A method and apparatus are disclosed to manage the enhanced medium access control-e (MAC-e) and enhanced MAC-es resources and respective variables for the enhanced dedicated channel (E-DCH) in the enhanced Cell_FACH state. Due to the nature of the E-DCH transmission in the uplink (UL) in the Cell_FACH state and the fact that a wireless transmit/receive unit (WTRU) might set up and release the E-DCH resources more frequently, methods to deal with the TSN numbering are described.

MANAGEMENT AND SETUP OF ENHANCED MAC-e/ES RESOURCES IN CELL-EACH STATE

CROSS REFERENCE TO RELATED APPLICATION

FIELD OF INVENTION

[0002] This application is related to wireless communications.

BACKGROUND

[0003] An enhanced uplink mechanism has been introduced for the Third Generation Partnership Project (3GPP) standards. As a part of the enhanced uplink mechanism and improved Layer 2 (L2), new functional entities have been introduced in the medium access control (MAC) including enhanced MAC-e/ES entities. In a wireless transmit/receive unit (WTRU), the enhanced MAC-e/ES are considered one single sublayer. However in the network side the enhanced MAC-e and the enhanced MAC-es entities may be considered separate, with the enhanced MAC-e residing in the Node-B and the enhanced MAC-es residing in the serving radio network controller (SRNC). One enhanced MAC-e and one enhanced MAC-es entity are present for each WTRU in the Node B and in the SRNC, respectively. The entities are separate in the network so that the more real-time critical functionality of enhanced MAC-e may be placed into the Node-B.

[0004] FIG. 1 is a block diagram of an enhanced MAC entity 100 of a WTRU. The enhanced MAC in the WTRU comprises a hybrid automatic repeat-request (HARQ) module, a multiplexing and transmission sequence number (TSN) setting module, an enhanced uplink transport format combination (E-TFC) selection module, and two segmentation modules.

[0005] The HARQ module performs the MAC functions relating to the HARQ protocol, including storing enhanced MAC-e payloads and re-transmitting them. The HARQ module determines the E-TFC, the retransmission sequence number (RSN), and the power offset to be used by Layer 1 (L1).

[0006] The multiplexing and TSN module concatenates multiple MAC-d protocol data units (PDUs) into enhanced MAC-e PDUs, and multiplexes one or multiple enhanced MAC-es PDUs into a single enhanced MAC-e PDU, to be transmitted in a subsequent transmission time interval (TTI), as instructed by the E-TFC selection module.

[0007] The E-TFC selection module performs E-TFC selection according to scheduling information, relative and absolute grants received from a UMTS Terrestrial Radio Access Network (UTRAN) via L1 signalling, and a serving grant signalled through the RRC for arbitration among the different flows mapped on the E-DCH.

[0008] The segmentation module performs segmenting of the MAC-d PDUs.

[0009] FIGS. 2 and 2A show the enhanced MAC-e and enhanced MAC-es entities located at the Node-B and RNCs, respectively. Referring to FIG. 2, the enhanced MAC-es sublayer manages E-DCH specific functionality. The enhanced MAC-es entity comprises a disassembly module, a reordering and queue distribution module, a reordering/combining module, and a reassembly module.

[0010] The reordering queue distribution module routes the enhanced MAC-es PDUs to the correct reordering buffer based on the serving radio network controller (SRNC) configuration and based on the logical channel identity.

[0011] The reordering/combining module reorders enhanced MAC-es PDUs according to the received TSN and Node-B tagging, (i.e. CFN, subframe number). Enhanced MAC-es PDUs with consecutive TSNs are delivered to the disassembly module upon reception.

[0012] The macro diversity selection module operates in the enhanced MAC-es, in case of soft handover with multiple Node-Bs.

[0013] The disassembly module is responsible for disassembly of enhanced MAC-es PDUs, including removal of the enhanced MAC-es header.

[0014] The reassembly function reassembles segmented MAC-d PDUs, and delivers the MAC-d PDUs to the correct MAC-d entity.

[0015] Referring to FIG. 2A, shows a MAC-e entity in communication with an E-DCH scheduling module. The enhanced MAC-e entity comprises an E-DCH control module, a de-multiplexing module, and a HARQ entity.

[0016] The E-DCH scheduling module manages E-DCH cell resources between WTRUs. Based on scheduling requests, scheduling grants are determined and transmitted.

[0017] The E-DCH control module is responsible for reception of scheduling requests and transmission of scheduling grants.

[0018] The de-multiplexing module performs the de-multiplexing of enhanced MAC-e PDUs into enhanced MAC-es PDUs. Enhanced MAC-es PDUs are forwarded to the SRNC in their associated MAC-d flow.

[0019] The HARQ module may support multiple HARQ processes. Each process is responsible for generating ACKs or NACKs indicating delivery status of E-DCH transmissions.

[0020] FIG. 3 shows the radio resource controller (RRC) service states of a 3GPP WTRU with an enhanced uplink. The WTRU may operate in several states which depend on the user activity. The following states have been defined: Idle, Cell_DCH, Cell_FACH, URA_PCH and Cell_PCH. The RRC state changes are controlled by the network using RNC parameters, the WTRU does not decide to perform state changes by itself.

[0021] In the Cell_DCH state, a dedicated physical channel is allocated to the WTRU in the uplink and the downlink. The WTRU is known on a cell level according to its current active set. The WTRU may use dedicated transport channels, shared transport channels, or a combination of these transport channels.

[0022] A WTRU is in the Cell_FACH state if it has been assigned to use the common control channels (e.g. CPCH). In the Cell_FACH state, no dedicated physical channel is allocated to the WTRU, and the WTRU continuously monitors a FACH (e.g. S-CCPCH) or a High Speed Downlink Shared Channel (HS-DSCH) in the downlink. The WTRU is assigned a default common or shared transport channel in the uplink (e.g. RACH) that it can use anytime according to the access procedure for that transport channel. The position of the WTRU is known by the UTRAN on a cell level according to the cell where the WTRU last performed a cell update.
[0023] In the Cell_PCH state, no dedicated physical channel is allocated to the WTRU. The WTRU selects a PCH, and uses discontinuous reception for monitoring the selected PCH via an associated PICH. No uplink activity is possible. The position of the WTRU is known by the UTRAN on a cell level according to the cell where the WTRU last performed a cell update in the CELL_FACH state.

[0024] In the URA_PCH state, no dedicated channel is allocated to the WTRU. The WTRU selects a PCH, and uses discontinuous reception for monitoring the selected PCH via an associated PICH. No uplink activity is possible. The location of the WTRU is known by the UTRAN registration area level according to the URA assigned to the WTRU during the last URA update in the Cell_FACH state.

[0025] As a part of the enhanced uplink mechanism an enhanced random access channel (E-RACH) has been introduced for the CELL_FACH state. The E-RACH refers to the use of the enhanced dedicated channel (E-DCH) in the Cell_FACH state or the resource/physical channel used by the WTRU for uplink contention-based access. Previously, the only uplink mechanism for a WTRU in the Cell_FACH state was transmission via the RACH using a slotted-Aloha approach with an acquisition indication message.

[0026] With the introduction of the E-DCH in the Cell_FACH state, the WTRU's and the network may require the introduction of enhanced MAC-e/es entities in order to enable the communication between the WTRU and the network. Due to the nature of the E-DCH operation in the Cell_FACH state, a number of issues may arise with the E-DCH MAC resources. One of the issues relates to defining how and when to set up the enhanced MAC-e/es entities. In addition, rules regarding the location of the enhanced MAC-e/es entities and whether the enhanced MAC-e and/or enhanced MAC-es are considered or dedicated entities are desired. Also, additional RNC to Node-B interface (Iub) signaling for the setup and management of the MAC entities are desired. Accordingly methods to manage E-DCH resources and to manage TSN numbering are desired.

SUMMARY

[0027] Methods and apparatus are disclosed to manage the enhanced MAC-e and enhanced MAC-es resources and respective variables for the E-DCH in the enhanced Cell_FACH state. Due to the nature of the E-DCH transmission in the uplink (UL) in the Cell_FACH state and the fact that the WTRU might set up and release the E-DCH resources more frequently, methods to manage the TSN numbering are described.

BRIEF DESCRIPTION OF THE DRAWINGS

[0028] A more detailed understanding may be had from the following description, given by way of example in conjunction with the accompanying drawings wherein:

[0029] FIG. 1 is a block diagram of a enhanced MAC-e/es entity of a WTRU;

[0030] FIGS. 2 and 2A are block diagrams of enhanced MAC-e/es entities of a Node-B and an RNC, respectively;

[0031] FIG. 3 is a block diagram of the RRC states in an HSPA+ system;

[0032] FIG. 4 shows an example wireless communication system including a plurality of wireless transmit/receive units (WTRUs), a base station, and a radio network controller (RNC);

[0033] FIG. 5 is a functional block diagram of a WTRU and the base station of FIG. 4; and

[0034] FIG. 6 is a flow diagram of a method where the enhanced MAC-e and enhanced MAC-es entities are preconfigured as common entities for each enhanced dedicated channel (E-DCH) resource set that may be assigned to the WTRU upon an E-RACH access procedure.

DETAILED DESCRIPTION

[0035] When referred to hereafter, the terminology "wireless transmit/receive unit (WTRU)" includes but is not limited to a user equipment (UE), a mobile station, a fixed or mobile subscriber unit, a pager, a cellular telephone, a personal digital assistant (PDA), a computer, or any other type of user device capable of operating in a wireless environment. When referred to hereafter, the terminology "base station" includes but is not limited to a Node-B, a site controller, an access point (AP), or any other type of interfacing device capable of operating in a wireless environment.

[0036] FIG. 4 shows a wireless communication system 400 including a plurality of WTRUs 410, a Node-B 420, a CRNC 430, an SRNC 440 and a core network 450. As shown in FIG. 4, the WTRUs 410 are in communication with the Node-B 420, which is in communication with the CRNC 430 and the SRNC 440. Although three WTRUs 410, one Node-B 420, one CRNC 430, and one SRNC 440 are shown in FIG. 4, it should be noted that any combination of wireless and wired devices may be included in the wireless communication system 400.

[0037] When referred to hereafter, the CRNC 430 and the SRNC 440 may be collectively referred to as the UTRAN.

[0038] FIG. 5 is a functional block diagram 500 of a WTRU 410 and the Node-B 420 of the wireless communication system 400 of FIG. 4. As shown in FIG. 5, the WTRU 410 is in communication with the Node-B 420 and both are configured to perform a method to manage and setup enhanced MAC-e/es resources in a Cell_FACH state.

[0039] In addition to the components that may be found in a typical WTRU, the WTRU 410 includes a processor 415, a receiver 416, a transmitter 417, and an antenna 418. The processor 415 is configured to perform a method to manage and setup enhanced MAC-e/es resources in a Cell_FACH state. The receiver 416 and the transmitter 417 are in communication with the processor 415. The antenna 418 is in communication with both the receiver 416 and the transmitter 417 to facilitate the transmission and reception of wireless data.

[0040] In addition to the components that may be found in a typical base station, the Node-B 420 includes a processor 425, a receiver 426, a transmitter 427, and an antenna 428. The processor 425 is configured to perform a method to manage and setup enhanced MAC-e/es resources in a Cell_FACH state. The receiver 426 and the transmitter 427 are in communication with the processor 425. The antenna 428 is in communication with both the receiver 426 and the transmitter 427 to facilitate the transmission and reception of wireless data.

[0041] The WTRU 410 may be configured to transmit on the E-RACH to register the WTRU 410 to the network for an initial RRC connection request, cell selection, and resellection. The connection requests are transmitted over the common control channel (CCCH). Once the WTRU is registered, the WTRU may transmit Dedicated Traffic Channel (DTCH) or Dedicated Control Channel (DCCH) traffic to the network. Wherein the DTCH is a bi-directional channel that carriers
user data and DCCH traffic comprises dedicated control information between a WTRU and the UTRAN. It is established through the RRC (Radio Resource Control) connection setup procedure. However, when the WTRU 410 is transmitting an initial E-RACH access attempt, the enhanced MAC-e and enhanced MAC-es entities may or may not be set up. Accordingly, several alternatives to configuring the enhanced MAC-e and enhanced MAC-es are described in greater detail herein.

[0042] Referring back to FIG. 4, the WTRU 410 may be configured with an enhanced MAC-e/es entity 419 when both the WTRU 410 and the network support the E-RACH, (i.e. capable of using the E-DCH in the Cell_DACH state) and the HS-DSCH. Whereas the HS-DSCH is a downlink transport channel shared by several WTRUs. The HS-DSCH is associated with one downlink dedicated physical channel (DPCH) and one or several high-speed shared control channels (HS-SCCH). The enhanced MAC-e/es entity 419 in the WTRU 410 may include a HARQ module, a multiplexing and TSN module, an E-TFC selection module, segmentation modules, a module used to append an E-RNTI, and a module used for CRC calculation for Common Control Channel (CCCH) traffic. The CCCH supports common procedures required to establish a dedicated link with the UTRAN. The CCCH may include the RACH and E-RACH, the forward access channel (FACH), and the paging channel (PCH). The enhanced MAC-es entity 419 may also include an access class control module. The WTRU 410 may transition to the Cell_FACH state when there is uplink data to transmit, or it is already in the Cell_DCH state and the network moves it to the Cell_FACH state for lack of activity, etc. The WTRU 410 may be configured to maintain the enhanced MAC-es entity as long as it is able to transmit uplink data on the E-DCH. The WTRU 410 may further be configured to maintain the enhanced MAC-es entity when operating in idle mode when an RRC connection request is initiated by the WTRU 410.

[0043] The Node-B 420 may be configured with a common MAC-e entity (enhanced MAC-es, to enhanced MAC-es), where x is the number of common E-DCH resources for all types of traffic. Each enhanced MAC-es entity may include an E-DCH scheduling module, an E-DCH control module, a demultiplexing module, and a HARQ module. The enhanced MAC-es entities may also be configured to read the E-RNTI used for contention resolution. The enhanced MAC-es entities may be configured to communicate with WTRUs that have not been assigned a U-RNTI or E-RNTI, in which case the WTRUs will communicate via the CCCH. Each enhanced MAC-es entity may be associated to a common E-DCH resource that a WTRU acquires as part of the random access procedure. For example, the Node-B 420 may be configured to use an enhanced MAC-es entity while a WTRU is attempting an E-RACH access and/or after the WTRU has performed cell selection/reselection (i.e. DTCH/DCCH traffic). The enhanced MAC-es entities may be preconfigured in the Node-B 420 (i.e. setup when the E-DCH resource pool for the Cell_FACH state and idle-mode is provided to the Node-B) or it may be setup in response to a signal received from a WTRU or RNC. Alternatively, the Node-B 420 may be configured to setup and maintain one dedicated enhanced MAC-es entity for each WTRU, for as long as the WTRU is in a given state.

[0044] The CRNC 430 may be configured with y enhanced MAC-es entities (enhanced MAC-es, to enhanced MAC-es,) used only for CCCH traffic, where y is the number of common E-DCH resources in the cell. Each enhanced MAC-es entity is associated to a common E-DCH resource set that may be used by a WTRU. Each enhanced MAC-es entity may include a disassembly module, a reordering and queue distribution module, a reordering module, a macro-diversity selection module, a reassembly module, and a CRC error correction module. Each enhanced MAC-es entity may be used during communications with a WTRU that has not been assigned a U-RNTI or E-RNTI (i.e. for CCCH traffic). The CCCH traffic may be terminated in the CRNC 430 such that the CCCH data traffic is not forwarded to the SRNC 440. Alternatively, the CRNC 430 may be configured to setup one dedicated enhanced MAC-es entity for each WTRU, for as long as the WTRU is in a given state.

[0045] The SRNC 440 is configured with z enhanced MAC-es entities (enhanced MAC-es, to enhanced MAC-es,) for the DTCH/DCCH traffic, wherein z is the number of WTRUs in the Cell_FACH state. Each of these enhanced MAC-es entities may be associated with the WTRU 410 after its WTRU-id is determined. Each enhanced MAC-es entity may comprise a disassembly module, a reordering and queue distribution module, a reordering module, a macro-diversity selection module, and a reassembly module. The SRNC 440 may be configured to setup the enhanced MAC-es entity in response to the WTRU entering the Cell_FACH state. The DTCH/DCCH traffic terminates in the SRNC 440.

[0046] Alternatively, the Node-B 420 and the CRNC 430 may be configured to maintain one dedicated enhanced MAC-es entity, respectively, for each WTRU as long as the WTRU is in the Cell_FACH state, independent of the E-DCH resources.

[0047] Alternatively, the Node-B 420 and the CRNC 430 may be configured to setup enhanced MAC-es entities after the Node-B 420 assigns and transmits an E-DCH radio network temporary identifier (E-RNTI) for the WTRU 410.

[0048] In some scenarios, the SRNC 440 may not know the WTRU’s 410 identity until the first transmission of the WTRU 410, which is after reception of the acquisition indicator channel (AICH) or the E-AICH. In such a case, the SRNC 440 may be configured to setup the enhanced MAC-es for the WTRU 410 at the time the WTRU-ID is read from the header. Accordingly, a new lub signaling procedure may be required to indicate to the SRNC 440 to setup the enhanced MAC-es entity for a given WTRU.

[0049] When common enhanced MAC-es and/or enhanced MAC-es resources are setup for a given connection, they may be setup as part of the common transport channel setup procedure between an RNC and the Node-B 420.

[0050] FIG. 6 is a flow diagram of a method where the CRNC 430 pre-configures and stores a common enhanced MAC-es entity and the Node-B 420 pre-configures and stores a common enhanced MAC-es entity for each enhanced dedicated channel (E-DCH) resource set that may be assigned to a WTRU upon an E-RACH access procedure. Referring to FIG. 6, the CRNC determines an E-DCH resource set and signals the Node-B 610. The CRNC and Node-B pre-configure and store common enhanced MAC-es and enhanced MAC-es entities, respectively, for each E-DCH resource set available (620). A WTRU performs a random access procedure obtains an E-DCH resource set (630). An RNC connection request message is received from a WTRU in Idle Mode using the E-DCH set that is obtained using the random access
The Node-B allocates an E-RNTI and an enhanced MAC-es entity is setup in the SRNC for the WTRU (650).

[0051] Since the CRNC’s enhanced MAC-es and the Node-B’s enhanced MAC-e entities are preconfigured for the E-DCH resource set, the enhanced MAC-e and enhanced MAC-es for the CCCH may be configured to operate as common entities that are associated with one WTRU at a time (i.e. for the WTRU that received the E-RACH access). In one option, the common enhanced MAC-e and MAC-es entities may be used for only the WTRU’s initial traffic. Alternatively the enhanced MAC entities may be used throughout the time the WTRU is communicating via the E-DCH resource set corresponding to that enhanced MAC entity. An RNC connection setup complete message may then be received indicating that the WTRU is in connected mode (660).

[0052] The enhanced MAC-es entity in the CRNC may be associated to a common E-DCH resource set used by the WTRU 410, or a common E-RNTI that is selected by the WTRU 410. The SRNC 440 may be configured to setup a dedicated enhanced MAC-es entity for each WTRU operating in the Cell_EACH state which is registered and has an E-RNTI allocated, and the entity may be maintained at least for the duration of the WTRU being in the Cell_EACH/CELL_PCH state for DTCH/DCCH traffic. For DTCH/DCCH traffic, the data is first received in the common enhanced MAC-e entity associated to the common E-DCH resource being used by the UE and then forwarded to the dedicated enhanced MAC-es entity in the SRNC over the lub/lur interface. Accordingly, when the enhanced MAC-e is a common entity for any WTRU using the set of resources, a process to identify the WTRU-ID over the lub/lur frame protocol may be desired. Several alternatives are described in greater detail hereafter.

[0053] In a first alternative, the Node-B 420 may be configured to transmit data on a common transport channel (for WTRUs using the E-DCH in the Cell_EACH state) using an lub flow. Because the lub is a common flow, the CRNC 430 may receive data from this common flow per WTRU and does not know to which WTRU this data belongs. Therefore, the Node-B 420 may be configured to transmit a WTRU-ID in the header field of the lub frame when the enhanced MAC-es is associated with a particular WTRU in the Cell_EACH state (i.e. for DTCH/DCCH traffic). Similarly the CRNC 430 may be configured to transmit a WTRU-ID in the header of an lur frame. The WTRU-id may comprise an E-RNTI when transmitted via the lub interface or an S-RNTI when transmitted via the lur interface. This would allow the SRNC 440 to know proper forwarding address of the data to the correct dedicated enhanced MAC-es entity for the WTRU.

[0054] In another alternative, the WTRU-id may comprise one or a combination of the E-RNTI, the U-RNTI, or C-RNTI, or the S-RNTI. For CCCH traffic, no WTRU-id is present and thus the lub frame protocol shall not include an E-RNTI. The CRNC 430 may be configured to detect that the traffic belongs to CCCH traffic from the logical channel identifier and forward the data to the correct enhanced MAC-es entity in the CRNC 430 that is associated to the proper E-DCH resource. In an optional embodiment, there may be one common transport channel for DTCH/DCCH traffic, and one transport channel setup for each E-DCH resource set for CCCH traffic. The Node-B 420 may be configured to receive the CCCH traffic and to forward the data to the transport channel associated with the enhanced MAC-e entity in which the data was received.

[0055] In another alternative, when both the Node-B 420 and the CRNC 430 are configured to setup the common enhanced MAC-e and enhanced MAC-es entities, the WTRU 410 may be configured to transmit a WTRU-id in an enhanced MAC-es header of an enhanced MAC-es PDU. The Node-B 420 may be further configured with a disassembly module capable of to decoding the enhanced MAC-es PDU header and determining the WTRU-id. By transmitting the information in the enhanced MAC-es PDU, the Node-B 420 does not need to transmit an lub frame with the WTRU-id information. For example, the WTRU 410 may be configured to transmit the WTRU-id in the enhanced MAC-es header only during the initial transmissions for contention resolution purposes. In this case, the Node-B 420 may be configured with an enhanced MAC-e entity that uses the initial transmission to determine forwarding procedures for consecutive data on subsequent transmissions to the RNC. The WTRU 410 may transmit the WTRU-id until it receives an absolute grant of the E-DCH channel, at which point the WTRU 410 can stop transmitting the WTRU-id.

[0056] In another alternative, the Node-B 420 may be configured to receive a WTRU-id from a WTRU, and to extract the WTRU-id from the first transmission. The Node-B 420 may then store the WTRU-id and use this information to transmit the WTRU-id to the SRNC 440 or CRNC 430 using lub signaling during subsequent transmissions. When the WTRU 410 releases the set of E-DCH resources the Node-B 420 may be configured to erase the WTRU-id. Alternatively, if a subsequent E-RACH access attempt is performed and a different WTRU-id is decoded, the Node-B 420 may change the stored WTRU-id information to reflect the new WTRU-id.

[0057] In yet another alternative, after a Node-B 420 receives a first transmission from a WTRU, the Node-B 420 may use the first transmission to determine to which WTRU the data belongs. Once the WTRU-id is determined, the Node-B 420 may setup a semi-dedicated flow to the RNC for the duration of the WTRU’s connection to the E-DCH resources. This creates a temporary connection flow between the common enhanced MAC-e and the dedicated enhanced MAC-es. This may be setup by transmitting an lub signal notifying the RNC to initiate the setup a flow between the common enhanced MAC-e and enhanced MAC-es entity corresponding to the WTRU. In this case, the WTRU-id does not have to be specified in the lub frame protocol because the WTRU-id is present in the enhanced MAC-es header of every transmission and the information is forwarded to the RNC via the lub frame protocol.

[0058] Alternatively, because the E-DCH resources may be negotiated between the Node-B 420 and the WTRU without the involvement of the RNC, the functionalities related to the E-DCH, such as enhanced MAC-es, may be moved to the Node-B 420. For this embodiment, the logical channel flows may be setup between the enhanced MAC-es and the radio link control (RLC) entities. Alternatively, the WTRU 410 and the Node-B 420 may establish a common transport channel and the WTRU-id and a linearization channel (LCH)-ID may be transmitted over the lub and/or lur frame protocol.

[0059] Although features and elements are described above in particular combinations, each feature or element can be used alone without the other features and elements or in various combinations with or without other features and ele-
ments. The methods or flow charts provided herein may be implemented in a computer program, software, or firmware incorporated in a computer-readable storage medium for execution by a general purpose computer or a processor. Examples of computer-readable storage mediums include a read only memory (ROM), a random access memory (RAM), a register, cache memory, semiconductor memory devices, magnetic media such as internal hard disks and removable disks, magneto-optical media, and optical media such as CD-ROM disks, and digital versatile disks (DVDs).

[0060] Suitable processors include, by way of example, a general purpose processor, a special purpose processor, a conventional processor, a digital signal processor (DSP), a plurality of microprocessors, one or more microprocessors in association with a DSP core, a controller, a microcontroller, Application Specific Integrated Circuits (ASICs), Field Programmable Gate Arrays (FPGAs) circuits, any other type of integrated circuit (IC), and/or a state machine.

[0061] A processor in association with software may be used to implement a radio frequency transceiver for use in a wireless transmit receive unit (WTRU), user equipment (UE), terminal, base station, radio network controller (RNC), or any host computer. The WTRU may be used in conjunction with modules, implemented in hardware and/or software, such as a camera, a video camera module, a videophone, a speakerphone, a microphone, a television transceiver, a hands free headset, a keyboard, a Bluetooth® module, a frequency modulated (FM) radio unit, a liquid crystal display (LCD) display unit, an organic light emitting diode (OLED) display unit, a digital music player, a media player, a video game player module, an Internet browser, and/or any wireless local area network (WLAN) or Ultra Wide Band (UWB) module.

What is claimed is:

1. A method of managing medium access control (MAC) resources, the method comprising:
   determining an enhanced Dedicated Channel (E-DCH) resource set;
   pre-configuring a common enhanced MAC-es entity for each enhanced dedicated channel (E-DCH) resource set;
   transmitting a signal to a Node-B identifying the E-DCH resource set, wherein the Node-B pre-configures a common enhanced MAC-es entity for each E-DCH resource set;
   transmitting a signal to a serving radio network controller (SRNC) upon connection of each of a plurality of wireless transmit/receive units (WTRUs), wherein the SRNC configures a MAC-es entity for each of the plurality of connected WTRUs.

2. The method of claim 1, wherein the enhanced MAC-es entity is a dedicated enhanced MAC-es entity maintained the each WTRU throughout the connection of the WTRU in the given state, independent of the E-DCH resources.

3. The method of claim 1, wherein the enhanced MAC-es is configured for a dedicated traffic channel and is terminated in an source radio network controller (SRNC) and associated to the WTRU.

4. The method of claim 1, wherein the enhanced MAC-es and enhanced MAC-es perform as common entities that are associated with one WTRU at a time.

5. The method of claim 1, wherein the enhanced MAC-es is configured for a common channel and is terminated in the controlling radio network controller (CRNC).

6. The method of claim 5, wherein the enhanced MAC-es entity is associated to a common E-DCH resource set that is used by the WTRU.

7. A method of managing medium access control (MAC) resources and transport channel, the method comprising:
   configuring an E-DCH in CELL_FACH transport channel as part of a common transport channel data stream; and
   transporting data on a common Enhanced Dedicated Channel (E-DCH) transport channel between the Node-B and CRNC over lub interface protocol, wherein the information on the frame protocol transporting data includes a wireless transmit/receive unit-identification (WTRU-id); and
   Further transporting data on a common Enhanced Dedicated Channel (E-DCH) transport channel from the CRNC to SRNC over the lub interface flow, wherein the information on the lub includes a wireless transmit/receive unit-identification (WTRU-ID)

8. The method of claim 7, wherein the WTRU-ID is an E-RNTI on the lub frame.

9. The method of claim 8, wherein the WTRU-ID is an S-RNTI on the lub frame.

10. A Node-B comprising:
    an antenna; and
    a processor configured to setup an enhanced MAC-es entity for each of a plurality of common E-DCH resources, wherein the enhanced MAC-es entity includes an enhanced Dedicated channel (E-DCH) scheduling module, an E-DCH control module, a de-multiplexing module, and a HARQ module.

11. The Node-B of claim 10, further comprising:
    a transmitter configured to transmit a WTRU-id in a header field of an lub frame protocol.

12. The Node-B of claim 11, wherein the WTRU-id is an E-RNTI and is transmitted via the lub interface.

13. The Node-B of claim 10, further comprising:
    a transmitter configured to transmit lub data for a plurality of wireless transmit receive units (WTRUs) over a common transport channel, wherein each of the plurality of WTRUs are configured to transmit over an enhanced-dedicated channel while in a Cell_FACH state.

14. The Node-B of claim 10 further configured to connect to a WTRU via an enhanced MAC-es entity associated at least one of the plurality of E-DCH resources in the case that the WTRU is transmitting dedicated traffic to the Node-B.

15. A controlling radio network controller (CRNC) comprising:
    an antenna; and
    a processor configured to setup one enhanced MAC-es entities for each common E-DCH resource in a cell, wherein the enhanced MAC-es entity is used for common control channel (CCCH) traffic and includes a disassembly module, a reordering and queue distribution module, a reordering module, a macro-diversity selection module, a reassembly module, and a cyclic redundancy check (CRC) error correction module.

16. The CRNC of claim 15, further comprising:
    a receiver configured to receive data via a common control channel (CCCH);
    the processor further configured to detects that the data was received via the CCCH and to determine a enhanced MAC-es entity associated with the; and
    a transmitter configured to forward the data to the enhanced MAC-es entity.
17. The serving radio network controller (SRNC) comprising:

an antenna configured to communicate with a plurality of wireless transmit/receive units (WTRUs); and

a processor configured to setup one enhanced MAC-es entity for each WTRU in a Cell_FACH state, wherein the enhanced MAC-es entity is used for enhanced dedicated channel (E-DCH) traffic and the MAC-es entity includes a disassembly module, a reordering and queue distribution module, a reordering module, a macro-diversity selection module, a reassembly module, and a CRC error correction module.
