(57) **ABSTRACT**

A new and distinct apple tree named ‘MAC 2137’ is dis-
closed. The new apple is notable for its attractive appearance,
superb texture, improved flavor and early ripening.

2 Drawing Sheets

1

Latin name of the genus and species of the plant claimed:
Malus domestica Mill.

Variety denomination: ‘MAC 2137’.

SPONSORED RESEARCH OR DEVELOPMENT**

None

BRIEF DESCRIPTION OF THE PHOTOGRAPHS

FIG. 1 shows a ‘MAC 2137’ apple tree;
FIG. 2 shows the fruit of a ‘MAC 2137’ apple tree

BACKGROUND OF THE INVENTION

‘MAC 2137’ is a new and distinct apple tree discovered by
the inventor in 1998. The inventor saved seeds from selected
apples (*Malus domestica* Mill., variety unknown) grown in a
cultivated area in Fairhaven, Minn., then cultivated those
seeds to produce seedlings for observation. One of those
seedlings was observed to produce fruit unlike other known
varieties, and was selected for further observation under the
name ‘MAC 2137’. In 2003 scion wood of the original ‘MAC
2137’ tree was budded onto ‘Vineland 1’ dwarfing rootstock
(not patented) at Fairhaven, Minn., and second generation
fruit was obtained. Further asexual propagation has been
conducted, and the cultivar has been found to remain true to
type through successive asexual propagations. The fruit of
‘MAC 2137’ is notable for its smaller size, earlier ripening,
similar crunchy texture and sweeter flavor balance as com-
pared to ‘Honeycrisp’ (U.S. Plant Pat. No. 7,197).

The parentage of ‘MAC 2137’ is unknown. The apple tree
varieties most similar to ‘MAC 2137’ are ‘Honeycrisp’ and
‘Minnewashta’ (U.S. Plant Pat. No. 11,367). A comparison of
relevant features of ‘MAC 2137’, ‘Honeycrisp’, and ‘Min-
newashta’ is provided in Table 1 below.

2

TABLE 1

Comparison of ‘MAC 2137’ to Similar Varieties

	MAC 2137	Honeycrisp	Minnewashta
5 Fruit texture	Very crisp, juicy	Very crisp, juicy	Crisp, juicy
Fruit size	Small, 5.7 cm	Large, 8.5 cm	Large, 8.0 cm
Color of mature fruit	Intense red over- color on yellow background	Red stripe over- color on yellow background	Intense red over- color on yellow background
10 Apple scab susceptibility/ resistance	Moderately susceptible	Resistant	Susceptible
Harvest date	Early September	Mid to late September	Late August

**DETAILED BOTANICAL DESCRIPTION OF THE
VARIETY**

The following detailed botanical description is based on
observations made during the 2012 growing season at
Fairhaven, Minn. of six year old trees. All colors are described
according to The Royal Horticultural Society Mini Colour
Chart (2005). It should be understood that the characteristics
described will vary somewhat depending upon cultural prac-
tices and climatic conditions, and can vary with location and
season. Quantified measurements are expressed as an average
of measurements taken from a number of individual plants of
the new variety. The measurements of any individual plant, or
any group of plants, of the new variety may vary from the
stated average.

Tree:

Type.—Tall Spindle.

Vigor.—Strong prior to fruiting then moderate.

Height.—3 meters.

Diameter.—1.3 meters.

Trunk diameter at 20 cm above the graft union.—4.5 cm.

Bark texture.—Smooth.
Bark color grayed brown N199C and N199A.
Lenticels.—Irregular sizes, 1×2.5 mm to 3×7 mm, distribution irregular, average about 2 per cm², color — white N155A. 5

Branch:
Length.—0.6 to 1 meter.
Diameter.—1.5 cm.
Crotch angle.—15 degrees.
Color.—Grey-brown N199C. 10
Lenticels.—Round to elongated, 1×1 mm or 1×2 mm, grey-brown N199D, 4 per cm².

One year old shoot:
Length.—0.2 to 0.6 meters. 15
Color.—Grayed purple N187A.
Pubescence.—Common, light to heavy, obscuring bark, underneath and toward terminal end.
Color.—Greyed-orange N166A.
Thickness.—3-4 mm at 10 cm from base. 20
Internode length.—2-3.5 cm.
Lenticels.—1 mm round to elongated, 7 per cm².

Winter hardiness: No injury in cold zone 4.
Leaves:
Shape.—Ovate.
Apex.—Acuminate. 25
Base.—Equilateral.
Length.—7.5 cm-10 cm.
Width.—3.5 cm-5.5 cm.
Length/width ratio.—1.89.
Margin.—Serrate. 30
Upper surface.—Smooth, green 137A.
Lower surface.—Slightly rough with slight pubescence, green 137C.
Venation.—Pinnate, yellow-green 146C. 35
Attitude in relation to shoot.—Spirals around.
Petiole.—Length — 1.5 cm-3.5 cm.
Diameter.—2 mm.
Color.—Yellow-green 146C.
Stipules.—2 per petiole, length 2 mm to 5 mm, width <1 mm, pointed, margin smooth, larger stipules yellow-green 149A, smaller stipules purple 76B, violet blue 90B and others. 40

Flower:
Bud (dormant).—Quantity per spur — 1 to 2. 45
Length.—6 mm, diameter — 3.5 mm.
Color.—Violet-blue 97C and greyed-orange 166A.
Color (balloon stage) grey-brown N199D and red-purple 63B.
Petals.—Quantity per flower — 5.
Shape.—Obelliptic to elliptic, apex acute, base aequilateral. 50
Length.—1.5 cm-2 cm.
Width.—1 cm-1.5 cm.
Color of upper surface.—White N999D with red-purple 70C towards the margins. 55
Color of lower surface.—White N999D with red 55B shading toward margin or center.
Arrangement.—Intermediate, touching.
Diameter of open flower.—3.5 cm-4 cm.
Pedicel.—Length — 1.2 cm-2.3 cm. 60
Diameter.—1.4 mm-2 mm.
Color.—Top — yellow-green 145A.
Underneath.—Greyed-orange 166C.
Sepals.—Quantity — 5.
Color.—Upper surface yellow-green 149D. 65

Length.—8 mm.
Shape.—Lanceolate with pointed tip, recurved.
Pistils.—Size — 0.5 cm-1 cm.
Color.—White 155D.
Anthers.—Quantity — 15-18.
Size.—1.5 mm.
Pollen.—Color — yellow 12A.
Stigma.—Size 1.4 cm.
Color.—Yellow-green 150B.
Style.—Size 0.5 mm-1 mm. 10
Color.—Yellow-green 150B.
Ovary.—Size — 4 mm.
Color.—Green 139C and purple N77B.
Bloom.—Date of first bloom — April 30th in Fairhaven, Minn. 15
Date of full bloom.—May 5th in Fairhaven, Minn.

Fruit:
Quantity per cluster.—1-3.
Size.—Height 4.7 cm, Width 5.7 cm.
Weight.—3 oz; Ratio of Height to Width — 0.82. 20
Shape.—Oblate.
Ribbing.—Insignificant.
Depth of eye basin.—9.5 mm.
Width of eye basin.—19 mm.
Length of stalk.—1.5 cm-2.5 cm. 25
Thickness of stalk.—1.5 mm.
Width of stalk cavity.—12 mm.
Depth of stalk cavity.—9.5 mm.
Lenticels.—Prominent, round, diameter 1 mm, color white 155D, density 7 per cm². 30
Bloom of skin.—Pronounced.
Greasiness of skin.—Some when more than three weeks past prime harvest date.
Background color of skin.—Yellow 8C.
Overcolor of skin.—Vivid red 45A. 35
Amount of over color.—70% on exposed fruit.
Intensity of overcolor.—Strong.
Pattern of over color.—Irregular blush.
Flesh texture.—Extremely crisp.
Aroma.—Mild apple. 40
Juiciness.—Juicy.
Brix.—14%.
Flesh coloration.—Yellowish white 155D; Locules — 5 per fruit, closed or slightly open, length 8 mm, width 3 mm.
Stem coloration.—Light greyed-brown 199C.
Fruit eating quality.—‘MAC 2137’ is sweet, low acid, very crisp, juicy and aromatic. Flesh is slow to brown and stays white for several days after cutting. 45

Seeds:
Seeds.—7 to 10 per fruit, length 9 mm, width 5 mm, teardrop shape with pointed tip.
Color brown 200A on edges, greyed-orange 165A toward center, tip often white 155D.
Disease resistance/susceptibility.—Moderate susceptibility to scab and cedar apple rust. 50
Harvest: August 28th-September 20th in Fairhaven, Minn.
Storage.—‘MAC 2137’ is a high sugar low acid cultivar. Acid declines in storage, making flavor less appealing after early December, though crisp texture persists. 55
Use: Fresh Market.
I claim:
1. A new and distinct apple tree substantially as shown and described herein. 60
