TOILET BOWL WITH A WIPING AND DRYING DEVICE

A toilet 1 includes a bottom-wiping hygiene device. A porous bottom-wiping member 7 is arranged on a wiping control member 4 mounted to a wall of the toilet. The wiping control member includes a handle 6 protruding from the toilet. A water supply conduit 8 is connected to the porous member 7. An optional drying device comprises a drying control member 10 carrying a drying element 12.
The invention provides a toilet including a hygiene device comprising a porous bottom-wiping member arranged on a wiping control member mounted to a wall of the toilet, the wiping control member including a handle protruding from the toilet, and a water supply conduit connected to the porous member for supplying water thereto. The porous member may be in the form of a brush or a sponge. With this arrangement, the user is given greater control over personal hygiene than is provided by the known arrangements involving jets of water.

The toilet may also include a drying device comprising a porous bottom-wiping member mounted to a wall of the toilet, the drying control member including a handle protruding from the toilet. The drying element may alternatively comprise a nozzle for emitting warm air.

In one embodiment, the water supply conduit is connected to a source of hot water and a source of cold water. A flexible hose may connect the water supply conduit to one or two taps which may be located on a rear wall of the toilet. Alternatively, the taps could be provided separately from the toilet.

A number of different toilets having bidet functions are known. For example, a nozzle may produce an upwardly-directed jet or spray of water.

It is an aim of the invention to provide a toilet that allows a particularly high level of personal hygiene.

This invention relates to a toilet.

A soap dispenser may be arranged to introduce liquid soap into the water supplied to the water supply conduit.

The or each handle may extend in line with the control member, below a seat of the toilet. Alternatively, particularly for users whose movement is restricted, the handle may extend upwardly above the seat.

The drawings show a toilet bowl 1 of generally conventional shape, except that circular apertures are provided on either side to accommodate the hygiene device and the drying device respectively.

A flexible hose 8 communicates with the supply pipe 5 adjacent the handle 6. Hot and cold water are supplied to the hygiene device through the hose 8 by means of taps 9. In this example the sponge is generally spherical, but other shapes are possible, e.g. cylindrical, disc-shaped or irregular, and other porous members such as a perforated pad or brush could be used instead of the sponge 7. Optionally, the sponge or other member can be retained on the pipe 5 by means of a recess in the sponge elastically stretchable over the end of the pipe. The sponge or other member could be removable and replaceable.

A flexible hose 8 communicates with the supply pipe 5 adjacent the handle 6. Hot and cold water are supplied to the hygiene device through the hose 8 by means of taps 9. In this example the taps are shown mounted on the rear of the toilet bowl 1. Alternatively, the taps could be provided separately from the toilet.

A drying control member 10 of the drying device extends through the bore of the other ball 3, and has a handle 11 at its outer end. The distal end of the drying control member 10 carries a drying element 12, such as a cloth or absorbent paper, which may be removable and replaceable. The mounting of the drying control member 10 is above the outlet from which flushing water flows into the toilet bowl, to prevent wetting of the drying element 12.

A wiping control member 4 of the hygiene device comprises a rigid supply pipe 5 extending slidably through the bore of one of the balls 3, and a handle 6 at the outer end of the control member. The distal end of the pipe 5 is open or perforated and carries a bottom-wiping sponge 7. In this example the sponge is generally spherical, but other shapes are possible, e.g. cylindrical, disc-shaped or irregular, and other porous members such as a perforated pad or brush could be used instead of the sponge 7. Optionally, the sponge or other member can be retained on the pipe 5 by means of a recess in the sponge elastically stretchable over the end of the pipe. The sponge or other member could be removable and replaceable.
a preferred temperature to the sponge 7. Using the handle 6, the user slides the wiping control member 4 through the ball 3 to the position shown in Figure 2. The handle 6 can be used to move the sponge forwards, backwards, up and/or down as required, and to rotate it about the axis of the control member for bottom-cleaning.

[0018] The water running through the sponge 7 will keep it clean. After use, the taps are closed and the hygiene device is returned to the position shown in Figure 1.

[0019] The user then uses the other handle 11 to slide the drying control member 10 inwardly. As with the handle 6, the handle 11 can be used to move the drying element 12 forwards, backwards, up and/or down as required, and to rotate it about the axis of the control member for bottom-drying.

[0020] In an alternative embodiment (not shown), the drying control member comprises an air conduit connected to a heating and blowing device, and terminates in a nozzle for emitting warm air for drying.

[0021] In the embodiment shown, the handles 6, 11 extend in line with their respective control elements 4, 10. In an alternative embodiment (not shown), suitable for users of restricted mobility, the handles extend vertically to a level above the toilet seat.

[0022] In the embodiment shown, mains water is supplied to the hygiene device. Optionally, a reservoir for liquid soap can be provided, communicating with the flexible hose, so as to supply soapy water to the sponge or other porous member. A valve can be provided to terminate the supply of soap so as to allow selection between soapy water and clean water, e.g. for rinsing.

Claims

1. A toilet including a hygiene device comprising a porous bottom-wiping member (7) arranged on a wiping control member (4) mounted to a wall of the toilet, the wiping control member including a handle (6) protruding from the toilet, and a water supply conduit (5, 8) connected to the porous member (7) for supplying water thereto.

2. A toilet according to claim 1, wherein the porous member (7) is in the form of a brush or a sponge.

3. A toilet according to claim 1 or 2, wherein the wiping control member (4) comprises a rod (5) extending in a generally transverse direction.

4. A toilet according to claim 1, 2 or 3, wherein a distal portion of the wiping control member (4) comprises the water supply conduit (5).

5. A toilet according to claim 4, wherein the wiping control member (4) carries the porous member (7) at a distal end of the wiping control member.

6. A toilet according to any preceding claim, including a drying device comprising a drying element (12) arranged on a drying control member (10) mounted to the wall of the toilet, the drying control member including a handle (11) protruding from the toilet.

7. A toilet according to claim 6, wherein the drying element (12) comprises a fabric or paper.

8. A toilet according to claim 6, wherein the drying element comprises a nozzle for emitting warm air.

9. A toilet according to any preceding claim, wherein the wiping control member (4) and/or the drying control member (10) is/are slidable through an opening in the wall of the toilet, such that the porous member (7) and/or the drying element (12) can be moved, using the handle (6, 11), from a position adjacent the wall to a central position, and retracted again to the position adjacent the wall.

10. A toilet according to any preceding claim, wherein the respective control member (4, 10) is pivotable at the toilet wall.

11. A toilet according to claim 10, wherein the respective control member (4, 10) is rotatable about its own axis and pivotable about two further orthogonal axes.

12. A toilet according to claim 11, including a ball (3) having a transverse passage through which the respective control member (4, 10) is slidable, the ball being rotatable within a part-spherical mounting (2) in the toilet wall.

13. A toilet according to any preceding claim, wherein the water supply conduit (5, 8) is connected to a source of hot water (9) and a source of cold water (9).

14. A toilet according to any preceding claim, including a soap dispenser, arranged to introduce liquid soap into the water supplied to the water supply conduit.

15. A toilet according to any preceding claim, wherein the or each handle extends upwardly above a seat of the toilet.
