Extensive pharmacological investigations have shown that the compounds I and their pharmaceutically acceptable salts, for example, have pronounced selectivity in inhibiting CETP (cholesteryl ester transfer protein). CETP is involved in the metabolism of any lipoprotein in living organisms, and has a major role in the reverse cholesterol transfer system. Namely, CETP has drawn attention as a mechanism for preventing accumulation of cholesterol in peripheral cells and preventing arteriosclerosis. In fact, with regard to HDL having an important role in this reverse cholesterol transfer system, a number of epidemiological researches have shown that a decrease in CE (cholesteryl ester) of HDL in blood is one of the risk factors of coronary artery diseases. It has been also clarified that the CETP activity varies depending on the animal species, wherein arteriosclerosis due to cholesterol-loading is hardly induced in animals with lower activity, and in reverse, easily induced in animals with higher activity, and that hyper-HDL-emia and hypo-LDL (low density lipoprotein)-emia are induced in the case of CETP deficiency, thus rendering the development of arteriosclerosis difficult, which in turn led to the recognition of the
significance of blood HDL, as well as significance of CETP that mediates transfer of CE in HDL into blood LDL. While many attempts have been made in recent years to develop a drug that inhibits such activity of CETP, a compound having a satisfactory activity has not been developed yet.

The CETP inhibitory effect of the compounds of the present invention can be demonstrated by using test models known by a person skilled in the pertinent art, for example, following test models:

(1) **CETP in vitro assay:**
CETP Activity Kit (#RB-RPAK) was purchased from Roar Biochemical, Inc. (New York, NY, USA). To each well of a 96-well NBS half-area plate (costar #3686), 1.2 ng/well of the donor solution, 1 µL of the acceptor solution and 5 µL compound solution diluted in 100% DMSO were added in a 38 µL of buffer containing 10 mM Tris, 150 mM NaCl and 2 mM EDTA, pH 7.4. Then, the plate was sealed with Themowell™ Sealers (costar #6524) and followed by a mixing on a plate shaker by MICROPLATE MIXER MPX-96 (IWAKI) at power 3 for 10 sec at room temperature. After 10-min incubation at 37°C, the reaction was started by adding 5 µL of rhCETP solution (Cardiovascular Target, New York, NY, USA) and mixed on the plate shaker for 10 sec, then the fluorescence intensity at 0 min was measured by an ARVO SX (Perkin Elmer, USA) at excitation wavelength of 465 nm and emission wavelength of 535 nm. After 120 min-incubation at 37°C, fluorescence intensity was measured again. The inhibition of rhCETP activity by a compound was calculated by the following calculation.

\[ \text{Inhibition} \% = \left\{ 1 - \frac{F_{120} - F_0}{(F_{120} - f_0)} \right\} \times 100\% \]

where \( F \) is measured fluorescence intensity with compound at 0 or 120 min. \( f \) is measured fluorescence intensity of without compound at 0 or 120 min.

The IC\(_{50}\) values are determined from the dose-effect curve by Origin software. IC\(_{50}\) values, especially from about 0.1 nM to about 50 µM, are determined for the compounds of the present invention or a pharmaceutically acceptable salt thereof.

(2) **Effects on plasma HDL levels in hamster:**
Effects of compounds on HDL-cholesterol level in hamsters are investigated by the method reported previously with some modifications (Eur, J. Pharmacol, 466 (2003) 147-154). In brief, male Syrian hamsters (10-11 week-old age, SLC, Shizuoka, Japan) are fed a high cholesterol diet for two weeks. Then, the animals are dosed singly with the compound
suspended with carboxyl methyl cellulose solution. HDL-cholesterol levels are measured by using commercially available kit (Wako Pure Chemical, Japan) after the precipitation of apolipoprotein B (apoB)-containing lipoproteins with 13% polyethylene glycol 6000.

(3) Preparation of human pro-apolipoprotein A1 (pro-apoAI)
The cDNA of human pro-apoAI (NCBI accession number: NM_000039) is cloned from human liver Quick-Clone™ cDNA (Clontech, CA) and inserted to a pET28a vector (Novagen, Germany) for bacterial expression. Expressed protein as a fusion protein with 6xHis-tag at N-terminus in BL-21 Gold (DE3) (Strategene, CA) is purified using HiTrap Chelating (GE Healthcare, CT).

(4) Preparation of donor microemulsion
Pro-apoAI containing microemulsion as a donor particle is prepared following previous reports (J. Biol. Chem., 280:14918-22). Glyceryl trioleate (62.5 ng, Sigma, MO), 3-sn-phosphatidylcholine (583 ng, Wako Pure Chemical Industries, Japan), and cholesteryl BODIPY® FL C_{12} (250 ng, Invitrogen, CA) are dissolved in 1 ml. of chloroform. The solution is evaporated, then residual solvent is removed in vacuum for more than 1 hr. The dried lipid mixture is dissolved in 500 μL of the assay buffer (50 mM Tris-HCl (pH7.4) containing 150 mM NaCl and 2 mM EDTA) and sonicated at 50°C with a microtip (MICROSON™ ULTRASONIC CELL DISRUPTOR, Misonix, Farmingdale, NY) at output power 006 for 2 min. After sonication, the solution is cooled to 40°C, added to 100 μg of human pro-apoAI, and sonicated at output power 004 for 5 min at 40°C. The solution, BODIPY-CE microemulsion as a donor molecule is stored at 4°C after filtration through a 0.45 μm PVDF filter.

(5) In vitro CETP activity assay in human plasma
Human EDTA plasma samples from healthy men are purchased from New Drug Development Research Center, Inc. Donor solution is prepared by a dilution of donor microemulsion with assay buffer. Human plasma (50 μL), assay buffer (35 μL) and test compound dissolved in dimethylsulfoxide (1 μL) are added to each well of 96 well half area black flat bottom plate. The reaction is started by the addition of donor solution (14 μL) into each well. Fluorescence intensities are measured every 30 min at 37°C with excitation wave length of 485 nm and emission wavelength of 535 nm. The CETP activity (Fl/min) is defined as the changes of fluorescence intensity from 30 to 90 min. The IC_{50} value is obtained by the
logistic equation \( Y = \text{Bottom} + \frac{(\text{Top} - \text{Bottom})}{1 + \left(\frac{x}{\text{IC}_{50}}\right)^\text{Hill slope}} \) using Origin software, version 7.5 SR3. The compounds of formula I exhibit inhibitory activity with an IC50 value in the range from approximately from 0.001 to 100 \( \mu \)M, especially from 0.01 to 10 \( \mu \)M.

The compounds of the present invention or a pharmaceutically acceptable salt thereof have superior CETP inhibitory activity in mammals (e.g., human, monkey, bovine, horse, dog, cat, rabbit, rat, mouse and the like), and can be used as CETP activity inhibitors. The invention relates in particular to the novel compounds shown in the examples and to the modes of preparation described therein.

The invention relates to processes for the preparation of the compounds according to the invention. The preparation of compounds of formula (I) or a salt thereof is carried out in a manner known per se and comprises, for example, as described in the following general schemes:

General synthesis of compounds of formula (I), especially exemplified for compounds of formulae (I A) and (I B), is outlined in the following Schemes:
Required starting compounds can be synthesized according to scheme 1. Starting from pyridone (A-I), halogenation with an appropriate reagent such as N-bromosuccinimide and bromine at -20~30°C in inert solvents such as dichloromethane gives compound A-II. Treatment with an appropriate reagent such as phosphoryl chloride at -20-30°C affords compound A-III. Halogen-metal exchange can be performed with alkyl metal reagents such as n-butyl lithium, and formylation with a formylating agent such as N,N-dimethylformamamide gives compound A-IV.

The compounds in this invention and depicted as compound VII can be prepared according to the following schemes 2-5.

Compound A-V is prepared by amination of compound A-IV in the presence of an appropriate base such as diisopropylethylamine, potassium carbonate, triethylamine, or sodium hydride. Reduction of the aldehyde group by using a reducing reagent such as sodium borohydride or lithium aluminum hydride gives the corresponding alcohol (A-VI). After conversion of the alcohol to a leaving group, for example, conversion to methanesulfonate, chloride or bromide, a secondary amine is alkylated in the presence of a base such as diisopropylethylamine, triethylamine or potassium carbonate to give a desired product.
Alternatively, compound A-VII can be synthesized from compound A-IV according to scheme 3 by utilizing similar conditions to that in scheme 2.

Synthesis of compound A-VII can also be performed from compounds A-VI as shown in scheme 4. A primary amine is reacted with compounds A-VI in the presence of a base such as diisopropylethylamine, sodium hydride, triethylamine or potassium bis(trimethylsilyl)amide. The resulting secondary amine can be reacted with an alkylating reagent such as alkyl bromide, alkyl iodide and alkyl methansulfonate, or a acid chloride, with a base such as diisopropylethylamine, sodium hydride, triethylamine or potassium bis(trimethylsilyl)amide to give a desired compound.

Compound A-VII can also be prepared according to scheme 5. Compound A-XI can be obtained by reductive amination from compound A-V by use of a reagent such as sodium borohydride or sodium triacetoxyborohydride, or amination after conversion of the alcohol to
a leaving group such as chloride, bromide or metansulfonate in the presence of a base such as diisopropylethylamine, triethylamine or potassium carbonate. The resulting compound A-XI can be reacted with an appropriate reagent such as acid chlorides, chloroformates, alkyl halides in the presence, or in the absence, of a base such as potassium carbonate, sodium carbonate, triethylamine or diisopropylethylamine to give a desired compound A-VII.

![Scheme 6](image)

Compound A-XII, wherein A is linker, W2 is C1-C6 alkyl and Pro is a protective group, and A-XIII can also be prepared according to scheme 2-5. Compound A-VII can be obtained by hydrolysis of compound A-XII by use of a base such as sodium hydroxide, or lithium hydroxide aqueous solution in an appropriate solvent, such as methanol, ethanol or THF. Compound A-XIV can be obtained by deprotection of A-XIII by use of appropriate reagent. Compound A-XIV can be reacted with an appropriate oxidative reagent such as Pyridinium Chlorochromate, Pyridinium dichromate, Dess-Martin periodinane, swem-oxidation, NaClO₂, and TEMPO-oxidation to give a desired compound A-VII.

Secondary amines (HNR₂R₃) can be prepared from amines and aldehydes by reductive amination with an appropriate reagent such as sodium borohydride or sodium triacetoxyborohydride, or from amines and alkyl halides by alkylation in the presence of a base such as sodium carbonate, potassium carbonate, triethylamine or diisopropylethylamine.
In view of the close relationship between the novel compound in the free form and in the form of its salts, in the preceding text and below the free compound or its salts may correspondingly and advantageously also be understood as meaning the corresponding salts or the free compound.

The novel compounds including their salts of salt-forming compounds can also be obtained in the form of their hydrates or can include other solvents used for crystallization.

Depending on the choice of the starting materials and procedures, the novel compounds can be present in the form of one of the possible isomers or as mixtures thereof, for example as pure optical isomers, such as antipodes, or as isomer mixtures, such as racemates, diastereoisomer mixtures or racemate mixtures, depending on the number of asymmetric carbon atoms.

Racemates and diastereomer mixtures obtained can be separated into the pure isomers or racemates in a known manner on the basis of the physicochemical differences of the components, for example by fractional crystallization. Racemates obtained may furthermore be resolved into the optical antipodes by known methods, for example by recrystallization from an optically active solvent, chromatography on chiral adsorbents, with the aid of suitable microorganisms, by cleavage with specific immobilized enzymes, via the formation of inclusion compounds, for example using chiral crown ethers, only one enantiomer being complexed, or by conversion into diastereomeric salts, for example by reaction of a basic final substance racemate with an optically active acid, such as a carboxylic acid, for example tartaric or malic acid, or sulfonic acid, for example camphorsulfonic acid, and separation of the diastereomer mixture obtained in this manner, for example on the basis of its differing solubilities, into the diastereomers from which the desired enantiomer can be liberated by the action of suitable agents. The more active enantiomer is advantageously isolated.

The invention also relates to those embodiments of the process, according to which a compound obtainable as an intermediate in any step of the process is used as a starting material and the missing steps are carried out or a starting
material in the form of a derivative or salt and/or its racemates or antipodes is used or, in particular, formed under the reaction conditions.

Abbreviations:

**Example 1:** Synthesis of [3-((3,5-bis(trifluoromethyl)benzyl)(2-methyl-2H-tetrazol-5-yOamino)methyl]OS-trifluoromethylpyridin^-ylKcyclopentylmethyOethylamine.

A mixture of [2-(cyclopentylmethylamino)-5-(trifluoromethyl)pyridin-3-yl]methanol (55 mg, 0.18 mmol) and thionyl chloride (17 µL, 0.22 mmol) in toluene (0.50 mL) is stirred at ambient temperature for 3 hours. The mixture is concentrated *in vacuo*. After [3,5-
bis(trifluoromethyl)phenylmethyl](2-methyl-2H-tetrazol-5-yl)amine (89 mg, 0.27 mmol) and DMF (0.5 mL) are added to the mixture, the mixture is stirred and then potassium t-butoxide (31 mg, 0.29 mmol) is added and the mixture is further stirred for 20 min. After adding sat. ammonium chloride, the mixture is extracted with ethyl acetate. The combined organic layer is washed with brine, dried over magnesium sulfate, filtrated, and concentrated. The resulting mixture is purified by silica gel column chromatography (ethyl acetate/hexane = 5/95 to 35/65) to give [3-[[3,5-bis(trifluoromethyl)benzyl](2-methyl-2H-tetrazol-5-yl)aminomethyl](2-methyl-2H-tetrazol-5-yl)aminomethyl]O-5-(trifluoromethyl)pyridin^-y^-cyclopentylmethyloethyamine (39 mg, 36% yield).

Example 3: Synthesis of [3,5-bis(trifluoromethyl)benzyl]([2-((cyclopentyl)methyl)ethylamino]-5-(trifluoromethyl)pyridin-3-ylmethyl)carbamic acid methyl ester

To a stirred solution of (3-[[3,5-bis(trifluoromethyl)benzylamino]methyl]-5-(trifluoromethyl)pyridin-2-yl)(cyclopentylmethyl)ethylamine (150 mg, 0.25 mmol), triethylamine (37 mg, 0.37 mmol) and N,N-dimethylaminopyridine (3 mg, 0.025 mmol) in THF (2.5 mL), methyl chloroformate (23 µL, 0.30 mmol) is added at room temperature. ![Reaction Scheme]
A mixture of \([\text{trans}-4-\{\{3\text{-}5\text{-}bis\text{(trifluoromethyl)benzyl}\}2\text{-}methyl\text{-}2H\text{-}tetrazol\text{-}5\text{-}yl}\text{amino}\}\{-\text{methyl}\}\text{-}5\text{-}trifluoromethylpyridin\text{-}2\text{-}yl\}\text{ethylamino}\}\{-\text{methyl}\}\text{-}cyclohexyl\}\text{acetic acid (68 mg, 0.10 mmol), oxalyl chloride and catalytic amount of DMF in dichloromethane is stirred at ambient temperature for 2 hours. After the mixture is concentrated in vacuo, 2 mL of THF is added. To the solution, ammonia solution (1 mL) in THF (1 mL) is added. After stirring at ambient temperature for 1 hour, ethyl acetate and water are added, and partitioned. The combined organic layer is washed with brine, dried over magnesium sulfate, filtrated and concentrated. The residue is purified by reverse phase HPLC (0.1% TAF-H_2O to CH_3CN) to give \([\text{trans}-4-\{\{3\text{-}5\text{-}bis\text{(trifluoromethyl)benzyl}\}2\text{-}methyl\text{-}2H\text{-}tetrazol\text{-}5\text{-}yl}\text{amino}\}\{-\text{methyl}\}\text{-}5\text{-}trifluoromethylpyridin\}\text{yl}ethyl\text{amino}\}\{-\text{methyl}\}\text{-}cyclohexyl\}\text{acetamide.}

The reaction mixture is cooled to room temperature, and diluted with water and dichloromethane. The organic layer is filtered through phase separator and concentrated. The residue is dissolved in AcOH (5 mL) and sodium perborate tetrahydride (148 mg, 0.965 mmol) is added to the solution. After stirring at 55°C for 15 hours, AcOH is removed by evaporation. Water is added to the residue and the mixture is extracted with dichloromethane. The organic layer is washed with brine, dried over magnesium sulfate and concentrated in vacuo. The crude product is purified by reverse-phase HPLC to give [3-[[3,5-bis(trifluoromethyl)benzyl][2-methyl-2H-tetrazol-5-yl]amino]methyl]5-trifluoromethylpyridin-2-yl]([1,1-dioxohexahydro-2H-thiopyran-4-yl)methyl]ethylamine (12 mg, 9%).

The starting materials can be prepared, for example, as follows:

**Example A**: Preparation of \( \{2-[(\text{cyclopentylmethyl)}\text{ethylamino}]-5\text{-trifluoromethyl}pyridin-3-yl\}\text{methanol} \).
Stepi:
A suspension of 2-chloro-5-trifluoromethylpyridine (2.16 g, 0.012 mmol), 70% ethylamine in water (3 mL), potassium carbonate (3.29 g, 0.023 mmol) in toluene is irradiated in a microwave reactor for 30 min. After adding water, the mixture is extracted with ethyl acetate. The combined organic layer is washed with brine, dried over magnesium sulfate, filtrated and concentrated to give ethyl(5-trifluoromethyl-pyridin-2-yl)amine (1.88 g, 83% yield).

\[ ^1H\text{-NMR (400MHz, CDCl}_3\text{), }\delta (ppm): 1.28 (t, 3H), 3.32-3.39 (m, 2H), 4.82 (br, 1H), 6.38 (d, 1H), 7.58 (dd, 1H), 8.32 (d, 1H). \]

Step2:
A solution of ethyl(5-trifluoromethylpyridin-2-yl)amine (1.87 g, 9.8 mmol) in DMF (20 mL) is treated with N-bromosuccinimide (2.10 g, 11.8 mmol) for 2 hours at ambient temperature. After adding water, the mixture is extracted with ethyl acetate. The combined organic layer is washed with water (3 times) and brine, dried over magnesium sulfate, filtrated and concentrated in vacuo to give (3-bromo-5-trifluoromethyl-pyridin-2-yl)ethylamine (2.55 g, 95% yield).

\[ ^1H\text{-NMR (400MHz, CDCl}_3\text{), }\delta (ppm): 1.29 (t, 3H), 3.51-3.57 (m, 2H), 5.33 (br, 1H), 7.78 (d, 1H), 8.31 (d, 1H). \]

Step3:
To a solution of cyclopentylmethanol (0.40 g, 4.0 mmol) in dichloromethane, pyridine (0.35 g, 4.4 mmol) and trifluoromethansulfonic anhydride (0.90 mL, 4.2 mmol) are added at 0°C, successively, and the mixture is stirred at the same temperature for 1 hour. After adding
water, the mixture is extracted with dichloromethane. The organic layer is washed with brine, dried over magnesium sulfate, filtrated and concentrated \textit{in vacuo} to give crude cyclopentylmethyl trifluoromethanesulfonate.

To a stirring solution of (3-bromo-5-trifluoromethylpyridin-2-yl)ethylamine (0.27 g, 1.0 mmol) in DMF, sodium hydride (0.080 g, 2.0 mmol) is added and the reaction mixture is stirred at room temperature over 25 min. A solution of the crude cyclopentylmethyl trifluoromethanesulfonate prepared above in DMF is added dropwise to the mixture, which is allowed to stir at ambient temperature for 30 min. After adding sat. sodium hydrogen carbonate solution, the mixture is extracted with ethyl acetate. The combined organic layer is washed with water and then brine, dried over magnesium sulfate, filtrated and concentrated in vacuo. The residue is purified by silica gel column chromatography (AcOEt/hexane = 5/95 to 50/50) to give (3-bromo-5-trifluoromethylpyridin-2-yl)(cyclopentylmethyl)ethylamine (0.17 g, 48 %).

Step4:
A solution of (3-bromo-5-trifluoromethylpyridin-2-yl)(cyclopentylmethyl)ethylamine (0.17 g, 0.48 mmol) in THF is treated with n-butyl lithium (1.5M in hexane, 1.2 mL, 1.8 mmol) at -78 °C for 5 min. To the mixture, DMF (0.5 mL) is added. After stirring, sat. ammonium chloride solution and ethyl acetate are added and the mixture is warmed to room temperature. After extraction with ethyl acetate, the organic layer is washed with brine, dried over magnesium sulfate, filtrated and concentrated in vacuo to give crude 2-[(cyclopentylmethyl)ethylamino]-5-trifluoromethylpyridine-3-carbaldehyde.

To a mixture of crude 2-[(cyclopentyl methyl)ethylamino]-5-trifluoromethylpyridine-3-carbaldehyde obtained above in ethanol (1 mL), 30 mg (0.80 mmol) of sodium borohydride is added and the mixture is stirred for 5 hours at room temperature.
