ROR γ MODULATORS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of U.S. Provisional Application No. 61/880,391, filed September 20, 2013, the disclosure of which is incorporated herein by reference in its entirety.

BACKGROUND OF THE INVENTION

This invention relates to modulators of the retinoid-related orphan receptor ROR γ and methods for using such modulators. The compounds described herein can be particularly useful for diagnosing, preventing, or treating a variety of diseases and disorders in humans and animals. Exemplary disorders include psoriasis, arthritis, asthma, inflammatory bowel disease and multiple sclerosis.

The retinoid-related orphan receptors ROR α , ROR β , and ROR γ play an important role in numerous biological processes including organ development, immunity, metabolism, and circadian rhythms. See, for example, Dussault *et al.* in *Mech. Dev.* (1998) vol. 70, 147-153; Andre *et al.* in *EMBO J.* (1998) vol. 17, 3867-3877; Sun *et al.* in *Science* (2000) vol. 288, 2369-2373; and Jetten in *Nucl. Recept. Signal.* (2009) vol. 7, 1-32.

ROR γ is expressed in several tissues including the thymus, kidney, liver, and muscle. Two isoforms of ROR γ have been identified: ROR γ 1 and ROR γ 2 (also known, respectively, as ROR γ and ROR γ t). See, for example, Hirose *et al.* in *Biochem. Biophys. Res. Commun.* (1994) vol. 205, 1976-1983; Ortiz *et al.* in *Mol. Endocrinol.* (1995) vol. 9, 1679-1691; and He *et al.* in *Immunity* (1998) vol. 9, 797-806. Expression of ROR γ t is restricted to lymphoid cell types including CD4 $^{+}$ CD8 $^{+}$ thymocytes, IL-17 producing T helper (Th17) cells, lymphoid tissue inducer (LTi) cells, and $\gamma\delta$ cells. ROR γ t is essential for the development of lymph nodes and Peyer's patches and for the normal differentiation of Th17, $\gamma\delta$, and LTi cells. See, for example, Sun *et al.* in *Science* (2000) vol. 288, 2369-2373; Ivanov *et al.* in *Cell* (2006) vol. 126, 1121-1133; Eberl *et al.* in *Nat. Immunol.* (2004) vol. 5, 64-73; Ivanov *et al.* in *Semin. Immunol.* (2007) vol. 19, 409-417; and Cua and Tato in *Nat. Rev. Immunol.* (2010) vol. 10, 479-489.

Proinflammatory cytokines such as IL-17A (also referred to as IL-17), IL-17F, and IL-22 produced by Th17 cells and other ROR γ + lymphocytes activate and direct the immune response to extracellular pathogens. See, for example, Ivanov *et al.* in *Semin. Immunol.* (2007) vol. 19: 409-417; and Marks and Craft in *Semin. Immunol.* (2009) vol. 21, 164-171. ROR γ directly regulates IL-17 transcription and disruption of ROR γ in mice attenuates IL-17 production. See, for example, Ivanov *et al.* in *Cell* (2006) vol. 126, 1121-1133.

Dysregulated production of IL-17 has been implicated in several human autoimmune and inflammatory diseases including multiple sclerosis, rheumatoid arthritis, psoriasis, inflammatory bowel disease (IBD), and asthma. See, for example, Lock *et al.* in *Nat. Med.* (2002) vol. 8, 500-508; Tzartos *et al.* in *Am. J. Pathol.* (2008) vol. 172, 146-155; Kotake *et al.* in *J. Clin. Invest.* (1999) vol. 103, 1345-1352; Kirkham *et al.* in *Arthritis Rheum.* (2006) vol. 54, 1122-1131; Lowes *et al.* in *J. Invest. Dermatol.* (2008) vol. 128, 1207-1211; Leonardi *et al.* in *N. Engl. J. Med.* (2012) vol. 366, 1190-1199; Fujino *et al.* in *Gut* (2003) vol. 52, 65-70; Seiderer *et al.* in *Inflamm. Bowel Dis.* (2008) vol. 14, 437-445; Wong *et al.* in *Clin. Exp. Immunol.* (2001) vol. 125, 177-183; and Agache *et al.* in *Respir. Med.* (2010) 104: 1131-1137. In murine models of these diseases, inhibition of IL-17 function by neutralizing antibodies or genetic disruption of IL-17 or IL-17 receptor ameliorates the disease course or clinical symptoms. See, for example, Hu *et al.* in *Ann. N.Y. Acad. Sci.* (2011) vol. 1217, 60-76.

Disruption of ROR γ in mice also attenuates disease progression or severity in animal models of autoimmunity and inflammation including experimental autoimmune encephalomyelitis (EAE), imiquimod induced psoriasis, colitis, and allergic airway disease. See, for example, Ivanov *et al.* in *Cell* (2006) vol. 126, 1121-1133; Yang *et al.* in *Immunity* (2008) vol. 28, 29-39; Pantelyushin *et al.* in *J. Clin. Invest.* (2012) vol. 122, 2252-2256; Leppkes *et al.* in *Gastroenterology* (2009) vol. 136, 257-267; and Tilley *et al.* in *J. Immunol.* (2007) vol. 178, 3208-3218.

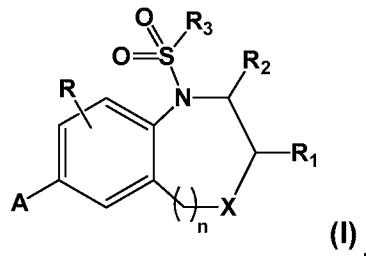

Each of the references in this Background section is hereby incorporated herein by reference in its entirety for all purposes.

Therapeutic agents exist to treat a variety of inflammatory and autoimmune diseases, but there still remains a significant unmet medical need in these therapeutic areas. Given the role of IL-17 in human disease and the validation of IL-17 and ROR γ as

targets in murine disease models, compounds capable of modulating ROR γ t activity are contemplated to provide a therapeutic benefit in the treatment of multiple immune and inflammatory disorders.

In another embodiment, the invention provides a compound of the present invention for use in therapy.

In another embodiment, the invention provides a combined preparation of a compound of the present invention and additional therapeutic agent(s) for simultaneous, separate or sequential use in therapy.

As noted above, each alkyl moiety (i.e., defined as “alkyl”) is optionally substituted with one or more substituents (e.g., in various embodiments, from 1-5, from 1-3, from 1-2 or one) selected from the group consisting of -D, -halogen, -CN, -NO₂, -O-R²⁰, -N(R²¹)₂ and -S(R²⁰), in which each R²⁰ is independently selected from the group consisting of -H, -CH₃, -CH₂CH₃ and -CF₃, and each R²¹ is independently selected from the group consisting of -H, -CH₃ and -CH₂CH₃. In certain embodiments of the invention as described herein, each alkyl is optionally substituted with one or more substituents selected from the group consisting of -D, -halogen, -O-R²⁰ and -N(R²¹)₂ and -S(R²⁰), in which each R²⁰ is independently selected from the group consisting of -H, and -CH₃, and each R²¹ is independently selected from the group consisting of -H and -CH₃. In other

embodiments, each alkyl is optionally substituted with one or more substituents selected from the group consisting of -D, -halogen, -OH, -NH₂ and -SH. In other embodiments, each alkyl is unsubstituted.

As used herein, the “alkyl” groups are defined as having a given number of carbons. Accordingly, “(C₁-C₄)alkyl” is an alkyl group having from one to four carbons. An alkyl group can be branched or unbranched. Thus, “(C₁-C₄)alkyl” encompasses methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl and t-butyl, in unsubstituted and substituted forms as described above.

The term “fluoroalkyl” as used herein, means an alkyl group substituted with one or more fluorines and no other substituents. In certain embodiments, one or more carbons of the fluoroalkyl group is substituted with fluorine. Examples of fluoroalkyl moieties include, without limitation, fluoromethyl, difluoromethyl, trifluoromethyl, pentafluoroethyl, 2,2,2-trifluoroethyl, and 1,1,1,3,3,3-hexafluoroisopropyl. “Fluoroalkyl” is encompassed within optionally-substituted alkyl as described above.

In general, any hydrogen atom of the compounds described herein (whether described explicitly as “-H” or as part of another moiety such as an alkyl or a phenyl) can be provided as a protium, or a deuterium. Thus, while deuterium is often described herein as a “substituent,” the person of skill in the art will understand that deuterium can be used as the hydrogen atom species at any position in the compound. However, in certain embodiments of the compounds described herein, every hydrogen atom, unless otherwise explicitly specified, is a protium.

The term “deuteroalkyl” as used herein means an alkyl group substituted with one or more deuteria and no other substituents. Examples of “deuteroalkyl” include deuteromethyl and dideuteromethyl.

Individual compounds of certain embodiments of the present invention are provided

One of skill in the art can adapt the reaction sequences of Schemes 1-50 to fit the desired target molecule. For example, use of a 2-ethylpyrimidine will result in compounds in which R¹ is ethyl, instead of methyl as in many of the example compounds. Similarly, while the schemes generally depict the -(“B” ring system)-(R^b)_y moiety as ortho-disubstituted phenyl, the person of skill will appreciate that use of different starting materials will provide different rings and/or different patterns of substitution. Of course,

in certain situations one of skill in the art will use different reagents to affect one or more of the individual steps or to use protected versions of certain of the substituents. Additionally, one skilled in the art would recognize that compounds of structural formula (I) can be synthesized using different routes altogether.

The compounds of the present invention can be provided in a number of stereoisomeric forms. Accordingly, another aspect of the invention is a stereoisomeric form of a compound as described herein. For example, a compound of the present invention can be provided in racemic form. In other embodiments, a compound of the present invention is provided in scalemic form, or in a stereoisomerically pure form (e.g., substantially as a single enantiomer).

Another aspect of the invention is an N-oxide of a compound or stereoisomeric form as described herein.

Another aspect of the invention is a pharmaceutically acceptable salt of a compound, stereoisomeric form, or N-oxide as described herein. As used herein, the phrase "pharmaceutically acceptable salt" refers to both pharmaceutically acceptable acid and base addition salts. Such pharmaceutically acceptable salts include salts of acids such as hydrochloric, phosphoric, hydrobromic, sulfuric, sulfinic, formic, trifluoroacetic, toluenesulfonic, methanesulfonic, nitric, benzoic, citric, tartaric, maleic, hydroiodic, alkanoic such as acetic, HOOC-(CH₂)_n-COOH where n is 0-4, and the like. Non-toxic pharmaceutical base addition salts include salts of bases such as sodium, potassium, calcium, ammonium, and the like. Those skilled in the art will recognize a wide variety of non-toxic pharmaceutically acceptable addition salts.

Another aspect of the invention is a solvate or hydrate of a compound, stereoisomeric form, N-oxide or pharmaceutically acceptable salt as described herein. The person of skill in the art can determine whether a particular compound will form a solvate or a hydrate.

Another aspect of the invention is a pharmaceutical composition including a compound, stereoisomeric form, N-oxide, pharmaceutical salt, solvate or hydrate as described herein. The pharmaceutical compositions described herein generally comprise a combination of a compound described herein and a pharmaceutically acceptable carrier, diluent, or excipient. Such compositions are substantially free of non-pharmaceutically acceptable components, *i.e.*, contain amounts of non-pharmaceutically acceptable

components lower than permitted by U.S. regulatory requirements at the time of filing this application. In some embodiments of this aspect, if the compound is dissolved or suspended in water, the composition further optionally comprises an additional pharmaceutically acceptable carrier, diluent, or excipient. In other embodiments, the pharmaceutical compositions described herein are solid pharmaceutical compositions (e.g., tablet, capsules, etc.).

These compositions can be prepared in a manner well known in the pharmaceutical art, and can be administered by a variety of routes, depending upon whether local or systemic treatment is desired and upon the area to be treated. Administration may be topical (including ophthalmic and to mucous membranes including intranasal, vaginal and rectal delivery), pulmonary (e.g., by inhalation or insufflation of powders or aerosols, including by nebulizer; intratracheal, intranasal, epidermal and transdermal), ocular, oral or parenteral. Methods for ocular delivery can include topical administration (eye drops), subconjunctival, periocular or intravitreal injection or introduction by balloon catheter or ophthalmic inserts surgically placed in the conjunctival sac. Parenteral administration includes intravenous, intraarterial, subcutaneous, intraperitoneal or intramuscular injection or infusion; or intracranial, e.g., intrathecal or intraventricular, administration. Parenteral administration can be in the form of a single bolus dose, or may be, for example, by a continuous perfusion pump. Pharmaceutical compositions and formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Conventional pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable.

Also, pharmaceutical compositions can contain, as the active ingredient, one or more of the compounds described herein above in combination with one or more pharmaceutically acceptable carriers. In making the compositions described herein, the active ingredient is typically mixed with an excipient, diluted by an excipient or enclosed within such a carrier in the form of, for example, a capsule, sachet, paper, or other container. When the excipient serves as a diluent, it can be a solid, semi-solid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid

medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders.

In preparing a formulation, the active compound can be milled to provide the appropriate particle size prior to combining with the other ingredients. If the active compound is substantially insoluble, it can be milled to a particle size of less than 200 mesh. If the active compound is substantially water soluble, the particle size can be adjusted by milling to provide a substantially uniform distribution in the formulation, *e.g.* about 40 mesh.

Some examples of suitable excipients include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water, syrup, and methyl cellulose. The formulations can additionally include: lubricating agents such as talc, magnesium stearate, and mineral oil; wetting agents; emulsifying and suspending agents; preserving agents such as methyl- and propylhydroxy-benzoates; sweetening agents; and flavoring agents. The compositions described herein can be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the subject by employing procedures known in the art.

The active compound can be effective over a wide dosage range and is generally administered in a pharmaceutically effective amount. It will be understood, however, that the amount of the compound actually administered will usually be determined by a physician, according to the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual subject, the severity of the subject's symptoms, and the like.

For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical excipient to form a solid preformulation composition containing a homogeneous mixture of a compound described herein. When referring to these preformulation compositions as homogeneous, the active ingredient is typically dispersed evenly throughout the composition so that the composition can be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation is then subdivided into unit dosage forms of the type described

above containing from, for example, 0.1 to about 500 mg of the active ingredient of a compound described herein.

The tablets or pills can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permit the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol, and cellulose acetate.

The liquid forms in which the compounds and compositions can be incorporated for administration orally or by injection include aqueous solutions, suitably flavored syrups, aqueous or oil suspensions, and flavored emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil, or peanut oil, as well as elixirs and similar pharmaceutical vehicles.

Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders. The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as described *supra*. In some embodiments, the compositions are administered by the oral or nasal respiratory route for local or systemic effect.

Compositions can be nebulized by use of inert gases. Nebulized solutions may be breathed directly from the nebulizing device or the nebulizing device can be attached to a face masks tent, or intermittent positive pressure breathing machine. Solution, suspension, or powder compositions can be administered orally or nasally from devices which deliver the formulation in an appropriate manner.

The amount of compound or composition administered to a subject will vary depending upon what is being administered, the purpose of the administration, such as prophylaxis or therapy, the state of the subject, the manner of administration, and the like. In therapeutic applications, compositions can be administered to a subject already suffering from a disease in an amount sufficient to cure or at least partially arrest the symptoms of the disease and its complications. Effective doses will depend on the disease

condition being treated as well as by the judgment of the attending clinician depending upon factors such as the severity of the disease, the age, weight and general condition of the subject, and the like.

The compositions administered to a subject can be in the form of pharmaceutical compositions described above. These compositions can be sterilized by conventional sterilization techniques, or may be sterile filtered. Aqueous solutions can be packaged for use as is, or lyophilized, the lyophilized preparation being combined with a sterile aqueous carrier prior to administration. The pH of the compound preparations typically will be between 3 and 11, more preferably from 5 to 9 and most preferably from 7 to 8. It will be understood that use of certain of the foregoing excipients, carriers, or stabilizers will result in the formation of pharmaceutical salts.

The therapeutic dosage of the compounds can vary according to, for example, the particular use for which the treatment is made, the manner of administration of the compound, the health and condition of the subject, and the judgment of the prescribing physician. The proportion or concentration of a compound described herein in a pharmaceutical composition can vary depending upon a number of factors including dosage, chemical characteristics (e.g., hydrophobicity), and the route of administration. For example, the compounds described herein can be provided in an aqueous physiological buffer solution containing about 0.1 to about 10% w/v of the compound for parenteral administration. Some typical dose ranges are from about 1 μ g/kg to about 1 g/kg of body weight per day. In some embodiments, the dose range is from about 0.01 mg/kg to about 100 mg/kg of body weight per day. The dosage is likely to depend on such variables as the type and extent of progression of the disease or disorder, the overall health status of the particular subject, the relative biological efficacy of the compound selected, formulation of the excipient, and its route of administration. Effective doses can be extrapolated from dose-response curves derived from *in vitro* or animal model test systems.

The compounds of the present invention are useful to prevent, diagnose, and treat various medical disorders in humans or animals. The compounds are used to inhibit or reduce one or more activities associated with ROR γ receptors, relative to ROR γ receptors in the absence of the same compounds. Thus, in one aspect of the invention, a method for treating a disease or disorder selected from an autoimmune disease or disorder, asthma,

an allergic disease or disorder, a metabolic disease or disorder, and cancer in a subject comprises administering to the subject a therapeutically effective amount of compound according to formula (I), stereoisomeric form, N-oxide, pharmaceutically acceptable salt, solvate, hydrate or pharmaceutical composition as described herein. *See, e.g.*, L.A. As used herein, the phrase “therapeutically effective amount” refers to the amount of active compound or pharmaceutical agent that elicits the biological or medicinal response that is being sought in a tissue, system, animal, individual or human by a researcher, veterinarian, medical doctor or other clinician.

In certain embodiments, a therapeutically effective amount can be an amount suitable for (1) preventing the disease; for example, preventing a disease, condition or disorder in an individual who may be predisposed to the disease, condition or disorder but does not yet experience or display the pathology or symptomatology of the disease; (2) inhibiting the disease; for example, inhibiting a disease, condition or disorder in an individual who is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder; or (3) ameliorating the disease; for example, ameliorating a disease, condition or disorder in an individual who is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder (*i.e.*, reversing the pathology and/or symptomatology) such as decreasing the severity of disease.

As used here, the terms “treatment” and “treating” means (i) ameliorating the referenced disease state, for example, ameliorating a disease, condition or disorder in an individual who is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder (*i.e.*, reversing or improving the pathology and/or symptomatology) such as decreasing the severity of disease; (ii) eliciting the biological or medicinal response that is being sought in a tissue, system, animal, individual or human by a researcher, veterinarian, medical doctor or other clinician; or (iii) inhibiting the referenced disease state; for example, inhibiting a disease, condition or disorder in an individual who is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder.

EXAMPLES

The following examples illustrate the particular and preferred embodiments of the present invention and do not limit the scope of the present invention. Chemical abbreviations and symbols as well as scientific abbreviations and symbols have their usual and customary meanings unless otherwise specified. Additional abbreviations employed in the Examples and elsewhere in this application are defined above. Common intermediates are generally useful for the preparation of more than one Example and are identified sequentially (e.g., Intermediate 1, Intermediate 2, etc. and are abbreviated as **Int. 1**, **Int. 2**, etc. Compounds of the Examples are identified by the example and step in which they were prepared (e.g., “1-A” denotes the Example 1, step A), or by the example only where the compound is the title compound of the example (for example, “1” denotes the title compound of Example 1). In some instances alternate preparations of intermediates or examples are described. Frequently chemists skilled in the art of synthesis may devise alternative preparations which may be desirable based on one or more considerations such as shorter reaction time, less expensive starting materials, ease of operation, amenable to catalysis, avoidance of toxic reagents, accessibility of specialized instrumentation, and decreased number of linear steps, etc. The intent of describing alternative preparations is to further enable the preparation of the examples of this invention. In some instances some functional groups in the outlined examples and

claims may be replaced by well known bioisosteric replacements known in the art, for example, replacement of a carboxylic acid group with a tetrazole or a phosphate moiety.

Those experiments specifying that they were performed in a microwave oven were conducted in a SmithSynthesizer™ oven manufactured by Personal Chemistry or a Discover™ microwave oven manufactured by CEM corporation. The microwave ovens generate a temperature which can be selected to be between 60-250°C. The microwave ovens automatically monitor the pressure which is between 0-300 PSI. Reaction hold times and temperature set points are reported.

Intermediates 1 and 2

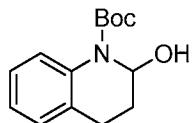

Step A: Tert-butyl 2-oxo-3,4-dihydroquinoline-1(2H)-carboxylate

A mixture of 3,4-dihydroquinolin-2(1H)-one (8.46 g, 57.4 mmol), (BOC)₂O (13.3 mL, 57.4 mmol) and DMAP (0.702 g, 5.74 mmol) in acetonitrile (60 mL) was stirred at rt for 40 hrs and concentrated under vacuum. The residue was diluted with ethyl acetate (400 ml) and washed with 1N HCl (2x20 ml), water (20 ml), brine(20 ml), dried over anhydrous magnesium sulfate and concentrated under reduced pressure to afford tert-

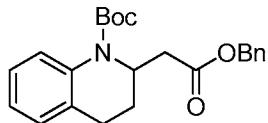

butyl 2-oxo-3,4-dihydroquinoline-1(2H)-carboxylate (13.5 g, 54.6 mmol, 95 % yield). LC/MS M-t-Bu+1 = 192.1; ¹H NMR (400MHz, CDCl₃) δ ppm 7.39 - 7.14 (m, 2H), 7.14 - 7.04 (m, 1H), 6.96 (m, 1H), 3.11 - 2.87 (m, 2H), 2.80 - 2.62 (m, 2H), 1.62 (s, 9H).

Step B: Tert-butyl 2-hydroxy-3,4-dihydroquinoline-1(2H)-carboxylate

1.0 M THF solution of lithium triethylborohydride (65.5 mL, 65.5 mmol) was added dropwise to the solution of tert-butyl 2-oxo-3,4-dihydroquinoline-1(2H)-carboxylate (13.5 g, 54.6 mmol) in THF (200 mL) at -78 °C and stirred for 60 min. Saturated Na₂CO₃ (50 ml) was added and the contents warmed to -15 °C. 30% H₂O₂ (50 ml) was then added dropwise. The resultant mixture was warmed to rt over a period of 1 hr and filtered. The filtrate was extracted with ethyl acetate (2x200 ml), washed with water, brine, dried over anhydrous magnesium sulfate and concentrated under reduced pressure to afford tert-butyl 2-hydroxy-3,4-dihydroquinoline-1(2H)-carboxylate (13.8 g) which was used as such for the next step without further purification. LC/MS M+Na = 272.1; ¹H-NMR (400 MHz, CD₃OD) δ ppm 7.49 (m, 1H), 7.17 - 7.07 (m, 1H), 7.05 - 6.88 (m, 1H), 5.96 (t, *J*=5.9 Hz, 1H), 2.83 - 2.68 (m, 1H), 2.62 - 2.49 (m, 1H), 2.26 (m, 1H), 1.89 - 1.65 (m, 2H), 1.57 - 1.48 (m, 9H).

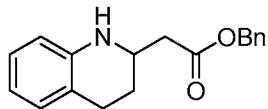

Step C: Tert-butyl 2-(2-(benzyloxy)-2-oxoethyl)-3,4-dihydroquinoline-1(2H)-carboxylate

60% sodium hydride in mineral oil (3.88 g, 97 mmol) was added portion wise to a solution of benzyl 2-(dimethoxyphosphoryl)acetate (25.1 g, 97 mmol) in THF (200 mL) at 0 °C. The resultant mixture was stirred at 0 °C for 1 hr. To this was added a solution of

tert-butyl 2-hydroxy-3,4-dihydroquinoline-1(2H)-carboxylate (12.1g, 48.5 mmol) in THF (100 ml) at 0 °C. The resultant mixture was warmed to rt over 1h, quenched with saturated aqueous NH₄Cl (100 ml) and extracted with ethyl acetate (2x200 ml). The combined organic layers were washed with water, brine, dried over anhydrous magnesium sulfate. Concentration under reduced pressure followed by purification by flash silica gel chromatography using a 10% mixture of ethyl acetate in hexane afforded tert-butyl 2-(2-(benzyloxy)-2-oxoethyl)-3,4-dihydroquinoline-1(2H)-carboxylate (13.8 g, 36.2 mmol, 75 % yield). GENERAL ROR γ SPA BINDING ASSAY

The binding of potential ligands to ROR γ is measured by competition with [^3H] 25-hydroxycholesterol using a scintillation proximity assay (SPA) binding assay. The ligand binding domain of human ROR γ (A262-S507) with an N-terminal His tag is expressed in *E. coli* and purified using nickel affinity chromatography. 50nM ROR γ (A262-S507) is incubated with test compound at varying concentrations for 15min at room temperature in PBS buffer containing 0.5% fatty acid free BSA. 10nM of [^3H] 25-hydroxycholesterol is then added, and the reaction is incubated for 15min. 4mg/mL of Ysi Copper HIS-TAG SPA Beads (Perkin Elmer) are added, and the mixture is incubated for 30min. The reaction is read on a MicroBeta Trilux scintillation plate reader (Perkin Elmer). IC₅₀ values are determined from the percentage inhibition of [^3H] 25-hydroxycholesterol binding.

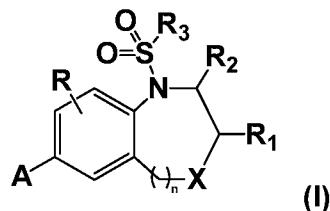

IC₅₀ values of the compounds of the invention in the ROR γ binding assay are provided below.
