)

Each compound of the present invention in a solution of acetonitrile were incubated in blood from various species. The incubation was typically performed at a concentration of 100ng/mL of test compound at 37°C, with time points taken over 60 minutes. The reaction was terminated by addition of an aliquot of blood / test compound mixture to acetonitrile/ethanol (7/3) to effect protein precipitation, followed by centrifugation. Then the sample was diluted with distilled water and analyzed by LC/MS/MS. An analytical column (Shim-pack XR-ODS II, 2.0 mm X 75 mm, 2.2 µm) and mobile phase (0.1% formic acid in water and 0.1% formic acid in acetonitrile, flow rate of 0.5 mL/min) were used. The system was used in multiple reaction monitoring (MRM) mode with positive ion detection.
