UNITED STATES PATENT OFFICE.

FORREST B. GOULD, OF BOSTON, MASSACHUSETTS.

LOCKET.

SPECIFICATION forming part of Letters Patent No. 296,741, dated April 15, 1884.

Application filed February 27, 1884. (No model.)

To all whom it may concern:

Be it known that I, FORREST B. GOULD, of Boston, county of Suffolk, State of Massachusetts, have invented an Improvement in Lockets, of which the following description, in connection with the accompanying drawings, is a specification, like letters on the drawings representing like parts.

The object of my invention is to adapt an ordinary hinged locket to receive and hold a picture or other object in one of its halves or sections, and a magnifying-glass in the other half or section, the said magnifying-glass being made adjustable from or toward the picture when the locket is open.

My invention consists, essentially, of a hinged locket with one of its halves or sections adapted to hold or contain a picture or other object to be magnified, and the other half or section having a slide-plate provided with a magnifying-glass hinged or pivoted thereto, substantially as hereinafter described, and particularly pointed out in the claims.

Figure 1 is a central vertical section of a hinged locket containing my invention, the locket being closed. Fig. 2 is a similar view, showing the locket open, with the slide partially withdrawn and the magnifying-glass supported in vertical position, to permit an examination of the picture or other object through said glass; and Fig. 3 is a front elevation, partly broken away, of the parts shown in section in Fig. 2; and Fig. 4 is a modification.

A B represent the halves or sections of an ordinary locket, hinged together at *a*. The half or section A is provided with a picture holder or plate, *a'*, which may form part of said section or be secured therein, and which is adapted to receive and retain a picture or other object to be magnified. The other half or section, B, is provided with a beveled plate, *c*, adapted to slide in the guideway *b*, provided with a beveled groove.

A frame, *d*, carrying a magnifying-glass, D, is hinged or pivoted to the outer end of the slide-plate *c*, so as to permit the said glass to be disposed parallel with the picture-holder *a'* or section A, when the locket is opened, and the halves or sections thereof are held at or about at right angles to each other, as clearly shown in Fig. 2. The slide-plate *c*,

carrying the magnifying-glass D, and capable of movement in the section B, permits said magnifying-glass to be moved from or toward the picture held in the section A, so as to get proper adjustment or the right focus.

Referring to Fig. 2, the slide *c* may be pushed or returned in place within the section B, and the glass D folded down upon the slide-plate *c*, as in Fig. 1, when the half or section A can be closed upon the other section, B, to shut the locket. When so closed, an ordinary hinged locket is presented to view.

In the drawings, Figs. 1 to 3, I have represented the magnifying-glass as placed in the frame hinged upon the slide-plate; but it is obvious that the lens may be placed in a suitable lever-holding ring fixed directly in the part A, as in Fig. 4, the picture in such event being placed in the pivoted frame *d* of the slide *c*.

I claim—

1. A locket composed of two halves, A B, and having a slide-plate provided with a pivoted frame, *d*, the said locket and pivoted frame being adapted to receive a magnifying-glass and a picture to be magnified, the glass and frame being made movable with relation to each other, to place the picture and the magnifying-glass at the proper focal distance apart, substantially as described.

2. A hinged locket having one of its halves or sections adapted to receive and hold a picture or other object to be magnified, the other half or section being provided with a slide-plate, and an attached magnifying-glass hinged or pivoted to said slide-plate, substantially as shown and described.

3. A hinged locket having its half or section A provided with a picture-holder, *a*, and the half-section B provided with the guideway *b*, and having the beveled slide or movable plate *c* therein, and the frame *d*, having the magnifying-glass D, and hinged to said slide *c*, all substantially as described, and for the purpose set forth.

In testimony whereof I have signed my name to this specification in the presence of two subscribing witnesses.

FORREST B. GOULD.

Witnesses:

G. W. GREGORY,
B. J. NOYES.
