Title: PYRAZOLO-PYRROLIDIN-4-ONE DERIVATIVES AND THEIR USE IN THE TREATMENT OF DISEASE

Abstract: The present invention provides a compound of formula (I) or a pharmaceutically acceptable salt thereof; a method for manufacturing the pyrazolo-pyrrolidin-4-one derivatives, and their use as BET inhibitors for the treatment of conditions or diseases such as cancer. The present invention further provides a combination of pharmacologically active agents and a pharmaceutical composition.
FIELD OF THE INVENTION

The invention provides pyrazolo-pyrrolidin-4-one derivatives and their use as BET inhibitors, for the treatment of conditions or diseases such as cancer.

BACKGROUND OF THE INVENTION

BET proteins are proteins encoded by either of the genes BRD2, BRD3, BRD4, or BRDT. Each of these proteins bears two N-terminal bromodomains. Bromodomains comprise of a conserved ~110 amino acid segment found in at least 42 diverse proteins that specifically interact with acetylated lysines that occur for example on histone tails (Filippakopoulos and Knapp, FEBS Letters, 586 (2012), 2692-2704). Histones are a constituent part of chromatin and their covalent modifications including lysine acetylation regulate gene transcription. Bromodomains are thus believed to regulate transcription by recruiting proteins to genes that are marked with specific patterns of lysine acetylation.

Several published reports have linked the BET protein family to diseases including cancer, metabolic disease and inflammation. Oncogenic fusions of BRD4 or BRD3 and the Nuclear protein in Testis (NUT) gene caused by chromosomal translocations are underlying an aggressive cancer named NUT midline carcinoma (French et al., J Clin Oncol, 22 (2004), 4135-9; French et al., J Clin Pathol, 63 (2008), 492-6). The BRD3/4 bromodomains are preserved in these fusion proteins, and their inhibition either by knockdown or with the selective BET bromodomain inhibitor JQ1 leads to death and/or differentiation of these cancer cells both in vitro and in animal tumour models (Filippakopoulos et al., Nature, 468 (2010), 1067-73). JQ1 and several other selective BET inhibitors have been shown to bind to BET bromodomains and thereby prevent acetyl-lysine binding, which prevents BET proteins from interacting with chromatin and thereby regulating transcription. BRD4 was also identified from an RNAi screen as a target in acute myeloid leukemia (AML) (Zuber et al., Nature, 478 (2011), 524-8). This finding was validated in vitro and in vivo using the BET inhibitor JQ1 and another selective BET inhibitor named I-BET151 that is chemically unrelated to JQ1 (Dawson et al., Nature, 478 (2011), 529-33). These and other studies showed that BET inhibitors have broad anti-cancer activity in acute leukemias, multiple myeloma and other hematological malignancies. In several cancer models an acute downregulation of the oncogenic transcription factor Myc upon BET inhibition has been observed (Delmore et al., Cell, 146 (2011), 904-17; Mertz et al., Proc Natl Acad Sci USA, 108 (2011), 16669-74). More recent studies suggest that the therapeutic potential of BET inhibitors extends to other cancer indications, for example lung and brain cancer.
Another BET inhibitor named I-BET762 that is closely related to JQ1 in chemical structure and the manner in which it binds to BET bromodomains, was reported to modulate expression of key inflammatory genes and thereby protect against endotoxic shock and bacteria-induced sepsis in mouse models (Nicodeme et al., Nature, 468 (2010), 1119-23). This body of data has been used to support the clinical evaluation of the BET inhibitor RVX-208 in clinical trials in patients suffering from atherosclerosis, coronary artery disease, dyslipidemia, diabetes, and other cardiovascular diseases (McNeill, Curr Opin Investig Drugs, 3 (2010), 357-64 and www.clinicaltrials.gov). Both RVX-208 and I-BET762 have been shown to upregulate Apolipoprotein A-I, which is critically involved in reducing the tissue levels of cholesterol. Finally, BET proteins have been linked to propagation and transcription regulation of several viruses, and therefore it is believed that BET inhibitors could have anti-viral activity (Weidner-Glunde, Frontiers in Bioscience 15 (2010), 537-549).

In summary, inhibitors of BET bromodomains have therapeutic potential in several human diseases.

Depending on the choice of the starting materials and procedures, the compounds can be present in the form of one of the possible isomers or as mixtures thereof, for example as pure optical isomers, or as isomer mixtures, such as racemates and diastereoisomer mixtures, depending on the number of asymmetric carbon atoms. The present invention is meant to include all such possible isomers, including racemic mixtures, diastereomeric mixtures and optically pure forms. Optically active (R)- and (S)-isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound of the invention. "Salts" include in particular "pharmaceutical acceptable salts". The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable. In many cases, the compounds of the present invention are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto.

Organic acids from which salts can be derived include, for example, acetic acid, propionic acid, glycolic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, toluenesulfonic acid, sulfosalicylic acid, and the like.
In another aspect, the present invention provides compounds of formula I in acetate, ascorbate, adipate, aspartate, benzoate, besylate, bromide/hydrobromide, bicarbonate/carbonate, bisulfate/sulfate, camphorsulfonate, caprate, chloride/hydrochloride, chlorothepyllonate, citrate, ethandisulfonate, fumarate, gluceptate, gluconate, glucuronate, glutamate, glutarate, glycolate, hippurate, hydroiodide/iodide, isethionate, lactate, lactobionate, laurylsulfate, maleate, maleate, malonate, mandelate, mesylate, methylsulphate, mucate, naphthoate, napsylate, nicotinate, nitrate, octadecanoate, oleate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen phosphate, polygalacturonate, propionate, sebacate, stearate, succinate, subsalicylate, sulfate, tartrate, tosylate trifenate, trifluoroacetate or xinafoate salt form.

Any formula given herein is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as $^{2}H$, $^{3}H$, $^{11}C$, $^{13}C$, $^{14}C$, $^{15}N$, $^{16}F$, $^{31}P$, $^{32}P$, $^{35}S$, $^{36}Cl$, $^{124}I$, $^{125}I$, respectively. The invention includes various isotopically labeled compounds as defined herein, for example those into which radioactive isotopes, such as $^{3}H$ and $^{14}C$, or those into which non-radioactive isotopes, such as $^{2}H$ and $^{13}C$ are present. Such isotopically labelled compounds are useful in metabolic studies (with $^{14}C$), reaction kinetic studies (with, for example $^{2}H$ or $^{3}H$), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an $^{18}F$ or labeled compound may be particularly desirable for PET or SPECT studies. Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples and Preparations using an appropriate isotopically-labeled reagents in place of the non-labeled reagent previously employed.

Further, substitution with heavier isotopes, particularly deuterium (i.e., $^{2}H$ or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index. It is understood that deuterium in this context is regarded as a substituent of a compound of the formula (I). The concentration of such a heavier isotope, specifically deuterium, may be defined by the isotopic enrichment factor. The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. If a substituent in a compound of this invention is denoted deuterium, such compound has an isotopic enrichment factor for each designated deuterium atom of at least 3500 (52.5%.
deuterium incorporation at each designated deuterium atom), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6333.3 (95% deuterium incorporation), at least 6466.7 (97% deuterium incorporation), at least 6600 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

Pharmaceutically acceptable solvates in accordance with the invention include those wherein the solvent of crystallization may be isotopically substituted, e.g. D$_2$O, d$_6$-acetone, d$_6$-DMSO.

Compounds of the invention, i.e. compounds of formula (I) that contain groups capable of acting as donors and/or acceptors for hydrogen bonds may be capable of forming co-crystals with suitable co-crystal formers. These co-crystals may be prepared from compounds of formula (I) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution compounds of formula (I) with the co-crystal former under crystallization conditions and isolating co-crystals thereby formed. Suitable co-crystal formers include those described in WO 2004/078163. Hence the invention further provides co-crystals comprising a compound of formula (I).

As used herein, the term "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (e.g., antibacterial agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drug stabilizers, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, and the like and combinations thereof, as would be known to those skilled in the art (see, for example, Remington's Pharmaceutical Sciences, 18th Ed. Mack Printing Company, 1990, pp. 1289-1329). Except insofar as any conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated.

A "BET protein" is a protein encoded by either of the genes BRD2, BRD3, BRD4, or BRDT". Unless indicated otherwise "BET proteins" or "BET protein" are used herein in the singular and plural forms interchangeably, and the use of either is not limiting. Unless indicated otherwise "BET proteins" includes all, or any combination of, such encoded proteins.

As used herein, the term "subject" refers to an animal. Typically the animal is a mammal. A subject also refers to for example, primates (e.g., humans, male or female), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice, fish, birds and the like. in certain embodiments, the subject is a primate. In yet other embodiments, the subject is a human.

As used herein, the term "inhibit", "inhibition" or "inhibiting" refers to the reduction or suppression of a given condition, symptom, or disorder, or disease, or a significant decrease in the baseline activity of a biological activity or process.

As used herein, the term "treat", "treating" or "treatment" of any disease or disorder refers in one embodiment, to ameliorating the disease or disorder (i.e., slowing or arresting or reducing the development of the disease or at least one of the clinical symptoms thereof). All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all examples, or
exemplary language (e.g. "such as") provided herein is intended merely to better illuminate the invention and does not pose a limitation on the scope of the invention otherwise claimed.

Any asymmetric atom (e.g., carbon or the like) of the compound(s) of the present invention can be present in racemic or enantiomerically enriched, for example the \( (R) \)-, \( (S) \)- or \( (R,S) \)- configuration. Typically, the compounds of formula (I) can be prepared according to the Schemes provided *infra*.

Compounds of formula (I), wherein C is

and R^1, R^2, R^3, R^4, R^5, R^6 and R^7 are as defined in Embodiment 1, may be prepared as described in Scheme 1.

**Scheme 1**
wherein
R is -H or -S-(pyridine-2-yl);
X is -OH or Cl;
M is a suitable metal, such as Li or Na;
LG is a suitable leaving group, such as mesylate; and
PG is a suitable acid protecting group, such as methyl.

Scheme 1 illustrates one method for preparing compounds of the invention (e.g. Examples 1-7 and 10-17). A carboxylic acid or acid chloride is converted with 1,2-di(pyridin-2-yl)disulfane or pyridine-2-thiol into the corresponding 2-thiopyridine ester derivative, which can be reacted with S-tert-butyl ethanethioate in the presence of an appropriate strong base (LiHMDS, NaHMDS) to provide the corresponding beta-keto-thioester derivative. Conversion of the secondary alcohol of the corresponding 2-aryl-2-hydroxy-acetate derivative into a leaving group, for example with (a) methanesulfonyl chloride or methanesulfonic anhydride in the presence of an organic base.
such as pyridine (together with a catalytic amount of 4-dimethylaminopyridine) or triethylamine or (b) 1-chloro-N,N,2-trimethylpropenylamine, followed by reaction with the corresponding amine at temperatures between -20 °C and 50 °C results in the introduction of the 5-amino-1-methylpyridin-2(1H)-one moiety containing different R-subsitituents at C-3. The resulting secondary amine is reacted with a /3-keto-thioester derivative in the presence of silver(II) trifluoroacetate at ambient temperature to provide the corresponding /3-keto-thioamide derivative. Subsequent Claisen condensation to the cyclized beta-diketone can be effected under basic conditions (a) either with CsF in DMF at a temperature between 20 °C and 100 °C or (b) with sodium ethoxide in EtOH at elevated temperature. The pyrazolo-pyrrolidinone derivative is usually generated by condensation of the beta-diketone derivative with the corresponding R-containing hydrazine in a solvent such as methanol or ethanol at elevated temperature, preferably between 60-150 °C. For the condensation of the beta-diketone derivative with aryl- and heteroaryl containing hydrazines, the final dehydration step to the pyrazolo-pyrrolidinone can be facilitated by addition of acetic acidic or a combination of acetic acid and sulfamic acid and at elevated temperature, preferably between 100-150 °C in a microwave oven.

Alternatively, compounds of formula (I), wherein C, R, R, R, R, R, and R are as defined in Embodiment 1, may be prepared as described in Scheme 2.

Scheme 2
wherein X, M, LG and PG are as defined in Scheme 1.
Scheme 2 illustrates a modification of the method shown in Scheme 1 for preparing compounds of the invention (e.g. Examples 8-9 and 18-21). This method is similar to the one described in Scheme 1 except that the R⁴-substituent is introduced by Chan-Lam coupling. The N-unsubstituted pyrazolo-pyrrolidinone derivative is treated with the R⁴-containing boronic acid derivative and an appropriate Cu(II)-salt, such as Cu(OAc)₂, and pyridine in an appropriate solvent such as acetonitrile at elevated temperatures, preferable between 60-80 °C.
The invention further includes any variant of the present processes, in which an intermediate product obtainable at any stage thereof is used as starting material and the remaining steps are carried out, or in which the starting materials are formed in situ under the reaction conditions, or in which the reaction components are used in the form of their salts or optically pure material. Compounds of the invention and intermediates can also be converted into each other according to methods generally known to those skilled in the art.

ASSAYS

The activity of a compound according to the present invention can be assessed by the following methods.

**TR-FRET in-vitro binding assays for BRD2, BRD3, and BRD4:**
All assays were performed in 384 well microtiter plates. Each assay plate contained 8-point serial dilutions for 40 test compounds, plus 16 high- and 16 low controls. Liquid handling and incubation steps were done on an Innovadesktop Nanodrop Express equipped with a robotic arm (Thermo CatX, Perkin Elmer/Caliper Twister II) and an incubator (Liconic STX40, Thermo Cytomat 2C450). The assay plates were prepared by addition of 50nl per well of compound solution in 90% DMSO HummingBird nanodispenser (Zinsser Analytic). The assay was started by stepwise addition of 4.5µl per well of bromo domain protein (50mM HEPES, pH 7.5, 0.005% Tween20, 0.1% BSA, 50mM NaCl, 45nM His-Brd2(60-472) or 45nM His-Brd3(20-477) or 45nM His-Brd4(44-477) all proteins produced in-house) and 4.5µl per well of peptide solution (50mM HEPES, pH 7.5, 0.005% Tween20, 0.1% BSA, 50mM NaCl, 60nM acetyl-histone H4 (AcK 5, 8, 12, 16) (Biosyntan GmbH) ). Reactions were incubated at 30°C for 35 minutes. Subsequently 4.5µl per well detection mix (50mM HEPES, pH 7.5, 0.005% Tween20, 0.1% BSA, 50mM NaCl, 3nM Eu-labeled anti-His6 antibody, 21nM streptavidin-allophycocyanin) were added. After 35minutes incubation at 30°C, plates were measured in a Perkin Elmer EnVision multilabel reader. Concentrations causing 50% inhibition (IC50) values were determined from percent inhibition values at different compound concentrations by non-linear regression analysis.

**AlphaScreen in-vitro binding assay for CREBBP**
In order to assess bromodomain selectivity, we set up a binding assay using the bromodomain encoded by the CREBBP gene. Compounds were tested in the CREBBP assay with a similar protocol, however using AlphaScreen (Amplified Luminescent Proximity Homogeneous Assay, Perkin Elmer) as detection readout instead of TR-FRET. The assay was started by stepwise addition of 4.5µl per well of bromo domain protein (50mM HEPES, pH 7.5, 0.005% Tween20, 0.02% BSA, 150mM NaCl, 324nM His-CREBBP(1081-1 97) (custom production at Viva Biotech Ltd.)) and 4.5µl per well of peptide solution (50mM HEPES, pH 7.5, 0.005% Tween20, 0.02%
BSA, 150mM NaCl, 120nM acetyl-histone H4 (AcK 5, 8, 12) (Biosyntan GmbH)). Reactions were incubated at 30°C for 35 minutes. Subsequently 4.5 µl per well detection mix (50mM HEPES, pH 7.5, 0.005% Tween20, 0.02% BSA, 150mM NaCl, 45Mg/ml Ni-chelate acceptor beads, 45µg/ml streptavidin-donor beads) (Perkin Elmer) were added. After 60 minutes incubation at room temperature, plates were measured in a Perkin Elmer EnVision multilabel reader. IC50 values were determined from percent inhibition values at different compound concentrations by non-linear regression analysis.

For further bromodomain selectivity profiling, additional panel assays were performed using analog protocols with minor modifications specific for the individual assay, using either TR-FRET or AlphaScreen for detection.

**Preparation of compound dilutions**

Test compounds were dissolved in DMSO (10 mM) and transferred into 1.4ml flat bottom or V-shaped Matrix tubes carrying a unique 2D matrix. The stock solutions were stored at +2°C if not used immediately. For the test procedure the vials were defrosted and identified by a scanner whereby a working sheet was generated that guided the subsequent working steps.

Compound dilutions were made in 96 well plates. This format enabled the assay of maximally 40 individual test compounds at 8 concentrations (single points) including 4 reference compounds, if desired (known BET inhibitors from the prior art, for this and other assays of the type disclosed herein). The dilution protocol included the production of "pre-dilution plates", "master plates" and "assay plates".

**Pre-dilution plates:** 96 polypropylene well plates were used as pre-dilution plates. A total of 4 pre-dilution plates were prepared including 10 test compounds each on the plate positions A1-A10, one standard compound at A11 and one DMSO control at A12. All dilution steps were done on a HamiltonSTAR robot.

**Master plates:** 30µl of individual compound dilutions including standard compound and controls of the 4 "pre-dilution plates" were transferred into a 384 "master plate" including the following concentrations 10000, 3003, 1000, 300, 100, 30, 10 and 3µM, respectively in 90 % of DMSO.

**Assay plates:** Identical "assay plates" were then prepared by pipetting 50nl each of compound dilutions of the "master plates" into 384-well "assay plates" by means of a HummingBird 384-channel dispenser. These plates were used directly for the assay which was performed in a total volume of 13.55µl. This led to a final compound concentration of 37, 11, 3.7, 1.1, 0.37, 0.11, 0.037 and 0.011µM and a final DMSO concentration of 0.37 % in the assay.

**Cell growth inhibition assay**
The human leukemia cell lines MV-4-11, THP-1 and K-562 were employed to characterize the effect of BET inhibitors on cellular proliferation and viability. Cells were obtained from the American Type Culture Collection (ATCC) and cultured at 37°C in a humidified 5% CO₂ incubator in the following media: MV-4-11: DMEM high glucose (Animed # 1-26F01-I), 10% FCS (Animed # 2-01F26-I), 4 mM L-Glutamine (Animed # 5-10K50), 1 mM Sodium Pyruvate (Animed # G03625P), 1x Penicillin-Streptomycin (Animed # F12478P); K-562: Iscove's MEM (Animed # 1-28F16-I), 10% FCS (Animed # 2-01 F26-I), 4 mM L-Glutamine (Animed # 5-10K50), 1x Penicillin-Streptomycin (Animed # F12478P); THP-1: RPMI-1640 (Animed # 1-41F01-I), 10% FCS (Animed # 2-01 F26-I), 2 mM L-Glutamine (Animed # 5-10K50), 10 mM HEPES (Animed # 5-31 F100), 1 mM Sodium Pyruvate (Animed # G03625P), 1x Penicillin-Streptomycin (Animed # F12478P). The AML lines MV-4-11 and THP-1 are very sensitive to BET inhibitors and show massive cell death upon BET inhibition (Zuber et al., Nature, 478 (2011), 524-8). Compound-mediated suppression of cell proliferation/viability was assessed by quantification of cellular ATP levels using the CellTiter-Glo (CTG) reagent (Promega). Briefly, cells were seeded in 20 µl fresh medium into 384-well plates, followed by addition of 5 µl medium containing compound dilutions at 5-fold their final intended concentration. Dose-response effects were assessed by 3-fold serial dilutions of the test compound, starting at 10 µM. Following incubation of the cells for 4 days at 37 °C and 5 % CO₂, the effect of inhibitors on cell viability was quantified following addition of 20 µl CTG and luminescence quantification (integration time: 100ms) as per vendor manual, using a correspondingly equipped Tecan M200 multi-mode platereader (TECAN, Switzerland). For data analysis, the assay background value determined in wells containing medium, but no cells, was subtracted from all data points. To enable differentiation of cytotoxic from cytostatic compounds, the number of viable cells is assessed relative to that observed at the time of compound addition using a separate cell plate (day 0). The effect of a particular test compound concentration on cell proliferation/viability is expressed as percentage of the background- and day 0-corrected luminescence reading obtained for cells treated with vehicle only (DMSO, 0.1% final concentration), which is set as 100%, whereas that luminescence reading for wells containing medium is set as -100%. Compound concentrations leading to half-maximal (IC50) and total growth inhibition (TGI) were determined using standard four parameter curve fitting.

Nut-foci formation assay
HCC2494 NUT midline carcinoma cells (expressing BRD4-NUT- fusion) were obtained from the University of Texas Southwestern and cultured in RPMI-1640 medium containing 10% Foetal Calf Serum at 37°C in a humidified 5% CO₂ incubator. Compound-mediated inhibition of BRD4 activity was monitored by quantification of the number and intensity of nuclear BRD4-NUT foci using automated immunofluorescence microscopy. Briefly, 5000 cells in 20 µl fresh medium were seeded into Poly-D-Lysine-precoated 384-well
plates and incubated overnight at 37 °C and 5 % CO₂, followed by addition of 5 µl medium containing compound dilutions at 5-fold their final intended concentration. Dose-response effects were assessed by 3-fold serial dilutions of the test compound, starting at 10 µM. Following incubation of the cells for 24 hours at 37 °C and 5 % CO₂, the cells were fixed by incubation with 3.7 % formaldehyde for 10 min, followed by immunofluorescence staining using rabbit anti-NUT (Cell Signaling Technologies, Cat#3625) as primary, and AlexaFluor488-labeled goat anti-rabbit (Invitrogen, Cat#A1008) as secondary antibody (latter complemented with 1 μg/mL Hoechst33342 as DNA dye). Assay plates were imaged using the appropriate filter sets on the Cellomics VTI automated fluorescence microscopy platform (ThermoFisher Scientific) and the population average of the number of NUT-foci per nucleus is quantified using the Cellomics Spot Detection BioApplication image analysis algorithm (ThermoFisher Scientific). The effect of a particular test compound concentration on NUT-foci number and intensity is expressed as percentage of the value obtained for cells treated with vehicle only (DMSO, 0.1% final concentration), which was set as 100. Compound concentrations leading to half-maximal (IC50) inhibition of the aforementioned readout parameters were determined using standard four parameter curve fitting.

Using the biochemical and cellular assays as described in this application compounds of the invention exhibit inhibitory efficacy in accordance to Tables 1 and 2, provided infra.
