**C-ARYL GLUCOSIDE DERIVATIVE, PREPARATION METHOD FOR SAME, AND MEDICAL APPLICATIONS THEREOF**

**Field of the invention**

The present invention belongs to the field of drugs, specifically relates to a C-aryl glucoside derivative, a preparation method for same and medical applications thereof.

**Background of the invention**

Diabetes is a metabolic disorder with recurrent or persistent hyperglycemia. Abnormal level of blood glucose can lead to some serious and long-term complications, including cardiovascular disease, chronic renal failure, retinal damage, nerve damage, microvascular damage and obesity.

In the early stage of diabetes treatment, control of diet and exercise therapies are the preferred control scheme of blood glucose. When these methods are difficult to achieve control of blood glucose, insulin or oral hypoglycemic drugs are needed for the treatment. There have been a variety of hypoglycemic drugs used currently in clinical treatment, including biguanide compounds, sulfonylurea compounds, insulin resistance improving agents, α-glucosidase inhibitors and so on. However, each of these drugs has various toxic and side effects, and is unable to meet the needs of long-term treatment. For example, biguanide compounds can cause lactic acidosis; sulfonylurea compounds can lead to hypoglycemia; insulin resistance improving agents can induce edema and heart failure, and α-glucosidase inhibitors can cause abdominal pain, distention, diarrhea and other symptoms. Because of the above situation, it is necessary to develop safer and more effective novel antidiabetic drugs to meet the needs of diabetes treatment.

Studies found that the regulation of cells on the process of glucose transport is mainly achieved by promoting the two protein family members of glucose transporter protein (GLUTs) (passive transport) and sodium-dependent glucose co-transporter protein (SGLTs) (active transport). SGLTs family members with glucose transporter function are mainly distributed in intestine and the proximal tubule of kidney and so on, accordingly it can be inferred that the SGLTs family members play a key role in glucose absorption in intestine and glucose reuptake in kidney, and they will become one of the ideal potential targets for treating diabetes.

In particular, one of family members is SGLT-1 protein that is mainly distributed in the intestinal mucosal cells of small intestine, and little expressed in cardiac muscle and kidney. It is mainly collaborative with GLUTs proteins to regulate glucose absorption in intestine. The another one of family members is SGLT-2 is mainly responsible for regulating glucose reuptake in kidney due to its high level of expression in kidney, i.e., when glucose in urine pass through glomerulus, it can actively attach to the epithelial cells of renal tubule and be transported into the cells and recycled. During this process, SGLT-2 is responsible for 90% of reabsorption, the remaining 10% of
reabsorption is completed by SGLT-1. The theory of SGLT-2 as a major transport protein has been further confirmed in animal tests. SGLT-2 mRNA levels of rat renal cortex cells are inhibited by a specific SGLT-2 antisense oligonucleotides, thereby significantly inhibiting the reuptake of rat renal glucose. Based on these findings, it can be inferred that if a SGLTs (SGLT-1/SGLT-2) protein inhibitor will be developed, through the regulation of its glucose transport function, it is possible to control intestinal absorption of glucose on one hand; and on the other hand to inhibit the reuptake of the renal glucose and enhance discharge of glucose from the urine, thereby achieving more systematic hypoglycemic effect. Therefore, a dual action inhibitor can be an ideal drug for treating diabetes.

Additionally, studies also found that SGLTs protein inhibitors can be useful for the treatment of diabetes-related complications, such as retinopathy, neuropathy, nephropathy, insulin resistance caused by glucose metabolism disorders, hyperinsulinemia, hyperlipidemia, obesity and so on. SGLTs protein inhibitors can be combined with the existing therapeutic agents, such as sulfonamides, thiazolidinediones, metformin, and insulin, etc. Without affecting efficacy, the dosage of drugs can be reduced to avoid or reduce the occurrence of adverse effects, thereby improving the adaptability of the patient to the treatment.

In summary, as a novel drug for treating diabetes, SGLTs protein inhibitor has a good development prospect. Therefore, there is an urgent need to develop an effective and good pharmacokinetic property, high safety compound for the treatment of diabetes and related metabolic disorder diseases.

Step 1: 2-bromo-5-iodobenzoyl chloride

To a 50 mL flask, 2-bromo-5-iodobenzoic acid (50 g, 150 mmol) was added, then anhydrous dichloromethane (500 mL) was added after purging with N₂ three times. The reaction mixture was cooled to 0°C, then a catalytic amount of DMF (2.0 mL) was added, and then oxalyl chloride (19.4 mL, 229 mmol) was slowly added. The reaction mixture was warmed up to room temperature and stirred for 3 hours. When the reaction solution became a clear solution, the stirring was stopped. Dichloromethane and excess oxalyl chloride were removed by rotary evaporation. The resulting residue was used directly in the next step.

Step 2: (2-bromo-5-iodophenyl)-(2,3-dihydrobenzo[b][1,4]dioxin-6-yl)methanone

**Activity assay of SGLT1 and SGLT2:**

The following method was used to determine the inhibitory activity of the compounds of the present invention on SGLT1 and SGLT2. Experimental method was summarized as follows:

SGLT1 and SGLT2 transiently transferred HEK293 cells (prepared according to the existing literature "Diabetes, 57, 1723-1729, 2008", wherein cDNA of SGLT1 and SGLT2 was purchased from Origene company) were seeded in a 96-well plate. The density of the cell was 1-1.5 $\times$ 10$^4$. The cells were cultured at 37°C and 5% CO$_2$ for 48 hours, and then washed twice with 200 µL sodium-free buffer. 90 µL sodium-containing buffer of the test compound at different concentrations was added to the well. Each test compound was repeated in three wells for each concentration. The cells were cultured at 37°C for 15 minutes, then 10 µL (in number 0.1 µCi [14C]) Methyl α-D-glucopyranoside was added to each well of the 96-well plate. The cells were further cultured at 37°C for 2 hours, then the supernatant was discarded. The cells were washed twice with pre-chilled sodium-free buffer and then dissolved in 100 µL NaOH (200 mM), 100 µL scintillation solution was added, and mixed well. Scintiloscope was used for the quantitative detection of 14C.

IC$_{50}$ values of the compounds of various examples were calculated from the aggregation rate at different concentrations.

A process for preparing the compound of formula (I-a3) as defined in claim 1, comprising the following steps of: condensing a compound of formula (II) with a compound of formula (III) to give a compound of formula (IV), converting the compound of formula (IV) into a compound of formula (V), and then deprotecting the compound of formula (V) to give the compound of formula (I-a3) as follows:

wherein:

Z is halogen, P_{g1}, P_{g2}, P_{g3} and P_{g4} are each independently hydroxy protective group that are the same or different, P_{g5} is selected from the group consisting of hydrogen and a hydroxy protective group; and

R_{1}, R_{2}, and R_{3} are as defined in claim 1.

4. The process according to claim 3, wherein Z is selected from the group
consisting of bromine and iodine, $P_{g1}$, $P_{g2}$, $P_{g3}$ and $P_{g4}$ are each independently selected from the group consisting of benzyl, trimethylsilyl and acetyl; and $P_{g5}$ is selected from the group consisting of hydrogen and C$_{1-3}$alkyl.

5. A pharmaceutical composition comprising the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2, and a pharmaceutically acceptable carrier.

6. Use of the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2 for the preparation of a medicament for inhibition of SGLT1s protein.

7. Use of the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2 for inhibition of SGLT1s protein.

8. Use of the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2 in the preparation of a medicament for inhibition SGLT-1 protein, SGLT-2 protein, or SGLT-1 and SGLT-2 dual protein.

9. Use of the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2 for inhibition SGLT-1 protein, SGLT-2 protein, or SGLT-1 and SGLT-2 dual protein.

10. Use of the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2, or the pharmaceutical composition as defined in claim 5 for the preparation of a medicament for treating or delaying the development or the attack of a diseases selected from the group consisting of diabetes, diabetic retinopathy, diabetic neuropathy, diabetic nephropathy, insulin resistance, hyperglycemia, hyperinsulinemia, elevated levels of fatty acids or glycerol, hyperlipidemia, obesity, hypertriglyceridemia, X syndrome, diabetes complications, atherosclerosis and hypertension.

11. Use of the compound, or the tautomer, enantiomer, diastereomer, racemate or the pharmaceutically acceptable salt thereof as defined in any one of claims 1 to 2, or the pharmaceutical composition as defined in claim 5 for treating diabetes, diabetic retinopathy, diabetic neuropathy, diabetic nephropathy, insulin resistance, hyperglycemia, hyperinsulinemia, elevated levels of fatty acids or glycerol, hyperlipidemia, obesity, hypertriglyceridemia, X syndrome, diabetes complications,
atherosclerosis or hypertension in a patient in need thereof.
