## Description

**[0001]** The present invention relates to compounds according to general formulae (II) or (III), which act as modulators of the glucocorticoid receptor and can be used in the treatment and/or prophylaxis of disorders which are at least partially mediated by the glucocorticoid receptor.

**[0002]** Glucocorticoids (GC) exert strong anti-inflammatory, immunosuppressive and disease-modifying therapeutic effects mediated by the glucocorticoid receptor (GR). They have been widely used to treat inflammatory and immune diseases for decades and still represent the most effective therapy in those conditions. However, chronic GC treatment of inflammatory diseases is hampered by GC-associated adverse effects. These undesired side effects include insulin resistance, diabetes, hypertension, glaucoma, depression, osteoporosis, adrenal suppression and muscle wasting with osteoporosis and diabetes being the most severe ones from the physician's point of view (Hapgood JP. et al., Pharmacol Ther. 2016 Sep; 165: 93-113; Buttgerit F. et al, Clin Exp Rheumatol. 2015 Jul-Aug;33(4 Suppl 92):S29-33; Hartmann K. et al, Physiol Rev. 2016 Apr;96(2):409-47).

**[0003]** One example of an oral glucocorticoid is prednisone which is frequently prescribed for the treatment of several inflammatory disorders (De Bosscher Ket al., Trends Pharmacol Sci. 2016 Jan;37(1):4-16; Buttgerit F. et al., JAMA. 2016;315(22):2442-2458). As GC cause adrenal suppression, prednisolone withdrawal symptoms can be severe if the drug is discontinued abruptly when all the signs of the disease have disappeared. Thus gradual GC tapering to physiological doses is frequently part of treatment protocols to reduce the risk of relapse and other withdrawal symptoms (Liu D. et al., Allergy Asthma Clin Immunol. 2013 Aug 15;9(1):30). Therefore, there is high medical need for novel potent anti-inflammatory drugs with less adverse effects.

**[0004]** Recent research has focused on the development of partial agonists or selective glucocorticoid receptor modulators which activate the pathways for the inhibition of inflammation but avoid targeting the pathways that lead to the GC-associated adverse effects. Most of these effects have been demonstrated to be mediated by different GR-dependent genomic mechanisms termed transactivation and transrepression. The anti-inflammatory actions of GC are mainly attributable to the transrepression of inflammatory genes while certain side effects are predominantly mediated via transactivation of several genes. According to the nature of a ligand the GR can be selectively modulated in a specific conformation which favors transrepression over transactivation resulting in an improved therapeutic benefit (De Bosscher Ket al., Trends Pharmacol Sci. 2016 Jan;37(1):4-16). The concept of such dissociating ligands was already defined about two decades ago and several compounds have been identified and were evaluated in preclinical and clinical testing but none of them has as yet been approved for clinical use.

**[0005]** Compounds which are active as modulators of the glucocorticoid receptor are also known from WO 2009/035067 and WO 2017/034006.

**[0006]** It was an object of the present invention to provide novel compounds which are modulators of the glucocorticoid receptor and which preferably have advantages over the compounds of the prior art. The novel compounds should in particular be suitable for use in the treatment and/or prophylaxis of disorders or diseases which are at least partially mediated by the glucocorticoid receptor.

**[0007]** This object has been achieved by the subject-matter of the patent claims.

**[0008]** It was surprisingly found that the compounds according to the present invention are highly potent modulators of the glucocorticoid receptor.

**[0009]** The present invention relates to a compound according to general formulae (II) or (III):

The binding to the superordinate general structure can be carried out via any desired and possible ring member of the heteroaryl residue if not indicated otherwise. **[0023]** The compounds according to the present invention are defined by substituents, for example by R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> (1<sup>st</sup> generation substituents) which may optionally be for their part themselves be substituted (2<sup>nd</sup> generation substituents). Depending on the definition, these substituents of the substituents can optionally be for their part resubstituted (3<sup>rd</sup> generation substituents). If, for example, R<sup>1</sup> = a C<sub>1-10</sub>-alkyl (1<sup>st</sup> generation substituent), then the C<sub>1-10</sub>-alkyl can for its part be substituted, for example with a N(H)(C<sub>1-6</sub>-alkyl) (2<sup>nd</sup> generation substituent). This produces the functional group R<sup>1</sup> = (C<sub>1-10</sub>-alkyl-NH-C<sub>1-6</sub>-alkyl). The NH-C<sub>1-6</sub>-alkyl can then for its part be resubstituted, for example with Cl (3<sup>rd</sup> generation substituent). Overall, this produces the functional group R<sup>1</sup> = C<sub>1-10</sub>-alkyl-NH-C<sub>1-6</sub>-alkyl, wherein the C<sub>1-6</sub>-alkyl of the NH-C<sub>1-6</sub>-alkyl is substituted by Cl. However, in a preferred embodiment, the 3<sup>rd</sup> generation substituents may not be resubstituted, i.e. there are then no 4<sup>th</sup> generation substituents. More preferably, the 2<sup>nd</sup> generation substituents may not be resubstituted, i.e. there are no 3<sup>rd</sup> generation substituents.

**[0024]** If a residue occurs multiply within a molecule, then this residue can have respectively different meanings for various substituents: if, for example, both R<sup>2</sup> and R<sup>3</sup> denote C<sub>1-6</sub>-alkyl, then C<sub>1-6</sub>-alkyl can e.g. represent ethyl for R<sup>2</sup> and can represent methyl for R<sup>3</sup>.

**[0025]** In connection with the terms "C<sub>1-10</sub>-alkyl", "C<sub>1-6</sub>-alkyl", "C<sub>1-4</sub>-alkyl", "C<sub>3-10</sub>-cycloalkyl", "C<sub>3-6</sub>-cycloalkyl", "3 to 7 membered heterocycloalkyl", "3 to 6-membered heterocycloalkyl", "C<sub>1-6</sub>-alkylene", "C<sub>1-4</sub>-alkylene" and "C<sub>1-2</sub>-alkylene", the term "substituted" refers in the sense of the present invention, with respect to the corresponding residues or groups, to the single substitution (monosubstitution) or multiple substitution (polysubstitution), e.g. disubstitution or trisubstitution; more preferably to monosubstitution or disubstitution; of one or more hydrogen atoms each independently of one another by at least one substituent. In case of a multiple substitution, i.e. in case of polysubstituted residues, such as di- or trisubstituted residues, these residues may be polysubstituted either on different or on the same atoms, for example trisubstituted on the same carbon atom, as in the case of CF<sub>3</sub>, CH<sub>2</sub>CF<sub>3</sub> or disubstituted as in the case of 1,1-difluorocyclohexyl, or at various points, as in the case of CH(OH)-CH=CH-CHCl<sub>2</sub> or 1-chloro-3-fluorocyclohexyl. The multiple substitution can be carried out using the same or using different substituents.

**[0026]** In relation to the terms "aryl", "phenyl", "heteroaryl" and "5- to 6-membered heteroaryl", the term "substituted" refers in the sense of this invention to the single substitution (monosubstitution) or multiple substitution (polysubstitution), e.g. disubstitution or trisubstitution, of one or more hydrogen atoms each independently of one another by at least one substituent. The multiple substitution can be carried out using the same or using different substituents.

40 [0074] in the form of the free compound or a physiologically acceptable salt thereof.

[0075] The compounds according to the present invention can be synthesized by standard reactions in the field of organic chemistry known to the person skilled in the art or in a manner as described herein (cf. Reaction Scheme 1 below) or analogously. The reaction conditions in the synthesis routes described herein are known to the skilled person and are for some cases also exemplified in the Examples described herein.

Reaction scheme 1:

**[0076]** Substituted indole/indazole moiety in compounds of formula (VII) can be introduced by subjecting a compound of formula (IV) in a metal catalyzed C-C coupling reaction. Metal catalyzed C-C coupling reactions are known in the art (cf. Metal Catalyzed Cross-Coupling Reactions and More, 3 Volume Set Wiley, 2014; Angew. Chem. Int. Ed., 2012, 51, 5062 - 5085). Favorable C-C coupling reactions are palladium catalyzed cross coupling reactions (cf. Angew. Chem., 2005, 117, 4516 - 4563). Triazole cyclization of compound (II) gives access to compounds of general formula (III). Triazole formation on quinoxalines is known in the art (cf. Heterocycles, 1992, 34, 771 - 780; Biological and Pharmaceutical Bulletin, 2005, 28, 1216 - 1220). Electrophilic aromatic bromination of compound (III) gives compound (IV). Bromination reactions of aromatic compounds are generally known (cf. Science of Synthesis, Compounds with One Saturated Carbon-Heteroatom Bond, Volume 35, Houben-Weyl, 2007). If desired, compound of formula (II) can be brominated to compound (V) which can undergo a metal catalyzed cross-coupling reaction to give compound (VI). Triazole formation leads to an alternate route to compounds of general formula (VII). Copper mediated quinoxaline cyclization of compound (I) to compound (II) is known in the art (cf. Adv. Synth. Catal., 2010, 352, 2531 - 2537). Compounds of formula (I) are commercially available or can be prepared according to methods known in the art.

**[0077]** The compounds according to the present invention can be produced in the manner described here or in an analogous manner.

**[0078]** In a preferred embodiment, the compounds according to the present invention are modulators of the glucocorticoid receptor. In the sense of the present invention, the term "selective modulator of the glucocorticoid receptor (glucocorticoid receptor modulator)" preferably means that the respective compound exhibits in a cellular target engagement assay for agonistic or antagonistic potency on the glucocorticoid receptor an EC<sub>50</sub> or IC<sub>50</sub> value on the glucocorticoid receptor of at most 15 μM (10<sup>-6</sup> mol/L) or at most 10 μM; more preferably at most 1 μM; still more preferably at most 500 nM (10<sup>-9</sup> mol/L); yet more preferably at most 300 nM; even more preferably at most 100 nM; most preferably at most 10 nM; and in particular at most 1 nM.

**[0079]** The person skilled in the art knows how to test compounds for modulation (agonistic or antagonistic) of the activity of the glucocorticoid receptor. Preferred target engagement assays for testing compounds for their agonistic or antagonistic potency (EC<sub>50</sub>, IC<sub>50</sub>) on the glucocorticoid receptor are described herein below:

#### Glucocorticoid receptor cell-based assays

**[0080]** Potential selective glucocorticoid receptor modulators of this intervention can be tested for modulation of the

activity of the glucocorticoid receptor using cell-based assays. These assays involve a Chinese hamster ovary (CHO) cell line which contains fragments of the glucocorticoid receptor as well as fusion proteins. The glucocorticoid receptor fragments used are capable of binding the ligand (e.g. beclomethasone) to identify molecules that compete for binding with glucocorticoid receptor ligands. In more detail, the glucocorticoid receptor ligand binding domain is fused to the DNA binding domain (DBD) of the transcriptionfactor GAL4 (GAL4 DBD-GR) and is stably integrated into a CHO cell line containing a GAL4-UAS-Luciferase reporter construct. To identify selective glucocorticoid receptor modulators, the reporter cell line is incubated with the molecules using an 8-point half-log compound dilution curve for several hours. After cell lysis the luminescence that is produced by luciferase after addition of the substrate is detected and EC<sub>50</sub> or IC<sub>50</sub> values can be calculated. Engagement of molecules which induce gene expression via glucocorticoid receptor binding to the DNA leads to expression of the luciferase gene under the control of the fusion protein GAL4 DBD-GR and therefore to a dose-dependent increase of the luminescence signal. Binding of molecules which repress beclomethasone-induced gene expression of the luciferase gene under the control of the fusion protein GAL4 DBD-GR leads to a dose-dependent reduction of the luminescence signal.

**[0081]** In a preferred embodiment, the compound according to the present invention exhibits in a cellular target engagement assay for agonistic or antagonistic potency on the glucocorticoid receptor an EC<sub>50</sub> or IC<sub>50</sub> value on the glucocorticoid receptor of at most 1  $\mu$ M ( $10^{-6}$  mol/L); still more preferably at most 500 nM ( $10^{-9}$  mol/L); yet more preferably at most 300 nM; even more preferably at most 100 nM; most preferably at most 50 nM; and in particular at most 10 nM or at most 1 nM.

**[0082]** In a preferred embodiment, the compound according to the present invention exhibits in a cellular target engagement assay for agonistic or antagonistic potency on the glucocorticoid receptor an EC<sub>50</sub> or IC<sub>50</sub> value on the glucocorticoid receptor in the range of from 0.1 nM ( $10^{-9}$  mol/L) to 1000 nM; still more preferably 1 nM to 800 nM; yet more preferably 1 nM to 500 nM; even more preferably 1 nM to 300 nM; most preferably 1 nM to 100 nM; and in particular 1 nM to 80 nM.

**[0083]** Preferably, the compounds according to the present invention are useful as selective modulators of the glucocorticoid receptor.

Synthesis of 8-bromo-6-fluoro-1,4,4,9-tetramethyl-4,5-dihydro-[1,2,4]triazolo[4,3-a]quinoxaline (**intermediate B-7**):

[0145]

**[0146]** Step1: To a stirred solution of 5-fluoro-2-methyl-phenylamine (100 g, 0.8 mol) in DCM (1500 mL) was added pyridine (129 mL, 1.6 mol) followed by DMAP (1 g, 0.008 mol) at RT. To this reaction mixture was added drop wise pivoyl chloride (109 mL, 0.88 mol) at 0°C. Resulting reaction mixture was stirred at 0°C for 2 h. After completion of starting material reaction mixture was poured into ice cooled 1(N) HCl solution (1500 mL) and stirred for 30 min. The two layers were separated and the organic layer was washed with 1(N) HCl solution (1000 mL) followed by saturated NaHCO<sub>3</sub> solution (1000 mL) followed by brine (1000 mL) and then dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure to afford crude product. Crude product was triturated using hexane to afford N-(5-fluoro-2-methyl-phenyl)-2,2-dimethyl-propionamide (158 g, 95%) as white solid.

**[0147]** Step2: To a stirring solution N-(5-fluoro-2-methyl-phenyl)-2,2-dimethyl-propionamide (90 g, 0.43 mol) in toluene (2000 mL) was added para-toluene sulphonic acid monohydrate (82.0 g, 0.43 mol), Pd(OAc)<sub>2</sub> (9.66 g, 0.043 mol)

followed by N-bromo succinimide (84.5 g, 0.473 mol) at RT. Resulting reaction mixture was stirred at RT for 48 h. Reaction monitoring TLC in 20% EA-Hex, showed formation of desired product (Rf=0.4) along with the ~60% unreacted SM (Rf =0.5). Reaction mixture was then concentrated, obtained residue was diluted with EtOAc and washed with water (twice). Total organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated to afford crude product. Two combined

5 batches of crude product (obtained from 90g and 100g reaction of N-(5-fluoro-2-methyl-phenyl)-2,2-dimethyl-propionamide) were purified by flash chromatography to afford N-(2-bromo-3-fluoro-6-methyl-phenyl)-2,2-dimethyl-propionamide (60 g, 23%) as white solid and recovered un-reacted N-(5-fluoro-2-methyl-phenyl)-2,2-dimethyl-propionamide (125 g).  
[0148] Step3: To a pre cooled solution of 70% H<sub>2</sub>SO<sub>4</sub> in water (430 mL) was added N-(2-bromo-3-fluoro-6-methyl-phenyl)-2,2-dimethyl-propionamide (60 g, 0.208 mol) portion wise at 0°C. Resulting reaction mixture was stirred at RT for 10 min and then heated to 100°C for 2 h. After completion of starting material (monitored by TLC in 10% EA-Hex, Rf =0.8) reaction mixture was cooled to 0°C and pH adjusted to ~10 with 10% NaOH solution. Resulting basic aqueous was extracted with EtOAc (3 x 500 mL). Total organic layers were washed with water followed by brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated to afford crude product. Crude product was purified by column chromatography to afford 2-bromo-3-fluoro-6-methyl-phenylamine (36 g, 85%) as pale yellow liquid.

10  
15 [0149] Step4: To the stirred suspension of 2-bromo-3-fluoro-6-methyl-phenylamine (36 g, 0.1764 mol) in dry DMSO (540 mL) was added 2-amino-2-methyl-propionic acid (16.9 g, 0.164 mol) followed by K<sub>3</sub>PO<sub>4</sub> (75 g, 0.353 mol) at RT. Resulting reaction mixture was degassed with nitrogen for 30 min, then CuCl (1.75 g, 0.0176 mol) was added and reaction mixture was heated at 140°C for 5 h. After completion of the starting material (monitored by TLC, 20% EA-Hexane, Rf 0.4) reaction mixture was cooled to RT and filtered through celite. Celite bed was washed with EtOAc (500 mL). Resulting filtrate was poured into ice cold water (2500 mL). Resulting aqueous layer was extracted with EtOAc (2 x 750 mL). Total organic part was washed with water (2 x 750 mL), followed by brine (500 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and evaporated under reduced pressure to afford crude product. Obtained crude product was triturated with hexane and filtered and dried to afford 5-fluoro-3,3,8-trimethyl-3,4-dihydro-1H-quinoxalin-2-one (19 g, 52%) as brown solid.

20  
25 [0150] Step5: To a solution of 5-fluoro-3,3,8-trimethyl-3,4-dihydro-1H-quinoxalin-2-one (19 g, 91.2 mmol) in toluene (380 mL) was added Lawesson's reagent (55.5 g, 137 mmol) at RT and the reaction mixture was refluxed at 120°C for 1 h. After completion of starting material (monitored by TLC in 20% EA-Hexane, Rf 0.7), the reaction mass was cooled to RT and quenched with sat. NaHCO<sub>3</sub> solution (250 mL) and resulting aqueous layer was extracted with EtOAc (3 x 250 mL). Combined organic layers were washed with water (250 mL), followed by brine (250 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and the solvent was evaporated to afford crude product. Obtained crude product was purified by column chromatography to afford 5-fluoro-3,3,8-trimethyl-3,4-dihydro-1H-quinoxaline-2-thione (19 g, 93%) as yellow solid.

30  
35 [0151] Step6: To a stirred solution of 5-fluoro-3,3,8-trimethyl-3,4-dihydro-1H-quinoxaline-2-thione (20.5 g, 91.5 mmol) in THF (512 mL) was added drop wise hydrazine hydrate (13.5 mL, 274.5 mmol) at 0°C. The reaction mixture was stirred at RT for 16 h. TEA (64 mL, 457.5 mmol) followed acetyl chloride (21.5 mL, 274.5 mmol) were added to the reaction mixture drop-wise at 0°C and stirred for 2 h at RT. After completion of starting material (monitored by LCMS) reaction mixture diluted with water (500 mL) and extracted by 10% MeOH-DCM (5 x 500 mL). The total organic part was washed by brine (250 mL), dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure to afford acetic acid (5-fluoro-3,3,8-trimethyl-3,4-dihydro-1H-quinoxalin-2-ylidene)-hydrazide (21 g, 87%, crude) as pale yellow solid.

40  
45 [0152] Step7: Acetic acid (5-fluoro-3,3,8-trimethyl-3,4-dihydro-1H-quinoxalin-2-ylidene)-hydrazide (10.5 g, 0.04 mol) was taken in round bottom flask (100 mL) and then cooled to -10°C. Then phosphorus oxychloride (18.5 ml, 0.2 mol) was added drop wise followed by drop wise addition of TEA (5.6 ml, 0.04 mol). After that the reaction mixture was stirred at -10°C for 10 min and then 10 min at RT and finally at reflux condition for 1 h. After completion of starting material (monitored by LCMS) reaction mixture cooled to 0°C and quenched with crushed ice water (100 mL). The aqueous part was then basified using cold aqueous ammonia solution (100 mL) drop-wise. Resulting basic aqueous was then extracted with EtOAc (3 x 150 mL). Total organic part was washed with brine (150 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure to afford crude compound. Crude product co-distillation with MTBE twice, then trituration with hexane and dried to afford 6-fluoro-1,4,4,9-tetramethyl-4,5-dihydro-[1,2,4]triazolo[4,3-a]quinoxaline (6 g, 61%) as pale yellow solid.

50

Combined organic layers were washed with water (750 mL) followed by brine (400 mL), dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated to afford crude compound. Obtained crude product was purified by column chromatography followed by trituration using MTBE to afford 8-bromo-6-fluoro-1,4,4,9-tetramethyl-4,5-dihydro-[1,2,4]triazolo[4,3-a]quinoxaline (9.1 g, 57%) as off white solid.

### Biological Assays

#### Agonistic mode of action on the glucocorticoid receptor

**[0332]** The reporter cell line CHO-Gal4/GR consisted of a chinese hamster ovary (CHO) cell line (*Leibniz Institute DSMZ - German Collection of Microorganisms and Cell Cultures GmbH: ACC-110*) containing a firefly luciferase gene under the control of the GR ligand binding domain fused to the DNA binding domain (DBD) of GAL4 (GAL4 DBD-GR) stably integrated into CHO cells. This cell line was established by stable transfection of CHO cells with a GAL4-UAS-Luciferase reporter construct. In a subsequent step the ligand binding domain of the GR cloned into pIRES2-EGFP-GAL4 containing the DNA binding domain of GAL4 from pFA-AT2 was transfected. This fusion construct activated firefly luciferase expression under the control of a multimerized GAL4 upstream activation sequence (UAS). The signal of the emitted luminescence was recorded by the FLIPR<sup>TETRA</sup>. This allowed for specific detection of ligand-induced activation of the GR and therefore for the identification of compounds with agonistic properties. The GAL<sub>4</sub>/LTAS reporter was premixed with a vector that constitutively expressed Renilla luciferase, which served as an internal positive control for transfection efficiency.

**[0333]** The complete culture medium for the assay was:

- DMEM F-12 (1:1) MIXTURE (LONZA cat. N°: BE04-687F/U1) 500mL
- 5 mL of 100 mM Sodium Pyruvate (LONZA cat. N°: BE12-115E)
- 25 mL of 7.5% Sodium Bicarbonate (LONZA cat. N° BE17-613E)
- 6.5 mL of 1 M Hepes (LONZA cat. N°: BE17-737E)
- 5 mL of 100X Penicillin/Streptomycin (LONZA cat. N° DE17-602E)
- 50 mL of Fetal Bovine Serum (Euroclone cat. N° ECS 0180L)
- 0.25 mL of 10mg/mL Puromycin (InvivoGen cat. : ant-pr-1 )
- 0.5 mL of 100 mg/mL Zeocin (InvivoGen cat. : ant-zn-1)

**[0334]** Cryo-preserved CHO-Gal4/GR cells were suspended in complete medium and 5000 cells/25 $\mu$ l/well were seeded into the wells of 384-well polystyrene assay plates (Thermo Scientific, cat.# 4332) and cultured at 37°C, 5% CO<sub>2</sub> and 95% humidity. After 24 hours growth medium was carefully removed and replaced by 30 $\mu$ l Opti-MEM (GIBCO, cat.# 31985062) as assay buffer. To test the compounds an 8-point half log compound dilution curve was generated in 100% DMSO starting from a 2mM stock and compounds were then diluted 1:50 in Opti-MEM. 10 $\mu$ l of compounds were then added to the wells containing 30 $\mu$ l Opti-MEM resulting in a final assay concentration range from 10  $\mu$ M to 0.003  $\mu$ M in 0.5% DMSO. Compounds were tested at 8 concentrations in quadruplicate data points. Cells were incubated for 6 hour with compounds and beclometasone (Sigma, cat.# Y0000351) as control compound at 37°C, 5% CO<sub>2</sub> and 95% humidity in a total volume of 40  $\mu$ l. Finally, cells were lysed with 20 $\mu$ l of Triton/Luciferin solution and the signal of the emitted luminescence was recorded at the FLIPR<sup>TETRA</sup> for 2 minutes.

**[0335]** The relative efficacy of a compound (% effect) was calculated based on the full effect of the agonist beclom-

### Antagonistic mode of action on the glucocorticoid receptor

**[0337]** The reporter cell line CHO-Gal4/GR consisted of a chinese hamster ovary (CHO) cell line (*Leibniz Institute DSMZ - German Collection of Microorganisms and Cell Cultures GmbH: ACC-110*) containing a firefly luciferase gene under the control of the GR ligand binding domain fused to the DNA binding domain (DBD) of GAL4 (GAL4 DBD-GR) stably integrated into CHO cells. This cell line was established by stable transfection of CHO cells with a GAL4-UAS-Luciferase reporter construct. In a subsequent step the ligand binding domain of the GR cloned into pIRES2-EGFP-GAL4 containing the DNA binding domain of GAL4 from pFA-AT2 was transfected. This fusion construct activated firefly luciferase expression under the control of a multimerized GAL4 upstream activation sequence (UAS). The signal of the emitted luminescence was recorded by the FLIPR<sup>TETRA</sup>. This allowed for specific detection of antagonistic properties of compounds by measuring the ligand-induced inhibition of beclometasone-activated GR. The GAL<sub>4</sub>/LTAS reporter was premixed with a vector that constitutively expressed Renilla luciferase, which served as an internal positive control for transfection efficiency.

**[0338]** The complete culture medium for the assay was:

- DMEM F-12 (1:1) MIXTURE (LONZA cat. N°: BE04-687F/U1) 500mL
- 5 mL of 100 mM Sodium Pyruvate (LONZA cat. N°: BE12-115E)
- 25 mL of 7.5% Sodium Bicarbonate (LONZA cat. N° BE17-613E)
- 6.5 mL of 1 M Hepes (LONZA cat. N°: BE17-737E)
- 5 mL of 100X Penicillin/Streptomycin (LONZA cat. N° DE17-602E)
- 50 mL of Fetal Bovine Serum (Euroclone cat. N° ECS 0180L)
- 0.25 mL of 10mg/mL Puromycin (InvivoGen cat. : ant-pr-1 )
- 0.5 mL of 100 mg/mL Zeocin (InvivoGen cat. : ant-zn-1)

**[0339]** Cryo-preserved CHO-Gal4/GR cells were suspended in complete medium and 5000 cells/25 $\mu$ l/well were seeded into the wells of 384-well polystyrene assay plates (Thermo Scientific, cat.# 4332) and cultured at 37°C, 5% CO<sub>2</sub> and 95% humidity. After 24 hours growth medium was carefully removed and replaced by 20 $\mu$ l Opti-MEM (GIBCO, cat.# 31985062) as assay buffer. For testing compounds an 8-point half log compound dilution curve was generated in 100% DMSO starting from a 2mM stock and compounds were then diluted 1:50 in Opti-MEM. To test the compounds in the antagonist mode 10 $\mu$ l of compounds were then added to the wells containing 20 $\mu$ l Opti-MEM and incubated for 10 min. After this pre-incubation 10 $\mu$ l of the reference agonist beclometasone (Sigma, cat.# Y0000351) at an EC<sub>50</sub> of 2.5 nM were added resulting in a final assay concentration range from 10  $\mu$ M to 0.003  $\mu$ M in 0.5% DMSO in a total volume of 40  $\mu$ l. Compounds were tested at 8 concentrations in quadruplicate data points. Cells were incubated for 6 hour with compounds and mifepristone as control compound (Sigma, cat.# M8046) at 37°C, 5% CO<sub>2</sub> and 95% humidity. Finally, cells were lysed with 20 $\mu$ l of Triton/Luciferin solution and the signal of the emitted luminescence was recorded at the FLIPR<sup>TETRA</sup> for 2 minutes.

**[0340]** The relative efficacy of a compound (% effect) was calculated based on the full effect of the antagonist mifepristone:

$$\% \text{ effect} = ((\text{compound} - \text{min}) / (\text{max} - \text{min})) \times -100$$

[min=Opti-MEM only, max=mifepristone]
