METHODS AND SYSTEMS FOR DETECTING CRACKS IN ILLUMINATED ELECTRONIC DEVICE SCREENS

Abstract: Systems and methods for detecting the cracks in illuminated electronic device screens are disclosed. In one embodiment, the method includes receiving an image of an electronic device screen and retrieving a plurality of kernels, each having values corresponding to a line region and a non-line region, with the orientation of the line region and the non-line region differing for each kernel. At least some of the kernels are applied to the image to obtain, at various locations of the image, values corresponding to the line regions and the non-line regions. Based on the values corresponding to the line regions and the non-line regions, cracks are automatically identified in the electronic device screen.
METHODS AND SYSTEMS FOR DETECTING CRACKS IN ILLUMINATED ELECTRONIC DEVICE SCREENS

CROSS-REFERENCE TO RELATED APPLICATION(S)

[0001] This application claims priority to U.S. Patent Application No. 15/195,828, entitled "METHODS AND SYSTEMS FOR DETECTING CRACKS IN ILLUMINATED ELECTRONIC DEVICE SCREENS," filed June 28, 2016, the contents of which are hereby incorporated by reference in their entirety.

TECHNICAL FIELD

[0002] The present disclosure is directed generally to methods and systems for evaluating mobile phones and other consumer electronic devices and, more particularly, to methods and systems associated with detecting cracks in screens of such devices.

BACKGROUND

[0003] It is often necessary to visually evaluate a screen of a mobile device (e.g., a smartphone or tablet) to identify cracks or other defects in the mobile device. For example, pricing the mobile device, assessing the mobile device for possible repair, and evaluating the mobile device for warranty coverage all may require identification of any cracks in the mobile device's screen and/or in non-screen portions of the device. Individualized manual inspection of mobile device screens for cracks is slow, cumbersome, and can yield inconsistent results. Current automated methods for detecting cracks in other contexts are often over-inclusive resulting in high rates of false-positive crack indications, particularly when the mobile device screen is illuminated. Accordingly, there is a need for improved methods and systems for automatically detecting cracks in mobile device screens.

BRIEF DESCRIPTION OF THE DRAWINGS

[0004] Figure 1 is a schematic diagram illustrating components of a suitable computing environment for implementing various aspects of the present technology.
Figure 2 is a flow diagram of a routine for identifying cracks in an illuminated electronic device screen, in accordance with an embodiment of the relevant technology.

Figure 3A illustrates an image pyramid of an electronic device with multiple layers for use in the routine of Figure 2, and Figure 3B illustrates a variety of kernels for use in the routine of Figure 2, in accordance with an embodiment of the relevant technology.

Figure 4 is an isometric view of a machine employing methods and systems in accordance embodiments of the present technology for recycling mobile phones and/or other electronic devices.

Figures 5A-5D are a series of isometric views of the machine of Figure 4 with a number of exterior panels removed to illustrate operation of the machine in accordance with an embodiment of the present technology.

DETAILED DESCRIPTION

Overview

The following disclosure describes systems and methods for automated visual inspection and evaluation of electronic device screens. In particular, at least some embodiments of the present technology enable automatic crack detection in illuminated electronic device screens, which pose particular problems for conventional crack-detection techniques. Illuminated electronic device screens — that is, screens that are actively emitting light — pose particular difficulties in detecting cracks as the images displayed by the emitted light can result in improper crack identification.

To detect cracks, in accordance with some embodiments, an image of the illuminated electronic device screen is obtained under both lighted conditions (i.e., an external light is applied during the image capture) and unlighted conditions (i.e., no external light is applied during the image capture). The unlighted image can then be subtracted from the lighted image which reduces the intensity of the illuminated image of the device screen. The resulting image can be enhanced and converted to grayscale before performing crack detection.
In one embodiment, the routine can first identify cracks in non-screen regions of the image. If no cracks are found in this region, then the routine can identify cracks in the screen region utilizing the methods as described herein. In some embodiments, for example, the routine can first generate an “image pyramid” in which multiple different images are generated by scaling and subsampling the images. For example, a first “layer” in the image pyramid is the original image, the second downsampled by a factor of 2 in each direction, a third layer is downsampled by a factor of 3 in each direction, a fourth layer is downsampled by a factor of 4 in each direction, etc. Next, the routine can begin with a first layer of the image pyramid and convolve the image with a set of multiple kernels (also called convolution matrices) configured to identify energy response above some threshold for a line at various angles. Each kernel can include a line configured to correspond to a crack at or near a particular angular orientation (e.g., 5 degrees with respect to the horizontal, 15 degrees, 30 degrees, 45 degrees, etc.). Each kernel can further include four regions or quadrants: the left portion of the line (LL), the right portion of the line (RL), above the line (AL), and below the line (BL). The values computed in each of these regions (e.g., minimum brightness, maximum brightness, average brightness, and standard deviation of brightness) can be used to determine whether a line in the image that corresponds to that particular kernel is identified in that location, indicating the presence of a crack at that location. For example, if the average brightness of the LL and RL regions is greater than the average brightness of the AL and BL regions by some amount (e.g., by 8 or more brightness units), then a crack is indicated for that kernel at that location. At a given location, each kernel can be applied in sequence until a crack is identified. If no crack is identified, an adjacent location is selected (e.g., by translating some predetermined number of pixels away from the previous location), and the kernels are again applied in sequence. This continues until the kernels have swept across all locations corresponding to the screen region of the electronic device. If the number of identified cracks in that layer exceeds some predetermined threshold, then the screen is considered cracked. If the number of identified cracks do not exceed the predetermined threshold, then the process repeats with the next layer in the image pyramid. This iterative process can advantageously identify cracks in illuminated electronic device screens without unduly misidentifying images from the illuminated screens as cracks.
Certain details are set forth in the following description and in Figures 1-5D to provide a thorough understanding of various embodiments of the present technology. In other instances, well-known structures, materials, operations and/or systems often associated with smartphones and other handheld devices, consumer electronic devices, computer hardware, software, and network systems, etc. are not shown or described in detail in the following disclosure to avoid unnecessarily obscuring the description of the various embodiments of the technology. Those of ordinary skill in the art will recognize, however, that the present technology can be practiced without one or more of the details set forth herein, or with other structures, methods, components, and so forth. The terminology used below should be interpreted in the broadest reasonable manner, even though it is being used in conjunction with a detailed description of certain examples of embodiments of the technology. Indeed, certain terms may even be emphasized below; however, any terminology intended to be interpreted in any restricted manner will be specifically defined as such in this Detailed Description section.

The accompanying Figures depict embodiments of the present technology and are not intended to be limiting of the scope of the present technology. The sizes of various depicted elements are not necessarily drawn to scale, and these various elements may be arbitrarily enlarged to improve legibility. Component details may be abstracted in the Figures to exclude details such as the position of components and certain precise connections between such components when such details are unnecessary for a complete understanding of how to make and use the invention.

In the Figures, identical reference numbers may identify identical, or at least generally similar, elements. To facilitate the discussion of any particular element, the most significant digit or digits of any reference number may refer to the Figure in which that element is first introduced. For example, element 101 is first introduced and discussed with reference to Figure 1.

Detection of Cracks in Illuminated Electronic Device Screens

Figure 1 illustrates an embodiment of an environment 100 in which various aspects of the present technology can be implemented. The environment 100 includes an imaging device 101 configured to obtain images and/or video of an
The imaging device 101 is in communication with a computing device 105 and a database 107 via a communications link 109. In at least one embodiment, the imaging device 101 is positioned within a consumer-operated kiosk that can be used to evaluate and recycle the electronic device 103.

[0016] The imaging device 101 includes a processing component 111, a memory 213, input and output components 115 and 117, and a power component 125. The imaging device 101 further includes an image sensor 127, associated optics 129, an illumination source 131, and a communication component 119. The communication component 119 includes a wired connection 123 and a wireless transceiver 121. The computing device 105 can include several components similar to components of the imaging device 101. For example, the computing device 105 can include a processing component 133, memory 135 (which can store an operating system 137, applications 139, and data 141), along with input 143 and output 145 components and a power component 153. A communication component 147 of the computing device 105 includes a wired connection 151 and a wireless transceiver 147. These features of the imaging device 101 and the computing device 105 are described in more detail below in the context of a routine for detecting cracks in illuminated electronic device screens in accordance with an embodiment of the present technology.

[0017] Figure 2 is a flow diagram of a routine for identifying cracks in an illuminated electronic device screen in accordance with an embodiment of the present technology. Figure 3A illustrates an image pyramid of an electronic device with multiple layers, and Figure 3B illustrates a variety of kernels for use in the routine of Figure 2. The routine 200 of Figure 2 can be carried out by the computing device 105 or another suitable computing device. With reference to Figures 2-3B together, the routine 200 begins in block 201 by subtracting a lighted image of an electronic device with an illuminated screen from a non-lighted image of the electronic device with the illuminated screen. For example, an image of the illuminated electronic device screen is obtained under both a lighted condition (i.e., an external light is applied during the image capture) and an unlighted condition (i.e., no external light is applied during the image capture). For example, the images can be obtained with the imaging device 101 and electronically transmitted to the computing device 105. The unlighted image can then be subtracted from the lighted image, which reduces the intensity of the
illuminated image of the device screen. In some embodiments, the resulting image is then enhanced and converted to grayscale before performing crack detection.

[0018] In block 203, the routine 200 checks for an animated background by, for example, determining whether there is a large discrepancy in the screen portion of the image between the lighted image and the non-lighted image, or between subsequent images taken under the same lighting conditions. In one embodiment, several images of the screen can be taken in succession, and each image can then be subtracted from the others, or sequentially, or each from the first image, etc. The resulting difference can then be evaluated, e.g., if a brightness in the screen region of the resulting difference exceeds a predetermined threshold, then a discrepancy is identified. A discrepancy indicates an animated or otherwise changing wallpaper or background, which may deleteriously affect the operation of the routine 200. Accordingly, if an animated background is identified, a user can be prompted to disable this feature or the crack detection routine can be bypassed altogether.

[0019] In block 205, the routine 200 identifies cracks outside the screen region. This can be performed by the computing device using crack detection techniques such as a Canny edge detector, Hough transform, and other automated crack detection techniques, such as those described in more detail in co-pending and commonly owned U.S. Patent Application no. 15/130,851, titled METHODS AND SYSTEMS FOR DETECTING CRACKS IN ELECTRONIC DEVICES, filed April 15, 2016, which is hereby incorporated by reference in its entirety. In some embodiments, if there are cracks found in the region outside the screen, then the phone is identified as "damaged" and the remainder of the crack detection process described below is bypassed. If no cracks are found in this region, then the routine can proceed to identify cracks in the screen region as described below.

[0020] Next, in block 207 the routine 200 generates an "image pyramid" in which multiple different images are generated by scaling and subsampling the image. Figure 3A illustrates various layers of an image pyramid of an image of an electronic device. As illustrated, a bottommost "layer" 301 is larger or higher resolution than subsequent layers 303, 305, and 307. Each subsequent layer of the pyramid is downsampled to a greater degree. For example, the first or bottommost layer 301 in the image pyramid is the original image, the second layer 303 can be downsampled by a factor of 2 in each
direction with respect to layer 301, the third layer 305 can be downsampled by a factor of 3 in each direction with respect to layer 301, the fourth layer 307 can be downsampled by a factor of 4 in each direction with respect to layer 301, etc. The layers 301, 303, 305, 307 of the image pyramid provide various sizes and/or resolutions of the image of the electronic device.

[0021] As described in more detail below, kernels can be convolved to select regions of these layers. Due to downsampling, the corresponding area of the electronic device screen 302 increases with each subsequent layer. The region 309, for example, illustrates a region corresponding to a particular kernel size and is not necessarily drawn to scale. In one embodiment, the region 309 corresponds to a region of 8x8 pixels in each layer, though in various embodiments the size of the kernels used can vary. As illustrated, the region 309 corresponds to a smaller proportional region of the screen in layer 301 than in layer 303, and similarly the region 309 corresponds to still smaller proportional regions of the screen in layers 305 and 307.

[0022] In block 209, the routine 200 selects the first layer 301 of the image pyramid. In one embodiment, the first layer 301 is the bottommost or original image. In block 211, the routine 200 identifies cracks in the selected layer. Identifying cracks involves a subroutine that first selects a first kernel and a first location in block 213. The first location can be, for example, an upper corner 304 of the screen 302 of the electronic device in the selected layer, and the first kernel can be, for example, kernel 311a in Figure 3B. As the routine 200 proceeds with other kernels (as in block 221), a next kernel is selected, for example kernel 311b in Figure 3B. This process can continue until all the kernels (e.g., 311a–311j) have been applied to the selected location.

[0023] In block 215, the routine 200 overlays the selected kernel at the selected location and identifies cracks. The routine can begin with the first layer of the image pyramid and convolve the image with a set of multiple kernels configured to identify cracks at various angles. Each kernel can be configured to correspond to a crack at or near a particular angular orientation (e.g., 5 degrees with respect to the horizontal, 15 degrees with respect to the horizontal, 30 degrees with respect to the horizontal, 45 degrees with respect to the horizontal, etc.). Figure 3B illustrates multiple kernels
Each of these 10 kernels is configured to detect cracks of different orientations by overlaying each kernel over a particular portion of the image and convolving the kernel with that portion of the image. For example, the kernels 311 can be configured to align with and be overlaid on 8x8 pixel areas (or any other suitable size) in the image under evaluation. Although 10 kernels are illustrated here, in other embodiments there may be more or fewer kernels to provide greater or lesser granularity with respect to the orientation of cracks detected by the kernels. Each kernel includes four regions or quadrants, as illustrated by kernel 313, which is a schematic representation of kernel 311d and kernel 315 which is a schematic representation of kernel 311j. As shown by kernels 313 and 315, the kernels include a left line region (LL) and a right line region (RL). These regions are adapted to correspond to left and right portions of a crack if present in the portion of the image to which the kernel is convolved. The kernels also include a below-the-line region (BL) and an above-the-line region (AL). These regions are adapted to correspond to portions outside of the crack in the portion of the image to which the kernel is convolved. Convolving a kernel to a selected portion of an image involves evaluating the pixel values in these four regions to determine if a crack generally corresponding to the orientation of the selected kernel is identified, as described in more detail below. Since the kernel corresponds to a larger proportional area of the screen in higher layers of the pyramid (i.e. those images that have been downsampled to a greater degree), the kernels are configured to detect cracks of greater thicknesses in those layers, and of smaller thicknesses in less downsampled layers. This configuration allows a single kernel (e.g., a kernel configured to detect cracks of approximately 15 degree orientation with respect to the horizontal) to detect cracks of varying thicknesses depending on the layer to which the kernel is applied.

As noted above, the kernel is aligned with a pixel at a selected location and values of the image that correspond to the four quadrants of the kernel (left portion of the line (LL), right portion of the line (RL), above the line (AL), and below the line (BL)) are identified. For each of these quadrants, the routine 200 can calculate the minimum brightness, maximum brightness, average brightness, and standard deviation of brightness. In one embodiment, the average brightness of the line region (Lavg) is calculated by averaging the brightness for the LL and RL regions and is designed as Lavg. The average brightness of the non-line region is then calculated by
averaging the brightness for the AL and BL regions, and is designated as ALBLavg.
With these values, a number of calculations can be used to determine if cracks are
present and to perform secondary checks if cracks are found. By way of example, in
one embodiment the selected location is marked as cracked if Lavg is greater than
ALBLavg by some threshold amount, e.g. greater than eight brightness units.

[0025] If a crack is found at this step, then a series of secondary checks can be
applied to reduce the incidence of false-positive crack identification. A first secondary
check can include, for example, determining whether the average brightness values
for the AL and BL regions (i.e., the non-line regions) are sufficiently close to one
another. If the average brightness in these regions differs by greater than some
threshold amount (e.g., greater than 5 brightness units apart), then any identified
crack is disregarded. This secondary check ensures that the background of the
identified crack is consistent.

[0026] A second secondary check can exclude any identified crack if either the
AL or BL regions (i.e., the non-line regions) are too dark, e.g. having average
brightness values less than 35 where the image has been normalized to an average
brightness of 140). This excludes false-positives that may be attributable to the
location being close to a dark icon displayed on the screen, or an artificial dark spot
due to a subtraction artifact.

[0027] A third secondary check can exclude any identified crack if the average
brightness of the RL and LL regions (Lavg) is much brighter than the average of the
AL and BL regions (ALBLavg), for example if Lavg is greater than ALBLavg by more
than 50 brightness units. This third secondary check can avoid situations in which
crack displayed by the active display are inappropriately categorized as cracks in
the initial crack detection process.

[0028] A fourth secondary check can exclude any identified crack if the average
brightness values for LL and RL (i.e. the line regions) are too far apart, for example
greater than 10 brightness units apart from one another. This ensures that any
identified underlying crack extends along both the LL and RL regions, thereby
excluding false-positives attributable to characters displayed in the active display that
align with the LL region moreso than the RL region or vice versa. An actual crack that
extends across the location covered by the kernel will tend to yield similar brightness values in the RL and LL regions.

[0029] A fifth secondary check can exclude any identified crack if any of the four regions (RL, LL, AL, and BL) have a maximum pixel brightness greater than some threshold value, e.g. greater than 110 brightness units. This can exclude areas in which artificially bright areas due to glints or image processing artifacts can negatively affect the crack-detection algorithm.

[0030] A sixth secondary check can exclude any identified crack if any of the four regions (RL, LL, AL, and BL) have a minimum pixel brightness below some value, e.g., less than 25 brightness units. This excludes false-positives that may be attributable to the location being close to a dark icon displayed on the screen or an artificial dark spot due to a subtraction artifact.

[0031] A seventh secondary check can evaluate each column and row of the kernel at the location for which a crack was identified to determine whether, for any three adjacent LL or RL values, the brightness values are monotonically increasing or decreasing. For example, kernel 313 shown in Figure 3B includes at least three adjacent LL values in the third column. To perform the seventh secondary check, the routine 200 determines whether the pixel locations in the image corresponding to those adjacent LL values correspond to increasing or decreasing values. A true crack will tend to have a gradient of brightness across three adjacent LL or RL values, leading to monotonically increasing or decreasing brightness values. Characters presented on an active display, in contrast, may present equal brightness values across three adjacent LL or RL values, and accordingly would not pass this seventh secondary check.

[0032] Following the initial crack detection (e.g., if Lavg is greater than ALBLavg by more than some threshold amount), one or more of the secondary checks described above can be performed to confirm the indication of a crack at that location with that kernel. If any of the secondary checks indicate that the identified crack should be disregarded as a false positive, then no crack is found for that kernel at that location. If the initially identified crack passes all of the secondary checks applied, then a crack is indicated and the routine proceeds as described below. In some embodiments, an initially identified crack is excluded only if it fails some threshold
number of the secondary checks (e.g., if the initially identified crack fails at least two secondary checks, at least three secondary checks, etc.).

[0033] In decision block 217, the routine 200 determines whether a crack is found for the selected kernel at the selected location. If no crack was found during the evaluation of block 215, then the routine 200 proceeds to decision block 219 to determine whether the final kernel has been completed (i.e., there are no remaining kernels in the series that have not yet been convolved at the selected location). If there are remaining kernels, then the routine 200 continues to block 221 to select the next kernel (e.g., moving from kernel 311a to kernel 311b in Figure 3B) and the process returns to block 215 to overlay the newly selected kernel at the same location.

[0034] Returning to decision block 217, if a crack was found during the evaluation of block 215, then after decision block 217 the routine 200 proceeds to decision block 223 to determine whether the final location has been evaluated. If not (i.e., there are remaining locations on the screen in the selected layer that have not yet been evaluated for cracks), then the routine proceeds to block 225, selects the next location (e.g., by moving a predetermined number of pixels to one side) and returns to block 215 to overlay the first kernel at the new location. This process can loop until each location on the screen has been evaluated. The locations can be overlapping portions, for example the adjacent location can be a 8x8 pixel square that is two pixels to the right of the previous 8x8 pixel square. The amount of overlap and the size of the kernels can be varied as desired. In some embodiments, the number of locations at which cracks have been identified is totaled and, if the sum exceeds some threshold value, the routine terminates with an indication that the screen is cracked. If the total number of locations at which cracks have been identified does not exceed the threshold, then the routine can proceed to evaluate additional layers of the image pyramid as described below.

[0035] Once the final location has been completed as determined in decision block 223, the routine 200 proceeds to decision block 227 to determine if the final layer has been completed. If not (i.e., there are remaining layers of the image pyramid that have not yet been evaluated), then the routine 200 continues to block 229 to select the next layer in the image pyramid, and returns to block 215 to overlay the first kernel at the first location in the newly selected layer and begins the crack
identification process. If, in decision block 227, the routine 200 determines that the
final layer has been completed, then the routine 200 ends. At this point, any number of
cracks have been identified in various regions of the electronic device screen and in
various layers of the image pyramid. These identified cracks can be evaluated to
determine an overall crack score for the device, to test whether the total number
exceeds a predetermined threshold, or to otherwise evaluate the overall condition of
the electronic device for possible purchase.

**Computing Environment**

[0036] Referring again to Figure 1, additional details are set forth below
regarding the computing environment in which the routine 200 can be performed. The
imaging device 101 can be, for example, a digital camera (e.g., having a CCD or
CMOS sensor) capable of capturing still and/or moving images of the electronic
device 103, and transmitting captured images over the communications link 109 to
remote devices. In some embodiments, the imaging device 101 can be incorporated
into a user-operated kiosk as described in more detail below. The imaging device 101
can include a camera and an associated fixture, base, or other imaging area in which
the electronic device 103 is to be placed for imaging. This can provide a standard
background against which the images and/or video of the electronic device 103 are
obtained. The imaging device 101 and/or the associated optics can be configured in
order to capture images and/or video of the electronic device 103 from various angles.
The imaging device 101 can also include an illumination source (e.g., LEDs,
fluorescent bulbs, lamps, etc.) which can also aid in obtaining images of the electronic
device 103 under uniform lighting conditions.

[0037] The electronic device 103 can be, for example, a smartphone, a tablet, a
laptop, a handheld gaming device, a media player, or any such device submitted for
evaluation that has a screen or other surface that may suffer cracks or similar defects.
Although many embodiments of the present technology are described herein in the
context of mobile phones, aspects of the present technology are not limited to mobile
phones and generally apply to other consumer electronic devices. Such devices
include, as non-limiting examples, all manner of mobile phones; smartphones;
handheld devices; personal digital assistants (PDAs); MP3 or other digital music
players; tablet, notebook, ultrabook and laptop computers; e-readers; all types of
cameras; GPS devices; set-top boxes and other media players; VoIP phones; universal remote controls; wearable computers; and larger consumer electronic devices, such as desktop computers, TVs, projectors, DVRs, game consoles, etc.

[0038] The computing device 105 can be a CPU (e.g., housed within a user-operated kiosk) or another suitable processing device. The computing device 105 is configured to receive images of the electronic device 103 from the imaging device 101 and to automatically analyze the images to detect the presence of cracks or other defects. In some embodiments, the computing device 105 is remote from the imaging device 101 and can be in communication via the communications link 109. In other embodiments, the computing device 105 is connected to the imaging device 101 via a hardwire connection, or in certain embodiments the imaging device 101 and the computing device 105 are integrated into the same machine. The computing device 105 is also in communication with the database 107 which can store data used in automatically analyzing the images of the electronic device 103. The database 107 may also store the results of the automatic analysis of the images, other data about the electronic device 103, etc.

[0039] In the illustrated embodiment, various devices including the imaging device 101 and the computing device 105 exchanges information with one another via the communication link 109. Although the communication link 109 can include a publicly available network (e.g., the Internet with a web interface), a private communication link (e.g., an intranet or other network) can also be used. Moreover, in various embodiments the imaging device 101 is connected to a host computer (not shown) that facilitates the exchange of information between the imaging device 101, the computing device 105, remote computers, mobile devices, etc.

[0040] In the illustrated embodiment, the imaging device 101 includes the processing component 111 that controls operation of the imaging device 101 in accordance with computer-readable instructions stored in memory 113. The processing component 111 may include any logic processing unit, such as one or more central processing units (CPUs), graphics processing units (GPUs), digital signal processors (DSPs), application-specific integrated circuits (ASICs), etc. The processing component 111 may be a single processing unit or multiple processing units in an electronic device or distributed across multiple devices. Aspects of the
present technology can be embodied in a special purpose computing device or data processor that is specifically programmed, configured, or constructed to perform one or more of the computer-executable instructions explained in detail herein. Aspects of the present technology can also be practiced in distributed computing environments in which functions or modules are performed by remote processing devices that are linked through a communications network, such as a local area network (LAN), wide area network (WAN), or the Internet. In a distributed computing environment, modules can be located in both local and remote memory storage devices.

[0041] The processing component 111 is connected to memory 113, which can include a combination of temporary and/or permanent storage, and both read-only memory (ROM) and writable memory (e.g., random access memory or RAM), writable non-volatile memory such as flash memory or other solid-state memory, hard drives, removable media, magnetically or optically readable discs, nanotechnology memory, biological memory, and so forth. As used herein, memory does not include a transitory propagating signal per se. The memory 213 includes data storage that contains programs, software, and information, such as an operating system and data. Imaging device 101 operating system and data can include software and databases configured to control imaging device 101 components, process images, communicate and exchange data and information with remote computers and other devices, etc.

[0042] The imaging device 101 further includes input components 115 that can receive input from user interactions and provide input to the processing component 111, typically mediated by a hardware controller that interprets the raw signals received from the input device and communicates the information to the processing component 111 using a known communication protocol. Examples of an input component 115 include touchpad, a keyboard (with physical or virtual keys), a pointing device (such as a mouse, dial, or eye tracking device), a touchscreen that detects contact events when it is touched by a user, a microphone that receives audio input, etc. The imaging device 101 can also include various other input components 115 such as GPS or other location determination sensors, motion sensors, wearable input devices with accelerometers (e.g. wearable glove-type input devices), biometric sensors (e.g., fingerprint sensors), light sensors, card readers (e.g., magnetic stripe readers or memory card readers) or the like.
The processing component 111 is also connected to one or more various output components 117, e.g., directly or via a hardware controller. The output devices can include a display on which text and graphics are displayed. The display can be, for example, an LCD, LED, or OLED display screen, an e-ink display, a projected display (such as a heads-up display device), and/or a display integrated with a touchscreen that serves as an input device as well as an output device that provides graphical and textual visual feedback to a user. The output components 117 can also include a speaker for playing audio signals, haptic feedback devices for tactile output such as vibration, etc. In some implementations, a speaker and microphone are implemented by a combined audio input-output device.

In the illustrated embodiment, the imaging device 101 further includes one or more communication components 119. The communication components can include, for example, a wireless transceiver 121 (e.g., one or more of a Wi-Fi transceiver; Bluetooth transceiver; near-field communication (NFC) device; wireless modem or cellular radio utilizing GSM, CDMA, 3G and/or 4G technologies; etc.) and/or a wired network connection 123 (e.g., one or more of an Ethernet port, cable modem, FireWire cable, Lightning connector, universal serial bus (USB) port, etc.). The communication components 119 are suitable for communication between the imaging device 101 and other local and/or remote devices, e.g., the computing device 105, directly via a wired or wireless peer-to-peer connection and/or indirectly via the communication link 109 (which can include the Internet, a public or private intranet, a local or extended Wi-Fi network, cell towers, the plain old telephone system (POTS), etc.). For example, the wireless transceiver 121 of the imaging device 101 can connect to a wireless transceiver 149 of the computing device via the wireless connection. The imaging device 101 further includes power 125, which can include battery power and/or facility power for operation of the various electrical components associated with the imaging device 101.

The imaging device 101 further includes the image sensor 127, optics 129, and illumination source 131. The image sensor 127 can be, for example, a CCD sensor, a CMOS sensor, or any other type of image sensor or array of sensors. The image sensor 127 can be aligned with optics 129, for example one or more lenses, filters, or other optical elements, configured to orient and modulate incoming light before it reaches the image sensor 127. The illumination source 131 can be
configured to direct illumination towards the field of view of the imaging device 101, and can be any type of light source, for example LEDs, fluorescent bulbs, etc. In some embodiments, the illumination source 131 includes multiple different types of light sources which can be individually activated, for example infrared, ultraviolet, broadband, etc.

[0046] The computing device 105 includes several components similar to those in the imaging device 101. In the illustrated embodiment, the computing device 105 includes a processing component 133 that controls operation of the computing device 105 in accordance with computer-readable instructions stored in memory 135. The processing component 133 may be any logic processing unit, such as one or more central processing units (CPUs), graphics processing units (GPUs), digital signal processors (DSPs), application-specific integrated circuits (ASICs), etc. The processing component 133 may be a single processing unit or multiple processing units in an electronic device or distributed across multiple devices. The processing component 133 is connected to memory 135, which includes data storage that contains programs, software, and information, such as an operating system 137, application programs 139, and data 141. The operating system 137 can include, for example, Windows®, Linux®, Android TM, iOS®, and/or an embedded real-time operating system. The application programs 139 and data 141 can include software and databases configured to control computing device 105 components, process and evaluate images received from the imaging device 101, communicate and exchange data and information with remote computers and other devices, etc.

[0047] The computing device 105 can include input components 143, such as a keyboard (with physical or virtual keys), a pointing device (such as a mouse, joystick, dial, or eye tracking device), a touchscreen, a microphone, and a camera for still photograph and/or video capture. The computing device 105 can also include various other input components 143 such as GPS or other location determination sensors, motion sensors, wearable input devices with accelerometers (e.g. wearable glove-type input devices), biometric sensors (e.g., fingerprint sensors), light sensors, card readers (e.g., magnetic stripe readers or memory card readers) and the like.

[0048] The processing component 133 can also be connected to one or more various output components 145, e.g., directly or via a hardware controller. The output
devices can include a display such as an LCD, LED, or OLED display screen (such as a desktop computer screen, handheld device screen, or television screen), an e-ink display, a projected display (such as a heads-up display device), and/or a display integrated with a touchscreen that serves as an input device as well as an output device that provides graphical and textual visual feedback to the user. The output devices can also include a speaker for playing audio signals, haptic feedback devices for tactile output such as vibration, etc.

[0049] In the illustrated embodiment, computing device 105 further includes one or more communication components 147. The communication components can include, for example, a wireless transceiver 149 (e.g., one or more of a Wi-Fi transceiver; Bluetooth transceiver; near-field communication (NFC) device; wireless modem or cellular radio utilizing GSM, .CDMA, 3G and/or 4G technologies; etc.) and/or a wired network connector port 251 (e.g., one or more of an Ethernet port, cable modem, FireWire cable, Lightning connector, universal serial bus (USB) port, etc.). The communication components 147 are suitable for communication between the computing device 105 and other local and/or remote computing devices, e.g., the imaging device 101 via a wired or wireless peer-to-peer connection and/or indirectly via the communication link 109. For example, the wireless transceiver 149 of the computing device 105 can connect to the wireless transceiver 121 of imaging device 101, and/or the wired connector port 151 of the computing device 105 can connect to the wired connector port 123 of the imaging device 101. The computing device 105 further includes power 153, which can include battery power and/or facility power for operation of the various electrical components associated with the computing device 105.

[0050] Unless described otherwise, the construction and operation of the various components shown in Figure 1 are of conventional design. As a result, such components need not be described in further detail herein, as they will be readily understood by those skilled in the relevant art. In other embodiments, the computing device 105 and the imaging device 101 include other features that may be different from those described above. In still further embodiments, the computing device 105 and/or the imaging device 101 include more or fewer features similar to those described above.
Kiosk Environment

[0051] In some embodiments, the routines described herein can be carried out using a kiosk that includes an imaging device (e.g., the imaging device 101) therein. In some embodiments, the kiosk can perform some or all of the functions performed by the computing device 105 described above, for example processing and evaluating images received from the imaging device 101. The kiosk can include, for example, a processing component (e.g., the computing device 105) and memory storing instructions that, when executed by the processing component, perform operations such as the routine 200 described above. Figure 4, for example, is an isometric view of a kiosk 400 for recycling and/or other processing of mobile phones and other consumer electronic devices in accordance with the present technology. The term “processing” is used herein for ease of reference to generally refer to all manner of services and operations that may be performed or facilitated by the kiosk 400 on, with, or otherwise in relation to an electronic device. Such services and operations can include, for example, selling, reselling, recycling, donating, exchanging, identifying, evaluating, pricing, auctioning, decommissioning, transferring data from or to, reconfiguring, refurbishing, etc., mobile phones and other electronic devices. Although many embodiments of the present technology are described herein in the context of mobile phones, aspects of the present technology are not limited to mobile phones and generally apply to other consumer electronic devices. Such devices include, as non-limiting examples, all manner of mobile phones, smart phones, handheld devices, PDAs, MP3 players, tablet, notebook and laptop computers, e-readers, cameras, etc. In some embodiments, it is contemplated that the kiosk 400 can facilitate selling and/or otherwise processing larger consumer electronic devices, such as desktop computers, TVs, game consoles, etc., as well smaller electronic devices such as Google Glass™, smart-watches, etc.

[0052] In the illustrated embodiment, the kiosk 400 is a floor-standing self-service kiosk configured for use by a user 401 (e.g., a consumer, customer, etc.) to recycle, sell, and/or perform other operations with a mobile phone or other consumer electronic device. In other embodiments, the kiosk 400 can be configured for use on a countertop or a similar raised surface. Although the kiosk 400 is configured for use by consumers, in various embodiments the kiosk 400 and/or various portions thereof can
also be used by other operators, such as a retail clerk or kiosk assistant to facilitate the selling or other processing of mobile phones and other electronic devices.

[0053] In the illustrated embodiment, the kiosk 400 includes a housing 402 that is approximately the size of a conventional vending machine. The housing 402 can be of conventional manufacture from, for example, sheet metal, plastic panels, etc. A plurality of user interface devices are provided on a front portion of the housing 402 for providing instructions and other information to users, and/or for receiving user inputs and other information from users. For example, the kiosk 400 can include a display screen 404 (e.g., a liquid crystal display ("LCD") or light emitting diode ("LED") display screen, a projected display (such as a heads-up display or a head-mounted device), and so on) for providing information, prompts, etc., to users. The display screen 404 can include a touch screen for receiving user input and responses to displayed prompts. In addition or alternatively, the kiosk 400 can include a separate keyboard or keypad for this purpose. The kiosk 400 can also include an ID reader or scanner 412 (e.g., a driver's license scanner), a fingerprint reader 414, and one or more cameras 416 (e.g., digital still and/or video cameras, identified individually as cameras 416a-c). The kiosk 400 can additionally include output devices such as a label printer having an outlet 410, and a cash dispenser having an outlet 418. Although not identified in Figure 4, the kiosk 400 can further include a speaker and/or a headphone jack for audibly communicating information to users, one or more lights for visually communicating signals or other information to users, a handset or microphone for receiving verbal input from the user, a card reader (e.g., a credit/debit card reader, loyalty card reader, etc.), a receipt or voucher printer and dispenser, as well as other user input and output devices. The input devices can include a touchpad, pointing device such as a mouse, joystick, pen, game pad, motion sensor, scanner, eye direction monitoring system, etc. Additionally the kiosk 400 can also include a bar code reader, QR code reader, bag/package dispenser, a digital signature pad, etc. In the illustrated embodiment, the kiosk 400 additionally includes a header 420 having a display screen 422 for displaying marketing advertisements and/or other video or graphical information to attract users to the kiosk. In addition to the user interface devices described above, the front portion of the housing 402 also includes an access panel or door 406 located directly beneath the display screen 404. As described in greater detail below, the access door is configured to automatically retract so that the
user 401 can place an electronic device (e.g., a mobile phone) in an inspection area 408 for automatic inspection by the kiosk 400.

[0054] A sidewall portion of the housing 402 can include a number of conveniences to help users recycle or otherwise process their mobile phones. For example, in the illustrated embodiment the kiosk 400 includes an accessory bin 428 that is configured to receive mobile device accessories that the user wishes to recycle or otherwise dispose of. Additionally, the kiosk 400 can provide a free charging station 426 with a plurality of electrical connectors 424 for charging a wide variety of mobile phones and other consumer electronic devices.

[0055] Figures 5A-5D are a series of isometric views of the kiosk 400 with the housing 402 removed to illustrate selected internal components configured in accordance with an embodiment of the present technology. Referring first to Figure 5A, in the illustrated embodiment the kiosk 400 includes a connector carrier 540 and an inspection plate 544 operably disposed behind the access door 406 (Figure 4). In the illustrated embodiment, the connector carrier 540 is a rotatable carrousel that is configured to rotate about a generally horizontal axis and carries a plurality of electrical connectors 542 (e.g., approximately 25 connectors) distributed around an outer periphery thereof. In other embodiments, other types of connector carrying devices (including both fixed and movable arrangements) can be used. In some embodiments, the connectors 542 includes a plurality of interchangeable USB connectors configured to provide power and/or exchange data with a variety of different mobile phones and/or other electronic devices. In operation, the connector carrier 540 is configured to automatically rotate about its axis to position an appropriate one of the connectors 542 adjacent to an electronic device, such as a mobile phone 550, that has been placed on the inspection plate 544 for recycling. The connector 542 can then be manually and/or automatically withdrawn from the connector carrier 540 and connected to a port on the mobile phone 550 for electrical analysis. Such analysis can include, e.g., an evaluation of the make, model, configuration, condition, etc.

[0056] In the illustrated embodiment, the inspection plate 544 is configured to translate back and forth (on, e.g., parallel mounting tracks) to move an electronic device, such as the mobile phone 550, between a first position directly behind the
access door 406 and a second position between an upper chamber 530 and an opposing lower chamber 532. Moreover, in this embodiment the inspection plate 544 is transparent, or at least partially transparent (e.g., formed of glass, Plexiglas, etc.) to enable the mobile phone 550 to be photographed and/or otherwise optically evaluated from all, or at least most viewing angles (e.g., top, bottom, sides, etc.) using, e.g., one or more cameras, mirrors, etc. mounted to or otherwise associated with the upper and lower chambers 530 and 532. When the mobile phone 550 is in the second position, the upper chamber 530 can translate downwardly to generally enclose the mobile phone 550 between the upper chamber 530 and the lower chamber 532. The upper chamber 530 is operably coupled to a gate 538 that moves up and down in unison with the upper chamber 530.

[0057] In some embodiments, the kiosk 400 includes the imaging device 101 disposed within the upper hood 530. The imaging device 101 can be used as described above to facilitate visual inspection of the mobile phone 550 in order to evaluate the screen for cracks. The upper chamber 530 and/or the lower chamber 532 can also include one or more magnification tools, scanners (e.g., bar code scanners, infrared scanners, etc.) or other imaging components (not shown) and an arrangement of mirrors (also not shown) to view, photograph and/or otherwise visually evaluate the mobile phone 550 from multiple perspectives. In some embodiments, one or more of the cameras and/or other imaging components discussed above can be movable to facilitate device evaluation. For example, as noted above with respect to Figure 1, the imaging device 101 can be affixed to a moveable mechanical component such as an arm, which in turn can be moved using a belt drive, rack and pinion system, or other suitable drive system coupled to an electronic controller (e.g., the computing device 105). The inspection area 408 can also include weight scales, heat detectors, UV readers/detectors, and the like, for further evaluation of electronic devices placed therein. The kiosk 400 can further include an angled binning plate 536 for directing electronic devices from the transparent plate 544 into a collection bin 534 positioned in a lower portion of the kiosk 400.

[0058] The kiosk 400 can be used in a number of different ways to efficiently facilitate the recycling, selling and/or other processing of mobile phones and other consumer electronic devices. Referring to Figures 4-5D together, in one embodiment a user wishing to sell a used mobile phone, such as the mobile phone 550,
approaches the kiosk 400 and identifies the type of device the user wishes to sell in response to prompts on the display screen 404. Next, the user may be prompted to remove any cases, stickers, or other accessories from the device so that it can be accurately evaluated. Additionally, the kiosk 400 may print and dispense a unique identification label (e.g., a small adhesive-backed sticker with a quick response code (“QR code”), barcode, or other machine-readable indicia, etc.) from the label outlet 410 for the user to adhere to the back of the mobile phone 550. After this is done, the door 406 retracts and opens allowing the user to place the mobile phone 550 onto the transparent plate 544 in the inspection area 408 (Figure 5A). The door 406 then closes and the transparent plate 544 moves the mobile phone 550 under the upper chamber 530 as shown in Figure 5B. The upper chamber 530 then moves downwardly to generally enclose the mobile phone 550 between the upper and lower chambers 530 and 532, and the cameras and/or other imaging components in the upper and lower chambers 530 and 532 perform a visual inspection of the mobile phone 550. In one embodiment, the visual inspection of the mobile phone 550 includes performing the routine 200 (Figure 2) to detect cracks in the screen. In some embodiments, the visual inspection includes a computer-implemented visual analysis (e.g., a three-dimensional (“3D”) analysis) performed by a processing device within the kiosk (e.g., a CPU) to confirm the identification of the mobile phone 550 (e.g. make, model and/or sub-model) and/or to evaluate or assess the condition and/or function of the mobile phone 550 and/or its various components and systems. For example, the visual analysis can include computer-implemented evaluation (e.g., a digital comparison) of images of the mobile phone 550 taken from top, side and/or end view perspectives to determine length, width, and/or height (thickness) dimensions of the mobile phone 550. The visual analysis can further include a computer-implemented inspection of a display screen on the mobile phone 550 to check for, e.g., cracks in the glass and/or other damage or defects in the LCD (e.g., defective pixels, etc.).

[0059] Referring next to Figure 5C, after the visual analysis is performed and the device has been identified, the upper chamber 530 returns to its upper position and the transparent plate 544 returns the mobile phone 550 to its initial position near the door 406. The display screen 404 can also provide an estimated price, or an estimated range of prices, that the kiosk 400 may offer the user for the mobile phone
550 based on the visual analysis, and/or based on user input (e.g., input regarding the type, condition, etc. of the phone 550). If the user indicates (via, e.g., input via the touch screen) that they wish to proceed with the transaction, the connector carrier 540 automatically rotates an appropriate one of the connectors 542 into position adjacent the transparent plate 544, and door 406 is again opened. The user can then be instructed (via, e.g., the display screen 404) to withdraw the selected connector 542 (and its associated wire) from the carrousel 540, plug the connector 542 into the corresponding port (e.g., a USB port) on the mobile phone 550, and reposition the mobile phone 550 in the inspection area on the transparent plate 544. After doing so, the door 406 once again closes and the kiosk 400 (e.g. the kiosk CPU) performs an electrical inspection of the device via the connector 542 to further evaluate the condition of the phone as well as specific component and operating parameters such as the memory, carrier, etc. In addition or alternatively, in some embodiments the electrical inspection can include a determination of phone manufacturer information (e.g., a vendor identification number or VID) and product information (e.g., a product identification number or PID). In some embodiments, the kiosk 400 can perform the electrical analysis using one or more of the methods and/or systems described in detail in the commonly owned patents and patent applications identified herein and incorporated by reference in their entireties.

[0060] After the visual and electronic analysis of the mobile phone 550, the user is presented with a phone purchase price via the display screen 404. If the user declines the price (via, e.g., the touch screen), a retraction mechanism (not shown) automatically disconnects the connector 542 from the mobile phone 550, the door 406 opens, and the user can reach in and retrieve the mobile phone 550. If the user accepts the price, the door 406 remains closed and the user may be prompted to place his or her identification (e.g., a driver's license) in the ID scanner 412 and provide a thumbprint via the fingerprint reader 414. As a fraud prevention measure, the kiosk 400 can be configured to transmit an image of the driver's license to a remote computer screen, and an operator at the remote computer can visually compare the picture (and/or other information) on the driver's license to an image of the person standing in front of the kiosk 400 as viewed by one or more of the cameras 416a-c (Figure 4) to confirm that the person attempting to sell the phone 550 is in fact the person identified by the driver's license. In some embodiments, one or more of the
cameras 416a-c can be movable to facilitate viewing of kiosk users, as well as other individuals in the proximity of the kiosk 400. Additionally, the person’s fingerprint can be checked against records of known fraud perpetrators. If either of these checks indicate that the person selling the phone presents a fraud risk, the transaction can be declined and the mobile phone 550 returned. After the user’s identity has been verified, the transparent plate 544 moves back toward the upper and lower chambers 530 and 532. As shown in Figure 5D, however, when the upper chamber 530 is in the lower position the gate 538 permits the transparent plate 544 to slide underneath but not electronic devices carried thereon. As a result, the gate 538 knocks the mobile phone 550 off of the transparent plate 544, onto the binning plate 536 and into the bin 534. The kiosk can then provide payment of the purchase price to the user. In some embodiments, payment can be made in the form of cash dispensed from the cash outlet 418. In other embodiments, the user can receive remuneration for the mobile phone 550 in various other useful ways. For example, the user can be paid via a redeemable cash voucher, a coupon, an e-certificate, a prepaid card, a wired or wireless monetary deposit to an electronic account (e.g., a bank account, credit account, loyalty account, online commerce account, mobile wallet etc.), Bitcoin, etc.

[0061] As those of ordinary skill in the art will appreciate, the foregoing routines are but some examples of ways in which the kiosk 400 can be used to recycle or otherwise process consumer electronic devices such as mobile phones. Although the foregoing example is described in the context of mobile phones, it should be understood that the kiosk 400 and various embodiments thereof can also be used in a similar manner for recycling virtually any consumer electronic device, such as MP3 players, tablet computers, PDAs, and other portable devices, as well as other relatively non-portable electronic devices such as desktop computers, printers, devices for implementing games, entertainment or other digital media on CDs, DVDs, Blu-ray, etc. Moreover, although the foregoing example is described in the context of use by a consumer, the kiosk 400 in various embodiments thereof can similarly be used by others, such as a store clerk, to assist consumers in recycling, selling, exchanging, etc. their electronic devices.

[0062] The disclosed technology also includes the disclosures of U.S. patent application number 14/498,763, titled "METHODS AND SYSTEMS FOR PRICING AND PERFORMING OTHER PROCESSES ASSOCIATED WITH RECYCLING
MOBILE PHONES AND OTHER ELECTRONIC DEVICES," attorney docket number 111220-8024.US00, filed by the applicant on September 26, 2014; U.S. patent application number 14/500,739, titled "MAINTAINING SETS OF CABLE COMPONENTS USED FOR WIRED ANALYSIS, CHARGING, OR OTHER INTERACTION WITH PORTABLE ELECTRONIC DEVICES," attorney docket number 111220-8025.US00, filed by the applicant on September 29, 2014; U.S. patent application number 14/500,739, titled "MAINTAINING SETS OF CABLE COMPONENTS USED FOR WIRED ANALYSIS, CHARGING, OR OTHER INTERACTION WITH PORTABLE ELECTRONIC DEVICES," attorney docket number 111220-8025.US00, filed by the applicant on September 29, 2014; U.S. patent application number 14/873,158, titled "WIRELESS-ENABLED KIOSK FOR RECYCLING CONSUMER DEVICES," attorney docket number 111220-8022.US01, filed by the applicant on October 1, 2015; U.S. patent application number 14/873,158, titled "WIRELESS-ENABLED KIOSK FOR RECYCLING CONSUMER DEVICES," attorney docket number 111220-8022.US01, filed by the applicant on October 1, 2015; U.S. patent application number 14/873,145, titled "APPLICATION FOR DEVICE EVALUATION AND OTHER PROCESSES ASSOCIATED WITH DEVICE RECYCLING," attorney docket number 111220-8023.US01, filed by the applicant on October 1, 2015; U.S. patent application number 14/873,145, titled "APPLICATION FOR DEVICE EVALUATION AND OTHER PROCESSES ASSOCIATED WITH DEVICE RECYCLING," attorney docket number 111220-8023.US01, filed by the applicant on October 1, 2015; U.S. patent application number 14/506,449, titled "SYSTEM FOR ELECTRICALLY TESTING MOBILE DEVICES AT A CONSUMER-OPERATED KIOSK, AND ASSOCIATED DEVICES AND METHODS," attorney docket number 111220-8035.US00, filed by the applicant on October 3, 2014; U.S. patent application number 14/925,357, titled "SYSTEMS AND METHODS FOR RECYCLING CONSUMER ELECTRONIC DEVICES," attorney docket number 111220-8027.US01, filed by the applicant on October 28, 2015; U.S. patent application number 14/925,357, titled "SYSTEMS AND METHODS FOR RECYCLING CONSUMER ELECTRONIC DEVICES," attorney docket number 111220-8027.US01, filed by the applicant on October 28, 2015; U.S. patent application number 14/925,375, titled "METHODS AND SYSTEMS FOR FACILITATING PROCESSES ASSOCIATED WITH INSURANCE SERVICES AND/OR OTHER SERVICES FOR ELECTRONIC DEVICES," attorney docket number 111220-8028.US01, filed by the applicant on October 28, 2015; U.S. patent application number 14/925,375, titled "METHODS AND SYSTEMS FOR FACILITATING PROCESSES ASSOCIATED WITH INSURANCE SERVICES AND/OR OTHER SERVICES FOR ELECTRONIC DEVICES," attorney docket number 111220-8028.US01, filed by the applicant on October 28, 2015; U.S. patent application number 14/966,346, titled "SYSTEMS AND METHODS FOR RECYCLING CONSUMER ELECTRONIC DEVICES," attorney docket number 111220-8037.US01, filed by the applicant on December 10, 2015; U.S. patent application number 14/966,346, titled "SYSTEMS AND METHODS FOR RECYCLING CONSUMER ELECTRONIC DEVICES," attorney docket number 111220-8037.US01, filed by the applicant on December 10, 2015; U.S. patent application number 14/598,469, titled "METHODS AND SYSTEMS FOR DYNAMIC
PRICING AND PERFORMING OTHER PROCESSES ASSOCIATED WITH RECYCLING MOBILE PHONES AND OTHER ELECTRONIC DEVICES," attorney docket number 111220-8034.US00, filed by the applicant on January 16, 2015; U.S. patent application number 14/660,768, titled "SYSTEMS AND METHODS FOR INSPECTING MOBILE DEVICES AND OTHER CONSUMER ELECTRONIC DEVICES WITH A LASER," attorney docket number 111220-8030.US00, filed by the applicant on March 17, 2015; U.S. patent application number 14/663,331, titled "DEVICE RECYCLING SYSTEMS WITH FACIAL RECOGNITION," attorney docket number 111220-8029.US00, filed by the applicant on March 19, 2015; U.S. provisional application number 62/169,072, titled "METHODS AND SYSTEMS FOR VISUALLY EVALUATING ELECTRONIC DEVICES," attorney docket number 111220-8041.US00, filed by the applicant on June 1, 2015; U.S. provisional application number 62/202,330, titled "METHODS AND SYSTEMS FOR INSPECTING MOBILE DEVICES AND OTHER CONSUMER ELECTRONIC DEVICES WITH ROBOTIC ACTUATION," attorney docket number 111220-8026.US00, filed by the applicant on August 7, 2015; U.S. patent application number 15/057,707, titled "METHODS AND SYSTEMS FOR RECORDING INTERACTIONS WITH A SYSTEM FOR PURCHASING MOBILE PHONES AND OTHER ELECTRONIC DEVICES," attorney docket number 111220-8032.US01, filed by the applicant on March 1, 2016; U.S. patent application number 14/873,158, titled "WIRELESS-ENABLED KIOSK FOR RECYCLING CONSUMER DEVICES," attorney docket number 111220-8022.US01, filed by the applicant on October 1, 2015; U.S. patent application number 14/873,145, titled "APPLICATION FOR DEVICE EVALUATION AND OTHER PROCESSES ASSOCIATED WITH DEVICE RECYCLING," attorney docket number 111220-8023.US01, filed by the applicant on October 1, 2015; U.S. patent application number 14/925,357, titled "SYSTEMS AND METHODS FOR RECYCLING CONSUMER ELECTRONIC DEVICES," attorney docket number 111220-8027.US01, filed by the applicant on October 28, 2015; U.S. patent application number 14/925,375, titled "METHODS AND SYSTEMS FOR FACILITATING PROCESSES ASSOCIATED WITH INSURANCE SERVICES AND/OR OTHER SERVICES FOR ELECTRONIC DEVICES," attorney docket number 111220-8028.US01, filed by the applicant on October 28, 2015; U.S. patent application number 14/934,134, titled "METHODS AND SYSTEMS FOR EVALUATING AND RECYCLING ELECTRONIC DEVICES," attorney
docket number 111220-8038. US01; and U.S. patent application number 14/967,183, titled "SYSTEMS AND METHODS FOR RECYCLING CONSUMER ELECTRONIC DEVICES," attorney docket number 111220-8048-US00, filed December 11, 2015; U.S. patent application no. 15/130,851, titled "METHODS AND SYSTEMS FOR DETECTING CRACKS IN ELECTRONIC DEVICES," attorney docket number 111220-8042. US00, filed April 15, 2016; U.S. patent application no. 15/176,975 titled "METHODS AND SYSTEMS FOR DETECTING SCREEN COVERS ON ELECTRONIC DEVICES," attorney docket number 111220-8046. US00, filed June 8, 2016; and U.S. patent application no. 62/332,736, titled "METHODS AND SYSTEMS FOR DETECTING DAMAGE IN EDGE REGIONS OF MOBILE ELECTRONIC DEVICES," attorney docket number 111220-8048. US00, filed May 6, 2016 each of which is incorporated herein by reference in its entirety. All of the patents and patent applications listed above are commonly owned by the applicant of the present application, and they along with any other patents or patent applications identified herein are incorporated herein by reference in their entireties.

[0063] While the Internet is shown, a private network, such as an intranet may likewise be used herein. The network may have a client-server architecture, in which a computer is dedicated to serving other client computers, or it may have other architectures such as peer-to-peer, in which one or more computers serve simultaneously as servers and clients. A database or databases, coupled to the server computer(s), stores much of the web pages and content exchanged between the user computers. The server computer(s), including the database(s), may employ security measures to inhibit malicious attacks on the system and preserve the integrity of the messages and data stored therein (e.g., firewall systems, message encryption and/or authentication (e.g., using transport layer security (TLS) or secure socket layers (SSL)), password protection schemes, encryption of stored data (e.g., using trusted computing hardware), and the like).

[0064] One skilled in the relevant art will appreciate that the concepts of the invention can be used in various environments other than location based or the Internet. In general, a display description may be in HTML, XML or WAP format, email format or any other format suitable for displaying information (including character/code-based formats, algorithm-based formats (e.g., vector generated), and bitmapped formats). Also, various communication channels, such as local area
networks, wide area networks, or point-to-point dial-up connections, may be used instead of the Internet. The system may be conducted within a single computer environment, rather than a client/server environment. Also, the user computers may comprise any combination of hardware or software that interacts with the server computer, such as television-based systems and various other consumer products through which commercial or noncommercial transactions can be conducted. The various aspects of the invention described herein can be implemented in or for any e-mail environment.

[0065] Although not required, aspects of the invention are described in the general context of computer-executable instructions, such as routines executed by a general-purpose data processing device, e.g., a server computer, wireless device or personal computer. Those skilled in the relevant art will appreciate that aspects of the invention can be practiced with other communications, data processing, or computer system configurations, including Internet appliances, hand-held devices (including personal digital assistants (PDAs)), wearable computers, all manner of cellular or mobile phones (including Voice over IP (VoIP) phones), dumb terminals, media players, gaming devices, multi-processor systems, microprocessor-based or programmable consumer electronics, set-top boxes, network PCs, mini-computers, mainframe computers, and the like. Indeed, the terms "computer," "server," "host," "host system," and the like, are generally used interchangeably herein, and refer to any of the above devices and systems, as well as any data processor. Input devices may include a touchpad, keyboard and/or a pointing device such as a mouse. Other input devices are possible such as a microphone, joystick, pen, game pad, scanner, digital camera, video camera, and the like. The data storage devices may include any type of computer-readable media that can store data accessible by a computer, such as magnetic hard and floppy disk drives, optical disk drives, magnetic cassettes, tape drives, flash memory cards, digital video disks (DVDs), Bernoulli cartridges, RAMs, ROMs, smart cards, etc. Indeed, any medium for storing or transmitting computer-readable instructions and data may be employed, including a connection port to a network such as a local area network (LAN), wide area network (WAN) or the Internet.

[0066] Aspects of the invention can be embodied in a special purpose computer or data processor that is specifically programmed, configured, or constructed to perform one or more of the computer-executable instructions explained in detail
herein. While aspects of the invention, such as certain functions, are described as being performed exclusively on a single device, the invention can also be practiced in distributed environments where functions or modules are shared among disparate processing devices, which are linked through a communications network, such as a Local Area Network (LAN), Wide Area Network (WAN), or the Internet. In a distributed computing environment, program modules may be located in both local and remote memory storage devices.

[0067] Aspects of the invention may be stored or distributed on tangible computer-readable media, including magnetically or optically readable computer discs, hard-wired or preprogrammed chips (e.g., EEPROM semiconductor chips), nanotechnology memory, biological memory, or other data storage media. The data storage devices may include any type of computer-readable media that can store data accessible by a computer, such as magnetic hard and floppy disk drives, optical disk drives, magnetic cassettes, tape drives, flash memory cards, DVDs, Bernoulli cartridges, RAM, ROMs, smart cards, etc. Indeed, any medium for storing or transmitting computer-readable instructions and data may be employed, including a connection port to a network such as a LAN, WAN, or the Internet. Alternatively, computer implemented instructions, data structures, screen displays, and other data under aspects of the invention may be distributed over the Internet or over other networks (including wireless networks), on a propagated signal on a propagation medium (e.g., an electromagnetic wave(s), a sound wave, etc.) over a period of time, or they may be provided on any analog or digital network (packet switched, circuit switched, or other scheme). The terms "memory" and "computer-readable storage medium" include any combination of temporary, persistent, and/or permanent storage, e.g., ROM, writable memory such as RAM, writable non-volatile memory such as flash memory, hard drives, solid state drives, removable media, and so forth, but do not include a propagating signal per se.

Examples

A method performed by one or more computing devices for detecting cracks in a screen of an electronic device, the method comprising:

receiving an image of an electronic device screen;
applying at least one kernel to the image to obtain, at various locations of the image, values corresponding to line regions and non-line regions, wherein the kernel comprising a matrix having a line region and a non-line region; based on the values corresponding to the line regions and the non-line regions, automatically identifying cracks in the electronic device screen.

2. The method of example 1, further comprising:
   generating an image pyramid with multiple layers of the image, each layer being downsampled to a different degree; and
   for each layer, applying at least one kernel to the layer to obtain, at various locations of the layer, values corresponding to the line regions and the non-line regions.

3. The method of any one of examples 1-2 wherein the kernel is configured to detect cracks in the image that align with the line region of the kernel.

4. The method of any one of examples 1-3 wherein the at least one kernel include at least 10 kernels, each kernel having a different orientation of the line region and the non-line region.

5. The method of any one of examples 1-4 wherein applying the at least one kernel with the image comprises moving the kernel across each location on the screen and multiplying underlying pixel values of the image with values of the kernel.

6. The method of any one of examples 1-5 wherein line region includes a left-line (LL) region and a right-line region (RL) and the non-line region includes an above-the-line (AL) region and a below-the-line region (BL).

7. The method of example 6 automatically identifying cracks comprises identifying a crack if, for the kernel at a selected location of the image, an average brightness of the LL region and the RL region is greater than an average brightness of the AL region and the BL region by at least some predetermined threshold amount.
8. The method of example 7 wherein, if no crack is automatically identified for the kernel at a selected location, the method further includes applying a next kernel at the selected location.

9. The method of any one of examples 7-8 wherein, if a crack is automatically identified for the kernel at the selected location, the method further includes applying a kernel at the next location.

10. The method of any one of examples 7-9 further comprising determining whether at least one of the following conditions is satisfied:
   (a) an average brightness of the AL region and an average brightness of BL region are within a predetermined range of one another;
   (b) the average brightness of the AL region or the average brightness of the BL region is below a predetermined threshold level;
   (c) the average brightness of the LL region and the RL region is greater than the average brightness of the AL region and the BL region by a predetermined threshold amount;
   (d) the average brightness of the LL region and the average brightness of the RL region differ from one another by more than a predetermined threshold amount;
   (e) any value in the LL, RL, AL, or BL regions is greater than a predetermined threshold value;
   (f) any value in the LL, RL, AL, or BL regions is lower than a predetermined threshold value; and
   (g) any three consecutive LL or RL values have corresponding brightness levels that do not increase or decrease monotonically, wherein, if any of conditions (a)—(g) are satisfied, then the identified crack is discarded.

11. The method of any one of examples 1-10, further comprising, before applying at least one kernel to the image, evaluating the image of the electronic device screen to determine if an animated background is present.
12. A method performed by one or more computing devices for detecting cracks in an illuminated electronic device screen, the method comprising:
   receiving an image of an illuminated electronic device screen;
   applying a first kernel to a first location of the image and automatically determining whether there is a crack in the first location, wherein the first kernel comprises a matrix having a line region and a non-line region;
   if no crack is identified in the first location, then applying a second kernel of the to the first location of the image and automatically determining whether there is a crack in the first location, wherein the second kernel comprises a matrix having a line region and a non-line region having a different orientation than the first kernel;
   if there are identified cracks in the first location, then applying the first kernel to a second location of the image and automatically determining whether there are cracks in the first region of the electronic device screen.

13. The method of example 12, further comprising:
   generating an image pyramid with multiple layers of the image, each layer being downsampled to a different degree; and
   for each layer, applying the first kernel to locations of the layer to automatically determine whether there is a crack at the locations.

14. The method of any one of examples 12-13 wherein the method comprises applying at least 10 kernels in sequence to a location of the image until a crack is identified at the location.

15. The method of any one of examples 12-14 wherein each kernel comprises a left-line (LL) region and a right-line region (RL) and the non-line region includes an above-the-line (AL) region and a below-the-line region (BL) and wherein automatically identifying cracks comprises identifying a crack if, for a select kernel at a select location of the image, an average brightness of the LL region and the RL region is greater than an average brightness of the AL region and the BL region by at least some predetermined threshold amount.
16. The method of example 15 wherein, automatically identifying a crack further comprises performing one or more secondary analyses based on the values in one or more of the LL, RL, AL, and BL regions.

17. The method of any one of examples 12-16, further comprising applying the first kernel to each location of the image and automatically determining whether there is a crack in each of the locations.

18. A computer-readable memory carrying computer-executable instructions for causing one or more processors to facilitate detecting cracks in an illuminated electronic device screen, the computer-executable instructions comprising instructions that, when executed by the one or more processors:
   receive an image of an electronic device screen;
   apply at least one kernel to the image to obtain, at various locations of the image, values corresponding to line regions and non-line regions, the kernel comprising a matrix having a line region and a non-line region;
   based on the values corresponding to the line regions and the non-line regions, automatically identify cracks in the electronic device screen.

19. The computer-readable memory of example 18 wherein the instructions, when executed by the one or more processors, further:
   generate an image pyramid with multiple layers of the image, each layer being downsampled to a different degree; and
   for each layer, apply the kernel with the layer to obtain, at various locations of the layer, values corresponding to the line regions and the non-line regions.

20. The computer-readable memory of any one of examples 18-19 wherein applying the kernel to the image comprises moving the kernel to each location on the screen and multiplying underlying pixel values of the image with values of the kernel.

21. The method of any one of examples 18-20 wherein line region includes a left-line (LL) region and a right-line region (RL) and the non-line region includes an
above-the-line (AL) region and a below-the-line region (BL), and wherein automatically identifying cracks comprises identifying a crack if, for the kernel at a selected location of the image, an average brightness of the LL region and the RL region is greater than an average brightness of the AL region and the BL region by at least some predetermined threshold amount.

[0068] The above Detailed Description of examples and embodiments of the invention is not intended to be exhaustive or to limit the invention to the precise form disclosed above. While specific examples for the invention are described above for illustrative purposes, various equivalent modifications are possible within the scope of the invention, as those skilled in the relevant art will recognize. References throughout the foregoing description to features, advantages, or similar language do not imply that all of the features and advantages that may be realized with the present technology should be or are in any single embodiment of the invention. Rather, language referring to the features and advantages is understood to mean that a specific feature, advantage, or characteristic described in connection with an embodiment is included in at least one embodiment of the present technology. Thus, discussion of the features and advantages, and similar language, throughout this specification may, but do not necessarily, refer to the same embodiment. Furthermore, the described features, advantages, and characteristics of the present technology may be combined in any suitable manner in one or more embodiments. One skilled in the relevant art will recognize that the present technology can be practiced without one or more of the specific features or advantages of a particular embodiment. In other instances, additional features and advantages may be recognized in certain embodiments that may not be present in all embodiments of the present technology.

[0069] Any patents and applications and other references noted above, including any that may be listed in accompanying filing papers, are incorporated herein by reference. Aspects of the invention can be modified, if necessary, to employ the systems, functions, and concepts of the various references described above to provide yet further implementations of the invention.

[0070] Unless the context clearly requires otherwise, throughout the description and the claims, the words "comprise," "comprising," and the like, are to be construed in an inclusive sense, as opposed to an exclusive or exhaustive sense; that is to say,
in the sense of "including, but not limited to." As used herein, the terms "connected," "coupled," or any variant thereof, means any connection or coupling, either direct or indirect, between two or more elements; the coupling or connection between the elements can be physical, logical, or a combination thereof. Additionally, the words "herein," "above," "below," and words of similar import, when used in this application, refer to this application as a whole and not to any particular portions of this application. Where the context permits, words in the above Detailed Description using the singular or plural number may also include the plural or singular number respectively. The word "or," in reference to a list of two or more items, covers all of the following interpretations of the word: any of the items in the list, all of the items in the list, and any combination of the items in the list.

[0071] The teachings of the invention provided herein can be applied to other systems, not necessarily the system described above. The elements and acts of the various examples described above can be combined to provide further implementations of the invention. Some alternative implementations of the invention may include not only additional elements to those implementations noted above, but also may include fewer elements. Further any specific numbers noted herein are only examples—alternative implementations may employ differing values or ranges.

[0072] While the above description describes various embodiments of the invention and the best mode contemplated, regardless how detailed the above text, the invention can be practiced in many ways. Details of the system may vary considerably in its specific implementation, while still being encompassed by the present disclosure. As noted above, particular terminology used when describing certain features or aspects of the invention should not be taken to imply that the terminology is being redefined herein to be restricted to any specific characteristics, features, or aspects of the invention with which that terminology is associated. In general, the terms used in the following claims should not be construed to limit the invention to the specific examples disclosed in the specification, unless the above Detailed Description section explicitly defines such terms. Accordingly, the actual scope of the invention encompasses not only the disclosed examples, but also 811 equivalent ways of practicing or implementing the invention under the claims.
From the foregoing, it will be appreciated that specific embodiments of the invention have been described herein for purposes of illustration, but that various modifications may be made without deviating from the spirit and scope of the various embodiments of the invention. Further, while various advantages associated with certain embodiments of the invention have been described above in the context of those embodiments, other embodiments may also exhibit such advantages, and not all embodiments need necessarily exhibit such advantages to fall within the scope of the invention. Accordingly, the invention is not limited, except as by the appended claims. Although certain aspects of the invention are presented below in certain claim forms, the applicant contemplates the various aspects of the invention in any number of claim forms. Accordingly, the applicant reserves the right to pursue additional claims after filing this application to pursue such additional claim forms, in either this application or in a continuing application.
CLAIMS

I/We claim:

1. A method performed by one or more computing devices for detecting cracks in a screen of an electronic device, the method comprising:
   receiving an image of an electronic device screen;
   applying at least one kernel to the image to obtain, at various locations of the image, values corresponding to line regions and non-line regions, wherein the kernel comprising a matrix having a line region and a non-line region;
   based on the values corresponding to the line regions and the non-line regions, automatically identifying cracks in the electronic device screen.

2. The method of claim 1, further comprising:
   generating an image pyramid with multiple layers of the image, each layer being downsampled to a different degree; and
   for each layer, applying at least one kernel to the layer to obtain, at various locations of the layer, values corresponding to the line regions and the non-line regions.

3. The method of claim 1 wherein the kernel is configured to detect cracks in the image that align with the line region of the kernel.

4. The method of claim 1 wherein the at least one kernel include at least 10 kernels, each kernel having a different orientation of the line region and the non-line region.

5. The method of claim 1 wherein applying the at least one kernel with the image comprises moving the kernel across each location on the screen and multiplying underlying pixel values of the image with values of the kernel.
6. The method of claim 1 wherein line region includes a left-line (LL) region and a right-line region (RL) and the non-line region includes an above-the-line (AL) region and a below-the-line region (BL).

7. The method of claim 6 automatically identifying cracks comprises identifying a crack if, for the kernel at a selected location of the image, an average brightness of the LL region and the RL region is greater than an average brightness of the AL region and the BL region by at least some predetermined threshold amount.

8. The method of claim 7 wherein, if no crack is automatically identified for the kernel at a selected location, the method further includes applying a next kernel at the selected location.

9. The method of claim 7 wherein, if a crack is automatically identified for the kernel at the selected location, the method further includes applying a kernel at a next location.

10. The method of claim 7 further comprising determining whether at least one of the following conditions is satisfied:
(a) an average brightness of the AL region and an average brightness of BL region are within a predetermined range of one another;
(b) the average brightness of the AL region or the average brightness of the BL region is below a predetermined threshold level;
(c) the average brightness of the LL region and the RL region is greater than the average brightness of the AL region and the BL region by a predetermined threshold amount;
(d) the average brightness of the LL region and the average brightness of the RL region differ from one another by more than a predetermined threshold amount;
(e) any value in the LL, RL, AL, or BL regions is greater than a predetermined threshold value;
(f) any value in the LL, RL, AL, or BL regions is lower than a predetermined threshold value; and
11. The method of claim 1, further comprising, before applying at least one kernel to the image, evaluating the image of the electronic device screen to determine if an animated background is present.

12. A method performed by one or more computing devices for detecting cracks in an illuminated electronic device screen, the method comprising:
   - receiving an image of an illuminated electronic device screen;
   - applying a first kernel to a first location of the image and automatically determining whether there is a crack in the first location, wherein the first kernel comprises a matrix having a line region and a non-line region;
   - if no crack is identified in the first location, then applying a second kernel of the to the first location of the image and automatically determining whether there is a crack in the first location, wherein the second kernel comprises a matrix having a line region and a non-line region having a different orientation than the first kernel;
   - if there are identified cracks in the first location, then applying the first kernel to a second location of the image and automatically determining whether there are cracks in the first region of the electronic device screen.

13. The method of claim 12, further comprising:
   - generating an image pyramid with multiple layers of the image, each layer being downsampled to a different degree; and
   - for each layer, applying the first kernel to locations of the layer to automatically determine whether there is a crack at the locations.

14. The method of claim 12 wherein the method comprises applying at least 10 kernels in sequence to a location of the image until a crack is identified at the location.
15. The method of claim 12 wherein each kernel comprises a left-line (LL) region and a right-line region (RL) and the non-line region includes an above-the-line (AL) region and a below-the-line region (BL) and wherein automatically identifying cracks comprises identifying a crack if, for a select kernel at a select location of the image, an average brightness of the LL region and the RL region is greater than an average brightness of the AL region and the BL region by at least some predetermined threshold amount.

16. The method of claim 15 wherein, automatically identifying a crack further comprises performing one or more secondary analyses based on the values in one or more of the LL, RL, AL, and BL regions.

17. The method of claim 12, further comprising applying the first kernel to each location of the image and automatically determining whether there is a crack in each of the locations.

18. A computer-readable memory carrying computer-executable instructions for causing one or more processors to facilitate detecting cracks in an illuminated electronic device screen, the computer-executable instructions comprising instructions that, when executed by the one or more processors:
   receive an image of an electronic device screen;
   apply at least one kernel to the image to obtain, at various locations of the image, values corresponding to line regions and non-line regions, the kernel comprising a matrix having a line region and a non-line region;
   based on the values corresponding to the line regions and the non-line regions, automatically identify cracks in the electronic device screen.

19. The computer-readable memory of claim 18 wherein the instructions, when executed by the one or more processors, further:
   generate an image pyramid with multiple layers of the image, each layer being downsampled to a different degree; and
for each layer, apply the kernel with the layer to obtain, at various locations of
the layer, values corresponding to the line regions and the non-line
regions.

20. The computer-readable memory of claim 18 wherein applying the kernel
to the image comprises moving the kernel to each location on the screen and
multiplying underlying pixel values of the image with values of the kernel.

21. The method of claim 18 wherein line region includes a left-line (LL)
region and a right-line region (RL) and the non-line region includes an above-the-line
(AL) region and a below-the-line region (BL), and wherein automatically identifying
cracks comprises identifying a crack if, for the kernel at a selected location of the
image, an average brightness of the LL region and the RL region is greater than an
average brightness of the AL region and the BL region by at least some
predetermined threshold amount.
Start

200 Subtract lighted image from non-lighted image

201 Check for animated background

203 Identify cracks outside screen region

205 Generate image pyramid with multiple layers

207 Select first layer of image pyramid

209 Identify cracks in selected layer

211 Select first kernel and first location

213 Overlay kernels at selected location and identify cracks

215 Crack found?

217 No

221 Select next kernel

225 Select next location

229 Select next layer in image pyramid

219 Yes

219 Completed final kernel?

223 Yes

223 Completed final location?

227 Yes

227 Completed final layer?

229 No

229 No

END
A. CLASSIFICATION OF SUBJECT MATTER

INV. G06T 7/00

ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
G06T

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EPO-Internal, WPI Data
