(54) Title: ANIMAL-OPERATED ORAL GEL DELIVERY AND DIAPHRAGM PUMP DEVICE FOR ANIMALS

FIG. 1

(57) Abstract: A dispenser includes an outer shell and diaphragm pumps that can be operated by an animal to dispense materials, such as a gel, with a flow viscosity between 1-100,000 cps. The outer shell houses a pressure-actuated sound generator and has outer surfaces with tongue cleaners. The outer shell includes receivers wherein diaphragm pumps can be installed. The diaphragm pumps are of a prescribed volume between 0.1ml and 50ml so that the amount of oral gel ejected into a dog's mouth can be determined. The outer shell is sufficiently flexible to be compressed by an animal's jaws such that the oral gel is pumped via actuation of the diaphragm pump. Gel is ejected or pumped to the teeth of the animal and in combination of sounds being generated, more or less simultaneously with the distribution of oral gel in a prescribed and measured volume.

ANIMAL-OPERATED ORAL GEL DELIVERY AND DIAPHRAGM PUMP DEVICE FOR ANIMALS

CROSS-REFERENCE TO RELATED APPLICATION

[0001] For purposes of the United States, the present application is a U.S. nonprovisional patent application of, and claims priority under 35 U.S.C. § 119(e) to, U.S. provisional patent application serial number 62/947,005 filed December 12, 2019, and to U.S. provisional patent application serial number 63/121,786 filed December 4, 2020, which provisional patent applications are incorporated by reference herein.

[0002] All of the material in this patent document is subject to copyright protection under the copyright laws of the United States and other countries. The copyright owner has no objection to the facsimile reproduction by anyone of the patent document or the patent disclosure, as it appears in official governmental records but, otherwise, all other copyright rights whatsoever are reserved.

BACKGROUND OF THE PRESENT INVENTION

Field of the Present Invention

[0003] The present invention relates generally to animal oral gel applicator devices, and, more specifically, to an animal-operated oral gel delivery and diaphragm pump device for animals and method of use, whereby a user can provide the device to an animal and the dog can operate the device to self-administer oral gels or liquids.

Background

[0004] It is well known that dogs and other animals need medicated gels or liquids applied or ingested for health reasons, and it is typically difficult to administer medicated gels or liquids to a dog or other pets. In many cases, dogs are taken to a veterinarian where the veterinarian performs the gel administration and oral care which can be time consuming and expensive. Pet oral applicators and various chew toys have been in use for years. Typical devices include syringes, pill holders, tubal oral applicators, rubber chew brushes and shapes, and the like. Some such prior art oral applicator devices and chew toy devices are referenced in the following patent or patent application publications: U.S. Patent No. 5,524,576 A, U.S. Patent No. 4,813,871 A, U.S. Patent No. 4,973,248 A, U.S. Patent No. 6,405,681, U.S. Patent No. 2,593,757 A, U.S. Patent No. 6,116,191A, U.S. Patent

No. 6,739,287 B1, U.S. Patent Publication No. 2006/0102099 A1, U.S. Patent No. 9,364,305B2, U.S. Patent Publication No. 2006/0107905 A1, U.S. Patent No. 5,263,436 A, U.S. Patent No. 5,647,302 A, U.S. Patent No. 5,560,320 A, and U.S. Patent No. 7,087,260 B2.

[0005] Many of the prior art devices such as those listed above are “oral injectors” or “manual oral applicators” that require a user to manually inject or apply a gel or liquid into the mouth of an animal. Unfortunately, because these prior art devices require the user to operate the device in order to apply gel or liquids, the animal must either be willing to receive such a device in their mouth or must be of a size small enough for the user to restrain the animal while administering the gel or liquid. Other prior art devices, including some listed hereinabove, are “chew toys” with exterior surfaces or other features designed to scrape teeth when bitten, to brush the animal’s teeth. Unfortunately, it is difficult or impossible to motivate a dog to chew the device or to determine whether such chew toy devices are being used correctly.

[0006] The above-mentioned prior art devices each fall short in providing a single applicator device which a dog or pet can operate on their own, by chewing, which dispenses medicated oral gel or oral liquids in a pre-designed or prescribed volume between 0.1ml and 50ml and with a material flow viscosity between 1 cps and 100,000 cps. The above-mentioned prior art devices also fail to provide sufficient entertainment or interest for the animal, such as through the use of one or more sounds triggered by the dog or pet, to ensure they use the device long enough to thoroughly dispense the gel to insure correct administration. Thus, a need exists for a toy like device which is also an oral gel applicator that sufficiently encourages and empowers dogs and other pets to self-administer pre-measured prescribed volumes of gel into their mouths during play. This and/or other needs are addressed by one or more aspects of the present invention.

SUMMARY OF THE PRESENT INVENTION

[0007] Some exemplary embodiments of the present invention may overcome one or more of the above disadvantages and other disadvantages not described above, but the present invention is not required to overcome any particular disadvantage described above, and some exemplary embodiments of the present invention may not overcome any of the disadvantages described above.

[0008] The present invention includes many aspects and features. Moreover, while many aspects and features relate to, and are described in, the context of delivering oral

gel to dogs and other pets, the present invention is not limited to use only in delivering oral gel to dogs and other pets, as will become apparent from the following summaries and detailed descriptions of aspects, features, and one or more embodiments of the present invention.

[0009] Broadly defined, the present invention according to one aspect relates to an oral gel delivery device for causing pets to ingest a gel dispensed therefrom, including: a body made of an animal-safe material, shaped to be attractive to a pet, and sized to be received in the mouth of the pet; a pet-operated diaphragm pump recessed within the body, the diaphragm pump having a face plate and a rear wall that together define a cavity, and a plurality of gel pod ejector structures penetrating the face plate and providing fluid ejection paths from the cavity to the exterior of the device; and a gel or liquid disposed within the cavity; wherein, when the device received in the mouth of the pet and compression is applied by jaws of the pet, the gel or liquid is squeezed or pumped from the cavity, via positive displacement pumping of the gel or liquid, through the gel pod ejector structures and into the mouth of the pet.

[0010] In a feature of this aspect, the body includes an outer shell and a hollow chamber, and wherein the diaphragm pump is recessed within the outer shell. In further features, the outer shell is flexible, the rear wall of the diaphragm pump is a flexible diaphragm, and compression of the outer shell applies pressure to the flexible diaphragm, thereby causing the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet; the diaphragm pump is a self-contained unit that is contained within a recess in the outer shell; the diaphragm pump is permanently connected to the outer shell; the diaphragm pump is removable from the outer shell; a replacement diaphragm pump may be attached to the outer shell; the diaphragm pump snaps to the outer shell; the diaphragm pump twist-locks to the outer shell; the face plate of the diaphragm pump includes a one-way opening for filling the pump cavity; the one-way opening includes a valve; the one-way opening is disposed within a baffle for directing flow of the gel into the opening; the one-way opening is surrounded by a coupler adapted to interact with a dispensing tip for a gel refill container; the body further comprises an inner shell, and the inner shell includes a flexible wall that serves as the flexible diaphragm; the device further includes a squeaker, and the compression applied by jaws of the pet also causes the squeaker to make a squeaking noise; the device is part of a system that includes a sound detector that detects the squeaker noise; and/or the sound detector includes electronics and software that analyze the squeaker noise received thereby and display a graphical representation thereof.

[0011] In another feature of this aspect, the body is solid.

[0012] In another feature of this aspect, each of the gel pod ejector structures includes an outwardly-oriented funnel such that gel is funneled out of the cavity when compression is applied to the device by the jaws of the pet.

[0013] In another feature of this aspect, the device comprises two diaphragm pumps.

[0014] In another feature of this aspect, the device comprises three or more diaphragm pumps.

[0015] In another feature of this aspect, the gel has a material viscosity of between 1 cps and 100,000 cps. In a further feature, the gel has a material viscosity of between 10 cps and 10,000 cps.

[0016] In another feature of this aspect, the cavity contains a predetermined volume of the gel that is between 0.1ml and 50ml.

[0017] In another feature of this aspect, the diaphragm pump further includes a structural sponge to provide additional force of pressure for causing the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.

[0018] In another feature of this aspect, the face plate of the diaphragm pump is a flexible diaphragm, and compression of the face plate causes the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.

[0019] In another feature of this aspect, the rear wall of the diaphragm pump is a flexible diaphragm, and compression of the face plate causes the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.

[0020] In another feature of this aspect, the diaphragm pump is a positive displacement pump that uses reciprocating action of a flexible diaphragm caused by successive chewing force of an animal that, in turn, flexes and reciprocates the diaphragm, thus actuating the positive displacement pump.

[0021] In another feature of this aspect, the body has an outer surface that is covered with tongue cleaners, brushing bristles, or both.

[0022] In another feature of this aspect, the body is in the shape of a ball.

[0023] In another feature of this aspect, the oral gel delivery device further includes a tug strap attached to the body.

[0024] In another feature of this aspect, the body is in the shape of a disk.

[0025] In another feature of this aspect, the body is in the shape of a plush toy.

[0026] In another feature of this aspect, the body is in the shape of a bone.

[0027] In another feature of this aspect, the body is in the shape of a whimsical object.

[0028] Further areas of applicability of the present invention will become apparent from the detailed description provided hereinafter. It should be understood that the detailed description and specific examples, while indicating the preferred embodiment of the invention, are intended for purposes of illustration only and are not intended to limit the scope of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

[0029] Further features, embodiments, and advantages of the present invention will become apparent from the following detailed description with reference to the drawings, wherein:

FIG. 1 is an orthogonal view of an oral gel delivery device, in accordance with one or more preferred embodiment of the present invention;

FIG. 2A is a front view of the oral gel delivery device of FIG. 1;

FIG. 2B is a top end view of the oral gel delivery device of FIG. 1;

FIG. 3 is a top end view of an oral gel delivery device with three diaphragm pumps in accordance with another preferred embodiment of the present invention;

FIG. 4 is a cross-sectional view of the oral gel delivery device of FIG. 1;

FIG. 5 is an exploded orthogonal view of the oral gel delivery device of FIG. 1;

FIG. 6A is an orthogonal view of one of the diaphragm pumps of the gel delivery device of FIG. 1;

FIG. 6B is an exploded orthogonal view of the diaphragm of FIG. 6A;

FIG. 6C is a cross-sectional view of the diaphragm pump of FIG. 6A;

FIG. 6D is an enlarged fragmentary cross-sectional view of a portion of the gel delivery device of FIG. 1, showing the fluid path;

FIG. 7A is an orthogonal view of an alternate design of a diaphragm pump in accordance with another preferred embodiment of the present invention;

FIG. 7B is a side cross-sectional view of the diaphragm pump of FIG. 7A;

FIG. 8 is a cross-sectional view of a diaphragm pump with a structural sponge of the gel delivery device in accordance with another preferred embodiment of the present invention;

FIG. 9 is an orthogonal view of an oral gel delivery device in accordance with another preferred embodiment of the present invention;

FIG. 10 is a front view of the oral gel delivery device of FIG. 9;

FIG. 11 is exploded side orthogonal view of the gel delivery device of FIG. 9;

FIG. 12 is a side cross-sectional view of the gel delivery device of FIG. 9;

FIG. 13 is a side view of the oral gel delivery device of FIG. 1, shown with a gel bottle for filling the device;

FIG. 14 is a cross-sectional view of a gel bottle filing the diaphragm pump of FIG. 6C;

FIG. 15 is an illustration of the gel delivery device of FIG. 1 being given to a pet dog by a user;

FIG. 16 is a side view of the gel delivery device of FIG. 1 being held between the teeth of a dog;

FIG. 17A is an orthogonal view of a large pre-filled diaphragm pump in accordance with an alternate embodiment of the present invention;

FIG. 17B is an orthogonal view of a smaller sized pre-filled diaphragm pump;

FIG. 17C is a cross-sectional view of the diaphragm pump of FIG. 17A;

FIG. 18 is a cross-sectional view of a gel delivery device with multiple diaphragm pumps sharing a single pump cavity, in accordance with another embodiment of the present invention;

FIG. 19A is a perspective view of a tube shaped diaphragm pump in accordance with one or more further preferred embodiments of the present invention.

FIG. 19B is a side cross-sectional view of the tube shaped diaphragm pump of FIG. 19A;

FIG. 20 is an exploded orthogonal view of the gel delivery device with an inner and outer shell, in accordance with another embodiment of the present invention;

FIG. 21 is a cross-sectional view of the gel delivery device of FIG. 20;

FIG. 22 is an orthogonal view of a stick-shaped gel delivery device in accordance with another preferred embodiment of the present invention;

FIG. 23 is an orthogonal view of a gel delivery device with a tug strap in accordance with one or more further preferred embodiments of the present invention;

FIG. 24 is an orthogonal view of a flying disk gel delivery device in accordance with one or more further preferred embodiments of the present invention;

FIG. 25 is an orthogonal view of a plush-type gel delivery device in accordance with one or more further preferred embodiments of the present invention;

FIG. 26 is an orthogonal view of a bone-shaped gel delivery device in accordance with one or more further preferred embodiments of the present invention;

FIG. 27 is an orthogonal view of a whimsical-shaped gel delivery device in accordance with one or more further preferred embodiments of the present invention;

FIG. 28 is a flow diagram illustrating a first method of use of a gel delivery device in accordance with one or more preferred embodiments of the present invention;

FIG. 29 is a flow diagram illustrating a second method of use of a gel delivery device in accordance with one or more preferred embodiments of the present invention;

FIG. 30 is a flow diagram illustrating a third method of use of a gel delivery device in accordance with one or more preferred embodiments of the present invention;

FIG. 31 is a side view of a gel delivery device, being squeezed by dog teeth, and emitting a sound detected by a sound detector; and

FIG. 32 is a flow diagram illustrating a fourth method of use of a gel delivery device in accordance with one or more preferred embodiments of the present invention.

DETAILED DESCRIPTION

[0030] As a preliminary matter, it will readily be understood by one having ordinary skill in the relevant art (“Ordinary Artisan”) that the present invention has broad utility and application. Furthermore, any embodiment discussed and identified as being “preferred” is considered to be part of a best mode contemplated for carrying out the present invention. Other embodiments also may be discussed for additional illustrative purposes in providing a full and enabling disclosure of the present invention. As should be understood, any embodiment may incorporate only one or a plurality of the above-disclosed aspects of the invention and may further incorporate only one or a plurality of the above-disclosed features. Moreover, many embodiments, such as adaptations, variations, modifications, and equivalent arrangements, will be implicitly disclosed by the embodiments described herein and fall within the scope of the present invention.

[0031] Accordingly, while the present invention is described herein in detail in relation to one or more embodiments, it is to be understood that this disclosure is illustrative and exemplary of the present invention, and is made merely for the purposes of providing a full and enabling disclosure of the present invention. The detailed disclosure herein of one or more embodiments is not intended, nor is to be construed, to limit the scope of patent protection afforded the present invention, which scope is to be defined by the claims and the equivalents thereof. It is not intended that the scope of patent protection afforded the present invention be defined by reading into any claim a limitation found herein that does not explicitly appear in the claim itself.

[0032] Thus, for example, any sequence(s) and/or temporal order of steps of various processes or methods that are described herein are illustrative and not restrictive. Accordingly, it should be understood that, although steps of various processes or methods may be shown and described as being in a sequence or temporal order, the steps of any such processes or methods are not limited to being carried out in any particular sequence or order, absent an indication otherwise. Indeed, the steps in such processes or methods generally may be carried out in various different sequences and orders while still falling within the scope of the present invention. Accordingly, it is intended that the scope of patent protection afforded the present invention is to be defined by the appended claims rather than the description set forth herein.

[0033] Additionally, it is important to note that each term used herein refers to that which the Ordinary Artisan would understand such term to mean based on the contextual use of such term herein. To the extent that the meaning of a term used herein—as understood by the Ordinary Artisan based on the contextual use of such term—differs in any way from any particular dictionary definition of such term, it is intended that the meaning of the term as understood by the Ordinary Artisan should prevail.

[0034] Regarding applicability of 35 U.S.C. §112, ¶6, no claim element is intended to be read in accordance with this statutory provision unless the explicit phrase “means for” or “step for” is actually used in such claim element, whereupon this statutory provision is intended to apply in the interpretation of such claim element.

[0035] Furthermore, it is important to note that, as used herein, “a” and “an” each generally denotes “at least one,” but does not exclude a plurality unless the contextual use dictates otherwise. Thus, reference to “a picnic basket having an apple” describes “a picnic basket having at least one apple” as well as “a picnic basket having apples.” In contrast,

reference to “a picnic basket having a single apple” describes “a picnic basket having only one apple.”

[0036] When used herein to join a list of items, “or” denotes “at least one of the items,” but does not exclude a plurality of items of the list. Thus, reference to “a picnic basket having cheese or crackers” describes “a picnic basket having cheese without crackers,” “a picnic basket having crackers without cheese,” and “a picnic basket having both cheese and crackers.” Finally, when used herein to join a list of items, “and” denotes “all of the items of the list.” Thus, reference to “a picnic basket having cheese and crackers” describes “a picnic basket having cheese, wherein the picnic basket further has crackers,” as well as describes “a picnic basket having crackers, wherein the picnic basket further has cheese.”

[0037] Referring now to the drawings, in which like numerals represent like components throughout the several views, one or more preferred embodiments of the present invention are next described. The following description of one or more preferred embodiment(s) is merely exemplary in nature and is in no way intended to limit the invention, its application, or uses.

[0038] FIG. 1 is an orthogonal view of an oral gel delivery device **100** in accordance with one or more preferred embodiment of the present invention, while FIGS. 2A and 2B are a front view and a top end view, respectively, of the oral gel delivery device **100** of FIG. 1. The oral gel delivery device **100** includes an outer shell **130**, one or more diaphragm pumps **106** (sometimes referred to as “gel pods” or “gel pod pumps”) and a squeaker **102**. The outer shell **130** is covered with tongue cleaners **136** and brushing bristles **138**. Notably, in the device of FIGS. 1, 2A, and 2B, two diaphragm pumps **106** are provided, but in various embodiments, a larger or smaller number of diaphragm pumps **106** may be provided. For example, FIG. 3 is a top end view of an oral gel delivery device **200** where three diaphragm pumps **106** are installed in the outer shell **230**.

[0039] FIG. 4 is a cross-sectional view of the oral gel delivery device **100** of FIG. 1. As shown therein, the outer shell **130** of the device **100** includes a flexible generally convex member or members **134**, each of which has one or more recessed area that defines a gel pod receiver **132** housing a diaphragm pump **106**. The outer shell **130** and the diaphragm pumps **106** may each respectively be made of a conventional flexible, animal-safe material and preferably provides at least some durability against repeated use by the jaws of an animal. In the illustrated embodiment, the outer shell **130** is surfaced with tongue cleaners

136 and brushing bristles **138**, but in alternative embodiments the outer shell **130** may have a very different appearance to provide visual interest, tactile interest, and/or the like.

[0040] The cross-sectional view of the gel delivery device **100** in FIG. 4 shows the outer shell **130** with a squeaker **102** installed through the shell **130** and the shell's flexible member **134** into a squeaker bellows chamber **104**. The squeaker bellows chamber **104** is formed by the interior cavity created by the outer shell **130** of the gel delivery device **100**. The diaphragm pumps **106** each include a face plate **111** and a back diaphragm **112** that when assembled together form or define the gel pod cavity or pump cavity **114**. The pump cavity **114** is used to hold a predetermined amount, quantity, or volume of oral gel **118**. Exemplary amounts of oral gel **118** includes, without limitation, 0.25ml, 2ml, 3ml, 4ml, and 5ml.

[0041] FIG. 5 is an exploded orthogonal view of the oral gel delivery device **100** of FIG. 1. The outer shell **130** and associated flexible membrane(s) **134** may be formed by one or more sections. The outer shell **130** of the gel delivery device **100** shown in FIG. 5 has two primary sections which may, for example, be manufactured via injection molding and then assembled together. In other embodiments, the outer shell **130** could also be formed with one primary section by a blow molding manufacturing process. FIG. 5 also further illustrates one of the gel pod receiver areas **132** where a diaphragm pump **106** may be inserted. Notably, FIG. 5 shows a preferred embodiment where the diaphragm pump **106** is inserted and permanently connected to the outer shell **130**. In at least some embodiments, this is accomplished via one or more gel pod receiver areas **132** recessed into the flexible member **134** of the outer shell **130**. Each gel pod receiver **132** mates with an assembled diaphragm pump **106** when two sections of the outer shell **130** are assembled, as further described herein below. In other embodiments, one or more of which are detailed below, the diaphragm pump or gel pod is removable and replaceable.

[0042] FIG. 6A is an orthogonal view of one of the diaphragm pumps **106** of the gel delivery device **100** of FIG. 1, and FIG. 6B is an exploded orthogonal view of the diaphragm pump **106** of FIG. 6A. The diaphragm pump **106** includes a face plate **111** which connects to a back diaphragm **112**, thereby forming a pump cavity **114** between the two pieces. The pump cavity **114** is used to hold any of multiple types of oral gel **118** or liquid. The face plate **111** includes a pump coupler **107** and gel pod ejectors **110**. The pump coupler **107** has a baffle **108** so as to direct and manage the flow of oral gel **118**.

[0043] FIG. 6C is a cross-sectional view of the diaphragm pump **106** of FIG. 6A, and FIG. 6D is an enlarged fragmentary cross-sectional view of a portion of the gel delivery device **100** of FIG. 1, showing the fluid path. As shown in FIGS. 6C and 6D, the baffle **108**

is a conical shaped conduit which directs and controls the filling the pump cavity **114** with oral gel **118**. By having an inward funnel-shaped baffle **108**, the oral gel **118** is directed in an inward, one-way direction into the pump cavity **114**. The gel pod ejectors **110** are outward funnel-shaped conduits, so when the diaphragm pumps **106** are operated by a dog **14**, the oral gel **118** is ejected or pumped outward through the ejectors **110**. As perhaps best shown in FIG. 6D, the inverse shapes of the baffle **108** and the gel pod ejectors **110** provides a flow pattern and direction of the oral gel **118** into the pump cavity **114** when filling, and out the gel pod ejectors **110** when in operational use. First, the oral gel **118** enters diaphragm pump **106** through the baffle **108** and fills the pump cavity **114**. When a dog **14** repetitively chews the gel delivery device **100**, the force from the biting is transferred to the back diaphragm **112** through the convex structural member **134**. With the repetitive chewing of dog **14**, the flexible back diaphragm **112** reciprocates back and forth, thus creating a positive displacement pump to pump oral gel **118** or any such fluids out of single or multiple gel pod ejectors **110**. The oral gel or material **118** which can be used in the diaphragm pump **106** may be any liquid or gel with a material viscosity between 1 cps and 100,000 cps, with a preferred viscosity of between 10 cps and 10,000 cps, and can be of any design or formulation known by an Ordinary Artisan.

[0044] FIGS. 7A and 7B are an orthogonal view and a side cross-sectional view, respectively, of an alternate design of a diaphragm pump **206** in accordance with another preferred embodiment of the present invention. The diaphragm pump **206** includes a rigid back plate **212** and a face plate diaphragm **211** which operates the diaphragm pump **206** when depressed. The diaphragm pump **206** also includes a pump coupler **207** and a baffle **208** with an x-shaped valve that is used to direct oral gel **118** into the pump cavity **214**. The face plate diaphragm **211** operates the diaphragm pump **206** when depressed, ejecting oral gel **118** out the gel pod ejectors **210**.

[0045] FIG. 8 is a cross-sectional view of a diaphragm pump **256** in accordance with another preferred embodiment of the present invention. The diaphragm pump **256** in FIG. 8 has a pump coupler **207**, a baffle **208**, and a pump cavity **214**. The pump cavity **214** includes a structural sponge **216**. Similar to FIG. 7A, the diaphragm pump **256** includes a face plate diaphragm **211** and a rigid back plate **212**. The sponge **216** provides additional force or pressure for ejecting the oral gel **118** through the gel pod ejectors **210** when the face plate diaphragm **211** is depressed.

[0046] FIGS. 9 and 10 are an orthogonal view and a front view, respectively, of an oral gel delivery device **300** in accordance with another preferred embodiment of the

present invention. The oral gel delivery device **300** includes one or more diaphragm pumps **306** and a solid gel dispenser body **301**. The solid body **301** can be made with an injection molding, cut-and-sew, part assembly, or other such manufacturing processes known by an Ordinary Artisan. The surface of the solid body **301** may also be covered with tongue cleaners **336** and brushing bristles **338**.

[0047] FIGS. 11 and 12 are an exploded side orthogonal view and a side cross-sectional view, respectively, of the gel delivery device **300** of FIG. 9. As shown in FIG. 11, the solid gel dispenser body **301** includes a female shaped gel pod receiver **332** as part of a snap coupling mechanism. The female gel pod receiver **332** may be formed as part of the gel dispenser body **301** or may be formed separately and embedded or otherwise attached to the gel dispenser body **301**. The diaphragm pump **306** includes a pump coupler **307** and face plate diaphragm **311**. The diaphragm pump **306** also includes a gel pod snap **313** as part of the rigid back plate **312**. The snap **313** acts as a male fastener. In one preferred embodiment, the gel pod snap **313** is permanently attached to or formed as a part of the back plate **312**. In alternative embodiments, the coupling mechanism may consist of a twist lock system, and/or or any other such fastening method known by an Ordinary Artisan used for the purposes described herein. In some embodiments, the diaphragm pump **306** may be removed by “unsnapping” or “uncoupling” the pump **306** from the gel dispenser body **301**, thereby permitting the diaphragm pump **306** to be removed from the oral gel delivery device **300**. In at least some of these embodiments, when a diaphragm pump **306** is removed, it may be replaced with a different diaphragm pump **306** which accommodates a different amount of oral gel **118** to allow for various dosing depending on the oral gel, the size and type of animal, and/or other factors.

[0048] In the embodiments of the various devices described thus far, the diaphragm pumps or gel pods may be filled or refilled with a desired gel or other material. In this regard, FIG. 13 is a side view of the oral gel delivery device **100** of FIG. 1, shown with a gel bottle **20** for filling the device **100**. The user **12** takes the gel delivery device **100** and the oral gel bottle **20** and couples the oral gel bottle nozzle **22** to the pump coupler **107**. The user **12** may then fill the diaphragm pump **106** with oral gel **118** by squeezing the gel **118** into the pod via the baffle **108**, valve, or the like. This is shown in FIG. 14, which is a side partially cross-sectional view of a gel bottle **20** filling the diaphragm pump **106** of FIG. 6C. More particularly, FIG. 14 illustrates the oral gel **118** filling the pump cavity **114**. Once the diaphragm pump **106** is filled with oral gel **118**, the user **12** uncouples oral gel bottle nozzle **22** from the pump coupler **107**. Notably, when the diaphragm pump **106** is filled, the amount

of oral gel **118** in the diaphragm pump **106** may correspond to a prescribed dosage by a veterinarian, thus ensuring the animal consumes the prescribed amount of oral gel **118**.

[0049] FIG. 15 is an illustration of the gel delivery device **100** of FIG. 1 being given to a pet dog **14** by a user **12**, and FIG. 16 is a side view of the gel delivery device **100** of FIG. 1 being held between the teeth of a dog **14**. Notably, as the outer shell **130** is squeezed by the chewing motion of the dog's teeth **16**, the interior components such as the convex structural member **134**, gel pod receiver **132** and concave back diaphragm **112** are actuated in a manner to compress the pump cavity **114**. As a result, oral gel **118** is ejected or pumped through the gel pod ejector **110**. Thus, as the dog **14** chews the gel delivery device **100**, oral gel **118** is ejected or pumped out of the diaphragm pump **106** to the dog's teeth **16** and mouth.

[0050] As shown in FIG. 16, at the same time that oral gel **118** is being ejected or pumped from a diaphragm pump **106**, the chewing motion compressing the outer shell **130**, also causes the squeaker bellows chamber **104** to be compressed, driving air through the squeaker to create a "squeaking" sound **105**. Additionally, when the gel delivery device **100** flexes, the tongue cleaners **136** rub the tongue **18** and gums **17**, thus allowing the device to apply oral gel **118** to the teeth **16**, massage the gums **17**, and squeak more or less simultaneously.

[0051] The outer shell **130** as well as portions of the gel pod receiver **132** are preferably flexible and provide spring resistance against the downward chewing motions of a dog **14**. As a result, the gel delivery device **100** returns to its original shape after compression. As a dog **14** repetitively chews the device **100**, and repeatedly moves his or her mouth open and closed on the device **100**, the result is repetitive oral gel **118** ejection and squeaking sounds **105** notifying the user **12** that the device is being used. Notably, when the animal's jaws operate to compress and release the outer shell **130**, or in some embodiments the solid body **301**, the devices **100,200,300,600,800** tend to rotate naturally in the dog's mouth. As a result, the one or more diaphragm pumps **106,206,306,606,424,524,806** will eject oral gel **118** throughout the mouth area.

[0052] In at least some embodiments, the outer shell **130** or solid body **301** includes tongue cleaners **136,336,936** which are three-dimensional surface features that clean the coating on the upper and lower surface of the dog's tongue **18** and also may aid in cleaning the dog's teeth. The tongue cleaners **136,336,936** can be of any design known by an Ordinary Artisan.

[0053] In at least some embodiments, the outer shell **130** or solid body **301** includes brushing bristles **138,338,938** which are three-dimensional surface features that clean the upper and lower gum line **17** and also clean the dog's teeth **16**. The brushing bristles **138,338,938** can be of any design known by an Ordinary Artisan.

[0054] In some embodiments, the outer shell **130** of the ball-type gel delivery device **100** may be bifurcated or otherwise partitioned such that at least a portion of the shell may be removed to access the squeaker bellows chamber **104** and change out the diaphragm pumps **106**.

[0055] In some preferred embodiments the oral gel delivery device's outer shell **130**, and diaphragm pump **106** are made with a flexible material such as rubber, thermoplastic rubber (TPR) or a thermoplastic elastomer (TPE), or other such flexible material. In other embodiments, the diaphragm pump **106** may alternatively be made of flexible eatable materials such as potato starch, bacon fat, pea protein, and/or other such eatable food ingredients that are flexible after manufacture. For high production, in some embodiments, some or all of the oral gel delivery devices can be made with an injection molding process or other such manufacturing processes known by an Ordinary Artisan.

[0056] In some embodiments, the diaphragm pumps are not refillable, but are filled once during manufacturing and subsequently disposed of or consumed. In this regard, FIGS. 17A and 17B are orthogonal views of two diaphragm pumps **424,524**, of different sizes, that are pre-filled with oral gel **118** at the production facility in accordance with an alternate embodiment of the present invention. FIG. 17C is a cross-sectional view of one of the diaphragm pump of FIG. 17A. The diaphragm pumps **424,524** of FIGS. 17A-C, are designed for one use and filled with oral gel **118** by the original equipment manufacturer (OEM), therefore have no pump coupler. As shown in the diaphragm pumps **424,524**, the pumps are of a specific pre-designed volume (3ml and 1ml) so as to dispense accurate or prescribed amounts of oral gel. Such diaphragm pumps **424,524** serve as an alternate embodiment to the diaphragm pumps **106,206,306** shown in FIGS. 1-14.

[0057] FIG. 18 is a cross-sectional view of a gel delivery device **600** with multiple diaphragm pumps **606**, each with a face plate **611**, sharing a single pump cavity **614**, in accordance with another embodiment of the present invention. The cavity **614** is formed within a solid gel dispenser body **601**. Oral gel **118** is injected into the pump cavity **614** by a common pump coupler **607** located in the solid gel dispenser body **601**.

[0058] FIGS. 19A and 19B are a perspective view and a side cross-sectional view, respectively, of a tube-shaped diaphragm pump **706** in accordance with one or more further

preferred embodiments of the present invention. The tube-shaped diaphragm pump **706** includes a pump coupler **707** and a baffle **708** for receiving oral gel **118**, a pump cavity **714** for holding the oral gel **118**, and gel pod ejectors **710** expelling the oral gel **118** from the pump cavity **714**. Similar to previously describe embodiments, the inward funnel shaped baffle **708** directs the oral gel **118** one-way into the linear pump cavity **714**. The gel pod ejectors **710** are outward funnel shaped conduits, so when the diaphragm pumps **706** are operated by a dog **14**, the oral gel **118** is ejected or pumped outward in the dog's mouth.

[0059] FIGS. 20 and 21 are an exploded orthogonal view and a cross-sectional view, respectively, of a gel delivery device **800** with outer and inner shells **830,831** in accordance with another preferred embodiment of the present invention. The outer shell **830** is similar in many respects to that of the device **100** of FIG. 1 and includes one or more diaphragm pumps **806** and a squeaker **802** and is covered with tongue cleaners **836** and brushing bristles **838**.

[0060] As shown in FIG. 21, the outer shell **830** of the device **800** includes two face plates **811**, each of which includes a pump coupler **807** and gel pod ejectors **810**. The device also includes an inner shell **831**, which may consist of two or more pieces. When assembled, the inner shell **831** has one or more recessed areas **812** which define the back of the gel pod cavity **814** and may be made of a material similar to the back diaphragm **112**. After assembly, the inner shell also creates the squeaker bellows chamber **804**. The outer shell **830** and the inner shell **831** may each respectively be made of a conventional flexible, animal-safe material, and each preferably provides at least some durability against repeated use by the jaws of an animal **14**. In the illustrated embodiment, the outer shell **830** is surfaced with tongue cleaners **836** and brushing bristles **838**, but in alternative embodiments the outer shell **830** may have a very different appearance to provide visual interest, tactile interest, and/or the like. The device **800** can be manufactured with an injection molding process with part assembly or other such manufacturing processes known by an Ordinary Artisan.

[0061] In other embodiments, oral gel delivery devices may have various shapes. For example, FIGS. 22-27 are orthogonal views of a stick-type device **910**, a device **920** with a tug strap **923**, a flying disk device **930**, a plush-type device **940**, a bone-shaped device **950**, and a whimsically-shaped device **960**, respectively, all in accordance with one or more further preferred embodiments of the present invention. In each device, a solid gel dispenser body **911,921,931,941,951,961** includes one or more gel pod receiver areas **132** recessed into the body of the respective device, not shown here but as shown in FIGS. 5 and 11. The

devices **910,920,930,940,950,960** in FIGS. 22-27 are shown with replaceable diaphragm pumps **306** which use the coupling arrangement shown in FIG. 11. However, an oral gel delivery device may be created using any combination of manufacturing techniques and features detailed in FIGS. 1-21, any of the shapes or forms further detailed in FIGS. 22-27, or other such shapes or forms known by an Ordinary Artisan, where diaphragm pumps **106,206,306,424,524,606,806** can be installed or formed.

[0062] The exemplary embodiments detailed in FIGS. 22-27 provide a variety of methods for engaging an animal to chew the toy with the purpose of causing the animal to ingest a prescribed amount of oral gel **118**. As an example, for the device **920** with a tug strap **923**, a user **12** may pull on the tug strap **923** to encourage the dog **14** to play “tug-of-war” with the device **920**, thus forcing the dog **14** into ejecting oral gel **118** to his or her teeth **16** and activating the squeaker **102** (not shown in this view) while playing. As another example, a user **12** can throw the flying disk device **930**, enticing a dog **14** to retrieve the disk **930**, thus gripping it between the dogs **14** teeth ejecting the oral gel **118** into the dog’s mouth. As yet another example, the whimsical-shaped device **960** includes paw handles **964** at the end of the solid gel dispenser body **961** extending therefrom on both sides. A dog **14** may place their paws on the handles **964** and hold the device while chewing. The whimsical-shaped device **960** may also have brushing bristles **938**, tongue cleaners **936** and a squeaker **962**. When the dog **14** chews the device, the dog “brushes” his or her teeth **16**, ejects oral gel **118** into gum line **17** and activates the squeaker **962** while playing. Notably, a portion of the body **961** of the whimsically-shaped device **960** may be solid, while a small squeaker and corresponding bellow chamber may be contained in a portion of the body **961** that is not solid. This device **960** is one example of a solid body **301,921,931,941,951,961** which may be manufactured with a small open area for a squeaker **962** and squeaker below chamber **104**.

[0063] To help enable various volumes of oral gel **118** being administered to different size dogs **14**, the various devices may utilize different numbers of diaphragm pumps in order to provide the desired contact with the dog’s teeth **16** or to provide the right about of gel for the dog to ingest. Each preferred embodiment described herein shows a different number of diaphragm pumps as examples of a variety of configurations.

[0064] FIG. 28 is a flow diagram illustrating a first method of use **1000** of a gel delivery device **100** in accordance with one or more preferred embodiments of the present invention. The user **12** takes the delivery device **100** and oral gel bottle **20** and couples them together with the oral gel bottle nozzle **22** and the pump coupler **107**. Next, the user **12** fills diaphragm pump **106** with oral gel **118**. In this regard, FIG. 14 is a side view of the

diaphragm pump **106** of FIG. 1, illustrating the filling of oral gel **118** to the pump cavity **114**. Once the diaphragm pump **106** is filled with oral gel **118**, the user **12** uncouples the oral gel bottle nozzle **22** and the pump coupler **107**. Finally, when the gel delivery device **100** is completely reassembled, the user **12** gives the device **100** to the dog **14** and the dog **14** operates the device **100** by chewing, thus effectively dispersing oral gel **118** to his or her teeth **16** in the process.

[0065] When a dog's chewing force is applied to the flexible outer shell **130**, such force is transferred to the generally flexible convex member shape **134** where it then deforms the back diaphragm **112** changing the generally concave shape to convex, thus operating the diaphragm pump **106** and ejecting oral gel **118** from the diaphragm pump **106**. The generally flexible convex member shape **134** and the generally concave shape of the pump cavity **114** and back diaphragm **112**, work together as a diaphragm pump and eject oral gel **118** from the diaphragm pump **106**, where the actuator or diaphragm pump is driven by the repetitive chewing motion and force of a dog **14**. The parts, shapes and dimensions of the generally flexible convex member shape **134** and diaphragm pump **106** and pumping system can be of any design known by an Ordinary Artisan.

[0066] FIG. 29 is a flow diagram illustrating a second method of use **2000** of a gel delivery device **100,300,960** in accordance with one or more preferred embodiments of the present invention. The user **12** installs a prefilled diaphragm pump or gel pod **306,424,524** into the gel pod receiver **132,332**. Then the user **12** gives the gel delivery device **100,300,960** to the dog **14** and the dog **14** operates the device **100,300,960** by chewing and thus automatically ejecting oral gel **118** to his or her teeth **16** while simultaneously operating the squeaker bellows chamber **104**, thus sounding the squeaker **102,962**.

[0067] FIG. 30 is a flow diagram illustrating a third method of use **3000** of a gel delivery device **100** in accordance with one or more preferred embodiments of the present invention. The device **100** is given to the dog **14** in a "dry" state, without diaphragm pump **106** filled with oral gel **118**, and the dog **14** cleans their tongue **18**.

[0068] As detailed above, in order to confirm that a dog **14** has chewed the gel delivery device **100** sufficiently to eject all of the prescribed oral gel **118** onto their teeth **16** or into their mouth, a sound detector **11** can be used to detect and count the individual sounds **105** emitted from the squeaker **102**. FIG. 31 is a side view of a gel delivery device **100** being squeezed by dog teeth **16** and emitting a sound **105** detected by a sound detector **11**. A user **12** can track the number of sounds **105** emitted from the gel delivery device **100** to confirm that it is being used correctly by the dog **14**. The sound detector **11** can be programed to

detect sounds **105** and how many individual sounds **105** must be emitted by the gel delivery device **100** to sufficiently and correctly eject the oral gel **118**.

[0069] FIG. 32 is a flow diagram illustrating a fourth method of use **4000** of a gel delivery device **100** in accordance with one or more preferred embodiments of the present invention. Assuming a full diaphragm pump **106**, a user gives the gel delivery device **100** to a dog **14**. Next, though chewing or biting, the dog operates the delivery device **100**. The result is the squeaker **102** to squeaks **105** and the diaphragm pump **106** to eject the oral gel **118**. Next, the detector **11** detects a sound **105**, emitted by the gel delivery device **100**. The detector **11** may then process and or react to the sound **105** with its processors, computer chips, electronics, software and the like. Per FIG. 31, the detector **11** may be in the form of a smart phone, showing the sound **105** in a graphic form on the smart phone's screen. The detector **11** may process and react to sounds **105** utilizing the detector's **11** hardware and software and then provide information and data regarding the use of the gel delivery device **100** with its user interface. The detector **11** may be a smart phone, frequency counter, cymometer or other such device that are known by an Ordinary Artisan or in the industry or art, that may be used for the purposes and devices as described herein.

[0070] The devices, systems, and their various features described herein may be used all together, separately, or in any combination. The devices may be used for gel delivery based on the use of the various components and manufacturing processes of the present invention.

[0071] Devices in accordance with the present invention may be provided commercially in the form of different sizes, and in some cases the different sizes may have different designs. For example, the device **100** of FIG. 1 may be sold for use with larger dogs, while the device **940** of FIG. 25 may be sold for use with smaller dogs.

[0072] The oral gel **118** referenced herein may be a conventional or specially formulated gel, butter, spread, paste, or liquid or any other cleaning or breathe freshener agent suitable for the device described herein and have a material flow viscosity between 1 and 100,000 cps. In some cases, oral gel specially formulated for use with dogs or other pets and animals may be packaged and sold with any of the devices described herein.

[0073] The devices and methods of use described and illustrated herein have generally been set forth for use with dogs, but it will be appreciated that such devices and methods may, in at least some embodiments, be applicable for other types of pets and animals, although appropriate size and material modifications may be necessary depending on the animal type.

[0074] Based on the foregoing information, it will be readily understood by those persons skilled in the art that the present invention is susceptible of broad utility and application. Many embodiments and adaptations of the present invention other than those specifically described herein, as well as many variations, modifications, and equivalent arrangements, will be apparent from or reasonably suggested by the present invention and the foregoing descriptions thereof, without departing from the substance or scope of the present invention.

[0075] Accordingly, while the present invention has been described herein in detail in relation to one or more preferred embodiments, it is to be understood that this disclosure is only illustrative and exemplary of the present invention and is made merely for the purpose of providing a full and enabling disclosure of the invention. The foregoing disclosure is not intended to be construed to limit the present invention or otherwise exclude any such other embodiments, adaptations, variations, modifications or equivalent arrangements; the present invention being limited only by the claims appended hereto and the equivalents thereof.

CLAIMS

What is claimed is:

1. An oral gel delivery device for causing pets to ingest a gel dispensed therefrom, comprising:
 - (a) a body made of an animal-safe material, shaped to be attractive to a pet, and sized to be received in the mouth of the pet;
 - (b) a pet-operated diaphragm pump recessed within the body, the diaphragm pump having:
 - (i) a face plate and a rear wall that together define a cavity, and
 - (ii) a plurality of gel pod ejector structures penetrating the face plate and providing fluid ejection paths from the cavity to the exterior of the device; and
 - (c) a gel or liquid disposed within the cavity;
 - (d) wherein, when the device received in the mouth of the pet and compression is applied by jaws of the pet, the gel or liquid is squeezed or pumped from the cavity, via positive displacement pumping of the gel or liquid, through the gel pod ejector structures and into the mouth of the pet.
2. The oral gel delivery device of Claim 1, wherein the body includes an outer shell and a hollow chamber, and wherein the diaphragm pump is recessed within the outer shell.
3. The oral gel delivery device of Claim 2, wherein the outer shell is flexible, wherein the rear wall of the diaphragm pump is a flexible diaphragm, and wherein compression of the outer shell applies pressure to the flexible diaphragm, thereby causing the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.
4. The oral gel delivery device of Claim 3, wherein the diaphragm pump is a self-contained unit that is contained within a recess in the outer shell.
5. The oral gel delivery device of Claim 4, wherein the diaphragm pump is permanently connected to the outer shell.

6. The oral gel delivery device of Claim 4, wherein the diaphragm pump is removable from the outer shell.
7. The oral gel delivery device of Claim 6, wherein a replacement diaphragm pump may be attached to the outer shell.
8. The oral gel delivery device of Claim 6, wherein the diaphragm pump snaps to the outer shell.
9. The oral gel delivery device of Claim 6, wherein the diaphragm pump twist-locks to the outer shell.
10. The oral gel delivery device of Claim 3, wherein the face plate of the diaphragm pump includes a one-way opening for filling the pump cavity.
11. The oral gel delivery device of Claim 10, wherein the one-way opening includes a valve.
12. The oral gel delivery device of Claim 10, wherein the one-way opening is disposed within a baffle for directing flow of the gel into the opening.
13. The oral gel delivery device of Claim 10, wherein the one-way opening is surrounded by a coupler adapted to interact with a dispensing tip for a gel refill container.
14. The oral gel delivery device of Claim 3, wherein the body further comprises an inner shell, and wherein the inner shell includes a flexible wall that serves as the flexible diaphragm.
15. The oral gel delivery device of Claim 2, wherein the device further comprises a squeaker, and wherein the compression applied by jaws of the pet also causes the squeaker to make a squeaking noise.

16. The oral gel delivery device of Claim 15, wherein the device is part of a system that includes a sound detector that detects the squeaker noise.

17. The oral gel delivery device of Claim 16, wherein the sound detector includes electronics and software that analyze the squeaker noise received thereby and display a graphical representation thereof.

18. The oral gel delivery device of Claim 1, wherein the body is solid.

19. The oral gel delivery device of Claim 1, wherein each of the gel pod ejector structures includes an outwardly-oriented funnel such that gel is funneled out of the cavity when the diaphragm pump is operated by the jaws of the pet.

20. The oral gel delivery device of Claim 1, wherein the device comprises two diaphragm pumps.

21. The oral gel delivery device of Claim 1, wherein the device comprises three or more diaphragm pumps.

22. The oral gel delivery device of Claim 1, wherein the gel has a material viscosity of between 1 cps and 100,000 cps.

23. The oral gel delivery device of Claim 22, wherein the gel has a material viscosity of between 10 cps and 10,000 cps.

24. The oral gel delivery device of Claim 1, wherein the cavity contains a predetermined volume of the gel that is between 0.1ml and 50ml.

25. The oral gel delivery device of Claim 1, wherein the diaphragm pump further comprises a structural sponge to provide additional force of pressure for causing the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.

26. The oral gel delivery device of Claim 1, wherein the face plate of the diaphragm pump is a flexible diaphragm, and wherein compression of the face plate causes the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.

27. The oral gel delivery device of Claim 1, wherein the rear wall of the diaphragm pump is a flexible diaphragm, and wherein compression of the face plate causes the gel to be squeezed or pumped from the cavity through the gel pod ejector structures and into the mouth of the pet.

28. The oral gel delivery device of Claim 1, wherein the diaphragm pump is a positive displacement pump that uses reciprocating action of a flexible diaphragm caused by successive chewing force of an animal that, in turn, flexes and reciprocates the diaphragm, thus actuating the positive displacement pump.

29. The oral gel delivery device of Claim 1, wherein the body has an outer surface that is covered with tongue cleaners, brushing bristles, or both.

30. The oral gel delivery device of Claim 1, wherein the body is in the shape of a ball.

31. The oral gel delivery device of Claim 1, further comprising a tug strap attached to the body.

32. The oral gel delivery device of Claim 1, wherein the body is in the shape of a disk.

33. The oral gel delivery device of Claim 1, wherein the body is in the shape of a plush toy.

34. The oral gel delivery device of Claim 1, wherein the body is in the shape of a bone.

35. The oral gel delivery device of Claim 1, wherein the body is in the shape of a whimsical object.

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X --- Y	US 6,405,681 B1 (WARD WILLIAM A) 18 June 2002; abstract; figures 2, 3, 5; column 3, line 39-column 4, line 67; column 5, lines 12-45	1-14, 18, 19, 25-28, 30, 34 --- 15-17, 22, 23, 31-33
X	US 2018/0295811 A1 (DERTSAKYAN PETROS) 18 October 2018; abstract; figures 3, 5; paragraphs [0024-0025], [0029-0030]	1, 20, 21, 24, 29, 35
Y	US 2007/0015100 A1 (MORRIS LEE M) 18 January 2007; figure 1; paragraph [0046]	15-17
Y	US 2018/0353422 A1 (COLGATE-PALMOLIVE COMPANY) 13 December 2018; paragraphs [0046-0047]	22, 23
Y	US 2002/0073927 A1 (CHAMBERLAIN JEFFREY LYNN) 20 June 2002; figure 2; paragraph [0019]	31
Y	CA 2575372 C (COLGATE PALMOLIVE CO) 08 July 2014; paragraph [24]; figures 1-5	32
Y	US 2010/0147229 A1 (DEFAZIO JUHANI C) 17 June 2010; figure 3, paragraphs [0043-0045]	33
Y	US 2014/0064504 A1 (TSENGAS STEVEN) 06 March 2014; figures 1-6; paragraph [0028]	16, 17
A	US 9,107,390 B1 (ZIGOO LLC) 18 August 2015; entire document	1-35
A	US 2013/0167780 A1 (AXELROD GLEN S.) 04 July 2013; entire document	1-35

☐ Further documents are listed in the continuation of Box C.

☐ See patent family annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"D" document cited by the applicant in the international application

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

02 March 2021 (02.03.2021)

Date of mailing of the international search report

MAR 19 2021
