Abstract: The present invention relates to novel compounds of general formula (I) for use as glucokinase activators in the treatment of diabetes and obesity.
5-0x0-2, 3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid amides and 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid amides for treatment and prevention of Diabetes Type 1 and 2

BACKGROUND OF THE INVENTION

The present invention relates to novel compounds having valuable properties, in particular compounds that can be used for the preparation of medicaments.

The present invention relates to compounds that are useful in the treatment and/or prevention of diseases mediated by deficient levels of glucokinase activity, such as diabetes mellitus, and methods of preparing such compounds. Also provided are methods of treating diseases and disorders characterized by underactivation of glucokinase activity or which can be treated by activating glucokinase, comprising administering an effective amount of a compound of this invention.

The identification of small compounds which specifically activate, regulate and/or modulate signal transduction of glucokinase is therefore desirable and an aim of the present invention. Moreover, aim of this invention was the preparation of new compounds for the prevention and/or treatment of Diabetes Type 1 and 2, obesity, neuropathy and/or nephropathy.

Surprisingly we have found that 5-Oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid amides and 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid amides activate glucokinase; therefore, these compounds are especially suitable for the prevention and treatment of Diabetes Type 1 and 2, obesity, neuropathy and/or nephropathy. It has been found that the compounds according to the invention and salts thereof have very valuable pharmacological properties while being well tolerated.
In particular, they exhibit glucokinase activating effects.
The present invention therefore relates to compounds according to the invention as medicaments and/or medicament active ingredients in the treatment and/or prophylaxis of the said diseases and to the use of compounds according to the invention for the preparation of a pharmaceutical for the treatment and/or prophylaxis of the said diseases and also to a process for the treatment of the said diseases which comprises the administration of one or more compounds according to the invention to a patient in need of such an administration.

The host or patient may belong to any mammal species, for example a primate species, particularly humans; rodents, including mice, rats and hamsters; rabbits; horses, cows, dogs, cats, etc. Animal models are of interest for experimental investigations, where they provide a model for the treatment of a human disease.

Diabetes mellitus (DM) is a progressive disease often associated with obesity characterized by insulin deficiency and insulin resistance or both. The fasting and post-prandial blood glucose is elevated, exposing the patient to acute and chronic complications (micro- and macro-vascular) leading to blindness, kidney failure, heart disease, stroke and amputations. Improving glycemic control has been demonstrated to lower the risk of these complications. Owing to the progressive nature of the disease, an evolving treatment strategy is necessary to maintain glycemic control. There are two forms of diabetes mellitus: type 1, or juvenile diabetes or insulin-dependent diabetes mellitus (IDDM), and type 2, or adult-onset diabetes or non insulin-dependent diabetes mellitus (NIDDM). Type 1 diabetes patients have an absolute insulin insufficiency due to the immunological destruction of pancreatic β cells that synthesize and secrete insulin. Type 2 diabetes is more complex in etiology and is characterized by a relative insulin deficiency, reduced insulin action, and insulin resistance. Early-onset NIDDM or maturity-onset diabetes of the young (MODY) shares many features of the most common form of NIDDM whose onset occurs in the midlife (Rotter et al 1990). A clear mode of
inheritance (autosomal dominant) has been observed for MODY. At least, 3 distinct mutations have been identified in MODY families (Bell et al. 1996).

The importance of Glucokinase (GK) in glucose homeostasis has been demonstrated by the association of GK mutants with diabetes mellitus in humans (MODY-2) and by alteration in glucose metabolism in transgenic mice and gene knock-out mice (Froguel et al. 2003; Bali et al. 1995, Postic et al. 1999).

GK, also known as hexokinase IV or D, is one of four hexokinase isozymes that metabolize glucose to glucose 6-phosphate [Wilson, 2004]. GK is known to be expressed in neural/neuroendocrine cells, hepatocytes and pancreatic cells and plays a central role in whole body homeostasis [Matschinsky et al. 1996; 2004]. GK plays an important role as a glucose sensor for controlling plasma glucose homeostasis by enhancing insulin secretion from pancreatic β-cells and glucose metabolism in the liver but also by increasing GLP1 secretion from L-Cells. β-cells, glucose-sensing in the arcuate (ARC) hypothalamic nucleus may depend on GK to detect a rise in glucose and facilitate glucose-induced-insulin secretion.

The multiple mechanism of action suggests that GK activators will exert their biological effects in diabetic and obese patients by improving the overall body glucose awareness which provides rational expectations that enhancement of GK activity would be a novel therapeutic strategy for metabolic disorders. It is anticipated that GK activators will restore appropriated pancreatic hormones and incretin secretion coupled with a suppression of hepatic glucose production without inducing severe hypoglycemia.

Bibliography

SUMMARY OF THE INVENTION

The invention relates to compounds of the following formula I

\[
\begin{array}{c}
\text{R}^1 \text{ to R}^4 \\

\]

\( X \) denotes O if Y is present, and H or A if Y is not present,

----

denotes a single or double bonding,

R¹⁰ to R¹² denote autonomously from each other: H, A, Ar or Het

A denotes unsubstituted or mono, di or ternary with =S, =NR¹⁰ (imine) and/or =0 (Carboxy) substituted branched or unbranched alkyl with 1-10 C-atoms, where one, two or three CH2 groups are replaced by O, S, SO, SO₂, NH, NAr, NHet and/or by -CH=CH-groups and/or 1-7 H-Atoms by F and/or Cl or cyclic alkyl with 3-7 C-Atoms where 1-7 H-atoms might be replaced by F, Cl, OR¹⁰, SOₙR¹¹ and/or NR¹⁰R¹¹

Het denotes mono- or binuclear saturated or unsaturated or aromatic heterocycle with 1 to 4 N-, O- and/or S-atoms that might be mono or autonomously from each other di-, ternary or quad substituted by A, Hal, Ar, Het, OR\(^{10}\), S(O)\(_{n}\)R\(^{10}\), NR\(^{10}\)R\(^{11}\), NO\(_{2}\), CN, COOR\(^{10}\), CONR\(^{10}\)R\(^{11}\), NR\(^{10}\)COR\(^{11}\), NR\(^{10}\)CONR\(^{11}\)R\(^{12}\), NR\(^{10}\)SO\(_{n}\)R\(^{11}\), CHO, COR\(^{10}\), SO\(_{3}\)H, SO\(_{n}\)NR\(^{10}\)R\(^{11}\), 0-A-NR\(^{10}\)R\(^{11}\), 0-A-CONR\(^{10}\)R\(^{11}\), 0-A-NR\(^{10}\)COR\(^{11}\), O-A-Het, O-A-Ar, A-Ar, A-Het, S(O)\(_{n}\)-A-Het, S(O)\(_{n}\)-A-Ar, =S, =NR\(^{10}\) and/or =O;

Hal denotes F, Cl, Br or I

n is 0, 1 or 2.

In a preferred embodiment the present invention relates to a compound of formula (Ia) below

![Diagram](image)

wherein R\(^{1}\) to R\(^{4}\) and R\(^{6}\) to R\(^{9}\), Het, Hal, n, Ar, A, and R\(^{10}\) to R\(^{12}\) have the meaning as set forth for formula (I) and

R\(^{5}\) denotes H, A, Hal, Ar, Het, OR\(^{10}\), S(O)\(_{n}\)R\(^{10}\), NR\(^{10}\)R\(^{11}\), NO\(_{2}\), CN, COOR\(^{10}\), CONR\(^{10}\)R\(^{11}\), NR\(^{10}\)COR\(^{11}\), NR\(^{10}\)CONR\(^{11}\)R\(^{12}\), NR\(^{10}\)SO\(_{n}\)R\(^{11}\), CHO, COR\(^{10}\), SO\(_{3}\)H, SO\(_{n}\)NR\(^{10}\)R\(^{11}\), 0-A-NR\(^{10}\)R\(^{11}\), 0-A-CONR\(^{10}\)R\(^{11}\), 0-A-NR\(^{10}\)COR\(^{11}\), O-A-Het, O-A-Ar, A-Ar, A-Het, S(O)\(_{n}\)-A-Het, and S(O)\(_{n}\)-A-Ar.
In a further preferred embodiment the present invention relates to a compound of formula (Ib) below

wherein R¹ to R⁴ and R⁶ to R⁹, Het, Hal, n, Ar, A, and R¹⁰ to R¹² have the meaning as set forth for formula (I).

Above and below, the radicals and parameters R¹ to R¹² and n have the meanings indicated for the formula I, unless expressly indicated otherwise.

A denotes alkyl, is unbranched (linear) or branched, and has 1, 2, 3, 4, 5, 6, 7, 8, 9 or 10 C atoms. A preferably denotes methyl, furthermore ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl or tert-butyl, furthermore also pentyl, 1-, 2- or 3-methylbutyl, 1,1-, 1,2- or 2,2-dimethylpropyl, 1-ethylpropyl, hexyl, 1-, 2-, 3- or 4-methylpentyl, 1,1-, 1,2-, 1,3-, 2,2-, 2,3- or 3,3-dimethylbutyl, 1- or 2-ethylbutyl, 1-ethyl-1-methylpropyl, 1-ethyl-2-methylpropyl, 1,1,2- or 1,2,2-trimethylpropyl, further preferably, for example, trifluoromethyl.

A very particularly preferably denotes alkyl having 1, 2, 3, 4, 5 or 6 C atoms, preferably methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, pentyl, hexyl, trifluoromethyl, pentafluoroethyl or 1,1,1-trifluoroethyl.

Moreover, A preferably denotes unbranched or branched alkyl having 1-10 C atoms, in which 1-7 H atoms may be replaced by OH, F and/or Cl. Cycloalkyl preferably denotes cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl or cycloheptyl.

A preferably denotes CH₂ oder CH₂CH₂.
Ar denotes, for example, phenyl, o, m- or p-tolyl, o-, m- or p-ethylphenyl, o-, m- or p-propylphenyl, o-, m- or p-isopropylphenyl, o-, m- or p-tert-butyl phenyl, o-, m- or p-hydroxyphenyl, o-, m- or p-nitrophenyl, o-, m- or p-aminophenyl, o-, m- or p-(N-methylamino)phenyl, o-, m- or p-(N-methylamino-carbonyl)phenyl, o-, m- or p-acetamidophenyl, o-, m- or p-methoxyphenyl, o-, m- or p-ethoxyphenyl, o-, m- or p-ethoxycarbonylphenyl, o-, m- or p-(N,N-dimethylamino)phenyl, o-, m- or p-(N,N-dimethylaminocarbonyl)phenyl, o-, m- or p-(N-ethylamino)phenyl, o-, m- or p-(N,N-diethylamino)phenyl, o-, m- or p-fluorophenyl, o-, m- or p-bromophenyl, o-, m- or p-chlorophenyl, o-, m- or p-(methylsulfonamido)phenyl, o-, m- or p-(methylsulfonyl)phenyl, o-, m- or p-cyanophenyl, o-, m- or p-ureidophenyl, o-, m- or p-formylphenyl, o-, m- or p-acetylphenyl, o-, m- or p-aminosulfonylphenyl, o-, m- or p-carboxyphenyl, o-, m- or p-carboxymethylphenyl, o-, m- or p-carboxymethoxyphenyl, further preferably 2,3-, 2,4-, 2,5-, 2,6-, 3,4- or 3,5-difluorophenyl, 2,3-, 2,4-, 2,5-, 2,6-, 3,4- or 3,5-dichlorophenyl, 2,3-, 2,4-, 2,5-, 2,6-, 3,4- or 3,5-dibromophenyl, 2,4- or 2,5-dinitrophenyl, 2,5- or 3,4-dimethoxyphenyl, 3-nitro-4-chlorophenyl, 3-amino-4-chloro-, 2-amino-3-chloro-, 2-amino-4-chloro-, 2-amino-5-chloro- or 2-amino-6-chlorophenyl, 2-nitro-4-N,N-dimethylamino- or 3-nitro-4-N,N-dimethylaminophenyl, 2,3-diaminophenyl, 2,3,4-, 2,3,5-, 2,3,6-, 2,4,6- or 3,4,5-trichlorophenyl, 2,4,6-trimethoxyphenyl, 2-hydroxy-3,5-dichlorophenyl, p-iodophenyl, 3,6-dichloro-4-aminophenyl, 4-fluoro-3-chlorophenyl, 2-fluoro-4-bromophenyl, 2,5-difluoro-4-bromophenyl, 3-bromo-6-methoxyphenyl, 3-chloro-6-methoxyphenyl, 3-chloro-4-acetamidophenyl, 3-fluoro-4-methoxyphenyl, 3-amino-6-methylphenyl, 3-chloro-4-acetamidophenyl or 2,5-dimethyl-4-chlorophenyl.

Ar preferably denotes phenyl, which is unsubstituted or mono-, di-, tri-, tetra- or pentasubstituted by A, Hal and/or O(CR₆R₇)ₘR₈.

Irrespective of further substitutions, Het denotes, for example, 2- or 3-furyl, 2- or 3-thienyl, 1-, 2- or 3-pyrrolyl, 1-, 2, 4- or 5-imidazolyl, 1-, 3-, 4- or
5-pyrazolyl, 2-, 4- or 5-oxazolyl, 3-, 4- or 5-isoxazolyl, 2-, 4- or 5-thiazolyl, 3-, 4- or 5-isothiazolyl, 2-, 3- or 4-pyridyl, 2-, 4-, 5- or 6-pyrimidinyl, furthermore preferably 1,2,3-triazol-1-, -4- or -5-yl, 1,2,4-triazol-1-, -3- or 5-yl, 1- or 5-tetrazolyl, 1,2,3-oxadiazol-4- or -5-yl, 1,2,4-oxadiazol-3- or -5-yl, 1,3,4-thiadiazol-2- or -5-yl, 1,2,4-thiadiazol-3- or -5-yl, 1,2,3-thiadiazol-4- or -5-yl, 3- or 4-pyridazinyl, pyrazinyl, 1-, 2-, 3-, 4-, 5-, 6- or 7-indolyl, 4- or 5-isoindolyl, 1-, 2-, 4- or 5-benzimidazolyl, 1-, 2-, 3-, 4-, 5-, 6- or 7-indazolyl, 1-, 3-, 4-, 5-, 6- or 7-benzopyrazolyl, 2-, 4-, 5-, 6- or 7-benzoxazolyl, 3-, 4-, 5-, 6- or 7-benzisoxazolyl, 2-, 4-, 5-, 6- or 7-benzothiazolyl, 2-, 4-, 5-, 6- or

The heterocyclic radicals can also be partially or fully hydrogenated. Het can thus also denote, for example, 2,3-dihydro-2-, -3-, -4- or -5-furanyl, 2,5-dihydro-2-, -3-, -4- or -5-furfuryl, tetrahydro-2- or -3-furyl, 1,3-dioxolan-4-yl, tetrahydro-2-or -3-thienyl, 2,3-dihydro-1-, -2-, -3-, -4- or -5-pyrryl, 2,5-dihydro-1-, -2-, -3-, -4- or -5-pyrrol, 1-, 2-, 3-pyrrolidinyl, tetrahydro-1-, -2- or -4-imidazolyl, 2,3-dihydro-1-, -2-, -3-, -4- or -5-pyrazolyl, tetrahydro-1-, -3- or -4-pyrazolyl, 1,4-dihydro-1-, -2-, -3-, -4- or -5-pyridyl, 2,3,4-tetrahydro-1-, -2-, -3-, -4- or -6-pyridyl, 1-, 2-, 3- or 4-piperidinyl, 2-, 3- or 4-morpholinyl, tetrahydro-2-, -3- or -4-pyranyl, 1,4-dioxany1, 1,3-dioxan-2-, -4- or -5-yl, hexahydro-1-, -3- or -4-pyridazinyl, hexahydro-1-, -2-, -4- or -5-pyrimidinyl, 1-, 2- or 3-piperazinyl, 1,2,3,4-tetrahydro-1-, -2-, -3-, -4- or -5-pyrimidinyl, 1-, 2- or 3-piperazine1, 1,2,3,4-tetrahydro-1-, -2-, -3-, -4-, -5-, -6-, -7- or -8-quinolyl, 1,2,3,4-tetrahydro-1-, -2-, -3-, -4-, -5-, -6-, -7- or -8-quinolyl, 2-, 3-, 5-, 6-, 7- or 8-H-benza-1,4-oxazinyl, further preferably 1,3-benzodioxol-5-yl, 1,4-benzodioxan-6-yl, 2,1,3-benzothiadiazol-4- or -5-yl or 2,1,3-benzoxadiazol-5-yl.
2H-1,5-benzodioxepin-6- or -7-yl, furthermore preferably 2,3-dihydrobenzofuranyl or 2,3-dihydro-2-oxofuranyl.

Het preferably denotes a mono- or bicyclic unsaturated or aromatic heterocycle having 1 to 4 N, O and/or S atoms, which may be mono-, di- or trisubstituted by Hal, A and/or (CR₆R₇).

Het particularly preferably denotes pyrazolyl, imidazolyl, triazolyl, tetrazolyl, pyrrolyl, furanyl, thiencyl, thiazolyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, oxazolyl, isoxazolyl, benzo[1,3]dioxolyl, benzimidazolyl, benzo[1,2,5]thiadiazolyl, indolyl, indazolyl, which may be mono-, di- or trisubstituted by Hal, A and/or (CR₆R₇)mCOOR.

It is mostly preferred when R¹ is H, R² is Hal, preferably F or Cl, R³ is Hal, A, Ar or OAr, the Ar at R³ if present preferably substituted with Cl, F, ethyl, phenyl, preferably phenyl substituted with Hal, preferably F, R⁴ to R⁷ preferably are H, R⁸ and R⁹ preferably are H or A, when being A, methyl is being preferred, X preferably is O and Y preferably is H. Het preferably denotes pyridinyl or thiazolyl.

Preferably, the compound is selected from the group consisting of

7.δ-Dichloro-δ-oxo-2.SA 5-tetrahydro-benzotbJoxepine- 4-carboxylic acid pyridine-2-ylamide (Compound No: 1),
8-Fluoro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 2),
8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide (Compound No: 3),
2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 4),
δ-Chloro-δ-oxo-2.3,4,5-tetrahydro-benzolbfcxepine^carboxylic acid pyridin-2-ylamide (Compound No: 5),
11

5-0x0-2,3,4, 5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 6),
8-Chloro-5-oxo-2, 3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 7),
7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 8),
8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 9),
7-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 10),
7-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 11),
7-Methoxy-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 12),
8-(4-Fluoro-phenyl)-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 13),
5-OXO-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 14),
5-Oxo-7-phenoxy-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 15),
8-Chloro-7-fluoro-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 16),
8-Ethyl-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide (Compound No: 17), and
2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide (Compound No: 18)

Comprised are also pharmaceutically usable derivatives, solvates, salts and stereoisomers of the compounds of the present invention including mixtures thereof in all ratios.
The invention also relates to the stereoisomers (including E, Z isomers) and the hydrates and solvates of these compounds. Solvates of the compounds are taken to mean adductions of inert solvent molecules onto the compounds which form owing to their mutual attractive force. Solvates are, for example, mono- or dihydrates or alcoholates.

Pharmaceutically usable derivatives is taken to mean, for example, the salts of the compounds according to the invention and also so-called prodrug compounds.

Prodrug derivatives is taken to mean compounds of the formula I which have been modified, with, for example, alkyl or acyl groups, sugars or oligopeptides and which are rapidly cleaved in the organism to form the active compounds according to the invention.

These also include biodegradable polymer derivatives of the compounds according to the invention, as is described, for example, in Int. J. Pharm. 115, 61-67 (1995).

The expression "effective amount" means the amount of a medicament or pharmaceutical active ingredient which causes a biological or medical response which is sought or aimed at, for example by a researcher or physician, in a tissue, system, animal or human.

In addition, the expression "therapeutically effective amount" means an amount which, compared with a corresponding subject who has not received this amount, has the following consequence:

improved treatment, healing, prevention or elimination of a disease,

syndrome, condition, complaint, disorder or prevention of side effects or also the reduction in the progress of a disease, condition, disorder or side effects or also the reduction in the progress of a disease, condition or disorder.
The expression "therapeutically effective amount" also encompasses the amounts which are effective for increasing normal physiological function.

The invention also relates to mixtures of the compounds of the formula I according to the invention, for example mixtures of two diastereomers, for example in the ratio 1:1, 1:2, 1:3, 1:4, 1:5, 1:10, 1:100 or 1:1000.

These are particularly preferably mixtures of stereoisomeric compounds, z.b enantiomers.

The compounds according to the invention and also the starting materials for their preparation are, in addition, prepared by methods known per se, as described in the literature (for example in the standard works, such as Houben-Weyl, Methoden der organischen Chemie [Methods of Organic Chemistry], Georg-Thieme-Verlag, Stuttgart), to be precise under reaction conditions which are known and suitable for the said reactions. Use can also be made here of variants known per se, which are not mentioned here in greater detail.

If desired, the starting materials can also be formed in situ so that they are not isolated from the reaction mixture, but instead are immediately converted further into the compounds according to the invention.

The starting compounds are generally known. If they are novel, however, they can be prepared by methods known per se.

Compounds of the invention can for example be obtained by reacting compounds of the following formula (II)
wherein $R_1$ to $R_9$, $X$ and $Y$ are as defined for formula (I), and $L_i$ is Cl, Br, I, OH, N$_3$, a reactive esterified OH-group or a diazonium moiety, is reacted with a compound of the following formula (III):

$$L_2\text{N}^+\text{Het}$$

wherein $L_2$ and $L_3$ are independently from one another H or a metal ion, and Het is as defined above for formula (I).

and optionally isolating and/or treating the compound of formula (I) obtained by said reaction with an acid, to obtain the salt thereof.

In general, the compounds of formula (II) and/or formula (III) are new. In any case, they can be prepared according to methods known in the art or analogous to those procedures.

In the compounds of formula (II), $L^1$ is preferably Cl, Br, I, OH, a reactive derivatized OH-moiety, especially a reactive esterified OH-moiety, for example an alkylsulfonyloxy-moiety comprising 1 to 6 carbon atoms (preferably methylsulfonyloxy) or and arylsulfonyloxy-moiety comprising 6 to 10 carbon atoms (preferably phenyl- or p-tolylsulfonyloxy), or diazonium moiety, more preferred Cl, Br or I and even more preferred Cl, or N$_3$.

It is specially preferred if $L^1$ is methoxy.
In the compounds of formula (III), \(L_2\) and/or \(L_3\) is preferably \(\text{H}\) or a moiety which activates the amino group it is bonded to, for example a metal ion. Suitable metal ions are preferably selected from the group consisting of alkaline metal ions, alkaline-earth metal ions and aluminium ions. Especially preferred metal ions are alkaline metal ions, of which Li, Na and K are especially preferred. In case of multi-valent metal ions, the metal ions and the compounds of formula IV form a complex containing one or more compounds of formula IV and one or more metal ions wherein the ratio between compounds of formula IV and metal ions is depending on the valency of the metal ion(s) according to the rules of stoichiometry and/or electroneutrality.

The reaction between the compounds of formula (M) and compounds of formula (III) is preferably carried out in the presence of an acid binding means, for example one or more bases. Suitable acid binding means are known in the art. Preferred as acid binding means are inorganic bases and especially organic bases. Examples for inorganic bases are alkaline or alkaline-earth hydroxides, alkaline or alkaline-earth carbonates and alkaline or alkaline-earth bicarbonates or other salts of a weak acid and alkaline or alkaline-earth metals, preferably of potassium, sodium, calcium or cesium.

Examples for organic bases are triethyl amine, diisopropyl ethyl amine (DIPEA), dimethyl aniline, pyridine or chinoline. If an organic base is used, it is advantageous in general to use a base with a boiling point that is higher than the highest reaction temperature employed during the reaction.

Especially preferred as organic base is diisopropyl ethyl amine.

Reaction times are generally in the range between some minutes and several days, depending on the reactivity of the respective compounds and the respective reaction conditions. Suitable reaction times are readily determinable by methods known in the art, for example reaction monitoring. Based on the reaction temperatures given above, suitable reaction times generally lie in the range 10 min and 24 hrs, preferably 30 min and 12 hrs.
and especially between 45 min and 8 hrs, for example about 1 hr, about 2 hrs, about 4 hrs or about 6 hrs, and the reaction temperature is between about -30° and 140°, normally between -10° and 110°, in particular between about 20° and about 100°.

Preferably, the reaction of the compounds of the formula (II) with the compounds of the formula (III) is carried out in the presence of a suitable solvent, that is preferably inert under the respective reaction conditions. Examples of suitable solvents are hydrocarbons, such as hexane, petroleum ether, benzene, toluene or xylene; chlorinated hydrocarbons, such as thchlorethylene, 1,2-dichloroethane, tetrachloromethane, chloroform or dichloromethane; alcohols, such as methanol, ethanol, isopropanol, n-propanol, n-butanol or tert-butanol; ethers, such as diethyl ether, diisopropyl ether, tetrahydrofuran (THF) or dioxane; glycol ethers, such as ethylene glycol monomethyl or monoethyl ether or ethylene glycol dimethyl ether (diglyme); ketones, such as acetone or butanone; amides, such as acetamide, dimethylacetamide or dimethylformamide (DMF); nitriles, such as acetonitrile; sulfoxides, such as dimethyl sulfoxide (DMSO); nitro compounds, such as nitromethane or nitrobenzene; esters, such as ethyl acetate, or mixtures of the said solvents. Polar solvents are in general preferred. Examples for suitable polar solvents are chlorinated hydrocarbons, alcohols, glycol ethers, nitriles, amides and sulfoxides or mixtures thereof. More preferred are amides, especially dimethylformamide (DMF).

Pharmaceutical salts and other forms
The said compounds according to the invention can be used in their final non-salt form. On the other hand, the present invention also encompasses the use of these compounds in the form of their pharmaceutically acceptable salts, which can be derived from various organic and inorganic acids and bases by procedures known in the art. Pharmaceutically acceptable salt forms of the compounds of the formula I are for the most part prepared by conventional methods. If the compound of the formula I contains a carboxyl
group, one of its suitable salts can be formed by reacting the compound with a suitable base to give the corresponding base-addition salt. Such bases are, for example, alkali metal hydroxides, including potassium hydroxide, sodium hydroxide and lithium hydroxide; alkaline earth metal hydroxides, such as barium hydroxide and calcium hydroxide; alkali metal alkoxides, for example potassium ethoxide and sodium propoxide; and various organic bases, such as piperidine, diethanolamine and N-methylglutamine. The aluminium salts of the compounds of the formula I are likewise included. In the case of certain compounds of the formula I, acid-addition salts can be formed by treating these compounds with pharmaceutically acceptable organic and inorganic acids, for example hydrogen halides, such as hydrogen chloride, hydrogen bromide or hydrogen iodide, other mineral acids and corresponding salts thereof, such as sulfate, nitrate or phosphate and the like, and alkyl- and monoarylsulfonates, such as ethanesulfonate, toluenesulfonate and benzenesulfonate, and other organic acids and corresponding salts thereof, such as acetate, trifluoroacetate, tartrate, maleate, succinate, citrate, benzoate, salicylate, ascorbate and the like. Accordingly, pharmaceutically acceptable acid-addition salts of the compounds of the formula I include the following: acetate, adipate, alginate, arginate, aspartate, benzoate, benzene-sulfonate (besylate), bisulfate, bisulfite, bromide, butyrate, camphorate, camphorsulfonate, caprylate, chloride, chlorobenzoate, citrate, cyclopentane-propionate, digluconate, dihydrogenphosphate, dinitrobenzoate, dodecyl-sulfate, ethanesulfonate, fumarate, galactarate (from mucic acid), galacturonate, glucoheptanoate, gluconate, glutamate, glycerophosphate, hemi-succinate, hemisulfate, heptanoate, hexanoate, hippurate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, iodide, isethionate, isobutyrate, lactate, lactobionate, malate, maleate, malonate, mandelate, metaphosphate, methanesulfonate, methylbenzoate, monohydrogenphophate, 2-naphthalenesulfonate, nicotinate, nitrate, oxalate, oleate, palmoate, pectinate, persulfate, phenylacetate, 3-phenyipropionate, phosphate, phosphonate, phthalate, but this does not represent a restriction.
Furthermore, the base salts of the compounds according to the invention include aluminium, ammonium, calcium, copper, iron(III), iron(II), lithium, magnesium, manganese(III), manganese(II), potassium, sodium and zinc salts, but this is not intended to represent a restriction. Of the above-mentioned salts, preference is given to ammonium; the alkali metal salts sodium and potassium, and the alkaline earth metal salts calcium and magnesium. Salts of the compounds of the formula I which are derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary and tertiary amines, substituted amines, also including naturally occurring substituted amines, cyclic amines, and basic ion exchanger resins, for example arginine, betaine, caffeine, chloroprocaine, choline, N,N'-dibenzylethlenediamine (benzathine), dicyclohexylamine, diethanolamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydabamine, isopropylamine, lidocaine, lysine, meglumine, N-methyl-D-glucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethanolamine, triethylamine, trimethylamine, tripropylamine and tris(hydroxymethyl)methylamine (tromethamine), but this is not intended to represent a restriction.

Compounds of the present invention which contain basic nitrogen-containing groups can be quaternised using agents such as (Ci-C₄)alkyl halides, for example methyl, ethyl, isopropyl and tert-butyl chloride, bromide and iodide; di(C₆-C₄)alkyl sulfates, for example dimethyl, diethyl and diamyl sulfate; (Ci₀-C₁₈)alkyl halides, for example decyl, dodecyl, lauryl, myristyl and stearyl chloride, bromide and iodide; and aryl(Ci-C₄)alkyl halides, for example benzyl chloride and phenethyl bromide. Both water- and oil-soluble compounds according to the invention can be prepared using such salts.

The above-mentioned pharmaceutical salts which are preferred include acetate, trifluoroacetate, besylate, citrate, fumarate, gluconate, hemisuccinate, hippurate, hydrochloride, hydrobromide, isethionate, mandelate,
meglumine, nitrate, oleate, phosphonate, pivalate, sodium phosphate, stearate, sulfate, subsalicylate, tartrate, thiomalate, tosylate and tromethamine, but this is not intended to represent a restriction.

The acid-addition salts of basic compounds of the formula I are prepared by bringing the free base form into contact with a sufficient amount of the desired acid, causing the formation of the salt in a conventional manner. The free base can be regenerated by bringing the salt form into contact with a base and isolating the free base in a conventional manner. The free base forms differ in a certain respect from the corresponding salt forms thereof with respect to certain physical properties, such as solubility in polar solvents; for the purposes of the invention, however, the salts otherwise correspond to the respective free base forms thereof.

As mentioned, the pharmaceutically acceptable base-addition salts of the compounds of the formula I are formed with metals or amines, such as alkali metals and alkaline earth metals or organic amines. Preferred metals are sodium, potassium, magnesium and calcium. Preferred organic amines are N,N'-dibenzylethlenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, N-methyl-D-glucamine and procaine.

The base-addition salts of acidic compounds according to the invention are prepared by bringing the free acid form into contact with a sufficient amount of the desired base, causing the formation of the salt in a conventional manner. The free acid can be regenerated by bringing the salt form into contact with an acid and isolating the free acid in a conventional manner. The free acid forms differ in a certain respect from the corresponding salt forms thereof with respect to certain physical properties, such as solubility in polar solvents; for the purposes of the invention, however, the salts otherwise correspond to the respective free acid forms thereof.
If a compound according to the invention contains more than one group which is capable of forming pharmaceutically acceptable salts of this type, the invention also encompasses multiple salts. Typical multiple salt forms include, for example, bitartrate, diacetate, difumarate, dimeglumine, diphasphate, disodium and trihydrochloride, but this is not intended to represent a restriction.

With regard to that stated above, it can be seen that the expression "pharmaceutically acceptable salt" in the present connection is taken to mean an active ingredient which comprises a compound of the formula I in the form of one of its salts, in particular if this salt form imparts improved pharmacokinetic properties on the active ingredient compared with the free form of the active ingredient or any other salt form of the active ingredient used earlier. The pharmaceutically acceptable salt form of the active ingredient can also provide this active ingredient for the first time with a desired pharmacokinetic property which it did not have earlier and can even have a positive influence on the pharmacodynamics of this active ingredient with respect to its therapeutic efficacy in the body.

Compounds of the formula I according to the invention may be chiral owing to their molecular structure and may accordingly occur in various enantiomeric forms. They can therefore exist in racemic or in optically active form.

Since the pharmaceutical activity of the racemates or stereoisomers of the compounds according to the invention may differ, it may be desirable to use the enantiomers. In these cases, the end product or even the intermediates can be separated into enantiomeric compounds by chemical or physical measures known to the person skilled in the art or even employed as such in the synthesis.

in the case of racemic amines, diastereomers are formed from the mixture by reaction with an optically active resolving agent. Examples of suitable resolving agents are optically active acids, such as the R and S forms of
tartaric acid, diacetyltartaric acid, dibenzoyltartaric acid, mandelic acid, malic acid, lactic acid, suitably N-protected amino acids (for example N-benzyolproline or N-benzenesulfonylproline), or the various optically active camphorsulfonic acids. Also advantageous is chromatographic enantiomer resolution with the aid of an optically active resolving agent (for example dinitrobenzoylphenylglycine, cellulose triacetate or other derivatives of carbohydrates or chirally derivatised methacrylate polymers immobilised on silica gel). Suitable eluents for this purpose are aqueous or alcoholic solvent mixtures, such as, for example, hexane/isopropanol/ acetonitrile, for example in the ratio 82:15:3.

The invention furthermore relates to the use of the compounds and/or physiologically acceptable salts thereof for the preparation of a medicament (pharmaceutical composition), in particular by non-chemical methods. They can be converted into a suitable dosage form here together with at least one solid, liquid and/or semi-liquid excipient or adjuvant and, if desired, in combination with one or more further active ingredients.

The invention furthermore relates to medicaments comprising at least one compound according to the invention and/or pharmaceutically usable derivatives, solvates and stereoisomers thereof, including mixtures thereof in all ratios, and optionally excipients and/or adjuvants.

Pharmaceutical formulations can be administered in the form of dosage units which comprise a predetermined amount of active ingredient per dosage unit. Such a unit can comprise, for example, 0.5 mg to 1 g, preferably 1 mg to 700 mg, particularly preferably 5 mg to 100 mg, of a compound according to the invention, depending on the disease condition treated, the method of administration and the age, weight and condition of the patient, or pharmaceutical formulations can be administered in the form of dosage units which comprise a predetermined amount of active ingredient per dosage unit. Preferred dosage unit formulations are those which comprise a daily dose or
part-dose, as indicated above, or a corresponding fraction thereof of an active ingredient. Furthermore, pharmaceutical formulations of this type can be prepared using a process which is generally known in the pharmaceutical art.

Pharmaceutical formulations can be adapted for administration via any desired suitable method, for example by oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual or transdermal), vaginal or parenteral (including subcutaneous, intramuscular, intravenous or intradermal) methods. Such formulations can be prepared using all processes known in the pharmaceutical art by, for example, combining the active ingredient with the excipient(s) or adjuvant(s).

Pharmaceutical formulations adapted for oral administration can be administered as separate units, such as, for example, capsules or tablets; powders or granules; solutions or suspensions in aqueous or non-aqueous liquids; edible foams or foam foods; or oil-in-water liquid emulsions or water-in-oil liquid emulsions.

Thus, for example, in the case of oral administration in the form of a tablet or capsule, the active-ingredient component can be combined with an oral, non-toxic and pharmaceutically acceptable inert excipient, such as, for example, ethanol, glycerol, water and the like. Powders are prepared by comminuting the compound to a suitable fine size and mixing it with a pharmaceutical excipient comminuted in a similar manner, such as, for example, an edible carbohydrate, such as, for example, starch or mannitol. A flavour, preservative, dispersant and dye may likewise be present.

Capsules are produced by preparing a powder mixture as described above and filling shaped gelatine shells therewith. Glidants and lubricants, such as, for example, highly disperse silicic acid, talc, magnesium stearate, calcium stearate or polyethylene glycol in solid form, can be added to the powder mixture before the filling operation. A disintegrant or solubiliser, such as, for
example, agar-agar, calcium carbonate or sodium carbonate, may likewise be added in order to improve the availability of the medicament after the capsule has been taken.

In addition, if desired or necessary, suitable binders, lubricants and disintegrants as well as dyes can likewise be incorporated into the mixture. Suitable binders include starch, gelatine, natural sugars, such as, for example, glucose or beta-lactose, sweeteners made from maize, natural and synthetic rubber, such as, for example, acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. The lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. The disintegrants include, without being restricted thereto, starch, methylcellulose, agar, bentonite, xanthan gum and the like.

The tablets are formulated by, for example, preparing a powder mixture, granulating or dry-pressing the mixture, adding a lubricant and a disintegrant and pressing the entire mixture to give tablets. A powder mixture is prepared by mixing the compound comminuted in a suitable manner with a diluent or a base, as described above, and optionally with a binder, such as, for example, carboxymethylcellulose, an alginate, gelatine or polyvinylpyrrolidone, a dissolution retardant, such as, for example, paraffin, an absorption accelerator, such as, for example, a quaternary salt, and/or an absorbent, such as, for example, bentonite, kaolin or dicalcium phosphate. The powder mixture can be granulated by wetting it with a binder, such as, for example, syrup, starch paste, acacia mucilage or solutions of cellulose or polymer materials and pressing it through a sieve. As an alternative to granulation, the powder mixture can be run through a tableting machine, giving lumps of non-uniform shape which are broken up to form granules. The granules can be lubricated by addition of stearic acid, a stearate salt, talc or mineral oil in order to prevent sticking to the tablet casting moulds. The lubricated mixture is then pressed to give tablets. The compounds according to the invention can also be combined with a free-flowing inert excipient and then pressed...
directly to give tablets without carrying out the granulation or dry-pressing steps. A transparent or opaque protective layer consisting of a shellac sealing layer, a layer of sugar or polymer material and a gloss layer of wax may be present. Dyes can be added to these coatings in order to be able to differentiate between different dosage units.

Oral liquids, such as, for example, solution, syrups and elixirs, can be prepared in the form of dosage units so that a given quantity comprises a pre-specified amount of the compounds. Syrups can be prepared by dissolving the compound in an aqueous solution with a suitable flavour, while elixirs are prepared using a non-toxic alcoholic vehicle. Suspensions can be formulated by dispersion of the compound in a non-toxic vehicle. Solubilisers and emulsifiers, such as, for example, ethoxylated isostearyl alcohols and polyoxyethylene sorbitol ethers, preservatives, flavour additives, such as, for example, peppermint oil or natural sweeteners or saccharin, or other artificial sweeteners and the like, can likewise be added.

The dosage unit formulations for oral administration can, if desired, be encapsulated in microcapsules. The formulation can also be prepared in such a way that the release is extended or retarded, such as, for example, by coating or embedding of particulate material in polymers, wax and the like.

The compounds according to the invention and salts, solvates and physiologically functional derivatives thereof can also be administered in the form of liposome delivery systems, such as, for example, small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from various phospholipids, such as, for example, cholesterol, stearylamine or phosphatidylcholines.

The compounds according to the invention and the salts, solvates and physiologically functional derivatives thereof can also be delivered using monoclonal antibodies as individual carriers to which the compound mole-
cules are coupled. The compounds can also be coupled to soluble polymers as targeted medicament carriers. Such polymers may encompass polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamido-phenol, polyhydroxyethylaspartamidophenol or polyethylene oxide polylysine, substituted by palmitoyl radicals. The compounds may furthermore be coupled to a class of biodegradable polymers which are suitable for achieving controlled release of a medicament, for example polylactic acid, poly-epsilon-caprolactone, polyhydroxybutyric acid, polyorthoesters, poly-acetals, polydihydroxypyrans, polycyanoacrylates and crosslinked or amphipathic block copolymers of hydrogels.

Pharmaceutical formulations adapted for transdermal administration can be administered as independent plasters for extended, close contact with the epidermis of the recipient. Thus, for example, the active ingredient can be delivered from the plaster by iontophoresis, as described in general terms in Pharmaceutical Research, 3(6), 318 (1986).

Pharmaceutical compounds adapted for topical administration can be formulated as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols or oils.

For the treatment of the eye or other external tissue, for example mouth and skin, the formulations are preferably applied as topical ointment or cream. In the case of formulation to give an ointment, the active ingredient can be employed either with a paraffinic or a water-miscible cream base. Alternatively, the active ingredient can be formulated to give a cream with an oil-in-water cream base or a water-in-oil base.

Pharmaceutical formulations adapted for topical application to the eye include eye drops, in which the active ingredient is dissolved or suspended in a suitable carrier, in particular an aqueous solvent.
Pharmaceutical formulations adapted for topical application in the mouth encompass lozenges, pastilles and mouthwashes.

Pharmaceutical formulations adapted for rectal administration can be administered in the form of suppositories or enemas.

Pharmaceutical formulations adapted for nasal administration in which the carrier substance is a solid comprise a coarse powder having a particle size, for example, in the range 20-500 microns, which is administered in the manner in which snuff is taken, i.e. by rapid inhalation via the nasal passages from a container containing the powder held close to the nose. Suitable formulations for administration as nasal spray or nose drops with a liquid as carrier substance encompass active-ingredient solutions in water or oil.

Pharmaceutical formulations adapted for administration by inhalation encompass finely particulate dusts or mists, which can be generated by various types of pressurised dispensers with aerosols, nebulisers or insufflators.

Pharmaceutical formulations adapted for vaginal administration can be administered as pessaries, tampons, creams, gels, pastes, foams or spray formulations.

Pharmaceutical formulations adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions comprising antioxidants, buffers, bacteriostatics and solutes, by means of which the formulation is rendered isotonic with the blood of the recipient to be treated; and aqueous and non-aqueous sterile suspensions, which may comprise suspension media and thickeners. The formulations can be administered in single-dose or multidose containers, for example sealed ampoules and vials, and stored in freeze-dried (lyophilised) state, so that only the addition of the sterile carrier liquid, for example water for injection purposes, immediately before use is necessary.
Injection solutions and suspensions prepared in accordance with the recipe can be prepared from sterile powders, granules and tablets.

It goes without saying that, in addition to the above particularly mentioned constituents, the formulations may also comprise other agents usual in the art with respect to the particular type of formulation; thus, for example, formulations which are suitable for oral administration may comprise flavours.

A therapeutically effective amount of a compound of the present invention depends on a number of factors, including, for example, the age and weight of the human or animal, the precise disease condition which requires treatment, and its severity, the nature of the formulation and the method of administration, and is ultimately determined by the treating doctor or vet. However, an effective amount of a compound according to the invention is generally in the range from 0.1 to 100 mg/kg of body weight of the recipient (mammal) per day and particularly typically in the range from 1 to 10 mg/kg of body weight per day. Thus, the actual amount per day for an adult mammal weighing 70 kg is usually between 70 and 700 mg, where this amount can be administered as an individual dose per day or usually in a series of part-doses (such as, for example, two, three, four, five or six) per day, so that the total daily dose is the same. An effective amount of a salt or solvate or of a physiologically functional derivative thereof can be determined as the fraction of the effective amount of the compound according to the invention per se. It can be assumed that similar doses are suitable for the treatment of other conditions mentioned above.

The invention furthermore relates to medicaments comprising at least one compound according to the invention and/or pharmaceutically usable derivatives, solvates and stereoisomers thereof, including mixtures thereof in all ratios, and at least one further medicament active ingredient.
Moreover the invention relates to medicaments comprising at least one compound selected from the group.

The invention also relates to a set (kit) consisting of separate packs of:

(a) an effective amount of a compound according to the invention and/or pharmaceutically usable derivatives, solvates and stereoisomers thereof, including mixtures thereof in all ratios, and

(b) an effective amount of a further medicament active ingredient.

The set comprises suitable containers, such as boxes, individual bottles, bags or ampoules. The set may, for example, comprise separate ampoules, each containing an effective amount of a compound according to the invention and/or pharmaceutically usable derivatives, solvates and stereoisomers thereof, including mixtures thereof in all ratios, and an effective amount of a further medicament active ingredient in dissolved or lyophilised form.

USE

The present compounds are suitable as pharmaceutical active ingredients for mammals, in particular for humans, in the treatment of Diabetes Type 1 and 2, obesity, neuropathy and/or nephropathy.

The invention thus relates to the use of compounds according to Claim 1 and to pharmaceutically usable derivatives, solvates and stereoisomers, including mixtures thereof in all ratios, for the preparation of a medicament for the treatment of Diabetes Type 1 and 2, obesity, neuropathy and/or nephropathy.

The compounds of the present invention can be used as prophylactics or therapeutic agents for treating diseases or disorders mediated by deficient levels of glucokinase activity or which can be treated by activating glucokinase, including, but not limited to, diabetes mellitus, impaired glucose metabolism, etc.
tolerance, IFG (impaired fasting glucose) and IFG (impaired fasting glycemia), as well as other diseases and disorders such as those discussed below.

Furthermore, the compounds of the present invention can be also used to prevent the progression of the borderline type, impaired glucose tolerance, IFG (impaired fasting glucose) or IFG (impaired fasting glycemia) to diabetes mellitus.

The compounds of the present invention can be also used as prophylactics or therapeutic agents of diabetic complications such as, but not limited to, neuropathy, nephropathy, retinopathy, cataract, macroangiopathy, osteopenia, diabetic hyperosmolar coma), infectious diseases (e.g., respiratory infection, urinary tract infection, gastrointestinal tract infection, dermal soft tissue infection, lower limb infection etc.), diabetic gangrene, xerostomia, decreased sense of hearing, cerebrovascular disease, peripheral circulatory disturbance, etc.

The compounds of the present invention can be also used as prophylactics or therapeutic agents in the treatment of diseases and disorders such as, but not limited to, obesity, metabolic syndrome (syndrome X), hyperinsulinemia, hyperinsulinemia-induced sensory disorder, dyslipoproteinemia (abnormal lipoproteins in the blood) including diabetic dyslipidemia, hyperlipidemia, hyperlipoproteinemia (excess of lipoproteins in the blood) including type I, II-a (hypercholesterolemia), II-b, III, IV (hypertriglyceridemia) and V (hypertriglyceridemia), low HDL levels, high LDL levels, atherosclerosis and its sequelae, vascular restenosis, neurodegenerative disease, depression, CNS disorders, liver steatosis, osteoporosis, hypertension, renal diseases (e.g., diabetic nephropathy, glomerular nephritis, glomerulosclerosis, nephrotic syndrome, hypertensive nephrosclerosis, terminal renal disorder etc.), myocardial infarction, angina pectoris, and cerebrovascular disease (e.g., cerebral infarction, cerebral apoplexy).
The compounds of the present invention can be also used as prophylactics or therapeutic agents in the treatment of diseases and disorders such as, but not limited to, osteoporosis, fatty liver, hypertension, insulin resistant syndrome, inflammatory diseases (e.g., chronic rheumatoid arthritis, spondylitis deformans, osteoarthritis, lumbago, gout, postoperative or traumatic inflammation, remission of swelling, neuralgia, pharyngolaryngitis, cystitis, hepatitis (including non-alcoholic steatohepatitis), pneumonia, inflammatory colitis, ulcerative colitis), pancreatitis, visceral obesity syndrome, cachexia (e.g., carcinomatous cachexia, tuberculous cachexia, diabetic cachexia, hemopathic cachexia, endocrinopathic cachexia, infectious cachexia, cachexia induced by acquired immunodeficiency syndrome), polycystic ovary syndrome, muscular dystrophy, tumor (e.g., leukemia, breast cancer, prostate cancer, skin cancer etc.), irritable bowel syndrome, acute or chronic diarrhea, spondylitis deformans, osteoarthritis, remission of swelling, neuralgia, pharyngolaryngitis, cystitis, SIDS, and the like.

The compounds of the present invention can be used in combination with one or more additional drugs such as described below. The dose of the second drug can be appropriately selected based on a clinically employed dose. The proportion of the compound of formula I and the second drug can be appropriately determined according to the administration subject, the administration route, the target disease, the clinical condition, the combination, and other factors. In cases where the administration subject is a human, for instance, the second drug may be used in an amount of 0.01 to 100 parts by weight per part by weight of the compound of formula I.

The second compound of the pharmaceutical combination formulation or dosing regimen preferably has complementary activities to the compound of formula I such that they do not adversely affect each other. Such drugs are suitably present in combination in amounts that are effective for the purpose intended. Accordingly, another aspect of the present invention provides a
composition comprising a compound of formula I, or a solvate, metabolite, or pharmaceutically acceptable salt or prodrug thereof, in combination with a second drug, such as described herein.

The compound of formula I and the additional pharmaceutically active agent(s) may be administered together in a unitary pharmaceutical composition or separately and, when administered separately this may occur simultaneously or sequentially in any order. Such sequential administration may be close in time or remote in time. The amounts of the compound of formula I and the second agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect.

The combination therapy may provide "synergy" and prove "synergistic", i.e., the effect achieved when the active ingredients used together is greater than the sum of the effects that results from using the compounds separately. A synergistic effect may be attained when the active ingredients are: (1) co-formulated and administered or delivered simultaneously in a combined, unit dosage formulation; (2) delivered by alternation or in parallel as separate formulations; or (3) by some other regimen. When delivered in alternation therapy, a synergistic effect may be attained when the compounds are administered or delivered sequentially, e.g., by different injections in separate syringes. In general, during alternation therapy, an effective dosage of each active ingredient is administered sequentially, i.e., serially, whereas in combination therapy, effective dosages of two or more active ingredients are administered together.

The compounds of the present invention can be used, for example in combination with additional drug(s) such as a therapeutic agent for diabetes mellitus, and/or a therapeutic agent for diabetic complications, as defined above.
Examples of known therapeutic agents for diabetes mellitus which can be used in combination with a compound of formula I include insulin preparations (e.g., animal insulin preparations extracted from the bovine or swine pancreas; human insulin preparations synthesized by a genetic engineering technique using Escherichia coli or a yeast), a fragment of insulin or derivatives thereof (e.g., INS-i), agents for improving insulin resistance (e.g., pioglitazone hydrochloride, troglitazone, rosiglitazone or its maleate, GI-262570, JTT-50 1, MCC-555, YM-440, KRP-297, CS-Oil, FK-614), alpha-glucosidase inhibitors (e.g., voglibose, acarbose, miglitol, emiglitate), biguanides (e.g., phenformin, metformin, buformin), insulin secretagogues [sulfonylureas (e.g., tolbutamide, glibenclamide, gliclazide, chlorpropamide, tolazamide, acetohexamide, glyclopyramide, glimepiride, glipizide, glybuzole), repaglinide, nateglinide, mitiglinide or its calcium salthydrate, GLP-U, dipeptidylpeptidase IV inhibitors (e.g., NVP-DPP-278, PT-100), beta-3 agonists (e.g., CL-3 16243, SR-5861 1-A, UL-TG-307, SB-226552, AJ-9677, BMS-I96085, AZ-40140, etc.), amylin agonists (e.g., pramlintide), phosphotyrosine phosphatase inhibitors (e.g., vanadic acid), gluconeogenesis inhibitors (e.g., glycogen phosphorylase inhibitors, glucose-6-phosphatase inhibitors, glucagon antagonists), SGLT (sodium-glucose cotransporter) inhibitors (e.g., T-1095), and the like.

Examples of known therapeutic agents for diabetic complications include aldose reductase inhibitors (e.g., tolrestat, epairestat, zenarestat, zopobestat, minairestat, fidarestat (SNK-860), CT-i 12), neurotrophic factors (e.g., NGF, NT-3, BDNF), neurotrophic factor production secretion promoters, PKC inhibitors (e.g., LY-333531), AGE inhibitors (e.g., ALT946, pimagedine, pyratoxathine, N-phenacylthiazolium bromide (ALT766), EXO-226), active oxygen scavengers (e.g., thiocic acid), and cerebral vasodilators (e.g., tiapuride, mexiletine).

The compounds of the present invention can also be used, for example in combination with antihyperlipidemic agents. Epidemiological evidence has
firmly established hyperlipidemia as a primary risk factor in causing cardiovascular disease (CVD) due to atherosclerosis. In recent years, emphasis has been placed on lowering plasma cholesterol levels, and low density lipoprotein cholesterol in particular, as an essential step in prevention of CVD.

Cardiovascular disease is especially prevalent among diabetic subjects, at least in part because of the existence of multiple independent risk factors in this population. Successful treatment of hyperlipidemia in the general population, and in diabetic subjects in particular, is therefore of exceptional medical importance. Examples of antihyperlipidemic agents include statin compounds which are cholesterol synthesis inhibitors (e.g., cerivastatin, pravastatin, simvastatin, lovastatin, atorvastatin, fluvastatin, itavastatin or their salts, etc.), squalene synthase inhibitors or fibrate compounds (e.g., bezafibrate, clofibrate, simfibrate, clinofibrate) having a triglyceride lowering action and the like.

The compounds of the present invention can also be used, for example in combination with hypotensive agents. Hypertension has been associated with elevated blood insulin levels, a condition known as hyperinsulinemia. Insulin, a peptide hormone whose primary actions are to promote glucose utilization, protein synthesis and the formation and storage of neutral lipids, also acts to promote vascular cell growth and increase renal sodium retention, among other things. These latter functions can be accomplished without affecting glucose levels and are known causes of hypertension. Peripheral vasculature growth, for example, can cause constriction of peripheral capillaries, while sodium retention increases blood volume. Thus, the lowering of insulin levels in hyperinsulinemias can prevent abnormal vascular growth and renal sodium retention caused by high insulin levels and thereby alleviates hypertension. Examples of hypotensive agents include angiotensin converting enzyme inhibitors (e.g., captopril, enalapril, delapril), angiotensin II antagonists (e.g., candesartan cilexetil, losartan, eprosartan,
vaisantan, termisartan, irbesartan, tasosartan), calcium antagonists (e.g., manidipine, nifedipine, nicardipine, amlodipine, efonidipine), and clonidine.

The compounds of the present invention can be used in combination with antiobesity agents. The term "obesity" implies an excess of adipose tissue. Obesity is a well-known risk factor for the development of many very common diseases such as diabetes, atherosclerosis, and hypertension. To some extent appetite is controlled by discrete areas in the hypothalamus: a feeding centre in the ventrolateral nucleus of the hypothalamus (VLH) and a satiety centre in the ventromedial hypothalamus (VMH). The cerebral cortex receives positive signals from the feeding center that stimulate eating, and the satiety center modulates this process by sending inhibitory impulses to the feeding center. Several regulatory processes may influence these hypothalamic centers. The satiety center may be activated by the increases in plasma glucose and/or insulin that follow a meal. Examples of antiobesity agents include antiobesity drugs acting on the central nervous system (e.g., dextfenfluramine, fenfluramine, phentermine, sibutramine, anfepramon, dexamphetamine, mazindol, phenyipropanolamine, clobenzorex), pancreatic lipase inhibitors (e.g. orlistat), beta-3 agonists (e.g., CL-3 16243, SR-5861 1-A, UL-TG-307, SB-226552, AJ-9677, BMS-196085, AZ-40140), anorectic peptides (e.g., leptin, CNTF (Ciliary Neurotrophic Factor) and cholecystokinin agonists (e.g. lintitript, FPL-1 5849).

**Examples**

The following examples are meant to illustrate the invention and must not be construed to be limiting the invention and the scope of protection conferred by what is defined in the claims in any respect.

**ASSAYS**

Glucokinase activation screening assay
GK activity (human or rat enzyme) is measured by a coupled enzyme assay using pyruvate kinase (PK) and lactate dehydrogenase (LDH) as coupling enzymes. GK activity is calculated from the decline in NADH monitored photometrically with a microtiter plate (MTP) reader at 340 nm.

For screening purposes, the GK assay is routinely run in a 384-MTP format, in a total volume of 33 µl/well. 10 µl of the ATP-regeneration solution (in HEPES-buffer*, pH 7.0, 6.73 U/ml pyruvate kinase, 6.8 U/ml lactate dehydrogenase) and 10 µl of the glucokinase-/glucose solution (15 µg/ml, 6.6 mM glucose in HEPES-buffer*, pH 7.0; the concentration of the glucose stock-solution was 660 mM in Millipore H₂O) were mixed together with 3 µl of a 10 % DMSO solution (in HEPES-buffer*, pH 7.0) containing 3.3-fold the amounts of the compounds to achieve final compound concentrations in the range between 1 nM to 30 µM (sometimes 300 µM) in the assay solution (s. below). The solutions were mixed for 5 sec, and after a centrifugation at 243xg for 5 min, the solutions were preincubated for 25 min at room temperature.

The reaction was started by the addition of 10 µl of the NADH-/ATP-solution (4.29 mM NADH, 4.95 mM ATP, in HEPES-buffer*). The MTP was shaken for 5 sec, and then, the absorbance at 340 nm was monitored continuously in a MTP-reader (TECAN Spectro fluor plus) for the next 27 min (with a MTP-cycling time of 199 sec). The final concentrations of the various components were as follows: 49.5 mM Hepes, pH 7.0, 1.49 mM PEP, 1.3 mM NADH, 49.5 mM KCl, 4.96 mM MgCl₂, 1.5 mM Mg-ATP, 1.98 mM DTT, 2.04 U/ml pyruvate kinase, 2.06 U/ml lactate-dehydrogenase, 0.91 % DMSO, 0.15 µg/well glucokinase, and test compounds in the range between 1 nM and 300 µM.

The change in the optical density (ΔOD₃₄₀nm) in the presence of the compound was expressed relative to the ΔOD₃₄₀nm,ctrl of the control incubation (in the presence of 2 mM glucose and 0.91 % DMSO), taking into
account the optical density of the blank sample (incubation in the absence of 2 mM glucose). For the determination of the half maximal effective concentration (EC_{50}), the %-Ctrl-values were plotted in a semi-logarithmic graph against the cone, of the compound of interest. The data points were fitted to a sigmoid curve function \( f(x) = ((%-\text{Ctrl}_{\text{max}} - %-\text{Ctrl}_{\text{min}})/(1 - (EC_{50}/x)^{\text{Hill}})) + %-\text{Ctrl}_{\text{min}} \) by a non-linear regression analysis.

* Hepes-buffer (50mM Hepes, pH 7.0, 5mM MgCl_{2}, 50mM KCl, 1.5 mM PEP, 0.1% BSA). DTT was added to the Hepes-buffer from a 200X stock solution (in Millipore H_{2}O) freshly each day. The final concentration of DTT in the Hepes-buffer is 2 mM.

**Culture of pancreatic INS-1 cells**

INS-1 cells were cultured in complete medium, RPMI1640 containing 1mM sodium pyruvate, 50µM 2-mercaptoethanol, 2mM glutamine, 10mM HEPES, 100IU/mL penicillin, and 100µg/ml streptomycin (CM), supplemented with 10mM glucose, and 10% (vol/vol) heat-inactivated fetal calf serum (FCS), as described by Asfari et al. (Endocrinology 130: 167-178, 1992).

**Insulin secretion assay**

INS-1 cells were plated and cultured in 48-well plates. After 2 days of culture, the medium was removed and cells were cultured for 24h with a medium change to 5mM glucose, 1% FCS. The cells were then washed with Krebs-Ringer Bicarbonate HEPES buffer (KRHB; 135mM NaCl; 3,6mM KCl; 5mM NaHCO_{3}; 0,5mM NaH_{2}PO_{4}; 0,5mM MgCl_{2}; 1,5mM CaCl_{2} and 10mM HEPES; pH 7,4) 0,1% BSA containing 2,8mM glucose and preincubated for 30min at 37°C in the same buffer. The cells were then washed twice and incubated for 1h in KRHB 0,1 % BSA containing 2,8 or 4,2mM glucose and different concentrations of the tested molecule. Insulin concentration in the
colected supernatants was measured with ELISA using rat insulin antibody (Insulin Rat Elit PLUS, cat. ret 10-1 145-01).

In order to illustrate the invention, the following examples are included. However, it is to be understood that these examples do not limit the invention and are only meant to suggest a method of practicing the invention.

Persons skilled in the art will recognize that the chemical reactions described may be readily adapted to prepare a number of other glucokinase activators of the invention, and alternative methods for preparing the compounds of this invention are deemed to be within the scope of this invention. For example, the synthesis of non-exemplified compounds according to the invention may be successfully performed by modifications apparent to those skilled in the art, e.g., by appropriately protecting interfering groups, by utilizing other suitable reagents known in the art other than those described, and/or by making routine modifications of reaction conditions. Alternatively, other reactions disclosed herein or known in the art will be recognized as having applicability for preparing other compounds of the invention.

Above and below, all temperatures are indicated in °C. In the following examples, "conventional work-up" means: if necessary, water is added, the pH is adjusted, if necessary, to between 2 and 10, depending on the constitution of the end product, the mixture is extracted with ethyl acetate or dichloromethane, the phases are separated, the organic phase is dried over sodium sulfate and evaporated, and the product is purified by chromatography on silica gel and/or by crystallisation. Rf values on silica gel; eluent: ethyl acetate/methanol 9:1.

Mass spectrometry (MS): El (electron impact ionisation) M^+
   FAB (fast atom bombardment) (M+H)^+
   ESI (electrospray ionisation) (M+H)^+
(uneless indicated otherwise)
Melting Points (mp.): melting points are determined with a BÜCHI Melting Point B-540

LC-MS-conditions
Mass data (MH⁺, given as m/z values) were taken from LC-MS measurements and were recorded with a Hewlett Packard System of the HP 1100 series with an ELS-detector Sedex 75 from ERC with the following characteristics: Ion source: Electrospray (positive mode); Scan: 100-1000 m/z; Fragmentation-voltage: 60 V; Gas-temperature: 300°C, DAD: 220 nm. Flow rate: 2.4 ml/Min. The used splitter reduced the flow rate after the DAD for the MS to 0.75ml/Min.
Column: Chromolith Speed ROD RP-18e 50-4.6
Solvent: LiChrosolv (Merck KGaA)
Solvent A: H2O (0.01% TFA)
Solvent B: ACN (0.01 % TFA)
Method A: In 2.6 min from 96% A to 100% B. Followed by 0.7 min 100% B.

Example 1
7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide

Step A: A suspension of sodiumhydride in parrafin (0.35 g, 60 %) was added to 5 ml dimethylcarbonate. To this suspension 7,8-Dichloro-3,4-dihydro-2H-benzo[b]oxepin-5-one (4.3 mmol) dissolved in 2 ml dimethylcarbonate was added dropwise at room temperature. The mixture was refluxed for two hours, cooled to room temperature and stirred overnight. 25 ml of 2 mol/l hydrochloric acid were added to the mixture. The resulting solution was extracted by ethyl acetate. The organic phase was washed over sodiumsulfate and the solvent removed in vacuo. The residue was dissolved in diethyl ether. 7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid methyl ester was obtained by crystallization from this solution in a yield of 40 %. LC-MS 2.3 min, 289.0 (MH⁺), 2.8 min, 289.0 (MH⁺)
Step B: 7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid methyl ester (0.2 mmol) and 2-aminopyridin (0.2 mmol) were dissolved in 1 ml xylene. Reaction was performed by microwave irradiation for one hour at 150 °C. The solution obtained from this reaction was cooled to room temperature and extracted by 2 mol/l hydrochloric acid and ethyl acetate. The ethyl acetate extract was dried over sodiumsulfate and the solvent removed in vacuo. The remaining residue was purified via HPLC (Chromolith prep. RP18, Solvent A water: acetonitrile 90:10 + 0.1 % formic acid, solvent B: water: acetonitrile 10:90 + 0.1 % formic acid, flow: t = 0 min 25 ml/min, t = 1 min 50 ml/min, gradient: t = 0 min 10 % B, t = 1 min 10 % B, t = 2 min 10 % B, t = 2.2 min 20 % B, t = 7.5 min 50 % B, t = 7.6 min 100 % B, t = 8.5 min 100 % B). After evaporation of the solvent in vacuo 7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide was obtained as a white powder in a yield of 14 %. LC-MS: 1.9 min, 351.0 (MH+) 1H-NMR: (DMSO-d6, 500 MHz): D [ppm]: 10.543 (s, 1H), 8.304 (s, 1H), 8.135 (d, 1H, J = 8.1 Hz), 7.809 (t, 1H, J = 7.6 Hz), 7.758 (s, 1H), 7.524 (s, 1H), 7.114 (s, 1H), 4.652 (m, 1H, J = 2.8 Hz), 4.360 (f, 1H, J = 8.9 Hz), 4.042 (m, 1H, J = 4.9 Hz), 2.512 (m, 2H, J = 1.8 Hz)

Example 2

8-Fluoro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide

Step A: A suspension of sodiumhydride in parrafin (0.49 g, 60 %) was added to 5 ml dimethylcarbonate. To this suspension 8-Fluoro-3,4-dihydro-2H-benzo[b]oxepin-5-one (6.2 mmol) dissolved in 2 ml dimethylcarbonate was added dropwise at room temperature. The mixture was refluxed for two hours, cooled to room temperature and stirred overnight. 25 ml of 2 mol/l hydrochloric acid were added to the mixture. The resulting solution was extracted by ethyl acetate. The organic phase was dried over sodiumsulfate and the solvent removed in vacuo. The residue was dissolved in diethyl ether. 8-Fluoro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid
methyl ester was obtained by crystallization from this solution in a yield of 7%. LC-MS: 1.8 min, 238.0 (MH⁺), 2.4 min, 238.0 (MH⁺)

**Step B:** 8-Fluoro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid methyl ester (0.6 mmol) and 2-aminothiazol (0.6 mmol) were dissolved in 2.5 ml xylene. Reaction was performed by microwave irradiation for 30 minutes at 140 °C. The solution obtained from this reaction was cooled to room temperature and extracted by 2 mol/l hydrochloric acid and ethyl acetate. The ethyl acetate extract was dried over sodiumsulfate and the solvent removed in vacuo. After evaporation of the solvent in vacuo 8-Fluoro-5-oxo-2, 3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide was obtained as a white powder in a yield of 7%. LC-MS: 1.9 min, 307.0 (MH⁺) ¹H-NMR: (DMSO-d₆, 500 MHz): d [ppm]: 12.102 (s, 1H), 7.731 (t, 1H, J = 7.3 Hz), 7.464 (of, 1H, J = 3.2 Hz), 7.234 (d, 1H, J = 3.6 Hz), 7.056 (m, 2H, J = 7.8 Hz), 4.654 (m, 1H, J = 2.6 Hz), 4.340 (m, 1H, J = 7.6 Hz), 4.013 (m, 1H, J = 7.2 Hz), 2.502 (m, 2H, J = 1.8 Hz)

**Example 3**
8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide

**Step A:** A suspension of sodiumhydride in paraffin (0.42 g, 60 %) was added to 4 ml of dimethylcarbonate. To this suspension 8-Ethyl-3,4-dihydro-2H-benzo[b]oxepin-5-one (5.3 mmol) dissolved in 2 ml dimethylcarbonate was added dropwise at room temperature. The mixture was refluxed for two hours, cooled to room temperature and stirred overnight. 25 ml of 2 mol/l hydrochloric acid were added to the mixture. The resulting solution was extracted by ethyl acetate. The organic phase was dried over sodiumsulfate and the solvent removed in vacuo. 8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid methyl ester was obtained as a brown oil in a yield of 87%. LC-MS: 2.2 min, 249.0 (MH⁺), 2.7 min, 249.0 (MH⁺)
Step B: δ-Ethyl-S-oxo^SA 5-tetrahydro-benzoltoloxepine^-carboxylic acid methyl ester (0.6 mmol) and 2-aminopyridin (0.6 mmol) were dissolved in 2.5 ml xylene. Reaction was performed by microwave irradiation for one hour at 150 °C. The solution obtained from this reaction was cooled to room temperature and extracted by 2 mol/l hydrochloric acid and ethyl acetate. The ethyl acetate extract was dried over sodium sulfate and the solvent removed in vacuo. After evaporation of the solvent in vacuo 8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide was obtained as a white powder in a yield of 5 %. LC-MS: 1.8 min, 311.2 (MH^+), 1H-NMR: (DMSO-d6, 500 MHz): D [ppm]: 10.543 (s, 1H), 8.296 (s, 1H), 8.152 (d, 1H, J = 8.1 Hz), 7.798 (f, 1H, J = 7.2 Hz), 7.605 (m, 1H, J = 8.1 Hz), 7.102(f, 1H, J = 6.3 Hz), 7.032 (m, 1H, J = 8.1 Hz), 6.983 (s, 1H), 4.594 (m, 1H, J = 3.0 Hz), 4.364 (f, 1H, J = 4.8 Hz), 3.942 (m, 1H, J = 5.2 Hz), 2.640 (g, 2H, J = 7.7 Hz), 2.512 (t, 2H, J = 1.7 Hz), 1.193 (/, 3H, J = 7.5 Hz)

Example 4
2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide

Step A: To a suspension of sodiumhydride in paraffin (2.5 g, 60 %) dimethylcarbonate (36 ml) has been added. To this suspension 3,4-Dihydro-2H-benzo[b]oxepin-5-one (31 mmol) has been added. The mixture was refluxed for two yours, cooled to room temperature and stirred for another two hours. 100 ml of 2 mol/l hydrochloric acid were added to the mixture. The resulting solution was extracted by ethyl acetate. The organic phase was dried over magnesiumsulfate and the solvent removed in vacuo. The residue was dissolved in dichloromethane, dried over magnesiumsulfate. 5-Oxo-2,3,4,5-tetrahydrobenzo[b]oxepine-4-carboxylic acid methyl ester was obtain by evaporation of the solvent in vacuo with a yield of 12 %. LC-MS: 1.8 min, 221.0 (MH^+), 2.3 min, 221.0 (MH^+)

Step B: A solution of 5-Oxo-2,3,4,5-tetrahydrobenzo[b]oxepine-4-carboxylic acid methyl ester (5 mmol) in 120 ml methanol was prepared. The solution
was subjected to catalytic hydrogenation by "H-cube" (Thales Nanotechnology, flow rate 0.5 ml/min, catalyst 10 % Pd/C 30x4 mm, room temperature, ambient pressure). This procedure has been repeated three times. By evaporation of the solvent in vacuo 1.1 g of crude product were obtained. The crude product was purified by preparative HPLC (Chromolith prep. RP18, Solvent A water: acetonitrile 90:10 + 0.1 % formic acid, solvent B: water: acetonitrile 10:90 + 0.1 % formic acid, flow: t = 0 min 25 ml/min, t = 1 min 50 ml/min, gradient: t = 0 min 10 % B, t = 1 min 10 % B, t = 2 min 10 % B, t = 2.2 min 20 % B, t = 7.5 min 50 % B, t = 7.6 min 100 % B, t = 8.5 min 100 % B) yielding 0.58 g of 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid methyl ester. LC-MS: 2.0 min, 205.2 (MH⁺)

**Step C**: 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid methyl ester (2.4 mmol) was dissolved in methanol. 5 ml of 2 mol/l sodiumhydroxide was added and the solution was stirred for two hours. The solvent was removed in vacuo. 2 mol/l hydrochloric acid were added and the solvent again removed in vacuo. The residue was extracted by diethylether. Evaporation of the solvent yielded 0.5 g of 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid. LC-MS: 1.8 min, 191.2 (MH⁺)

**Step D**: 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid (2.3 mmol) was dissolved in 15 ml tetrahydrofuran. 0.7 ml of thionylchloride were added dropwise and the solution was stirred for two hours. The reaction was quenched by methanol. Methanol and thionylchloride were removed in vacuo yielding 340 mg of 2,3-Dihydro-benzo[b]oxepine-4-carbonylchloride. This was used for step E without further purification.

**Step E**: 10 ml of 2-aminopyridine were dissolved in 10 ml tetrahydrofuran. 2,3-Dihydro-benzo[b]oxepine-4-carbonylchloride (1.1 mmol) dissolved in 2 ml tetrahydrofuran were added dropwise. The reaction mixture was quenched by water and extracted with diethylether. The diethylether phase was washed by 1 mol/l sodiumhydroxide and dried over sodiumsulfate. Evaporation of the
solvent yielded 230 mg of crude product which was purified by preparative HPLC (Chromolith prep. RP18, Solvent A: acetonitrile 90:10 + 0.1 % formic acid, solvent B: water : acetonitrile 10:90 + 0.1 % formic acid, flow: t = 0 min 25 ml/min, t = 1 min 50 ml/min, gradient: t = 0 min 10 % B, t = 1 min 10 % B, t = 2 min 10 % B, t = 2.2 min 20 % B, t = 7.5 min 50 % B, t = 7.6 min 100 % B, t = 8.5 min 100 % B). Form this 85 mg of 2,3-Dihydro-benz[b]oxepine-4-carboxylic acid pyridin-2-ylamide. LC-MS 1.6 min, 267.2 (MH+) 1H-NMR: (DMSO-d6, 500 MHz) d [ppm] 10.358 (s, 1H), 8.370 (m, 1H, J = 1 Hz), 8.109 (m, 1H, J = 4 Hz), 7.815 (m, 1H, J = 2.4 Hz), 7.474 (m, 1H, J = 2.3 Hz), 7.392 (s, 1H), 7.277 (m, 1H, J = 1.7 Hz), 7.140 (m, 1H, J = 1.9 Hz), 7.068 (m, 1H, J = 3.2 Hz), 6.983 (m, 1H, J = 1.9 Hz), 4.259 (m, 2H, J = 3.1 Hz), 2.985 (t, 2H, J = 2.6 Hz)

The compounds of the following examples have been obtained by similar procedures:

**Example 5**
δ-Chloro-δ-oxo-2,3,4,5-tetrahydro-benz[b]oxepine^-carboxylic acid pyridin-2-ylamide

LC-MS: 1.7 min, 317.0 (MH+)

**Example 6**
5-0xo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide

LC-MS: 1.5 min, 283.2 (MH+)

**Example 7**
δ-Chloro-δ-oxo-2,3,4,δ-tetrahydro-benzofloxepine^-carboxylic acid thiazol-2-ylamide

LC-MS: 2.0 min, 323.0 (MH+)

**Example 8**
7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide
LC-MS: 2.2 min, 357.0 (MH+)

Example 9
8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide
LC-MS: 2.0 min, 317.0 (MH+)

Example 10
7-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide
LC-MS: 1.7 min, 317.0 (MH+)

Example 11
7-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide
LC-MS: 2.1 min, 323.0 (MH+)

Example 12
7-Methoxy-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide
LC-MS: 1.5 min, 313.2 (MH+)

Example 13
8-(4-Fluoro-phenyl)-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide
LC-MS: 2.3 min, 405.0 (MH+)

Example 14
δ-Oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide
LC-MS: 1.9 min, 289.0 (MH+)
Example 15
5-Oxo-7-phenoxy-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide
LC-MS: 1.9 min, 375.2 (MH+)

Example 16
8-Chloro-7-fluoro-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide
LC-MS: 2.0 min, 363.0 (MH+)

Example 17
δ-Ethyl-S,S-dimethyl-5-oxo-2,3,4,δ-tetrahydro-benzofloxepine^-carboxylic acid pyridin-2-ylamide
LC-MS: 1.9 min, 339.2 (MH+)

Example 18
2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide
LC-MS: 1.9 min, 273.2 (MH+)

Claims

1. A compound of the following formula I

\[ \text{denote} \ H, \ A, \ \text{Hal, Ar, Het, OR}^{10}, \ S(O)\text{R}^{10}, \ NR^{10}\text{R}^{11}, \ NO_2, \ CN, \ COOR^{10}, \ CONR^{10}\text{R}^{11}, \ NR^{10}\text{COR}^{11}, \ NR^{10}\text{CONR}^{11}\text{R}^{12}, \ NR^{10}\text{SO}_n\text{R}^{11}, \ \text{CHO, COOR}^{10}, \ \text{SO}_3\text{H, SO}_n\text{NR}^{10}\text{R}^{11}, \ 0\text{-A-NR}^{10}\text{R}^{11}, \ 0\text{-A-CONR}^{10}\text{R}^{11}, \ 0\text{-A-NR}^{10}\text{COR}^{11}, \ 0\text{-A-Het, 0-A-Ar, A-Ar, A-Het, S(O)\text{A-Het, S(O)}_n\text{A-Ar, Y may be present or not, and if present, denotes H, A, Hal, Ar, Het, OR}^{10}, \ S(O)\text{R}^{10}, \ NR^{10}\text{R}^{11}, \ NO_2, \ CN, \ COOR^{10}, \ CONR^{10}\text{R}^{11}, \ NR^{10}\text{COR}^{11}, \ NR^{10}\text{CONR}^{11}\text{R}^{12}, \ NR^{10}\text{SO}_n\text{R}^{11}, \ \text{CHO, COOR}^{10}, \ \text{SO}_3\text{H, SO}_n\text{NR}^{10}\text{R}^{11}, \ 0\text{-A-NR}^{10}\text{R}^{11}, \ 0\text{-A-CONR}^{10}\text{R}^{11}, \ 0\text{-A-NR}^{10}\text{COR}^{11}, \ 0\text{-A-Het, 0-A-Ar, A-Ar, A-Het, S(O)\text{A-Het, S(O)}_n\text{A-Ar, X denotes O if Y is present, and H if Y is not present, R}^6 \text{to R}^9 \ \text{denote autonomously from each other denote H, A, Hal, Ar, Het, OR}^{10}, \ S(O)\text{R}^{10}, \ NR^{10}\text{R}^{11}, \ NO_2, \ CN, \ COOR^{10}, \ CONR^{10}\text{R}^{11}, \ NR^{10}\text{COR}^{11}, \ NR^{10}\text{CONR}^{11}\text{R}^{12}, \ NR^{10}\text{SO}_n\text{R}^{11}, \ \text{CHO, COOR}^{10}, \ \text{SO}_3\text{H, SO}_n\text{NR}^{10}\text{R}^{11}, \ 0\text{-A-NR}^{10}\text{R}^{11}, \ 0\text{-A-CONR}^{10}\text{R}^{11}, \ 0\text{-A-NR}^{10}\text{COR}^{11}, \ 0\text{-A-Het, 0-A-Ar, A-Ar, A-Het, S(O)\text{A-Het, S(O)}_n\text{A-Ar, R}^{10} \text{to R}^{12} \ \text{denote autonomously from each other: H, A, Ar or Het.} \]
A denotes unsubstituted or mono, di or ternary with =S, =NR\(^{10}\) (imine) and/or =O (Carboxy) substituted branched or unbranched alkyl with 1-10 C-atoms, where one, two or three CH2 groups are replaced by O, S, SO, SO2, NH, NAr, NHet and/or by -CH=CH-groups and/or 1-7 H-Atoms by F and/or Cl or cyclic alkyl with 3-7 C-Atoms where 1-7 H-atoms might be replaced by F, Cl, OR\(^{10}\), SO\(_n\)R\(^{11}\) and/or NR\(^{10}\)R\(^{11}\).

Ar denotes unsubstituted or mono, di, ternary or tertiary with autonomously from each other A, Hal, Ar, Het, OR\(^{10}\), S(O)\(_n\)R\(^{10}\), NR\(^{10}\)R\(^{11}\), NO\(_2\), CN, COOR\(^{10}\), CONR\(^{10}\)R\(^{11}\), NR\(^{10}\)COR\(^{11}\), NR\(^{10}\)CONR\(^{11}\)R\(^{12}\), NR\(^{10}\)SO\(_n\)R\(^{11}\), CHO, COR\(^{10}\), SO\(_3\)H, SO\(_n\)NR\(^{10}\)R\(^{11}\), 0-A-NR\(^{10}\)R\(^{11}\), 0-A-COR\(^{10}\)R\(^{11}\), O-A-NR\(^{10}\)COR\(^{11}\), O-A-Het, O-A-Ar, A-Ar, A-Het, S(O)\(_n\)-A-Het, S(O)\(_n\)-A-Ar substituted Phenyl, Naphthyl or Biphenyl, Het denotes mono- or binuclear saturated or unsaturated or aromatic heterocycle with 1 to 4 N-, O- and/or S-atoms that might be mono or autonomously from each other di, ternary or quad substituted by A, Hal, Ar, Het, OR\(^{10}\), S(O)\(_n\)R\(^{10}\), NR\(^{10}\)R\(^{11}\), NO\(_2\), CN, COOR\(^{10}\), CONR\(^{10}\)R\(^{11}\), NR\(^{10}\)COR\(^{11}\), NR\(^{10}\)CONR\(^{11}\)R\(^{12}\), NR\(^{10}\)SO\(_n\)R\(^{11}\), CHO, COR\(^{10}\), SO\(_3\)H, SO\(_n\)NR\(^{10}\)R\(^{11}\), 0-A-NR\(^{10}\)R\(^{11}\), 0-A-COR\(^{10}\)R\(^{11}\), O-A-NR\(^{10}\)COR\(^{11}\), O-A-Het, O-A-Ar, A-Ar, A-Het, S(O)\(_n\)-A-Het, S(O)\(_n\)-A-Ar, =S, =NR\(^{10}\) and/or =O;

Hal denotes F, Cl, Br or I

n is 0, 1 or 2, and

pharmaceutically usable derivatives, solvates, salts, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

2. Compound according to claim 1 characterized through formula (Ia)
wherein

R₁ to R₄ and R₆ to R₉, Het, Hal, n, Ar, A, and R₁₀ to R₁₂ have the meaning as set forth for claim 1 and

R⁵ denotes H, A, Hal, Ar, Het, OR¹⁰, S(O)ₙR¹⁰, NR¹⁰R¹¹, NO₂,
CN, COOR¹⁰, CONR¹⁰R¹¹, NR¹⁰COR¹¹, NR¹⁰CONR¹¹R¹²,
NR¹⁰SOₙR¹¹, CHO, COR¹⁰, SO₂H, SOₙNR¹⁰R¹¹, O-A-
NR¹⁰R¹¹, 0-A-COR¹⁰R¹¹, 0-A-NR¹⁰COR¹¹, O-A-Het, O-
pharmaceutically usable derivatives, solvates, salts,
tautomers and stereoisomers thereof, including mixtures
thereof in all ratios.

3. Compound according to claim 1 characterized through formula (Ib) below

wherein

R₁ to R₄ and R₆ to R₉, Het, Hal, n, Ar, A, and R₁₀ to R₁₂ have the meaning as set forth for formula (I), and

pharmaceutically usable derivatives, solvates, salts, tautomers and
stereoisomers thereof, including mixtures thereof in all ratios.
4. Compound to one of the preceding claims wherein $R^1 R^4$, $R^5$, $R^6$ and $R^7$ are H, $R^2$ is Hal, $R^3$ is Hal, A, Ar or OAr, $R^8$ and $R^9$ preferably are H or A, X preferably is O and Y preferably is H and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

5. Compound according to claim 4 wherein $R^2$ is F or Cl.

6. Compound according to claim 4 wherein the Ar at $R^3$ if present is substituted with Cl, F, ethyl, or phenyl and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

7. Compound according to claim 6 wherein Ar is phenyl substituted with Hal, preferably F and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

8. Compound according to claim 4 wherein $R^8$ and $R^9$ are methyl and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

9. Compound according to any of claims 1 to 8 wherein Het denotes pyridinyl or thiazolyl and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

10. Compound selected from the group consisting of: 7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide, 8-Fluoro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide, 8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridine-2-ylamide, 2,3-Dihydro-
benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 8-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 5-Oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 8-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 7,8-Dichloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide, 8-Ethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide, 7-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 7-Chloro-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide, 7-Methoxy-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 8-(4-Fluoro-phenyl)-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 5-Oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide, 5-Oxo-7-phenoxy-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 8-Chloro-7-fluoro-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, 8-Ethyl-3,3-dimethyl-5-oxo-2,3,4,5-tetrahydro-benzo[b]oxepine-4-carboxylic acid pyridin-2-ylamide, and 2,3-Dihydro-benzo[b]oxepine-4-carboxylic acid thiazol-2-ylamide, and pharmaceutically usable derivatives, solvates, salts, tautomers and stereoisomers thereof, including mixtures thereof in all ratios.

11. Method of manufacturing a compound of formula (I) by reacting compounds of formula (II)
wherein R1 to R9, X and Y are as defined for formula (I), and
L1 is Cl, Br, I, OH, N3 or a reactive esterified OH-group or a diazonium moiety,

with a compound of the following formula (III):

$$\begin{array}{c}
\text{L}_2 \text{N} \text{Het} \\
\text{L}_3
\end{array}$$

(III)

wherein L2 and L3 are independently from one another H or a metal ion, and Het is as defined above for formula (I).

12. Use of a compound according to one of claims 1 to 10 and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios for the preparation of a medicament.

13. Use according to claim 12 wherein the medicament is for the treatment of Diabetes Type 1 and 2, obesity, neuropathy and/or nephropathy.

14. Use according to claim 13 wherein the disease is diabetes.

15. Use of compounds according to Claims 1-10 and pharmaceutically usable derivatives, salts, solvates, tautomers and stereoisomers thereof, including mixtures thereof in all ratios, for the preparation of a medicament for the treatment of diseases in which the activation of glucokinase is indicated.

16. Medicament comprising at least one compound of the formula I according to one or more of Claims 1 to 10 and/or pharmaceutically usable derivatives, solvates and stereoisomers thereof, including
mixtures thereof in all ratios, and at least one further medicament active ingredient.

17. Set (kit) consisting of separate packs of
    (a) an effective amount of a compound of the formula I according to one or more of Claims 1 to 10 and/or pharmaceutically usable derivatives, solvates, salts and stereoisomers thereof, including mixtures thereof in all ratios, and
    (b) an effective amount of a further medicament active ingredient.
### A. CLASSIFICATION OF SUBJECT MATTER

<table>
<thead>
<tr>
<th>INV.</th>
<th>C07D405/12</th>

According to International Patent Classification (IPC) or to both national classification and IPC.

### B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

C07D A61K A61P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched.

### Electronic database consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, BEILSTEIN Data, CHEM ABS Data

### C. DOCUMENTS CONSIDERED TO BE RELEVANT

<table>

Further special categories of cited documents:

- 'A' document defining the general state of the art which is not considered to be of particular relevance
- 'E' earlier document but published on or after the international filing date
- 'L' document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- 'O' document referring to an oral disclosure, use, exhibition or other means
- 'P' document published prior to the international filing date but later than the priority date claimed
- 'T' later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- 'X' document of particular relevance, the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- 'Y' document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- 'Z' document member of the same patent family

Date of the actual completion of the international search: 1 July 2009

Date of mailing of the international search report: 13/07/2009
