## CXCR3 RECEPTOR AGONISTS

### FIELD OF THE INVENTION

- [1] This disclosure is directed to small molecule agonists of the chemokine receptor CXCR3, and product containing the same, as well as to methods related to the use of such small molecule agonists.

### BACKGROUND

- [2] The chemokine receptor CXCR3 is a member of the seven transmembrane-spanning G protein-coupled receptor (GPCR) superfamily. CXCR3 is primarily expressed on activated T lymphocytes and NK cells. CXCL9/Mig, CXCL10/IP-10 and CXCL11/I-TAC, the natural chemokine ligands for CXCR3, are involved in directing activated T cells and other cells, such as NK cells, to sites of inflammation. CXCR3 has been implicated in Th1 cell-mediated inflammation, and upregulation of CXCR3 has been shown in a number of diseases involving T cells, such as inflammatory bowel disease (IBD), multiple sclerosis (MS), rheumatoid arthritis (RA) and diabetes, to name a few.
- [3] CXCR3 receptor agonists inhibit migration of activated T lymphocytes and NK cells. As described by O'Boyle et al ("Chemokine receptor CXCR3 agonist prevents human T-cell migration in a humanized model of arthritic inflammation," PNAS, 109(12):4598-4603, 2012), generalized chemokine receptor desensitization can be induced by specific stimulation of a CXCR3 receptor on the surface of activated T cells, resulting in the inhibition of the inflammatory response that is normally produced. In effect, CXCR3 receptor agonists may act as functional antagonists through chemokine receptor desensitization.
- [4] Prior efforts directed to the identification of small molecule agonists of CXCR3 have been undertaken, resulting in the identification of several compounds. As described by Stroke et al ("Identification of CXCR3 receptor agonists in combinatorial small-molecule libraries," Biochemical and Biophysical Research Communication, 349:221-228, 2006), high-throughput screening of encoded

combinatorial libraries have identified two classes of receptor agonists. In one class, compounds **A** and **B** have been identified, while the other class includes compound **C**:

**A****B****C**

- [5] While advances have been made in this field, there remains a significant need for small molecule agonists of CXCR3, as well as for products and methods related to the same. The present disclosure fulfills these and other needs, as described in more detail in the following detailed description.

**[15]** As used herein, “alkyl” groups include straight chain and branched alkyl groups and cycloalkyl groups having from 1 to about 20 carbon atoms, and typically from 1 to 12 carbons ( $C_1$ – $C_{12}$  alkyl), or, in some embodiments, from 1 to 8 carbon atoms ( $C_1$ – $C_8$  alkyl), or, in some embodiments, from 1 to 4 carbon atoms ( $C_1$ – $C_4$  alkyl). In the case of cycloalkyl groups, such groups have from 3–20 carbon atoms as more specifically defined below. Examples of straight chain alkyl groups include, but are not limited to, methyl, ethyl, n-propyl, n-butyl, n-pentyl, n-hexyl, n-heptyl, and n-octyl groups. Examples of branched alkyl groups include, but are not limited to, isopropyl, iso-butyl, sec-butyl, t-butyl, neopentyl, isopentyl, and 2,2-dimethylpropyl groups.

**[16]** “Alkenyl” groups include straight and branched chain and cyclic alkyl groups as defined above, except that at least one double bond exists between two carbon atoms. Thus, alkenyl groups have from 2 to about 20 carbon atoms, and typically from 2 to 12 carbons or, in some embodiments, from 2 to 8 carbon atoms. Examples include, but are not limited to  $-CH=CH_2$ ,  $-CH=CH(CH_3)$ ,  $-CH=C(CH_3)_2$ ,  $-C(CH_3)=CH_2$ ,  $-C(CH_3)=CH(CH_3)$ ,  $-C(CH_2CH_3)=CH_2$ ,  $-CH=CHCH_2CH_3$ ,  $-CH=CH(CH_2)_2CH_3$ ,  $-CH=CH(CH_2)_3CH_3$ ,  $-CH=CH(CH_2)_4CH_3$ , vinyl, cyclohexenyl, cyclopentenyl, cyclohexadienyl, butadienyl, pentadienyl, and hexadienyl among others.

**[17]** “Alkynyl” groups include straight and branched chain alkyl groups, except that at least one triple bond exists between two carbon atoms. Thus, alkynyl groups have

from 2 to about 20 carbon atoms, and typically from 2 to 12 carbons or, in some embodiments, from 2 to 8 carbon atoms. Examples include, but are not limited to  $-\text{C}\equiv\text{CH}$ ,  $-\text{C}\equiv\text{C}(\text{CH}_3)$ ,  $-\text{C}\equiv\text{C}(\text{CH}_2\text{CH}_3)$ ,  $-\text{CH}_2\text{C}\equiv\text{CH}$ ,  $-\text{CH}_2\text{C}\equiv\text{C}(\text{CH}_3)$ , and  $-\text{CH}_2\text{C}\equiv\text{C}(\text{CH}_2\text{CH}_3)$ , among others.

[18] “Cycloalkyl” groups are alkyl groups forming a ring structure, which can be substituted or unsubstituted, wherein the ring is either completely saturated, partially unsaturated, or fully unsaturated, wherein if there is unsaturation, the conjugation of the pi-electrons in the ring do not give rise to aromaticity. Examples of cycloalkyl include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl groups. In some embodiments, the cycloalkyl group has 3 to 8 ring members, whereas in other embodiments the number of ring carbon atoms range from 3 to 5, 3 to 6, or 3 to 7. Cycloalkyl groups further include polycyclic cycloalkyl groups such as, but not limited to, norbornyl, adamantyl, bornyl, camphenyl, isocamphenyl, and carenyl groups, and fused rings such as, but not limited to, decalinyl, and the like.

[19] “(Cycloalkyl)alkyl” groups, also referred to as “cycloalkylalkyl”, are alkyl groups as defined above in which a hydrogen or carbon bond of the alkyl group is replaced with a bond to a cycloalkyl group as defined above.

[20] The term “cycloalkenyl” alone or in combination denotes a cyclic alkenyl group wherein at least one double bond is present in the ring structure. Cycloalkenyl groups include cycloalkyl groups having at least one double bond between two adjacent carbon atoms. Thus for example, cycloalkenyl groups include but are not limited to cyclohexenyl, cyclopentenyl, and cyclohexadienyl groups, as well as polycyclic and/or bridging ring systems such as adamantane.

[21] “(Cycloalkenyl)alkyl” groups, also referred to as “cycloalkylalkyl”, are alkyl groups as defined above in which a hydrogen or carbon bond of the alkyl group is replaced with a bond to a cycloalkenyl group as defined above.

[22] The terms “carbocyclic” and “carbocyclyl” denote a ring structure wherein the atoms of the ring are carbon. In some embodiments, the carbocyclyl has 3 to 8 ring

members, whereas in other embodiments the number of ring carbon atoms is 4, 5, 6, or 7. Carbocyclyl includes, for example, cycloalkyl and cycloalkenyl.

[23] “(Carbocyclyl)alkyl” groups, also referred to as “carbocyclylalkyls”, are alkyl groups as defined above in which a hydrogen or carbon bond of the alkyl group is replaced with a bond to a carbocyclyl as defined above.

[24] A “nonaromatic carbocyclyl” or a “nonaromatic carbocyclylalkyl” is a group in which the carbocyclic ring of the carbocyclyl or carbocyclylalkyl is a completely saturated, a partially unsaturated, or a fully unsaturated carbocyclyl, wherein if there is unsaturation, the conjugation of the pi-electrons of the carbocyclic ring do not give rise to aromaticity.

[25] “Aryl” groups are cyclic aromatic hydrocarbons that do not contain heteroatoms. Thus aryl groups include, but are not limited to, phenyl, azulenyl, heptalenyl, biphenyl, indacenyl, fluorenyl, phenanthrenyl, triphenylenyl, pyrenyl, naphthacenyl, chrysenyl, biphenylenyl, anthracenyl, and naphthyl groups. In some embodiments, aryl groups contain 6–14 carbons in the ring portions of the groups. The phrase “aryl groups” includes groups containing fused rings, such as fused aromatic-aliphatic ring systems (e.g., indanyl, tetrahydronaphthyl, and the like).

[26] “Aralkyl” groups are alkyl, alkenyl or alkynyl groups as defined above in which a hydrogen atom of an alkyl, alkenyl or alkynyl group is replaced with an aryl group as defined above. Representative aralkyl groups include benzyl ( $-\text{CH}_2\text{phenyl}$ ), phenylethyl ( $-\text{CH}_2\text{CH}_2\text{phenyl}$ ) and phenylethylene ( $-\text{CH}=\text{CHphenyl}$ ) groups and fused (cycloalkylaryl)alkyl groups such as 4-ethyl-indanyl. Aralkyl groups can be substituted on the aryl moiety, the alkyl, alkenyl or alkynyl moiety, or both.

[27] “Heterocyclyl” or “heterocyclic” groups include aromatic and non-aromatic ring moieties containing 3 or more ring members, of which one or more is a heteroatom such as, but not limited to, N, O, S, or P. In some embodiments, heterocyclyl groups include 3 to 20 ring members, whereas other such groups have 3 to 15 ring members, including for example single ring systems containing 5, 6 or 7 ring members. At least one ring contains a heteroatom, but every ring in a polycyclic system need not contain a heteroatom. For example, a dioxolanyl ring and a

benzdioxolanyl ring system (methylenedioxyphenyl ring system) are both heterocyclyl groups within the meaning herein. A heterocyclyl group designated as a C<sub>2</sub>-heterocyclyl can be a 5-ring with two carbon atoms and three heteroatoms, a 6-ring with two carbon atoms and four heteroatoms, and so forth. Likewise a C<sub>4</sub>-heterocyclyl can be a 5-ring with one heteroatom, a 6-ring with two heteroatoms, and so forth. The number of carbon atoms plus the number of heteroatoms sums up to equal the total number of ring atoms.

**[28]** The term “heterocyclyl” includes fused ring species including those having fused aromatic and non-aromatic groups. The phrase also includes polycyclic and/or bridging ring systems containing a heteroatom such as, but not limited to, quinuclidyl and 7-azabicyclo[2.2.1]heptane. A heterocyclyl group as defined herein can be a heteroaryl group or a partially or completely saturated cyclic group including at least one ring heteroatom. Heterocyclyl groups include, but are not limited to, pyrazinyl, pyrimidinyl, pyridazinyl, thiadiazolyl, oxadiazolyl, imidazolinyl, hexahydropyrimidinyl, diazepanyl, triazinyl, imidazolyl, pyrrolidinyl, furanyl, tetrahydrofuranyl, tetrahydro-2H-pyranyl, dioxolanyl, piperidinyl, piperazinyl, morpholinyl, pyrrolyl, pyrazolyl, triazolyl, tetrazolyl, oxazolyl, isoxazolyl, thiazolyl, pyridinyl, thiophenyl, benzothiophenyl, benzofuranyl, dihydrobenzofuranyl, indolyl, dihydroindolyl, azaindolyl, indazolyl, benzimidazolyl, azabenzimidazolyl, benzoxazolyl, benzothiazolyl, benzothiadiazolyl, imidazopyridinyl, isoxazolopyridinyl, thianaphthalenyl, purinyl, xanthinyl, adeninyl, guaninyl, quinolinyl, isoquinolinyl, tetrahydroquinolinyl, quinoxalinyl, and quinazolinyl groups.

**[29]** “Heteroaryl” groups are aromatic ring moieties containing 5 or more ring members, of which, one or more is a heteroatom such as, but not limited to, N, O, and S. A heteroaryl group designated as a C<sub>2</sub>-heteroaryl can be a 5-ring with two carbon atoms and three heteroatoms, a 6-ring with two carbon atoms and four heteroatoms and so forth. Likewise a C<sub>4</sub>-heteroaryl can be a 5-ring with one heteroatom, a 6-ring with two heteroatoms, and so forth. The number of carbon atoms plus the number of heteroatoms sums up to equal the total number of ring

atoms. Heteroaryl groups include, but are not limited to, groups such as pyrrolyl, pyrazolyl, pyridinyl, pyridazinyl, pyrimidyl, pyrazyl, pyrazinyl, pyrimidinyl, thiadiazolyl, imidazolyl, oxadiazolyl, thienyl, triazolyl, tetrazolyl, triazinyl, thiazolyl, thiophenyl, oxazolyl, isoxazolyl, benzothiophenyl, benzofuranyl, indolyl, azaindolyl, indazolyl, benzimidazolyl, azabenzimidazolyl, benzoxazolyl, benzothiazolyl, benzothiadiazolyl, imidazopyridinyl, isoxazolopyridinyl, thianaphthalenyl, purinyl, xanthinyl, adeninyl, guaninyl, quinolinyl, isoquinolinyl, tetrahydroquinolinyl, tetrahydroisoquinolinyl, quinoxalinyl, and quinazolinyl groups. The terms "heteroaryl" and "heteroaryl groups" include fused ring compounds such as wherein at least one ring, but not necessarily all rings, are aromatic, including tetrahydroquinolinyl, tetrahydroisoquinolinyl, indolyl and 2,3-dihydro indolyl.

**[30]** Additional examples of aryl and heteroaryl groups include but are not limited to phenyl, biphenyl, indenyl, naphthyl (1-naphthyl, 2-naphthyl), N-hydroxytetrazolyl, N-hydroxytriazolyl, N-hydroxyimidazolyl, anthracenyl (1-anthracenyl, 2-anthracenyl, 3-anthracenyl), thiophenyl (2-thienyl, 3-thienyl), furyl (2-furyl, 3-furyl), indolyl, oxadiazolyl (1,2,4-oxadiazolyl, 1,3,4-oxadiazolyl), thiadiazolyl (1,2,4-thiadiazolyl, 1,3,4-thiadiazolyl), isoxazolyl, quinazolinyl, fluorenyl, xanthenyl, isoindanyl, benzhydryl, acridinyl, thiazolyl, pyrrolyl (2-pyrrolyl), pyrazolyl (3-pyrazolyl), imidazolyl (1-imidazolyl, 2-imidazolyl, 4-imidazolyl, 5-imidazolyl), triazolyl (1,2,3-triazol-1-yl, 1,2,3-triazol-2-yl, 1,2,3-triazol-4-yl, 1,2,4-triazol-3-yl), oxazolyl (2-oxazolyl, 4-oxazolyl, 5-oxazolyl), thiazolyl (2-thiazolyl, 4-thiazolyl, 5-thiazolyl), pyridyl (2-pyridyl, 3-pyridyl, 4-pyridyl, pyrimidinyl (2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 6-pyrimidinyl), pyrazinyl, pyridazinyl (3-pyridazinyl, 4-pyridazinyl, 5-pyridazinyl), prazolo[1,5- $\alpha$ ]pyridinyl, quinolyl (2-quinolyl, 3-quinolyl, 4-quinolyl, 5-quinolyl, 6-quinolyl, 7-quinolyl, 8-quinolyl), isoquinolyl (1-isoquinolyl, 3-isoquinolyl, 4-isoquinolyl, 5-isoquinolyl, 6-isoquinolyl, 7-isoquinolyl, 8-isoquinolyl), benzo[b]furanyl (2-benzo[b]furanyl, 3-benzo[b]furanyl, 4-benzo[b]furanyl, 5-benzo[b]furanyl, 6-benzo[b]furanyl, 7-benzo[b]furanyl), isobenzofuranyl, 2,3-dihydro-benzo[b]furanyl (2-(2,3-dihydro-

Heterocyclalkyl groups can be substituted on the heterocyclalkyl moiety, the alkyl, alkenyl or alkynyl moiety, or both.

- [32] "Heteroarylalkyl" groups are alkyl, alkenyl or alkynyl groups as defined above in which a hydrogen or carbon bond of an alkyl, alkenyl or alkynyl group is replaced with a bond to a heteroaryl group as defined above. Heteroarylalkyl groups can be substituted on the heteroaryl moiety, the alkyl, alkenyl or alkynyl moiety, or both.
- [33] An "optionally substituted" heterocyclyl, heteroaryl, heterocyclalkyl or heteroarylalkyl refers to a heterocyclyl, heteroaryl, heterocyclalkyl or heteroarylalkyl as defined above having no additional substituents (*i.e.*, unsubstituted) or have one or more substituents (*i.e.*, substituted), wherein such substituents independently one or more  $R^4$  groups as defined above, and in the case of a single carbon atom bearing two substituents includes oxo (=O) and thioxo (=S).
- [34] By a "ring system" as the term is used herein is meant a moiety comprising one, two, three or more rings, which can be substituted with non-ring groups or with other ring systems, or both, which can be fully saturated, partially unsaturated, fully unsaturated, or aromatic, and when the ring system includes more than a single ring, the rings can be fused, bridging, or spirocyclic. By "spirocyclic" is meant the class of structures wherein two rings are fused at a single tetrahedral carbon atom, as is well known in the art.
- [35] A "monocyclic, bicyclic or polycyclic, aromatic or partially aromatic ring" as the term is used herein refers to a ring system including an unsaturated ring possessing  $4n+2$  pi electrons, or a partially reduced (hydrogenated) form thereof. The aromatic or partially aromatic ring can include additional fused, bridged, or spiro rings that are not themselves aromatic or partially aromatic. For example, naphthalene and tetrahydronaphthalene are both a "monocyclic, bicyclic or polycyclic, aromatic or partially aromatic ring" within the meaning herein. Also, for example, a benzo-[2.2.2]-bicyclooctane is also a "monocyclic, bicyclic or polycyclic, aromatic or partially aromatic ring" within the meaning herein, containing a phenyl ring fused to a bridged bicyclic system. A fully saturated ring has no double bonds therein, and is carbocyclic or heterocyclic depending on the presence of heteroatoms within the meaning herein.

- [36] When two “R” groups are said to be joined together or taken together to form a ring, it is meant that together with the carbon atom or a non-carbon atom (*e.g.*, nitrogen atom), to which they are bonded, they may form a ring system. In general, they are bonded to one another to form a 3- to 7-membered ring, or a 5- to 7-membered ring. Non-limiting specific examples are the cyclopentyl, cyclohexyl, cycloheptyl, piperidinyl, piperazinyl, pyrrolidinyl, pyrrolyl, pyridinyl.
- [37] The term "alkoxy" refers to an oxygen atom connected to an alkyl group, including a cycloalkyl group, as are defined above. Examples of linear alkoxy groups include but are not limited to methoxy, ethoxy, n-propoxy, n-butoxy, n-pentyloxy, n-hexyloxy, n-heptyloxy, n-octyloxy, n-nonyloxy, and the like. Examples of branched alkoxy include but are not limited to isopropoxy, sec-butoxy, tert-butoxy, isopentyloxy, isohexyloxy, and the like. Examples of cyclic alkoxy include but are not limited to cyclopropyloxy, cyclobutyloxy, cyclopentyloxy, cyclohexyloxy, and the like.
- [38] The terms "aryloxy" and “arylalkoxy” refer to, respectively, an aryl group bonded to an oxygen atom and an aralkyl group bonded to the oxygen atom at the alkyl moiety. Examples include but are not limited to phenoxy, naphthyloxy, and benzyloxy.
- [39] An "acyl" group as the term is used herein refers to a group containing a carbonyl moiety wherein the group is bonded via the carbonyl carbon atom. The carbonyl carbon atom is also bonded to another carbon atom, which can be part of an alkyl, aryl, aralkyl, cycloalkyl, cycloalkylalkyl, heterocyclyl, heterocyclylalkyl, heteroaryl, heteroarylalkyl group or the like. In the special case wherein the carbonyl carbon atom is bonded to hydrogen, the group is a “formyl” group, an acyl group as the term is defined herein. An acyl group can include 0 to about 12–20 additional carbon atoms bonded to the carbonyl group. An acyl group can include double or triple bonds within the meaning herein. An acryloyl group is an example of an acyl group. An acyl group can also include heteroatoms within the meaning here. A nicotinoyl group (pyridyl-3-carbonyl) group is an example of an acyl group within the meaning herein. Other examples include acetyl, benzoyl, phenylacetyl,

pyridylacetyl, cinnamoyl, and acryloyl groups and the like. When the group containing the carbon atom that is bonded to the carbonyl carbon atom contains a halogen, the group is termed a "haloacyl" group. An example is a trifluoroacetyl group.

[40] The term "amine" includes primary, secondary, and tertiary amines having, e.g., the formula  $N(\text{group})_3$  wherein each group can independently be H or non-H, such as alkyl, aryl, and the like. Amines include but are not limited to  $R-NH_2$ , for example, alkylamines, arylamines, alkylarylamines;  $R_2NH$  wherein each R is independently selected, such as dialkylamines, diarylamines, aralkylamines, heterocyclylamines and the like; and  $R_3N$  wherein each R is independently selected, such as trialkylamines, dialkylarylamines, alkyl diarylamines, triarylamines, and the like. The term "amine" also includes ammonium ions as used herein.

[41] An "amino" group is a substituent of the form  $-NH_2$ ,  $-NHR$ ,  $-NR_2$ ,  $-NR_3^+$ , wherein each R is independently selected, and protonated forms of each. Accordingly, any compound substituted with an amino group can be viewed as an amine.

[42] An "ammonium" ion includes the unsubstituted ammonium ion  $NH_4^+$ , but unless otherwise specified, it also includes any protonated or quaternarized forms of amines. Thus, trimethylammonium hydrochloride and tetramethylammonium chloride are both ammonium ions, and amines, within the meaning herein.

[43] The term "amide" (or "amido") includes C- and N-amide groups, i.e.,  $-C(O)NR_2$ , and  $-NRC(O)R$  groups, respectively. Amide groups therefore include but are not limited to carbamoyl groups ( $-C(O)NH_2$ ) and formamide groups ( $-NHC(O)H$ ). A "carboxamido" group is a group of the formula  $C(O)NR_2$ , wherein R can be H, alkyl, aryl, etc.

[44] The term "hydroxyl" refers to an  $-OH$  group.

[45] The term "hydroxyalkyl" refers to an  $-alkyl-OH$  group.

[46] The term "cyano" refers to a  $-CN$  group.

[47] The term "carbonyl," refers to a  $-C(=O)-$  group.

[48] "Halo," "halogen," and "halide" include fluorine, chlorine, bromine and iodine.

- [49] The term "perhaloalkyl" refers to an alkyl group where all of the hydrogen atoms are replaced by halogen atoms. Perhaloalkyl groups include, but are not limited to,  $-\text{CF}_3$  and  $-\text{C}(\text{CF}_3)_3$ . The term "haloalkyl" refers to an alkyl group where some but not necessarily all of the hydrogen atoms are replaced by halogen atoms. Haloalkyl groups include but are not limited to  $-\text{CHF}_2$  and  $-\text{CH}_2\text{F}$ .
- [50] The term "perhaloalkoxy" refers to an alkoxy group where all of the hydrogen atoms are replaced by halogen atoms. Perhaloalkoxy groups include, but are not limited to,  $-\text{OCF}_3$  and  $-\text{OC}(\text{CF}_3)_3$ . The term "haloalkoxy" refers to an alkoxy group where some but not necessarily all of the hydrogen atoms are replaced by halogen atoms. Haloalkoxy groups include but are not limited to  $-\text{OCHF}_2$  and  $-\text{OCH}_2\text{F}$ .
- [51] The compounds disclosed herein may be in the form of a neutral compound, or in the form of the free acid or free base. Alternatively, the compounds disclosed herein may be associated with a counter ion, and be in the form a salt. In one embodiment, the compound is in the form of a "pharmaceutically acceptable" salt, which refers to a salt possessing toxicity profiles within a range that affords utility in pharmaceutical applications.
- [52] A "hydrate" is a compound that exists in a composition with water molecules. The composition can include water in stoichiometric quantities, such as a monohydrate or a dihydrate, or can include water in random amounts. As the term is used herein a "hydrate" refers to a solid form (*i.e.*, a compound in water solution, while it may be hydrated, is not a hydrate as the term is used herein).
- [53] A "solvate" is a similar composition except that a solvent other than water replaces the water. For example, methanol or ethanol can form an "alcoholate", which can again be stoichiometric or non-stoichiometric. As the term is used herein a "solvate" refers to a solid form (*i.e.*, a compound in solution in a solvent, while it may be solvated, is not a solvate as the term is used herein).
- [54] A prodrug is a substance that can be administered to a patient where the substance is converted *in vivo* by the action of biochemicals within the patient's body, such as enzymes, to the active pharmaceutical ingredient. Examples of prodrugs include esters of carboxylic acid groups, which can be hydrolyzed by

endogenous esterases as are found in the bloodstream of humans and other mammals. In one embodiment of the present invention, substances are provided that can be administered to a patient where the substance is converted *in vivo* by the action of biochemical within the patient's body, such as enzymes, to a compound having the structure of any one of Formulas (I)-(IV).

[55] The term “isotope” refers to atoms with the same number of protons but a different number of neutrons, and an isotope of a compound of Formula (I) includes any such compound wherein one or more atoms are replaced by an isotope of that atom. For example, carbon 12, the most common form of carbon, has six protons and six neutrons, whereas carbon 13 has six protons and seven neutrons, and carbon 14 has six protons and eight neutrons. Hydrogen has two stable isotopes, deuterium (one proton and one neutron) and tritium (one proton and two neutrons). While fluorine has a number of isotopes, fluorine 19 is longest-lived. Thus, an isotope of a compound having the structure of Formula (I) includes, but not limited to, compounds of Formula (I) wherein one or more carbon 12 atoms are replaced by carbon 13 and/or 14 atoms, wherein one or more hydrogen atoms are replaced with deuterium and/or tritium, and/or wherein one or more fluorine atoms are replaced by fluorine 19.

[56] In addition, where features or aspects of the invention are described in terms of Markush groups, those skilled in the art will recognize that the invention is also thereby described in terms of any individual member or subgroup of members of the Markush group. For example, if X is described as selected from the group consisting of bromine, chlorine, and iodine, claims for X being bromine and claims for X being bromine and chlorine are fully described. Moreover, where features or aspects of the invention are described in terms of Markush groups, those skilled in the art will recognize that the invention is also thereby described in terms of any combination of individual members or subgroups of members of Markush groups. Thus, for example, if X is described as selected from the group consisting of bromine, chlorine, and iodine, and Y is described as selected from the group

consisting of methyl, ethyl, and propyl, claims for X being bromine and Y being methyl are fully described.

[57] All chiral, diastereomeric, racemic forms of a structure are intended, unless a particular stereochemistry or isomeric form is specifically indicated. Compounds of the present invention include enriched or resolved optical isomers at any or all asymmetric atoms as are apparent from the depictions, at any degree of enrichment. Both racemic and diastereomeric mixtures, as well as the individual optical isomers can be synthesized so as to be substantially free of their enantiomeric or diastereomeric partners, and these are all within the scope of certain embodiments of the invention.

[58] "Isolated optical isomer" means a compound which has been substantially purified from the corresponding optical isomer(s) of the same formula. In an embodiment, the isolated isomer is at least about 80% pure by weight, or at least 80% pure by weight, or at least 85% pure by weight. In other embodiments, the isolated isomer is at least 90% pure by weight, or at least 98% pure by weight, or at least 99% pure by weight.

[59] "Substantially enantiomerically or diastereomerically" pure means a level of enantiomeric or diastereomeric enrichment of one enantiomer with respect to the other enantiomer or diastereomer of at least 80%, and in other embodiments means in excess of 80%, 85%, 90%, 95%, 98%, 99%, 99.5% or 99.9%.

[60] Enantiomers are sometimes called optical isomers because a pure enantiomer rotates plane-polarized light in a particular direction. If the light rotates clockwise, then that enantiomer is labeled "(+)" or "d" for dextrorotatory, its counterpart will rotate the light counterclockwise and is labeled "(-)" or "l" for levorotatory.

[61] The terms "racemate" and "racemic mixture" are frequently used interchangeably. A racemate is an equal mixture of two enantiomers. A racemate is labeled "(±)" because it is not optically active (*i.e.*, will not rotate plane-polarized light in either direction since its constituent enantiomers cancel each other out).

[62] All structures encompassed within a claim are "chemically feasible," by which is meant that the structure depicted by any combination or subcombination of

optional substituents meant to be recited by the claim is physically capable of existence with at least some stability as can be determined by the laws of structural chemistry and by experimentation. Structures that are not chemically feasible are not within a claimed set of compounds. Further, isotopes of the atoms depicted (such as deuterium and tritium in the case of hydrogen) are encompassed within the scope of this invention.

[63] Phrases such as “under conditions suitable to provide” or “under conditions sufficient to yield” or the like, in the context of methods of synthesis, as used herein refers to reaction conditions, such as time, temperature, solvent, reactant concentrations, and the like, that are within ordinary skill for an experimenter to vary, that provide a useful quantity or yield of a reaction product. It is not necessary that the desired reaction product be the only reaction product or that the starting materials be entirely consumed, provided the desired reaction product can be isolated or otherwise further used.

[64] The term "heteroatoms" as used herein refers to non-carbon and non-hydrogen atoms, capable of forming covalent bonds with carbon, and is not otherwise limited. Typical heteroatoms are N, O, and S. When sulfur (S) is referred to, it is understood that the sulfur can be in any of the oxidation states in which it is found, thus including sulfoxides ( $R-S(O)-R'$ ) and sulfones ( $R-S(O)_2-R'$ ), unless the oxidation state is specified; thus, the term "sulfone" encompasses only the sulfone form of sulfur; the term "sulfide" encompasses only the sulfide ( $R-S-R'$ ) form of sulfur.

**[117]** As used herein, “individual” (as in the subject or patient of the treatment) means both mammals and non-mammals. Mammals include, for example, humans; non-human primates, *e.g.*, apes and monkeys; cattle; horses; sheep; and goats. Non-mammals include, for example, fish and birds.

**[118]** A "receptor", as is well known in the art, is a biomolecular entity usually comprising a protein that specifically binds a structural class of ligands or a single native ligand in a living organism, the binding of which causes the receptor to transduce the binding signal into another kind of biological action, such as signaling a cell that a binding event has occurred, which causes the cell to alter its function in some manner. Any molecule, naturally occurring or not, that binds to a receptor and activates it for signal transduction, is referred to as an "agonist" or "activator." Any molecule, naturally occurring or not, that binds to a receptor, but does not cause signal transduction to occur, and which can block the binding of an agonist and its consequent signal transduction, is referred to as an "antagonist." Certain molecules bind to receptors at locations other than the binding sites of their natural ligands and such allosteric binding molecules may potentiate, activate or agonize the receptor and may enhance the effect of a natural ligand or a co-administered ligand.

[119] A "CXCR3 compound" or "CXCR3 agonist" or "CXCR3 activator" or "CXCR3 modulator" or "CXCR3 antagonist" or "CXCR3 potentiator" or "CXCR3 modulator" as the terms are used herein refer to compounds that interact in some way with the CXCR3 receptor. They can be agonists, potentiators, or activators, or they can be antagonists or inhibitors, and can be selective for action of the CXCR3 receptor family.

[120] The term "disease" or "disorder" or "malcondition" are used interchangeably, and are used to refer to diseases or conditions wherein a CXCR3 receptor plays a role in the biochemical mechanisms involved in the disease or malcondition or symptom(s) thereof such that a therapeutically beneficial effect can be achieved by acting on a CXCR3 receptor.

[121] "Substantially" as the term is used herein means completely or almost completely; for example, a composition that is "substantially free" of a component either has none of the component or contains such a trace amount that any relevant functional property of the composition is unaffected by the presence of the trace amount, or a compound is "substantially pure" if there are only negligible traces of impurities present.

[122] "Treating" or "treatment" within the meaning herein refers to an alleviation of symptoms associated with a disorder or disease, or inhibition of further progression or worsening of those symptoms, or prevention or prophylaxis of the disease or disorder.

[123] The expression "effective amount", when used to describe use of a compound of the invention in providing therapy to a patient suffering from a disorder or malcondition mediated by a CXCR3 receptor refers to the amount of a compound of the invention that is effective to bind to as an agonist or as an antagonist a CXCR3 receptor in the individual's tissues, wherein the CXCR3 is implicated in the disorder, wherein such binding occurs to an extent sufficient to produce a beneficial therapeutic effect on the patient. Similarly, as used herein, an "effective amount" or a "therapeutically effective amount" of a compound of the invention refers to an amount of the compound that alleviates, in whole or in part, symptoms associated

with the disorder or condition, or halts or slows further progression or worsening of those symptoms, or prevents or provides prophylaxis for the disorder or condition. In particular, a "therapeutically effective amount" refers to an amount effective, at dosages and for periods of time necessary, to achieve the desired therapeutic result by acting as an agonist of CXCR3 activity. A therapeutically effective amount is also one in which any toxic or detrimental effects of compounds of the invention are outweighed by the therapeutically beneficial effects. For example, in the context of treating a malcondition mediated by activation of a CXCR3 receptor, a therapeutically effective amount of a CXCR3 receptor antagonist of the invention is an amount sufficient to control the malcondition, to mitigate the progress of the malcondition, or to relieve the symptoms of the malcondition.

[143] A stirring solution of Intermediate 1D (30 mg, 0.053 mmol), 3,4-dichloroaniline (8.2 mg, 0.05 mmol) and DIEA (0.023 mL, 0.13 mmol) in THF (5 mL) was cooled to 0°C. A solution of HATU (20 mg, 0.05 mmol) in THF (1 mL) was added dropwise over 5 min. The reaction mixture was warmed to rt, stirred for 2 h, then diluted with EA and washed with NaHCO<sub>3</sub> (sat.) The aqueous fraction was back-extracted with EA. The combined organic fractions were dried (Na<sub>2</sub>SO<sub>4</sub>) then purified by column chromatography (EA/hexane then MeOH/DCM) to provide Intermediate 1E (28 mg, 78%). [144] A solution of 4N HCl in dioxane (0.03 mL, 0.1 mmol) was added to Intermediate 1E (28 mg, 0.04 mmol) in DCM (0.5 mL). The reaction mixture was allowed to stir for 2 h at rt, then concentrated *in vacuo* and suspended in diethyl ether. The resulting precipitate was filtered, washed with diethyl ether, and dried to give Compound 1-1. LCMS (m/z) calculated for C<sub>32</sub>H<sub>34</sub>Cl<sub>2</sub>N<sub>4</sub>O<sub>4</sub>: 608.2; found 609.2 [M+H]<sup>+</sup>, *t*<sub>R</sub> = 11.31 min (*Method 1*).

## EXAMPLE 2

SYNTHESIS OF (*S*)-*N*-((*S*)-4-AMINO-1-((3,4-DICHLOROPHENYL)AMINO)-1-OXOBUTAN-2-  
YL)-2-(4-OXO-4-PHENYLBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-3-  
CARBOXAMIDE (COMPOUND 2-1)

Step 2A: 2,5-dioxopyrrolidin-1-yl (*S*)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetra hydro isoquinoline -3-carboxylate (Intermediate 2A).

[146] EDCI (4.9 g, 26 mmol) was added to a solution of *N*-hydroxysuccinimide (2.96 g, 26 mmol) and (*S*)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid (Intermediate 1B) (6.2 g, 18 mmol) in DCM (25 mL). After stirring overnight, the reaction mixture was concentrated and purified over SiO<sub>2</sub> (EA/Hexane) to provide Intermediate 2A (5.6g, 70%). LCMS (*m/z*) calculated for C<sub>24</sub>H<sub>22</sub>N<sub>2</sub>O<sub>6</sub>: 434.2; found 434.9 [*M*+H]<sup>+</sup>, *t*<sub>R</sub> = 3.99 min (*Method 2*).

Step 2B: (S)-4-((tert-butoxycarbonyl)amino)-2-((S)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamido)butanoic acid (Intermediate 2B).

[147] DIEA (0.5 mL, 2.8 mmol) was added to a solution of (S)-2-amino-4-((tert-butoxycarbonyl)amino)butanoic acid (0.27 g, 1.23 mmol) and Intermediate 2A (0.5 g, 1.15 mmol) in DCM (2.5 mL) and stirred overnight. The reaction mixture was diluted with EA and washed with 1N HCl and water. The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ), concentrated and purified over  $\text{SiO}_2$  (MeOH/ DCM). The resulting material was recrystallized from THF/  $\text{Et}_2\text{O}$  to provide Intermediate 2B (0.3 g, 49%). LCMS (m/z) calculated for  $\text{C}_{29}\text{H}_{35}\text{N}_3\text{O}_7$ : 537.3; found 537.9  $[\text{M}+\text{H}]^+$ ,  $t_R$  = 4.67 min (Method 2).

Step 2C: *tert*-butyl ((*S*)-4-((3,4-dichlorophenyl)amino)-4-oxo-3-((*S*)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamido)butyl)carbamate  
(Intermediate 2C).

[148] HATU (233 mg, 0.61 mmol) and DIEA (0.25 mL, 1.4 mmol) were added to a solution of Intermediate 2B (0.3 g, 0.6 mmol) and 3,4-dichloroaniline (99 mg, 0.61 mmol) in THF (15 mL). After stirring overnight, the reaction mixture was concentrated, diluted with EA and washed with 0.1 M HCl, 0.1 M NaOH, saturated NaHCO<sub>3</sub>, water and brine. The resulting material (Intermediate 2C) was used without further purification. LCMS (m/z) calculated for C<sub>35</sub>H<sub>38</sub>Cl<sub>2</sub>N<sub>4</sub>O<sub>6</sub>: 680.2; found 681.1 [M+H]<sup>+</sup>, *t<sub>R</sub>* = 13.28 min (*Method 1*).

Step 2D: (S)-N-((S)-4-amino-1-((3,4-dichlorophenyl)amino)-1-oxobutan-2-yl)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamide (Compound 2-1).

[149] A solution of 4M HCl (4.4 mL, 17.6 mmol) in dioxane was added to a solution of Intermediate 2C (0.3 g, 0.44 mmol) in THF (5 mL) at 0°C. DCM (5 mL) was added to dissolve the resulting precipitate. After 4 h, the reaction mixture was concentrated and purified by RP-Prep HPLC to provide Compound 2-1 (31 mg, 12%). LCMS (m/z) calculated for C<sub>30</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>4</sub>O<sub>4</sub>: 580.2; found 582.0 [M+H]<sup>+</sup>, t<sub>R</sub> = 12.42 min (Method 1).

[150] Following the procedures as set forth in Example 2 above, the compounds of the following Table 2 were prepared using the appropriate R<sup>1</sup> reagents:

SYNTHESIS OF (*S*)-*N*-((*S*)-1-((3,4-DICHLOROPHENYL)AMINO)-1-OXO-5-UREIDOPENTAN-2-  
YL)-2-(4-OXO-4-PHENYLBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-3-  
CARBOXAMIDE(COMPOUND 3-1)

Step 3A: Synthesis of *tert*-butyl (*S*)-(1-((3,4-dichlorophenyl)amino)-1-oxo-5-ureidopentan-2-yl)carbamate (Intermediate 3A).

[151] A stirring solution of (*S*)-2-((*tert*-butoxycarbonyl)amino)-5-ureidopentanoic acid (1.0 g, 3.6 mmol), 3,4-dichloroaniline (0.56 g, 3.5 mmol) and DIEA (1.5 mL, 8.7 mmol) in 10 mL of THF was cooled to 0°C. A solution of HATU (1.4 g, 3.6 mmol) in 1 mL of THF was added dropwise over 5 min. The reaction mixture was allowed to warm to rt and stirred for 2 h. The mixture was diluted with EA and washed with NaHCO<sub>3</sub> (sat. aqueous). The organic solvent was concentrated water

was added. The resulting solid was filtered and dried to provide Intermediate 3A. LCMS (m/z) calculated for  $C_{17}H_{24}Cl_2N_4O_4$ : 418.1; found 419  $[M+H]^+$ ,  $t_R = 4.73$  min (*Method 2*).

Step 3B: Synthesis of (S)-2-amino-N-(3,4-dichlorophenyl)-5-ureidopentanamide. (Intermediate 3B).

[152] A solution of 4N HCl in dioxane (3.3 mL, 13.1 mmol) was added to Intermediate 3A (1.1 g, 2.6 mmol) in DCM (10 mL). The mixture was stirred overnight and then concentrated. Diethyl ether was added and the resulting solid was collected by filtration to provide Intermediate 3B. LCMS (m/z) calculated for  $C_{12}H_{16}Cl_2N_4O_2$ : 318.1; found 319  $[M+H]^+$ ,  $t_R = 3.08$  min (*Method 2*).

Step 3C: Synthesis of (*S*)-*N*-((*S*)-1-((3,4-dichlorophenyl)amino)-1-oxo-5-ureidopentan-2-yl)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamide (Compound 3-1).

SYNTHESIS OF (*S*)-*N*-((*S*)-6-AMINO-1-((4-CHLORO-3-METHYLPHENYL)AMINO)-1-  
OXOHEXAN-2-YL)-2-(4-OXO-4-PHENYLBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-  
3-CARBOXAMIDE (COMPOUND 4-2)

Step 4A: Synthesis of (9H-fluoren-9-yl)methyl *tert*-butyl (6-((4-chloro-3-methylphenyl)amino)-6-oxohexane-1,5-diyl)(*S*)-dicarbamate (Intermediate 4A).

[155] A stirring solution of  $N^2$ -(((9H-fluoren-9-yl)methoxy)carbonyl)- $N^6$ -(*tert*-butoxycarbonyl)-*L*-lysine (2.0 g, 4.3 mmol), 4-chloro-3-methylaniline (0.58 g, 4.1 mmol) and DIEA (1.77 mL, 10.2 mmol) in THF (15 mL) was cooled to 0°C. A solution of HATU (1.62 g, 4.3 mmol) in THF (1 mL) was added dropwise over 5 min. The reaction mixture was allowed to warm to rt and stirred for 2 h, then diluted with EA and washed with NaHCO<sub>3</sub> (sat. aqueous). The aqueous fraction was back-extracted with EA. The combined organic fractions were dried (Na<sub>2</sub>SO<sub>4</sub>) then concentrated to provide 2 g (83%) of crude Intermediate 4A. LCMS (*m/z*) calculated for C<sub>33</sub>H<sub>38</sub>ClN<sub>3</sub>O<sub>5</sub>: 591.3; found 592.0 [M+H]<sup>+</sup>, *t<sub>R</sub>* = 6.4 min (*Method 2*).

Step 4B: Synthesis of *tert*-butyl (*S*)-(5-amino-6-((4-chloro-3-methylphenyl)amino)-6-oxohexyl)carbamate (Intermediate 4B).

[156] A solution of 50% piperidine in DMF (1 mL) was added to a solution of Intermediate 4A (2.0 g, 3.4 mmol) DCM (25 mL) and the mixture was stirred for 30 min at rt. The reaction mixture was concentrated *in vacuo* and the residue (Intermediate 4B) was directly used for the next step without purification. LCMS

(m/z) calculated for  $C_{18}H_{27}ClN_3O_3$ : 369.2; found 370.0  $[M+H]^+$ ,  $t_R = 4.5$  min (Method 2).

Step 4C: Synthesis of *tert*-butyl ((*S*)-6-((4-chloro-3-methylphenyl)amino)-6-oxo-5-((*S*)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamido) hexyl) carbamate. (Intermediate 4C).

[157] A stirring solution of Intermediate 1B (80 mg, 0.24 mmol), Intermediate 4B (88 mg, 0.24 mmol) and DIEA (0.87 mL, 0.6 mmol) in THF (5 mL) was cooled to 0°C. A solution of HATU (90 mg, 0.24 mmol) in THF (1 mL) was added dropwise over 5 min. The reaction mixture was allowed to warm to rt and stirred for 2 h, then diluted with EA and washed with  $NaHCO_3$  (sat. aqueous). The aqueous fraction was back-extracted with EA. The combined organic fractions were dried ( $Na_2SO_4$ ) then concentrated to provide crude Intermediate 4C. LCMS (m/z) calculated for  $C_{38}H_{45}ClN_4O_6$ : 688.3; found 689.0  $[M+H]^+$ ,  $t_R = 4.5$  min (Method 2).

Step 4D: Synthesis of (S)-N-((S)-6-amino-1-((4-chloro-3-methylphenyl)amino)-1-oxohexan-2-yl)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamide (Compound 4-2).

**[158]** A solution of 4N HCl in dioxane (0.5 mL, 2 mmol) was added to a solution of Intermediate 4C (100 mg, 0.15 mmol) in DCM (2 mL). After stirring overnight at rt, the reaction mixture was concentrated *in vacuo* and purified by RP-prep HPLC to provide Compound 4-2. LCMS [m/z] calculated for C<sub>33</sub>H<sub>37</sub>ClN<sub>4</sub>O<sub>4</sub>: 588.3; found: 589.0 [M+H]<sup>+</sup>, t<sub>R</sub> = 11.05 min (Method 1).

5-1

Step 5A. Synthesis of (9H-fluoren-9-yl)methyl (S)-(1-((3,4-dichlorophenyl)amino)-5-(3,3-dimethylguanidino)-1-oxopentan-2-yl)carbamate (Intermediate 5A).

[160] A stirring solution of  $N^2$ -((((9H-fluoren-9-yl)methoxy)carbonyl)- $N^\omega$ , $N^\omega$ -dimethyl-*L*-arginine (0.20 g, 0.47 mmol), 3,4-dichloroaniline (0.076 g, 0.47 mmol) and DIEA (0.2 mL, 1.2 mmol) in THF (8 mL) was cooled to 0°C. A solution of HATU (0.18 g, 0.47 mmol) in THF (1 mL) was added dropwise over 5 min. The reaction mixture was allowed to warm to rt and stirred for 2h, then diluted with EA and washed with NaHCO<sub>3</sub> (sat. aqueous) The aqueous fraction was back-extracted with EA. The combined organic fractions were dried (Na<sub>2</sub>SO<sub>4</sub>) then concentrated to provide crude Intermediate 5A. LCMS (m/z) calculated for C<sub>29</sub>H<sub>31</sub>Cl<sub>2</sub>N<sub>5</sub>O<sub>3</sub>: 567.2; found 568.0 [M+H]<sup>+</sup>,  $t_R$  = 5.2 (*Method 2*).

Step 5B. Synthesis of (*S*)-2-amino-*N*-(3,4-dichlorophenyl)-5-(3,3-dimethylguanidino)pentanamide (Intermediate 5B).

[161] A solution of 50% piperidine in DMF (10 mL) was added to a solution of Intermediate 5A (70 mg, 0.12 mmol) in DCM (5 mL) and the mixture was stirred for 30 min at rt. The reaction mixture was concentrated *in vacuo* and the residue (Intermediate 5B) was directly used for next step without purification. LCMS (m/z) calculated for C<sub>14</sub>H<sub>21</sub>Cl<sub>2</sub>N<sub>5</sub>O: 345.1; found 346.0 [M+H]<sup>+</sup>, *t<sub>R</sub>* = 2.7 min (*Method 2*).

Step 5C. Synthesis of (S)-N-((S)-1-((3,4-dichlorophenyl) amino)-5-(3,3-dimethylguanidino) -1-oxopentan-2-yl) -2-(4-oxo-4-phenylbutanoyl)- 1,2,3,4-tetrahydroisoquinoline- 3-carboxamide. (Compound 5-1).

[162] A stirring solution of Intermediate 1D (30 mg, 0.09 mmol), Intermediate 5B (31 mg, 0.09 mmol) and DIEA (0.054 mL, 0.31 mmol) in THF (10 mL) was cooled to 0°C. A solution of HATU (36 mg, 0.09 mmol) in THF (8 mL) was added dropwise over 5 min. The reaction mixture was allowed to warm to rt and stirred for 2 h, then diluted with EA and washed with NaHCO<sub>3</sub> (sat. aqueous). The aqueous fraction was back-extracted with EA. The combined organic fractions were dried (Na<sub>2</sub>SO<sub>4</sub>) then concentrated to provide crude material which was purified by RP-Prep HPLC to provide product Compound 5-1. LCMS [m/z] calculated for C<sub>34</sub>H<sub>38</sub>Cl<sub>2</sub>N<sub>6</sub>O<sub>4</sub>: 665.6; found 666.9[M+H]<sup>+</sup>, *t<sub>R</sub>* = 11.56 min (*Method 1*).

SYNTHESIS OF *N*-((*S*)-6-AMINO-1-((4-CHLORO-3-METHYLPHENYL)AMINO)-1-OXOHXAN-2-YL)-2-(4-(4-FLUOROPHENYL)-4-OXOBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-3-CARBOXAMIDE (COMPOUND 7-1).

Step 7A. Synthesis of 2-(4-(4-fluorophenyl)-4-oxobutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid (Intermediate 7A).

[166] A stirring solution of ethyl 1,2,3,4-tetrahydroisoquinoline-3-carboxylate HCl (680 mg, 2.8 mmol), 4-(4-fluorophenyl)-4-oxobutanoic acid (500 mg, 2.55 mmol) and DIEA (1.6 ml, 8.9 mmol) in THF (8 mL) and DMF (2 mL) was cooled to 0°C. HATU (1.0 g, 2.7 mmol) was added over 5 min and the reaction mixture was allowed to warm to rt and stirred for 2 h. The reaction mixture was diluted with EA and washed with NaHCO<sub>3</sub> (sat. aqueous). The aqueous fraction was back-extracted

with EA and the combined organic fractions were dried ( $\text{Na}_2\text{SO}_4$ ), then concentrated onto celite and purified by column chromatography (EA/Hexane) to provide Intermediate 7A (980 mg, 46%). LCMS  $[\text{m/z}]$  calculated for  $\text{C}_{22}\text{H}_{22}\text{FNO}_4$ : 383.2; found 384.0  $[\text{M}+\text{H}]^+$ ,  $t_{\text{R}} = 4.96$  min (*Method 2*).

Step 7B. Synthesis of 2-(4-(4-fluorophenyl)-4-oxobutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid (Intermediate 7B).

[167] A solution of 1.0M LiOH (10.9 mL, 10.9 mmol) was added to a solution of Intermediate 7A (400 mg, 1.1 mmol) in THF (16 mL) and  $\text{H}_2\text{O}$  (3 mL). The reaction mixture was stirred overnight at rt and was diluted with  $\text{H}_2\text{O}$  and the THF was removed *in vacuo*. The aqueous layer was washed with diethyl ether, made acidic with 1N HCl, and extracted with EA. The organic layer was dried ( $\text{Na}_2\text{SO}_4$ ) then concentrated and purified by column chromatography to provide Intermediate 7B (250 mg, 66%). ## EXAMPLE 11

SYNTHESIS OF (*S*)-*N*-(4-((2-CHLORO-3-METHYLPHENYL)CARBAMOYL)PIPERIDIN-4-YL)-2-(4-OXO-4-PHENYLBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-3-CARBOXAMIDE (COMPOUND 11-1)

11-1

Step 11A. Synthesis of *tert*-butyl 4-(((9H-fluoren-9-yl)methoxy)carbonyl)amino)-4-((2-chloro-3-methylphenyl)carbamoyl)piperidine-1-carboxylate (Intermediate 11A).

11A

[183] A solution of 4-(((9H-fluoren-9-yl)methoxy)carbonyl)amino)-1-(*tert*-butoxycarbonyl)piperidine-4-carboxylic acid (130 mg, 0.28 mmol) in DCM (3mL) was treated with 1-chloro-*N,N*,2-trimethylprop-1-en-1-amine (74  $\mu$ L, 0.56 mmol). After 1 h, 2-chloro-3-methylaniline (79 mg, 0.56 mmol) in pyridine (1 mL) was added. After stirring overnight, the reaction mixture was partitioned between DCM and 1 M aqueous solution of HCl (5 mL each). The phases were passed through phase sep cartridge and the solvent was removed under vacuum. The crude products

were purified by chromatography (EA/isohexane) to afford 144 mg (87%) of Intermediate 11A. LCMS [m/z] calculated for  $C_{33}H_{36}ClN_3O_5$ : 589.2; found 612.0  $[M+Na]^+$ ,  $t_R=3.04$  min (Method 4).

Step 11B. Synthesis of *tert*-butyl 4-amino-4-((2-chloro-3-methylphenyl) carbamoyl) piperidine-1-carboxylate (Intermediate 11B).

**[184]** A solution of Intermediate 11A (144 mg, 0.24 mmol) in DCM (4 mL) was treated with diethylamine (1 mL). After 6 h the reaction mixture was concentrated and the crude product co-evaporated with DCM / toluene and purified by chromatography (MeOH (0.7N  $NH_3$ )/ DCM) to afford 96 mg (50%) of Intermediate 11B. LCMS [m/z] calculated for  $C_{18}H_{26}ClN_3O_3$ : 367.2; found 268.1  $[M+H-Boc]^+$ ,  $t_R=1.51$  min (Method 4).

Step 11C. Synthesis of *tert*-butyl (*S*)-4-((2-chloro-3-methylphenyl)carbamoyl)-4-(1,2,3,4-tetrahydroisoquinoline-3-carboxamido)piperidine-1-carboxylate (Intermediate 11C).

**[185]** A solution of Intermediate 11B (95 mg, 0.26 mmol) and (*S*)-2-(((9H-fluoren-9-yl)methoxy)carbonyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid (155 mg,

0.39 mmol) in DCM (4 mL) was treated with DIEA (225  $\mu$ L, 0.26 mmol) and HATU (295 mg, 0.8 mmol). After stirring overnight, the reaction mixture was partitioned between DCM and 1 M aqueous solution of HCl (5 mL each). The aqueous layer was re-extracted with DCM (5 mL). The combined organic layers were dried ( $\text{MgSO}_4$ ), filtered and concentrated and the crude product was purified by chromatography (EA/hexane) to afford 208 mg (38%) of Intermediate 11C. LCMS [m/z] calculated for  $\text{C}_{43}\text{H}_{45}\text{ClN}_4\text{O}_6$ : 748.3; found 771.0  $[\text{M}+\text{Na}]^+$ ,  $t_R=2.85$  min (Method 4).

Step 11D. Synthesis of *tert*-butyl (*S*)-4-((2-chloro-3-methylphenyl)carbamoyl)-4-(1,2,3,4-tetrahydroisoquinoline-3-carboxamido)piperidine-1-carboxylate (Intermediate 11D).

**[186]** A solution of Intermediate 11C (206 mg, 0.28 mmol) in DCM (3 mL) was treated with diethylamine (1 mL). After 6 h the reaction mixture was concentrated and the crude product was purified by chromatography (MeOH (0.7 N  $\text{NH}_3$ )/ DCM) to afford 75 mg (35%) of Intermediate 11D. LCMS [m/z] calculated for  $\text{C}_{28}\text{H}_{35}\text{ClN}_4\text{O}_4$ : 526.2; found 527.1  $[\text{M}+\text{H}]^+$ ,  $t_R=1.63$  min (Method 4).

Step 11E. Synthesis of *tert*-butyl (*S*)-4-((2-chloro-3-methylphenyl)carbamoyl)-4-(2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamido)piperidine-1-carboxylate (Intermediate 11E).

[187] A solution of Intermediate 11D (75 mg, 0.14 mmol) and 4-oxo-4-phenylbutanoic acid (51 mg, 0.29 mmol) in DCM (4 mL) was treated with *N*-ethyl-*N*-isopropylpropan-2-amine (120  $\mu$ l, 0.71 mmol) and HATU (162 mg, 0.43 mmol). The reaction mixture was stirred at rt for 4 h. The reaction mixture was partitioned between DCM (5 mL) and 1 M aq HCl solution. The layers were separated using a phase sep-cartridge then re-extracted with DCM (5 mL). The combined organic layers were concentrated and the crude product was purified by chromatography (EA / isohexane) to afford 56 mg (57%) of Intermediate 11E. LCMS [m/z] calculated for  $C_{38}H_{43}ClN_4O_6$ : 686.3; found 709  $[M+Na]^+$ ,  $t_R$ =2.72 min (Method 4).

[188] Into a solution of Intermediate 11E (56 mg, 0.08 mmol) in DCM (4 mL) was added TFA (1 mL) and the reaction mixture was stirred at rt. The solvent was removed and the crude products were purified by chromatography (0.7 M NH<sub>3</sub>/MeOH)/DCM) to afford 34 mg (39%) of Compound 11-1. LCMS [m/z] calculated for C<sub>33</sub>H<sub>35</sub>ClN<sub>4</sub>O<sub>4</sub>: 586.2; found 587.1 [M+H]<sup>+</sup>, t<sub>R</sub>=3.99 min (Method 4).

## Scheme 13

## EXAMPLE 13

SYNTHESIS OF ((*S*)-*N*-(4-((2,3-DIHYDRO-1H-INDEN-5-YL)CARBAMOYL)PIPERIDIN-4-YL)-2-(4-OXO-4-PHENYLBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-3-CARBOXAMIDE (COMPOUND 13-1)

Step 13A. Synthesis of 1-(*tert*-butyl) 4-methyl (*S*)-4-(2-(((9H-fluoren-9-yl)methoxy)carbonyl) -1,2,3,4-tetrahydroisoquinoline-3-carboxamido) piperidine-1,4-dicarboxylate (Intermediate 13A).

[194] Into a solution of (*S*)-2-(((9H-fluoren-9-yl)methoxy)carbonyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid (1.7 g, 4.3 mmol) and 1-*tert*-butyl 4-methyl 4-aminopiperidine-1,4-dicarboxylate (1.0 g, 3.9 mmol) in DCM (100 mL) were added DIEA (3.0 mL, 19.4 mmol) and, after 20 min, HATU (4.4 g, 11.6 mmol). After 2 h, the reaction mixture was partitioned between DCM (5 mL) and a 1 M aqueous solution of HCl (100 mL). The layers were separated using a phase sep-

cartridge and the aqueous layer was re-extracted with DCM (100 mL). The combined organic phases were concentrated. The crude product was purified by chromatography (EA/isohexane) to afford 2.6g (93%) of Intermediate 13 as a white foaming solid. LCMS [m/z] calculated for  $C_{37}H_{41}N_3O_7$ : 639.3; found 662.1  $[M+Na]^+$ ,  $t_R=2.85$  min (Method 4).

Step 13B. Synthesis of 1-(*tert*-butyl) 4-methyl (*S*)-4-(1,2,3,4-tetrahydroisoquinoline-3-carboxamido)piperidine-1,4-dicarboxylate (Intermediate 13B).

**[195]** Diethylamine (5 mL, 38.7 mmol) was added to a solution of Intermediate 13A (2.6 g, 4.06 mmol) in DCM (8 mL, 4.06 mmol). After 30 min, the reaction mixture was concentrated *in vacuo* and dissolved in toluene/DCM and re-concentrated (2X). The crude product was purified by chromatography (MeOH (+1%  $NH_3$ ) / DCM) to afford 1.6 g (94%) of Intermediate 13 as a white sticky solid. LCMS [m/z] calculated for  $C_{22}H_{31}N_3O_5$ : 417.2; found 418.2  $[M+H]^+$ ,  $t_R=1.36$  min (Method 4).

Step 13C. Synthesis of (S)-1-tert-butyl 4-methyl 4-(2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamido)piperidine-1,4-dicarboxylate (Intermediate 13C).

[196] Into a solution of Intermediate 13B (1.5 g, 3.6 mmol) and 4-oxo-4-phenylbutanoic acid (1.3 g, 7.2 mmol) in DCM (15 mL) was added *N*-ethyl-*N*-isopropylpropan-2-amine (3.13 mL, 17.96 mmol). After 10 min, HATU (4.10 g, 10.78 mmol) was added. After 2 h, the reaction mixture was partitioned between DCM (20 mL) and 1 M aqueous solution of HCl (20 mL). The layers were separated using a phase sep-cartridge and the aqueous layer was re-extracted with DCM (20 mL). The combined organic phases were concentrated and the crude product was purified by chromatography (EA/isohehexane) to afford 1g (43%) of Intermediate 13C as a sticky yellow gum. LCMS [m/z] calculated for C<sub>32</sub>H<sub>39</sub>N<sub>3</sub>O<sub>7</sub>: 577.7; found 600.1 [M+Na]<sup>+</sup>, t<sub>R</sub>=2.34 min (Method 4).

Chemical reaction scheme showing the conversion of compound 13C to compound 13D.

Compound 13C (left) is a complex molecule featuring a 1,2,3,4-tetrahydroquinoline ring system. The nitrogen at position 1 is substituted with a 3-oxo-3-phenylpropyl group. The nitrogen at position 3 is substituted with a (2-methoxycarbonyl-2-(4-tert-butoxycarbonyl-4,5,6,7-tetrahydropyridin-2-yl)ethyl)carbamoyl group.

Compound 13D (right) is the product of the reaction, where the methoxycarbonyl group has been hydrolyzed to a carboxylic acid group.

Step 13E. Synthesis of *tert*-butyl (*S*)-4-((2,3-dihydro-1H-inden-5-yl)carbamoyl)-4-(2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamido)piperidine-1-carboxylate (Intermediate 13E).

**[198]** Into a solution of Intermediate 13D (50 mg, 0.09 mmol) and 2,3-dihydro-1H-inden-5-amine (35.4 mg, 0.27 mmol) in DMF (3 mL) was added DIEA (0.08 mL, 0.44 mmol). The reaction mixture was heated at 50 °C for 10 min and HATU (101 mg, 0.266 mmol) was added. The reaction mixture was stirred at 50 °C overnight then partitioned between DCM (5 mL) and 1 M aqueous solution of HCl (5 mL). The layers were separated using a phase sep-cartridge and the aqueous layer was re-extracted with DCM (5 mL). The combined organic phases were concentrated *in vacuo* and the resulting crude material was purified by chromatography (MeOH/DCM) to afford unclean Intermediate 13E, which was used without further purification.

Step 13F. Synthesis of ((S)-N-(4-((2,3-dihydro-1H-inden-5-yl)carbamoyl) piperidin-4-yl)- 2-(4-oxo-4-phenylbutanoyl)- 1,2,3,4- tetrahydroisoquinoline-3-carboxamide (Compound 13-1).

**[199]** Intermediate 13E was dissolved in DCM (5 mL) and TFA (1 mL). After 4 h, the solvents were removed and the crude product was purified by chromatography (0.7 M NH<sub>3</sub>/MeOH)/DCM) to afford 16 mg (30%) of Compound 13-1 as a white solid. LCMS [m/z] calculated for C<sub>35</sub>H<sub>38</sub>N<sub>4</sub>O<sub>4</sub>: 578.3; found 579.1 [M+H]<sup>+</sup>, t<sub>R</sub>=4.31 min (Method 5). <sup>1</sup>H NMR (400 MHz, DMSO-*d*<sub>6</sub>, 363 K) δ 8.68 (br s, 1H), 8.00 – 7.83 (m, 2H), 7.62 (t, *J* = 7.4 Hz, 1H), 7.49 (t, *J* = 7.6 Hz, 2H), 7.35 (br s, 2H), 7.25 – 7.18 (m, 4H), 6.97 (d, *J* = 8.2 Hz, 1H), 4.85 – 4.74 (m, 3H), 3.34 (br s, 2H), 3.21 (br s, 2H), 2.97 – 2.82 (m, 4H), 2.79 – 2.73 (m, 4H), 2.68 – 2.64 (m, 1H), 2.62 – 2.55 (m, 1H), 2.18 – 1.74 (m, 6H), CH<sub>2</sub>NH, NHAr not observed.

## EXAMPLE 14

SYNTHESIS OF (*S*)-*N*-((*S*)-4-AMINO-1-((2-CHLORO-5-FLUOROPHENYL)AMINO)-1-OXOBUTAN-2-YL)-2-(4-OXO-4-PHENYLBUTANOYL)-1,2,3,4-TETRAHYDROISOQUINOLINE-3-CARBOXAMIDE (COMPOUND 14-1)

Step 14A. Synthesis of (9H-fluoren-9-yl) methyl (*S*)-(4-azido-1-((2-chloro-5-fluorophenyl) amino)-1-oxo butan-2-yl)carbamate (Intermediate 14A).

[201] A solution of (*S*)-2-((((9H-fluoren-9-yl)methoxy)carbonyl)amino)-4-azidobutanoic acid (300 mg, 0.81 mmol) in anhydrous DCM (15 mL) in a flame-dried round-bottom flask under N<sub>2</sub> was cooled to 0°C. 1-Chloro-*N*, *N*-2-trimethylprop-1-en-1-amine (0.18 mL, 1.5 mmol) was added. After 10 min, a solution of 2-chloro-5-fluoroaniline (108 mg, 0.75 mmol) in 2 mL of 1:1 DCM:pyridine was added. After 10 min, the reaction was diluted with DCM and washed with brine (2X). The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated to provide

crude Intermediate 14A, which was used without further purification. LCMS [m/z] calculated for  $C_{25}H_{21}ClFN_5O_3$ : 493.1; found 494.3  $[M+H]^+$ ,  $t_R=5.9$ min (Method 1).

Step 14B. Synthesis of (S)-2-amino-4-azido-N-(2-chloro-5-fluorophenyl)butanamide (Intermediate 14B).

[202] Pyrrolidine (1 mL) was added to a solution of Intermediate 14A in DCM (2 mL). After 30 min, the reaction mixture was concentrated *in vacuo*. The resulting crude material was purified by chromatography (EA/hexanes) to provide 201 mg (75%) of Intermediate B. LCMS [m/z] calculated for  $C_{25}H_{21}ClFN_5O_3$ : 271.1; found 272.4  $[M+H]^+$ ,  $t_R=2.8$ min (Method 1).

Step 14C. Synthesis of (S)-N-((S)-4-azido-1-((2-chloro-5-fluorophenyl)amino)-1-oxobutan-2-yl)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamide (Intermediate 14C).

[203] Into a solution of Intermediate 14B (150 mg, 0.55 mmol) and Intermediate 1B (170 mg, 0.5 mmol) in DMF (2 mL) and THF (2 mL) was added DIEA (0.22 mL, 1.26 mmol). The reaction mixture was cooled to 0°C and HATU (191 mg, 0.5 mmol) was added. The reaction mixture was stirred for 6 h then diluted with EA and washed with water (3X), NaHCO<sub>3</sub>, and dried (MgSO<sub>4</sub>). The resulting crude material was purified by chromatography (MeOH/DCM) to afford 150 mg (51%) Intermediate 14C. LCMS [m/z] calculated for C<sub>30</sub>H<sub>28</sub>ClFN<sub>6</sub>O<sub>4</sub>: 590.2; found 591.3 [M+H]<sup>+</sup>, t<sub>R</sub>=5.41 min (Method 1).

Synthesis of (S)-N-((S)-4-azido-1-((3,4-dichloro-2-fluorophenyl)amino)-1-oxobutan-2-yl)-2-(4-oxo-4-phenylbutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamide (Compound 14-22)

[204] Compound 14-22 was synthesized from (S)-2-amino-4-azido-N-(3,4-dichloro-2-fluorophenyl)butanamide according to Step 14C. LCMS [m/z] calculated for C<sub>30</sub>H<sub>27</sub>Cl<sub>2</sub>FN<sub>6</sub>O<sub>4</sub>: 625.5; found 627.9 [M+H]<sup>+</sup>, t<sub>R</sub>=8.33 min (Method 3).

Step 14D. Synthesis of (S)-N-((S)-4-amino- 1-((2-chloro-5-fluorophenyl) amino)-1-oxobutan-2-yl)-2- (4-oxo-4-phenylbutanoyl)-1,2,3,4- tetrahydroisoquinoline-3-carboxamide (Compound 14-1)

**[205]** Into a solution of Intermediate 14C (150 mg, 0.25 mmol) in THF (5 mL) were added H<sub>2</sub>O (0.2 mL) and PS-PPh<sub>3</sub> resin (250 mg, 0.5 mmol equiv). After shaking for 24 h, the resin was removed via filtration through celite. The resulting solution was concentrated and purified by RP-HPLC (MeOH/ H<sub>2</sub>O) to afford 22.4 mg (16%) Compound 14-1. LCMS [m/z] calculated for C<sub>30</sub>H<sub>30</sub>ClFN<sub>4</sub>O<sub>4</sub>: 564.2; found 565.2 [M+H]<sup>+</sup>, t<sub>R</sub>=11.33 min (Method 1).

**[206]** Following the procedures as set forth in Example 14 above, the compounds of the following Table 14 were prepared using the appropriate R<sup>1</sup> reagents.

[208] Into a solution of Intermediate 15A (2.1 g, 3.7 mmol) in DCM (8 mL) was added 4N HCl in dioxane (2.79 mL, 11.17 mmol). After 5h, the reaction was concentrated and purified by prep-HPLC to provide 1.5 g (87%) of Intermediate

15B. LCMS [m/z] calculated for  $C_{20}H_{19}Cl_2FN_6O_2$ : 464.1; found 465.1  $[M+H]^+$ ,  $t_R=4.3$  min (Method 1).

Step 15C. Synthesis of 4-((S)-3-(((S)-4-azido-1-((3,4-dichloro-2-fluorophenyl)amino)-1-oxobutan-2-yl) carbamoyl)-3,4-dihydroisoquinolin-2 (1H)-yl)-4-oxobutanoic acid (Intermediate 15C).

**[209]** Into a solution of Intermediate 15B (1.5 g, 3.2 mmol) in DCM (10 mL) were added  $NEt_3$  (0.45 mL, 3.2 mmol) and succinic anhydride (0.32 g, 3.2 mmol). After 18 h, the reaction was concentrated and purified by column chromatography (MeOH/ DCM) to provide 1.5 g (83%) of Intermediate 15C. LCMS [m/z] calculated for  $C_{24}H_{23}Cl_2FN_6O_5$ : 564.1; found 565.2  $[M+H]^+$ ,  $t_R=6.08$  min (Method 1).

Step 15D. Synthesis of (S)-N-((S)-4-azido-1-((3,4-dichloro-2-fluorophenyl)amino)-1-oxobutan-2-yl)-2-(4-(4,4-dimethylpiperidin-1-yl)-4-oxobutanoyl)-1,2,3,4-tetrahydroisoquinoline-3-carboxamide (Intermediate 15D).

**[210]** Into a solution of Intermediate 15C (0.2 g, 0.35 mmol) in DMF (2 mL) at 0°C were added DIEA (0.22 mL, 1.2 mmol), 4,4-dimethylpiperidine (52 mg, 0.35 mmol) and HATU (0.14 g, 0.37 mmol). After 2 h, the reaction was diluted with EA and washed with NaHCO<sub>3</sub>. The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), concentrated and purified by column chromatography (EA/ hexane) to provide 0.2 g (86%) of Intermediate 15D. LCMS [m/z] calculated for C<sub>31</sub>H<sub>36</sub>Cl<sub>2</sub>FN<sub>7</sub>O<sub>4</sub>: 659.2; found 660.1 [M+H]<sup>+</sup>, t<sub>R</sub>=6.04 min (Method 1).

Step 15E. Synthesis of (*S*)-*N*-((*S*)-4-amino-1-((3,4-dichloro-2-fluorophenyl)amino)-1-oxobutan-2-yl)-2-(4-(4,4-dimethylpiperidin-1-yl)-4-oxobutanoyl)-1,2,3,4-tetrahydro isoquinoline-3-carboxamide (Compound 15-1).

[211] Into a solution of Intermediate 15D (92 mg, 0.14 mmol) in THF (5 mL) were added H<sub>2</sub>O (0.1 mL) and PS-PPH<sub>3</sub> resin (210 mg, 0.42 mmol equivalents). After shaking for 24 h, the resin was removed via filtration through celite. The resulting solution was concentrated and purified by RP-Column Chromatography (MeOH/H<sub>2</sub>O) to afford 10.4 mg (12%) Compound 15-1. LCMS [m/z] calculated for C<sub>31</sub>H<sub>38</sub>Cl<sub>2</sub>FN<sub>5</sub>O<sub>4</sub>: 633.2; found 634.2 [M+H]<sup>+</sup>, t<sub>R</sub>=4.75 min (Method 1).

[212] Following the procedures as set forth in Example 15 above, the compounds of the following Table 15 were prepared using the appropriate NR<sup>8</sup> and NR<sup>9</sup> reagents.

23-1

Step 23A: Synthesis of *tert*-butyl (((9H-fluoren-9-yl)methoxy)carbonyl)-L-homoserinate (Intermediate 23A)

[251] To a stirred solution of (S)-3-((((9H-fluoren-9-yl)methoxy)carbonyl)amino)-4-(tert-butoxy)-4-oxobutanoic acid (6.7 g, 16.3 mmol) in THF (65.1 mL, 16.3 mmol) was added *N*-methylmorpholine (1.8 mL, 16.3 mmol). The reaction was cooled to 0 °C followed by the slow addition of ethyl chloroformate (1.6 mL, 16.3 mmol). A colourless precipitate began to form immediately. The reaction was warmed to rt and stirred for 1 h. The formed precipitate was filtered off using a phase sep cartridge, rinsing with THF (10 mL). The filtrate was cooled again to 0 °C and a solution of sodium borohydride (0.8 g, 21.2 mmol) in 21 mL of H<sub>2</sub>O/THF (1:1) was added. The resulting mixture was stirred at 0 °C, followed by slow warming to rt over 1 h. The reaction mixture was then concentrated under reduced pressure and the residue was dissolved in EA (120 mL), washed with 1 M HCl (2 x 50 mL) and dried (MgSO<sub>4</sub>). The solvent was removed in vacuo to afford 7.3 g (104%) of Intermediate 22A as a colorless oil. LCMS [m/z] calculated for C<sub>23</sub>H<sub>27</sub>NO<sub>5</sub>: 397.2; found 420.0 [M+Na]<sup>+</sup>, t<sub>R</sub> = 2.55 min (Method 4).

Step 23B: Synthesis of *tert*-butyl (S)-2-((((9H-fluoren-9-yl)methoxy)carbonyl)amino)-4-oxobutanoate (Intermediate 23B)

The reaction was stirred at rt under N<sub>2</sub> for 15 min, then cooled to 0 °C and sodium triacetoxyborohydride (670 mg, 3.2 mmol) was added to the reaction mixture portionwise. The reaction was then allowed to warm to rt overnight. The reaction mixture was diluted with DCM (30 mL) and washed with a NaHCO<sub>3</sub> (2 x 30 mL) before being passed through a hydrophobic frit. The solvent was removed *in vacuo* to afford Intermediate 23C (695 mg, 1.3 mmol, 100 % yield) as a colourless oil. LCMS [m/z] calculated for C<sub>28</sub>H<sub>35</sub>FN<sub>2</sub>O<sub>4</sub>: 482.3; found 483.1 [M+H]<sup>+</sup>, t<sub>R</sub>= 1.8 min (Method 4).

Step 23D: Synthesis of (S)-2-((((9H-fluoren-9-yl)methoxy)carbonyl)amino)-4-(4-fluoropiperidin-1-yl)butanoic acid (Intermediate 23D)

[254] Intermediate 23C (675 mg, 1.4 mmol) was dissolved in DCM (3 mL). TFA (1 mL, 12.9 mmol) was added and the reaction mixture was stirred at rt for 2 h. Additional TFA (1 mL) was added. After 1.5 h, the solvent was removed *in vacuo* and chased with toluene (2 x 5 mL) before DCM (3 mL) was added and the mixtures were stood at rt overnight. Isohexane (10 mL) was added to the resultant oil and the mixture was sonicated before the solvent was removed *in vacuo* to afford Intermediate 23D (662 mg, 1.4 mmol, 100 % yield) as a white solid. LCMS [m/z] calculated for  $C_{24}H_{27}FN_2O_4$ : 426.2; found 427.0  $[M+H]^+$ ,  $t_R$  = 1.54 min (Method 4).

After 1.5 h, the reaction mixture was diluted with DCM (10 mL) and sat. aq.  $\text{NH}_4\text{Cl}$  (10 mL) and the mixture was transferred to a separating funnel. The layers were partitioned and the aqueous layer was further extracted with DCM (2 x 10 mL). The combined organics were dried ( $\text{MgSO}_4$ ), filtered, and the solvent was removed *in vacuo*. The material was purified by chromatography (MeOH (0.7 M  $\text{NH}_3$ ) / DCM), to provide 191 mg (74%) of Intermediate 23E as a clear colourless oil. LCMS [m/z] calculated for  $\text{C}_{33}\text{H}_{36}\text{FN}_3\text{O}_3$ : 541.3; found 542.1  $[\text{M}+\text{H}]^+$ ,  $t_{\text{R}}$  = 1.95 min (Method 4).

BIOLOGICAL ASSAYSCXCR3 cAMP assay

[344] The cAMP Hunter™ CHOK1 CXCR3 Gi cell line was purchased from DiscoverX. Cells were seeded into a 96-well white assay plate at 50,000 cells/well/94 µl assay buffer (Hank's Buffered Saline Solution, 10 mM HEPES, 0.1% fatty acid-free BSA, pH 7.4) and immediately assayed in suspension. Forskolin was added to 20 µM (5 µl of 400 µM stock) simultaneously with a 12-point dose response curve of compound at 0–10 µM (1 µl of 100x stock in 100% DMSO), and cells were incubated for 30 minutes. A cAMP standard curve is run as an assay control. A CXCL11 dose response was included to determine maximum efficacy. Direct detection of cAMP was carried out using the DiscoverX HitHunter cAMP kit according to manufacturer's instructions, and luminescence was read using a SpectraMax M5 plate reader.

## EXAMPLE 49

DMPK ASSAYSFormulation and Dosing

[346] Compounds were formulated in 5%DMSO/5%Tween20 in H<sub>2</sub>O, sonicated, vortexed, and put on stir plate overnight at a dose volume of 10 mL/kg. Balb/C (Jackson laboratories) or C57bl/6 (Taconic Biosciences) mice (8-9 weeks old) were acclimated to the colony for 3 days prior to dosing. Water and food were provided *ab libitum*. Compounds were administered by oral gavage. Groups of six animals received 3 to 4 bleeds per day with one terminal bleed. The time points were 30 min, 1 h, 2 h, 4 h, 6 h, 8 h, 24 h. Plasma was collected via centrifugation and analyzed for drug concentrations.

Preparation of study samples and standards for analysis by LC-MS/MS

[347] 50 µL of plasma was aliquoted into a 96 well deep-well polypropylene plate (2 mL) to which 5 µL of DMSO was added. For standards, 5 µL of test compound in DMSO at 10X the standard concentration was added to 50 µL of blank matrix in a 96 well deep-well polypropylene plate. For example, for a 300 nM standard, the 10X DMSO concentration was 3 µM. Study samples that require dilution are diluted with the appropriate blank matrix. For example, for a 10x dilution, 5 µL of study sample is added to 45 µL of blank matrix. Protein was precipitated from study samples and standards with the addition of 150 µL of acetonitrile. After a clean plate map was placed firmly over the top of the 96-well plate, a bench top shaker was used for 1 min to ensure complete precipitation of protein. The precipitated protein was pelleted by centrifuging for 3,000 rpm for 10 min at 20°C and then the clear supernatant was transferred to a clean 96-well plate and spun again under the same conditions in order to pellet any solid material that may have been transferred.

Analysis of study samples and standards with LCMS with MRM detection

[348] An Agilent 1200 HPLC with binary pump and a Leap CTC with fast wash autosampler were used to introduce samples to the mass spectrometer. The reversed phase chromatography method was as shown in the following Table 37.

[349] The column used was a Phenomenex Luna C8 30x2 mm 5  $\mu$ m with a security guard. Mass detection was performed by an Applied Biosystems 4000 Qtrap in MRM mode and ionization was achieved by positive electrospray with a source temperature of 500°C. The ion transitions, depolarizing potential and collision energies were dependent on the specific analyte.

10

[350] Prepared samples were usually analyzed in reverse chronological order with bracketing standard curves. Typically at least 6 standards were used for quantification with a percent accuracy of +/- 15% for all standards except at the LLOQ where a percent accuracy of +/- 20% was allowed. The concentration time profile was fit using a one compartment model for the applicable mode of dosing using Phoenix WinNonLin 6.4.
