2. BACKGROUND

2.1 PATHOBIOLOGY OF CANCER AND OTHER DISEASES

[2] Cancer is characterized primarily by an increase in the number of abnormal cells derived from a given normal tissue, invasion of adjacent tissues by these abnormal cells, or lymphatic or blood-borne spread of malignant cells to regional lymph nodes and to distant sites (metastasis). Clinical data and molecular biologic studies indicate that cancer is a multistep process that begins with minor preneoplastic changes, which may under certain conditions progress to neoplasia. The neoplastic lesion may evolve clonally and develop an increasing capacity for invasion, growth, metastasis, and heterogeneity, especially under conditions in which the neoplastic cells escape the host's immune surveillance. Roitt, I., Brostoff, J and Kale, D., Immunology, 17.1-17.12 (3rd ed., Mosby, St. Louis, Mo., 1993).

[3] There is an enormous variety of cancers which are described in detail in the medical literature. Examples include cancer of the lung, colon, rectum, prostate, breast, brain, and intestine. The incidence of cancer continues to climb as the general population ages, as new cancers develop, and as susceptible populations (e.g., people infected with AIDS or excessively exposed to sunlight) grow. However, options for the treatment of cancer are limited. For example, in the case of blood cancers (e.g., multiple myeloma), few treatment options are available, especially when conventional chemotherapy fails and bone-marrow transplantation is not an option. A tremendous demand therefore exists for new methods and compositions that can be used to treat patients with cancer.

[4] Many types of cancers are associated with new blood vessel formation, a process known as angiogenesis. Several of the mechanisms involved in tumor-induced angiogenesis have been elucidated. The most direct of these mechanisms is the secretion by the tumor cells of cytokines with angiogenic properties. Examples of these cytokines include acidic and basic fibroblastic growth factor (a,b-FGF), angiogenin, vascular endothelial growth factor (VEGF), and TNF-a. Alternatively, tumor cells can release angiogenic peptides through the production of proteases and the subsequent breakdown of the extracellular matrix where some cytokines are stored (e.g., b-FGF). Angiogenesis can
also be induced indirectly through the recruitment of inflammatory cells (particularly macrophages) and their subsequent release of angiogenic cytokines (e.g., TNF-a, b-FGF).

A variety of other diseases and disorders are also associated with, or characterized by, undesired angiogenesis. For example, enhanced or unregulated angiogenesis has been implicated in a number of diseases and medical conditions including, but not limited to, ocular neovascular diseases, choroidal neovascular diseases, retina neovascular diseases, ruberosis (neovascularization of the angle), viral diseases, genetic diseases, inflammatory diseases, allergic diseases, and autoimmune diseases. Examples of such diseases and conditions include, but are not limited to: diabetic retinopathy; retinopathy of prematurity; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; arthritis; and proliferative vitreoretinopathy.

Accordingly, compounds that can control angiogenesis or inhibit the production of certain cytokines, including TNF-a, may be useful in the treatment and prevention of various diseases and conditions.

**2.2 METHODS OF TREATING CANCER**

Current cancer therapy may involve surgery, chemotherapy, hormonal therapy and/or radiation treatment to eradicate neoplastic cells in a patient (see, e.g., Stockdale, 1998, *Medicine*, vol. 3, Rubenstein and Federman, eds., Chapter 12, Section IV). Recently, cancer therapy could also involve biological therapy or immunotherapy. All of these approaches pose significant drawbacks for the patient. Surgery, for example, may be contraindicated due to the health or age of a patient or may be unacceptable to the patient.

Additionally, surgery may not completely remove neoplastic tissue. Radiation therapy is only effective when the neoplastic tissue exhibits a higher sensitivity to radiation than normal tissue. Radiation therapy can also often elicit serious side effects. Hormonal therapy is rarely given as a single agent. Although hormonal therapy can be effective, it is often used to prevent or delay recurrence of cancer after other treatments have removed the majority of cancer cells. Biological therapies and immunotherapies are limited in number and may produce side effects such as rashes or swellings, flu-like symptoms, including fever, chills and fatigue, digestive tract problems or allergic reactions.

With respect to chemotherapy, there are a variety of chemotherapeutic agents available for treatment of cancer. A majority of cancer chemotherapeutics act by inhibiting DNA synthesis, either directly, or indirectly by inhibiting the biosynthesis of deoxyribonucleotide triphosphate precursors, to prevent DNA replication and concomitant

[10] Despite availability of a variety of chemotherapeutic agents, chemotherapy has many drawbacks. Stockdale, Medicine, vol. 3, Rubenstein and Federman, eds., ch. 12, sect. 10, 1998. Almost all chemotherapeutic agents are toxic, and chemotherapy causes significant, and often dangerous side effects including severe nausea, bone marrow depression, and immunosuppression. Additionally, even with administration of combinations of chemotherapeutic agents, many tumor cells are resistant or develop resistance to the chemotherapeutic agents. In fact, those cells resistant to the particular chemotherapeutic agents used in the treatment protocol often prove to be resistant to other drugs, even if those agents act by different mechanism from those of the drugs used in the specific treatment. This phenomenon is referred to as pleiotropic drug or multidrug resistance. Because of the drug resistance, many cancers prove or become refractory to standard chemotherapeutic treatment protocols.

[11] Other diseases or conditions associated with, or characterized by, undesired angiogenesis are also difficult to treat. However, some compounds such as protamine, hepan and steroids have been proposed to be useful in the treatment of certain specific diseases. Taylor et al., Nature 297:307 (1982); Folkman et al., Science 221:719 (1983); and U.S. Pat. Nos. 5,001,116 and 4,994,443.

[12] Still, there is a significant need for safe and effective methods of treating, preventing and managing cancer and other diseases and conditions, including for diseases that are refractory to standard treatments, such as surgery, radiation therapy, chemotherapy and hormonal therapy, while reducing or avoiding the toxicities and/or side effects associated with the conventional therapies.

Administration of a compound provided herein, or a pharmaceutically acceptable salt, solvate, clathrate, stereoisomer or prodrug thereof, and the second active agents to a patient can occur simultaneously or sequentially by the same or different routes of administration. The suitability of a particular route of administration employed for a particular active agent will depend on the active agent itself (e.g., whether it can be administered orally without decomposing prior to entering the blood stream) and the disease being treated. One of administration for compounds provided herein is oral. Routes of administration for the second active agents or ingredients are known to those of ordinary skill in the art. See, e.g., Physicians 'Desk Reference (60th ed., 2006).
In one embodiment, the second active agent is administered intravenously or subcutaneously and once or twice daily in an amount of from about 1 to about 1000 mg, from about 5 to about 500 mg, from about 10 to about 350 mg, or from about 50 to about 200 mg. The specific amount of the second active agent will depend on the specific agent used, the type of disease being treated or managed, the severity and stage of disease, and the amount(s) of compounds provided herein and any optional additional active agents concurrently administered to the patient.

As discussed elsewhere herein, also encompassed is a method of reducing, treating and/or preventing adverse or undesired effects associated with conventional therapy including, but not limited to, surgery, chemotherapy, radiation therapy, hormonal therapy, biological therapy and immunotherapy. Compounds provided herein and other active ingredients can be administered to a patient prior to, during, or after the occurrence of the adverse effect associated with conventional therapy.

4.4 CYCLING THERAPY

In certain embodiments, the prophylactic or therapeutic agents provided herein are cyclically administered to a patient. Cycling therapy involves the administration of an active agent for a period of time, followed by a rest (i.e., discontinuation of the administration) for a period of time, and repeating this sequential administration. Cycling therapy can reduce the development of resistance to one or more of the therapies, avoid or reduce the side effects of one of the therapies, and/or improve the efficacy of the treatment.

Consequently, in one embodiment, a compound provided herein is administered daily in a single or divided doses in a four to six week cycle with a rest period of about a week or two weeks. Cycling therapy further allows the frequency, number, and length of dosing cycles to be increased. Thus, another embodiment encompasses the administration of a compound provided herein for more cycles than are typical when it is administered alone. In yet another embodiment, a compound provided herein is administered for a greater number of cycles than would typically cause dose-limiting toxicity in a patient to whom a second active ingredient is not also being administered.

In one embodiment, a compound provided herein is administered daily and continuously for three or four weeks at a dose of from about 0.1 mg to about 500 mg per day, followed by a rest of one or two weeks. In other embodiments, the dose can be from about 1 mg to about 300 mg, from about 0.1 mg to about 150 mg, from about 1 mg to about 200 mg, from about 10 mg to about 100 mg, from about 0.1 mg to about 50 mg, from about
1 mg to about 50 mg, from about 10 mg to about 50 mg, from about 20 mg to about 30 mg, or from about 1 mg to about 20 mg, followed by a rest.

In one embodiment, a compound provided herein and a second active ingredient are administered orally, with administration of the compound provided herein occurring 30 to 60 minutes prior to the second active ingredient, during a cycle of four to six weeks. In another embodiment, the combination of a compound provided herein and a second active ingredient is administered by intravenous infusion over about 90 minutes every cycle.

Typically, the number of cycles during which the combination treatment is administered to a patient will be from about one to about 24 cycles, from about two to about 16 cycles, or from about four to about three cycles.

4.5 PHARMACEUTICAL COMPOSITIONS AND DOSAGE FORMS

Pharmaceutical compositions can be used in the preparation of individual, single unit dosage forms. Pharmaceutical compositions and dosage forms provided herein comprise a compound provided herein, or a pharmaceutically acceptable salt, solvate, stereoisomer, clathrate, or prodrug thereof. Pharmaceutical compositions and dosage forms can further comprise one or more excipients.

Pharmaceutical compositions and dosage forms provided herein can also comprise one or more additional active ingredients. Examples of optional second, or additional, active ingredients are disclosed in Section 4.3, above.

Single unit dosage forms provided herein are suitable for oral, mucosal (e.g., nasal, sublingual, vaginal, buccal, or rectal), parenteral (e.g., subcutaneous, intravenous, bolus injection, intramuscular, or intraarterial), topical (e.g., eye drops or other ophthalmic preparations), transdermal or transcutaneous administration to a patient. Examples of dosage forms include, but are not limited to: tablets; caplets; capsules, such as soft elastic gelatin capsules; cachets; troches; lozenges; dispersions; suppositories; powders; aerosols (e.g., nasal sprays or inhalers); gels; liquid dosage forms suitable for oral or mucosal administration to a patient, including suspensions (e.g., aqueous or non-aqueous liquid suspensions, oil-in-water emulsions, or a water-in-oil liquid emulsions), solutions, and elixirs; liquid dosage forms suitable for parenteral administration to a patient; eye drops or other ophthalmic preparations suitable for topical administration; and sterile solids (e.g., crystalline or amorphous solids) that can be reconstituted to provide liquid dosage forms suitable for parenteral administration to a patient.
The composition, shape, and type of dosage forms will typically vary depending on their use. For example, a dosage form used in the acute treatment of a disease may contain larger amounts of one or more of the active ingredients it comprises than a dosage form used in the chronic treatment of the same disease. Similarly, a parenteral dosage form may contain smaller amounts of one or more of the active ingredients it comprises than an oral dosage form used to treat the same disease. These and other ways in which specific dosage forms are used will vary from one another will be readily apparent to those skilled in the art. See, e.g., Remington’s Pharmaceutical Sciences, 20th ed., Mack Publishing, Easton PA (2000).

In one embodiment, pharmaceutical compositions and dosage forms comprise one or more excipients. Suitable excipients are well known to those skilled in the art of pharmacy, and non-limiting examples of suitable excipients are provided herein. Whether a particular excipient is suitable for incorporation into a pharmaceutical composition or dosage form depends on a variety of factors well known in the art including, but not limited to, the way in which the dosage form will be administered to a patient. For example, oral dosage forms such as tablets may contain excipients not suited for use in parenteral dosage forms. The suitability of a particular excipient may also depend on the specific active ingredients in the dosage form. For example, the decomposition of some active ingredients may be accelerated by some excipients such as lactose, or when exposed to water. Active ingredients that comprise primary or secondary amines are particularly susceptible to such accelerated decomposition. Consequently, provided are pharmaceutical compositions and dosage forms that contain little, if any, lactose other mono- or disaccharides. As used herein, the term "lactose-free" means that the amount of lactose present, if any, is insufficient to substantially increase the degradation rate of an active ingredient.

Lactose-free compositions can comprise excipients that are well known in the art and are listed, for example, in the U.S. Pharmacopeia (USP) 25-NF20 (2002). In general, lactose-free compositions comprise active ingredients, a binder/filler, and a lubricant in pharmaceutically compatible and pharmaceutically acceptable amounts. In one embodiment, lactose-free dosage forms comprise active ingredients, microcrystalline cellulose, pre-gelatinized starch, and magnesium stearate.

Also provided are anhydrous pharmaceutical compositions and dosage forms comprising active ingredients, since water can facilitate the degradation of some compounds. For example, the addition of water (e.g., 5%) is widely accepted in the
pharmaceutical arts as a means of simulating long-term storage in order to determine characteristics such as shelf-life or the stability of formulations over time. See, e.g., Jens T. Carstensen, *Drug Stability: Principles & Practice*, 2d Ed., Marcel Dekker, NY, NY, 1995, pp. 379-80. In effect, water and heat accelerate the decomposition of some compounds. Thus, the effect of water on a formulation can be of great significance since moisture and/or humidity are commonly encountered during manufacture, handling, packaging, storage, shipment, and use of formulations.

Anhydrous pharmaceutical compositions and dosage forms can be prepared using anhydrous or low moisture containing ingredients and low moisture or low humidity conditions. Pharmaceutical compositions and dosage forms that comprise lactose and at least one active ingredient that comprises a primary or secondary amine are anhydrous if substantial contact with moisture and/or humidity during manufacturing, packaging, and/or storage is expected.

An anhydrous pharmaceutical composition should be prepared and stored such that its anhydrous nature is maintained. Accordingly, anhydrous compositions are, in one embodiment, packaged using materials known to prevent exposure to water such that they can be included in suitable formulary kits. Examples of suitable packaging include, but are not limited to, hermetically sealed foils, plastics, unit dose containers (e.g., vials), blister packs, and strip packs.

Also provided are pharmaceutical compositions and dosage forms that comprise one or more compounds that reduce the rate by which an active ingredient will decompose. Such compounds, which are referred to herein as "stabilizers," include, but are not limited to, antioxidants such as ascorbic acid, pH buffers, or salt buffers.

Like the amounts and types of excipients, the amounts and specific types of active ingredients in a dosage form may differ depending on factors such as, but not limited to, the route by which it is to be administered to patients. In one embodiment, dosage forms comprise a compound provided herein in an amount of from about 0.10 to about 500 mg. In other embodiments, dosage forms comprise a compound provided herein in an amount of about 0.1, 1, 2, 5, 7.5, 10, 12.5, 15, 17.5, 20, 25, 50, 100, 150, 200, 250, 300, 350, 400, 450, or 500 mg.

In other embodiments, dosage forms comprise the second active ingredient in an amount of 1 to about 1000 mg, from about 5 to about 500 mg, from about 10 to about 350 mg, or from about 50 to about 200 mg. Of course, the specific amount of the second active agent will depend on the specific agent used, the diseases or disorders being treated.
or managed, and the amount(s) of a compound provided herein, and any optional additional active agents concurrently administered to the patient.

4.5.1 Oral Dosage Forms

[169] Pharmaceutical compositions that are suitable for oral administration can be provided as discrete dosage forms, such as, but not limited to, tablets (e.g., chewable tablets), caplets, capsules, and liquids (e.g., flavored syrups). Such dosage forms contain predetermined amounts of active ingredients, and may be prepared by methods of pharmacy well known to those skilled in the art. See generally, Remington's Pharmaceutical Sciences, 20th ed., Mack Publishing, Easton PA (2000).

[170] Oral dosage forms provided herein are prepared by combining the active ingredients in an intimate admixture with at least one excipient according to conventional pharmaceutical compounding techniques. Excipients can take a wide variety of forms depending on the form of preparation desired for administration. For example, excipients suitable for use in oral liquid or aerosol dosage forms include, but are not limited to, water, glycols, oils, alcohols, flavoring agents, preservatives, and coloring agents. Examples of excipients suitable for use in solid oral dosage forms (e.g., powders, tablets, capsules, and caplets) include, but are not limited to, starches, sugars, micro-crystalline cellulose, diluents, granulating agents, lubricants, binders, and disintegrating agents.

[171] In one embodiment, oral dosage forms are tablets or capsules, in which case solid excipients are employed. In another embodiment, tablets can be coated by standard aqueous or nonaqueous techniques. Such dosage forms can be prepared by any of the methods of pharmacy. In general, pharmaceutical compositions and dosage forms are prepared by uniformly and intimately admixing the active ingredients with liquid carriers, finely divided solid carriers, or both, and then shaping the product into the desired presentation if necessary.

[172] For example, a tablet can be prepared by compression or molding. Compressed tablets can be prepared by compressing in a suitable machine the active ingredients in a free-flowing form such as powder or granules, optionally mixed with an excipient. Molded tablets can be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent.

[173] Examples of excipients that can be used in oral dosage forms provided herein include, but are not limited to, binders, fillers, disintegrants, and lubricants. Binders suitable for use in pharmaceutical compositions and dosage forms include, but are not limited to, corn starch, potato starch, or other starches, gelatin, natural and synthetic gums
such as acacia, sodium alginate, alginic acid, other alginates, powdered tragacanth, guar gum, cellulose and its derivatives (e.g., ethyl cellulose, cellulose acetate, carboxymethyl cellulose calcium, sodium carboxymethyl cellulose), polyvinyl pyrrolidone, methyl cellulose, pre-gelatinized starch, hydroxypropyl methyl cellulose, (e.g., Nos. 2208, 2906, 2910), microcrystalline cellulose, and mixtures thereof.

Suitable forms of microcrystalline cellulose include, but are not limited to, the materials sold as AVICEL-PH-101, AVICEL-PH-103, AVICEL RC-581, AVICEL-PH-105 (available from FMC Corporation, American Viscose Division, Avicel Sales, Marcus Hook, PA), and mixtures thereof. An specific binder is a mixture of microcrystalline cellulose and sodium carboxymethyl cellulose sold as AVICEL RC-581. Suitable anhydrous or low moisture excipients or additives include AVICEL-PH-103™ and Starch 1500 LM.

Examples of fillers suitable for use in the pharmaceutical compositions and dosage forms provided herein include, but are not limited to, talc, calcium carbonate (e.g., granules or powder), microcrystalline cellulose, powdered cellulose, dextrates, kaolin, mannitol, silicic acid, sorbitol, starch, pre-gelatinized starch, and mixtures thereof. The binder or filler in pharmaceutical compositions is, in one embodiment, present in from about 50 to about 99 weight percent of the pharmaceutical composition or dosage form.

Disintegrants may be used in the compositions to provide tablets that disintegrate when exposed to an aqueous environment. Tablets that contain too much disintegrant may disintegrate in storage, while those that contain too little may not disintegrate at a desired rate or under the desired conditions. Thus, a sufficient amount of disintegrant that is neither too much nor too little to detrimentally alter the release of the active ingredients may be used to form solid oral dosage forms. The amount of disintegrant used varies based upon the type of formulation, and is readily discernible to those of ordinary skill in the art. In one embodiment, pharmaceutical compositions comprise from about 0.5 to about 15 weight percent of disintegrant, or from about 1 to about 5 weight percent of disintegrant.

Disintegrants that can be used in pharmaceutical compositions and dosage forms include, but are not limited to, agar-agar, alginic acid, calcium carbonate, microcrystalline cellulose, croscarmellose sodium, crospovidone, polacrilin potassium, sodium starch glycolate, potato or tapioca starch, other starches, pre-gelatinized starch, other starches, clays, other algin, other celluloses, gums, and mixtures thereof.
Lubricants that can be used in pharmaceutical compositions and dosage forms include, but are not limited to, calcium stearate, magnesium stearate, mineral oil, light mineral oil, glycerin, sorbitol, mannitol, polyethylene glycol, other glycols, stearic acid, sodium lauryl sulfate, talc, hydrogenated vegetable oil (e.g., peanut oil, cottonseed oil, sunflower oil, sesame oil, olive oil, corn oil, and soybean oil), zinc stearate, ethyl oleate, ethyl laurate, agar, and mixtures thereof. Additional lubricants include, for example, a syloid silica gel (AEROSIL200, manufactured by W.R. Grace Co. of Baltimore, MD), a coagulated aerosol of synthetic silica (marketed by Degussa Co. of Piano, TX), CAB-O-SIL (a pyrogenic silicon dioxide product sold by Cabot Co. of Boston, MA), and mixtures thereof. If used at all, lubricants may be used in an amount of less than about 1 weight percent of the pharmaceutical compositions or dosage forms into which they are incorporated.

In one embodiment, a solid oral dosage form comprises a compound provided herein, anhydrous lactose, microcrystalline cellulose, polyvinylpyrrolidone, stearic acid, colloidal anhydrous silica, and gelatin.

**4.5.2 Controlled Release Dosage Forms**

Active ingredients such as the compounds provided herein can be administered by controlled release means or by delivery devices that are well known to those of ordinary skill in the art. Examples include, but are not limited to, those described in U.S. Patent Nos.: 3,845,770; 3,916,899; 3,536,809; 3,598,123; and 4,008,719; 5,674,533; 5,059,595; 5,591,767; 5,120,548; 5,073,543; 5,639,476; 5,354,556; 5,639,480; 5,733,566; 5,739,108; 5,891,474; 5,922,356; 5,972,891; 5,980,945; 5,993,855; 6,045,830; 6,087,324; 6,113,943; 6,197,350; 6,248,363; 6,264,970; 6,267,981; 6,376,461; 6,419,961; 6,589,548; 6,613,358; 6,699,500 each of which is incorporated herein by reference. Such dosage forms can be used to provide slow or controlled release of one or more active ingredients using, for example, hydropropylmethyl cellulose, other polymer matrices, gels, permeable membranes, osmotic systems, multilayer coatings, microparticles, liposomes, microspheres, or a combination thereof to provide the desired release profile in varying proportions. Suitable controlled release formulations known to those of ordinary skill in the art, including those described herein, can be readily selected for use with the active ingredients provided herein. Thus, the compositions provided encompass single unit dosage forms suitable for oral administration such as, but not limited to, tablets, capsules, gelcaps, and caplets that are adapted for controlled release.
All controlled release pharmaceutical products have a common goal of improving drug therapy over that achieved by their non controlled counterparts. Ideally, the use of an optimally designed controlled release preparation in medical treatment is characterized by a minimum of drug substance being employed to cure or control the condition in a minimum amount of time. Advantages of controlled release formulations include extended activity of the drug, reduced dosage frequency, and increased subject compliance. In addition, controlled release formulations can be used to affect the time of onset of action or other characteristics, such as blood levels of the drug, and can thus affect the occurrence of side (e.g., adverse) effects.

Most controlled release formulations are designed to initially release an amount of drug (active ingredient) that promptly produces the desired therapeutic effect, and gradually and continually release of other amounts of drug to maintain this level of therapeutic or prophylactic effect over an extended period of time. In order to maintain this constant level of drug in the body, the drug must be released from the dosage form at a rate that will replace the amount of drug being metabolized and excreted from the body.

Controlled release of an active ingredient can be stimulated by various conditions including, but not limited to, pH, temperature, enzymes, water, or other physiological conditions or compounds.

In certain embodiments, the drug may be administered using intravenous infusion, an implantable osmotic pump, a transdermal patch, liposomes, or other modes of administration. In one embodiment, a pump may be used (see, Sefton, CRC Crit. Ref. Biomed. Eng. 14:201 (1987); Buchwald et al., Surgery 88:507 (1980); Saudek et al., N. Engl. J. Med. 321:574 (1989)). In another embodiment, polymeric materials can be used. In yet another embodiment, a controlled release system can be placed in a subject at an appropriate site determined by a practitioner of skill, i.e., thus requiring only a fraction of the systemic dose (see, e.g., Goodson, Medical Applications of Controlled Release, vol. 2, pp. 115-138 (1984)). Other controlled release systems are discussed in the review by Langer (Science 249:1527-1533 (1990)). The active ingredient can be dispersed in a solid inner matrix, e.g., polymethylmethacrylate, polybutylmethacrylate, plasticized or unplasticized polyvinylchloride, plasticized nylon, plasticized polyethylene terephthalate, natural rubber, polyisoprene, polyisobutylene, polybutadiene, polyethylene, ethylene-vinylacetate copolymers, silicone rubbers, polydimethylsiloxanes, silicone carbonate copolymers, hydrophilic polymers such as hydrogels of esters of acrylic and methacrylic acid, collagen, cross-linked polyvinylalcohol and cross-linked partially hydrolyzed...
polyvinyl acetate, that is surrounded by an outer polymeric membrane, e.g., polyethylene, polypropylene, ethylene/propylene copolymers, ethylene/ethyl acrylate copolymers, ethylene/vinylacetate copolymers, silicone rubbers, polydimethyl siloxanes, neoprene rubber, chlorinated polyethylene, polyvinylchloride, vinylchloride copolymers with vinyl acetate, vinylidene chloride, ethylene and propylene, ionomer polyethylene terephthalate, butyl rubber epichlorohydrin rubbers, ethylene/vinyl alcohol copolymer, ethylene/vinyl acetate/vinyl alcohol terpolymer, and ethylene/vinylxyethanol copolymer, that is insoluble in body fluids. The active ingredient then diffuses through the outer polymeric membrane in a release rate controlling step. The percentage of active ingredient in such parenteral compositions is highly dependent on the specific nature thereof, as well as the needs of the subject.

### 4.5.3 Parenteral Dosage Forms

[184] Parenteral dosage forms can be administered to patients by various routes including, but not limited to, subcutaneous, intravenous (including bolus injection), intramuscular, and intraarterial. In some embodiments, administration of a parenteral dosage form bypasses patients’ natural defenses against contaminants, and thus, in these embodiments, parenteral dosage forms are sterile or capable of being sterilized prior to administration to a patient. Examples of parenteral dosage forms include, but are not limited to, solutions ready for injection, dry products ready to be dissolved or suspended in a pharmaceutically acceptable vehicle for injection, suspensions ready for injection, and emulsions.

[185] Suitable vehicles that can be used to provide parenteral dosage forms are well known to those skilled in the art. Examples include, but are not limited to: Water for Injection USP; aqueous vehicles such as, but not limited to, Sodium Chloride Injection, Ringer’s Injection, Dextrose Injection, Dextrose and Sodium Chloride Injection, and Lactated Ringer’s Injection; water-miscible vehicles such as, but not limited to, ethyl alcohol, polyethylene glycol, and polypropylene glycol; and non-aqueous vehicles such as, but not limited to, corn oil, cottonseed oil, peanut oil, sesame oil, ethyl oleate, isopropyl myristate, and benzyl benzoate.

[186] Compounds that increase the solubility of one or more of the active ingredients disclosed herein can also be incorporated into the parenteral dosage forms. For example, cyclodextrin and its derivatives can be used to increase the solubility of a compound provided herein. See, e.g., U.S. Patent No. 5,134,127, which is incorporated herein by reference.
4.5.4 **Topical and Mucosal Dosage Forms**

Topical and mucosal dosage forms provided herein include, but are not limited to, sprays, aerosols, solutions, emulsions, suspensions, eye drops or other ophthalmic preparations, or other forms known to one of skill in the art. See, *e.g.*, *Remington’s Pharmaceutical Sciences*, 16th, 18th and 20th eds., Mack Publishing, Easton PA (1980, 1990 and 2000); and *Introduction to Pharmaceutical Dosage Forms*, 4th ed., Lea & Febiger, Philadelphia (1985). Dosage forms suitable for treating mucosal tissues within the oral cavity can be formulated as mouthwashes or as oral gels.

Suitable excipients (*e.g.*, carriers and diluents) and other materials that can be used to provide topical and mucosal dosage forms encompassed herein are well known to those skilled in the pharmaceutical arts, and depend on the particular tissue to which a given pharmaceutical composition or dosage form will be applied. In one embodiment, excipients include, but are not limited to, water, acetone, ethanol, ethylene glycol, propylene glycol, butane-1,3-diol, isopropyl myristate, isopropyl palmitate, mineral oil, and mixtures thereof to form solutions, emulsions or gels, which are non-toxic and pharmaceutically acceptable. Moisturizers or humectants can also be added to pharmaceutical compositions and dosage forms. Examples of additional ingredients are well known in the art. See, *e.g.*, *Remington’s Pharmaceutical Sciences*, 16th, 18th and 20th eds., Mack Publishing, Easton PA (1980, 1990 and 2000).

The pH of a pharmaceutical composition or dosage form may also be adjusted to improve delivery of one or more active ingredients. Also, the polarity of a solvent carrier, its ionic strength, or tonicity can be adjusted to improve delivery. Compounds such as stearates can also be added to pharmaceutical compositions or dosage forms to alter the hydrophilicity or lipophilicity of one or more active ingredients so as to improve delivery. In other embodiments, stearates can serve as a lipid vehicle for the formulation, as an emulsifying agent or surfactant, or as a delivery-enhancing or penetration-enhancing agent. In other embodiments, salts, solvates, prodrugs, clathrates, or stereoisomers of the active ingredients can be used to further adjust the properties of the resulting composition.

**4.6 KITS**

In one embodiment, active ingredients provided herein are not administered to a patient at the same time or by the same route of administration. In another embodiment, provided are kits which can simplify the administration of appropriate amounts of active ingredients.
In one embodiment, a kit comprises a dosage form of a compound provided herein. Kits can further comprise additional active ingredients such as oblimersen (Genasense®), melphalan, G-CSF, GM-CSF, EPO, topotecan, dacarbazine, irinotecan, taxotere, IFN, COX-2 inhibitor, pentoxifylline, ciprofloxacin, dexamethasone, IL2, IL8, IL18, Ara-C, vinorelbine, isotretinoin, 13 cis-retinoic acid, or a pharmacologically active mutant or derivative thereof, or a combination thereof. Examples of the additional active ingredients include, but are not limited to, those disclosed herein (see, e.g., section 4.3).

In other embodiments, kits can further comprise devices that are used to administer the active ingredients. Examples of such devices include, but are not limited to, syringes, drip bags, patches, and inhalers.

Kits can further comprise cells or blood for transplantation as well as pharmaceutically acceptable vehicles that can be used to administer one or more active ingredients. For example, if an active ingredient is provided in a solid form that must be reconstituted for parenteral administration, the kit can comprise a sealed container of a suitable vehicle in which the active ingredient can be dissolved to form a particulate-free sterile solution that is suitable for parenteral administration. Examples of pharmaceutically acceptable vehicles include, but are not limited to: Water for Injection USP; aqueous vehicles such as, but not limited to, Sodium Chloride Injection, Ringer's Injection, Dextrose Injection, Dextrose and Sodium Chloride Injection, and Lactated Ringer's Injection; water-miscible vehicles such as, but not limited to, ethyl alcohol, polyethylene glycol, and polypropylene glycol; and non-aqueous vehicles such as, but not limited to, corn oil, cottonseed oil, peanut oil, sesame oil, ethyl oleate, isopropyl myristate, and benzyl benzoate.

5. **EXAMPLES**

Certain embodiments of the claimed subject matter are illustrated by the following non-limiting examples.

5.1 **4-CARBAMOYL-4-(4-HYDROXY-1-OXO-1,3-DIHYDRO-ISOINDOL-2-YL)-BUTYRIC ACID METHYL ESTER**

![Chemical Structure](image)
5.1.1 3-Hydroxy-2-methyl-benzoic acid methyl ester

[195] 3-Hydroxy-2-methylbenzoic acid (105 g, 690 mmol) was added to MeOH (800 mL) in a 2L three neck round bottom flask equipped with condenser, thermometer and stirring bar followed by the addition of MeOH (250ml). H$_2$SO$_4$ (10 mL, 180 mmol) was added to above solution. The reaction mixture was stirred at 62°C for 17 hours. The solvent was removed in vacuo. The residue (200 mL) was added to water (600 mL) slowly at room temperature and a white solid was formed. The suspension was stirred in an ice bath for 30 minutes and filtered. The solid was washed with water (5 x 250 mL) and dried to give 3-hydroxy-2-methyl-benzoic acid methyl ester as a white solid (10Og, 87% yield). The compound was used in the next step without further purification: LCMS MH = 167; H NMR (DMSO-de) δ 2.28 (s, 3H, CH$_3$), 3.80 (s, 3H, CH$_3$), 6.96 - 7.03 (m, 1H, Ar), 7.09 (t, J = 7.8 Hz, 1H, Ar), 7.14 - 7.24 (m, 1H, Ar), 9.71 (s, 1H, OH).

5.1.2 3-(tert-Butyl-dimethyl-silanyloxy)-2-methyl-benzoic acid methyl ester

[196] To a 1L three neck RB flask equipped with stirring bar and thermometer, were added DMF (300 mL), methyl 3-hydroxy-2-methylbenzoate (90 g, 542 mmol) and imidazole (92 g, 1,354 mmol). TBDMS-C1 (90 g, 596 mmol) was added to the above solution in portions to control the internal temp between 15-19°C over 20 minutes, and after addition, the internal temp dropped below 1°C. The ice bath was removed and the reaction mixture was stirred at room temperature for 16 hours. The reaction mixture was added to ice water (500 mL), and the resulting solution was divided into two portions (700 mL x 2). Each portion was extracted with EtOAc (700 mL). Each organic layer was washed with cold water (350 mL) and brine (350 mL). Organic layers were combined and dried by MgSO4. The combined organic layer was concentrated to give 3-(tert -butyl-dimethyl-silanyloxy)-2-methyl-benzoic acid methyl ester as a light brown oil (160 g, 100% crude yield). The compound was used in the next step without further purification: LCMS MH = 281; H NMR (DMSO-d$_6$) δ -0.21 (s, 6H, CH$_3$, CH$_3$), 0.73 - 0.84 (m, 9H, CH$_3$, CH$_3$, CH$_3$).
2.10 (s, 3H, CH₃), 3.60 (s, 3H, CH₃), 6.82 (dd, 1H, Ar), 6.97 (t, J = 7.9 Hz, 1H, Ar), 7.13 (dd, J = 1.1, 7.7 Hz, 1H, Ar).

5.1.3 2-Bromomethyl-3-(3-tert-butyl-dimethyl-silyloxy)-benzoic acid methyl ester

[197] NBS (49.8 g, 280 mmol) was added to methyl 3-(3-tert-butyl dimethylsilyloxy)-2-methylbenzoate (78.4 g, 280 mmol) in methyl acetate (500 mL) at room temperature to give an orange colored suspension. The resulting reaction mixture was heated in an oil bath at 40°C and shined by 300 wt sunlight bulb at reflux for 4 hours. The reaction mixture was cooled down and washed by Na₂S₀₃ solution (2 x 600 mL, 50% saturated concentration), water (500 mL) and brine (600 mL). The organic layer was dried by MgS₀₄ and decolorized by charcoal. The organic layer was concentrated to give 2-bromomethyl-3-(3-tert-butyl-dimethyl-silyloxy)-benzoic acid methyl ester as a light brown oil (96 g, 91% crude yield). The compound was used in the next step without further purification: LCMS M-Br = 279; H NMR (DMSO-d₆) δ 0.05 - 0.11 (m, 6H, CH₃, CH₃), 0.82 (s, 9H, CH₃, CH₃, CH₃), 3.65 (s, 3H, CH₃), 4.74 (s, 2H, CH₂), 6.94 (dd, J = 1.3, 8.1 Hz, 1H, Ar), 7.10 - 7.20 (m, 1H, Ar), 7.21 - 7.29 (m, 1H, Ar).

5.1.4 4-Carbamoyl-butyric acid methyl ester

[198] To a stirred solution of methyl 2-(bromomethyl)-3-(3-tert-butyl-dimethylsilyloxy)benzoate (137.5 g, 325 mmol) in acetonitrile (1100 mL) in a 2 L round bottom flask, was added methyl 4,5-diamino-5-oxopentanoate hydrochloride (70.4 g, 358 mmol). To the suspension was added DIPEA (119 ml, 683 mmol) through an addition funnel over 10 minutes and the suspension was stirred at room temperature for 1 hour before the mixture was heated in an oil bath at 40°C for 23 hours. The reaction mixture was concentrated under vacuo. The residue was stirred in ether (600 mL), and a white solid precipitated out. The mixture was filtered and the solid was washed with ether (400 mL). The filtrate was washed with HCl (1N, 200 mL), NaHC0₃ (sat. 200 mL) and brine (250
mL). The aqueous acid layer and basic layer were kept separately. Then the solid was further washed with ether (250 mL) and the liquid was washed with above acid solution and basic solution. The two organic layers were combined and concentrated under vacuo to give 4-[4-(tert-Butyl-dimethyl-silyloxy)-1-oxo-1,3-dihydro-isooindol-2-yl]-4-carbamoyl-butyric acid methyl ester as a brown oil (152 g, 115% crude yield, 77% purity by H NMR). The compound was used in the next step without further purification: LCMS MH = 293.

5.1.5 4-Carbamoyl-4-f4-hydra1xy-l-oxo-l,3-dihydro-isooindol-2-yl)-butyric acid methyl ester

[199] To a stirred cold solution of methyl 5-amino-4-(4-(tert-butyldimethylsilyloxy)-1-oxoisooindolin-2-yl)-5-oxopentanoate (152 g, 288 mmol) in DMF (500 mL) and water (55 mL), was added by K₂CO₃ (19.89 g, 144 mmol) by portions over 5 minutes. The resulting reaction mixture was stirred at room temperature for 40 minutes. The reaction mixture was cooled in an ice bath. To the mixture, HCl (12M, 23.99 ml, 288 mmol) was added slowly. After the addition, acetonitrile (280 mL) was added to the mixture and a solid precipitated out. The mixture was stirred at room temperature for 10 minutes and filtered. The solid was washed with acetonitrile (50 mL x 4). The filtrate was concentrated under high vacuo to give a yellow oil (168 g). The oil was dissolved in acetonitrile (600 mL) and stirred at room temperature for 10 minutes. The mixture was filtered and the solid was washed with acetonitrile (25 mL x 2). The filtrate was concentrated under high vacuo to give a yellow oil (169g), which was added to a mixture of water (1200 mL) and ether (1000 mL). The mixture was stirred for 3 minutes and the layers were separated. The aqueous solution was concentrated under high vacuo and the residue was stirred in acetonitrile (160 mL) and a white solid was formed after overnight stirring. The mixture was filtered to give 4-carbamoyl-4-(4-hydroxy-l-oxo-l,3-dihydro-isooindol-2-yl)-butyric acid methyl ester as a white solid (46 g, 54% yield). The filtrate was concentrated and the residue was further crystallized in acetonitrile (60 mL) to give more 4-carbamoyl-4-(4-hydroxy-l-oxo-l,3-dihydro-isooindol-2-yl)-butyric acid methyl ester as a white solid (11.7 g, 14% yield). The filtrate was concentrated and the residue was purified by ISCO chromatography to give more 4-carbamoyl-4-(4-hydroxy-l-oxo-l,3-dihydro-isooindol-2-yl)-butyric acid methyl ester as a white solid (13.2 g, 15% yield). The total product obtained was 70.9 g in 83% yield: LCMS MH = 293; H NMR (DMSO-d₆) δ 1.95 -

The reaction mixture was filtered, and the filtrate was concentrated. The resulting oil was purified on silica gel column eluted with methylene chloride and methanol (gradient, product came out at 6% methanol) to give 4-carbamoyl-4-[4-(4-morpholin-4-ylmethyl-benzyloxy)-1-oxo-1,3-dihydro-isoidol-2-yl]-butyric acid methyl ester (2.2 g, 54% yield). The product was used in the next step without further purification.

The mixture was stirred at 0°C for 10 minutes and was quenched with IN HCl (5 mL, 5mmol) followed by saturated NaHCO₃ (25 mL). The mixture was extracted with EtOAc (2 X 50 mL). The organic layer was washed with water (30 mL), brine (30 mL), dried over MgSO₄ and concentrated. To the resulting solid was added EtOAc (10 mL) followed by hexane (10 mL) under stirring. room temperature, followed by addition of (4-chloromethyl-phenyl)-methanol (902 mg,

diisopropylethylamine (115 µℓ, 0.66 mmol) followed by methanesulfonyl chloride (47 µℓ, 0.605 mmol). After 5 minutes, the mixture was allowed to warm up to room temperature. The mixture was stirred for about 45 minutes at room temperature, then more MsCl (20 µℓ) was added. The reaction was complete after 10 minutes as judged by LCMS. The crude mixture was concentrated and the residue was dried further in a vacuum oven at 40°C overnight to give the crude product as a white solid (320 mg). LCMS indicated that the obtained solid contained about 5:1 mixture of 4-carbamoyl-2-[4-(4-methanesulfonyloxymethyl-benzyloxy)-1-oxo-1,3-dihydro-isoindol-2-yl]-butyric acid tert-butyl ester and 4-carbamoyl-2-[4-(4-chloromethyl-benzyloxy)-1-oxo-1,3-dihydro-isoindol-2-yl]-butyric acid tert-butyl ester (MH = 533 amu and 473, respectively). The mixture was used in the next step without further purification. To a solution of the crude product (293 mg, 0.55 mmol, assuming quantitative yield from previous step) and N,N-diisopropylethylamine (240 µℓ, 1.375 mmol) in acetonitrile (5 mL), was added thiomorpholine 1,1-dioxide (82 mg, 0.605 mmol). The mixture was stirred at room temperature for about 45 minutes and then more thiomorpholine 1,1-dioxide (82 mg, 0.605 mmol) was added. After 3 hours, the mixture was heated to reflux for about 4 hours and then stirred at room temperature for 2 days. The volatiles were removed in vacuo and the residue was partitioned between EtOAc (150 mL) and 1 N NaHCO₃ (30 mL). The aqueous layer was washed with additional EtOAc (150 mL). The organic layers were combined, washed with brine, dried (Na₂SO₄), and concentrated on a rotovap to give 4-carbamoyl-2-[4-[4-(1,1-dioxo-1-thiomorpholin-4-ylmethyl)-benzyloxy]-1-oxo-1,3-dihydro-isoindol-2-yl]-butyric acid tert-butyl ester as an off-white solid (340 mg). LCMS MH = 572. The solid was used in the next step without further purification.

Step 3: To a stirred solution of 4-carbamoyl-2-[4-[4-(1,1-dioxo-1-thiomorpholin-4-ylmethyl)-benzyloxy]-1-oxo-1,3-dihydro-isoindol-2-yl]-butyric acid tert-butyl ester (230 mg, 0.40 mmol) in THF (10 mL), was added a 1 M solution of KOtBu (402 µℓ, 0.402 mmol). The resulting mixture was stirred at room temperature for about 2 hours, then more KOtBu (100 µℓ) was added. After approximately another 2.5 hours, the reaction mixture was cooled in an ice bath and then transferred to a 1 N aqueous HCl solution. The mixture was concentrated to dryness and the residue was redissolved in minimal DMF and 1 N HCl (1:1) and filtered. The filtrate containing the crude product was purified by injection onto a C-18 preparatory HPLC column. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases) and fractions were collected by mass trigger. [251] Step 1: In a 250-mL RB flask, L-glutamine a-tert-butyl ester (7.83 g, 32.8 mmol) and N,N-diisopropylethylamine (11.46 ml, 65.6 mmol) were slurried in acetonitrile (100 mL) at room temperature. The suspension was stirred for about 10 minutes and then a
solution of methyl 2-(bromomethyl)-3-(tert-butyldimethylsilyloxy)benzoate (11.4 g, 29.8 mmol) in acetonitrile (20 mL) was added dropwise over about 10 minutes. The reaction mixture was heated in an oil bath to a slow reflux (80 °C) for 4 hours. The reaction mixture was allowed to cool to room temperature for about 1 hour and then a solution of cesium fluoride (4.53 g, 29.8 mmol) in water (15 mL) was added. The resulting mixture was vigorously stirred at room temperature for about 1 hour at which point LCMS indicated desilylation was complete. The reaction mixture was diluted with acetonitrile and filtered to remove undissolved solids. The solids were washed with additional acetonitrile. The filtrate and washes (total volume 200 mL) were diluted further with EtOAc (300 mL), transferred to a 1-L separatory funnel, and washed with 0.5 N Aqueous KH₂PO₄ (100 mL, pH ~5). To the aqueous layer was added 1 N HCl in portions (-20 mL, pH changed from pH 7-8 to pH - 5 using pH paper). NaCl (-10 g) and EtOAc (-200 mL) were added to aqueous layer. The mixture was shaken vigorously in a separatory funnel. The organic layers were combined, washed with brine (50 mL), dried (Na₂SO₄), and concentrated on rotovap to give 15 g of an off-white solid. This solid containing the crude product was slurried in acetonitrile (200 mL) and the suspension was heated in an oil bath to reflux (85 °C) for 30 minutes with stirring. The mixture was allowed to cool down to room temperature over 1 hour then aged at 4°C for another 2 hours. The solid formed was collected by suction filtration. The remaining solid in the flask was transferred onto a filter funnel using some MTBE. The cake was washed with additional MTBE (total filtrate volume -300 mL), suction dried, and then placed in a vacuum oven at 40°C for several hours to afford tert-butyl 5-amino-2-(4-hydroxy-l-oxoisoindolin-2-yl)-5-oxopentanoate as a white solid (7.3 g 72% yield, adjusted for purity of starting material and product): HPLC: Waters Symmetry C₁₈, 5 μm, 3.9 x 150 mm, 1 ml/min, 240 nm, 30/70 acetonitrile/0.1% H₃PO₄, 2.91 min (96.9%); mp: 198-200 °C; H NMR (DMSO-d₆) δ 1.39 (s, 9H, tBu), 1.93 - 2.14 (m, 3H, CH₂, CHH), 2.15 - 2.33 (m, 1H, CHH), 4.35 (s, 2H, CH₂), 4.61 - 4.83 (m, 1H, CH), 6.76 (br. s., 1H, NH), 6.97 - 7.07 (m, 1H, Ar), 7.11 - 7.20 (m, 1H, Ar), 7.26 (br. s., 1H, NH), 7.29 - 7.36 (m, 1H, Ar), 10.10 (s, 1H, OH); 13C NMR (DMSO-d₆) δ 24.81, 27.56, 31.44, 44.71, 54.02, 81.38, 113.72, 117.96, 127.99, 129.36, 133.36, 152.50, 168.36, 169.88, 172.94; LCMS MH = 335; Anal Calcd for C₁₇H₂₂N₂O₅ + 0.19 H₂O : C, 60.45; H, 6.68; N, 8.29. After 15 minutes, the ice bath was removed and the clear solution was allowed to stir overnight (~17 hours). The reaction mixture was cooled in an ice bath and quenched with H₂O (25 mL). EtOAc (100 mL) was added and the mixture was washed with 1 N NaHCO₃ (40 mL) and brine, dried (Na₂SO₄), and concentrated in vacuo. The oily residue was dissolved in dichloromethane and concentrated again and then dried in a vacuum oven at 40°C to give tert-butyl 4-(4-(hydroxymethyl)phenyl)piperidine-1-carboxylate as a clear oil (707 mg, 93% yield). The oil solidified upon standing and was used in the next step without further purification. [266] Step 2: To a solution of tert-butyl 5-amino-2-(4-hydroxy-l-oxoisindolin-2-yl)-5-oxopentanoate (0.7 g, 1.96 mmol) in THF (25 ml), was added triphenyl phosphine on polystyrene (1.6 gm/mmol, 1.845 g, 2.95 mmol). The resin was allowed to swell for several minutes at room temperature, and then the reaction mixture was cooled in an ice bath at 0°C. DIAD (0.574 ml, 2.95 mmol) was added dropwise while stirring. After about 15 minutes, tert-butyl 4-(4-(hydroxymethyl)phenyl)piperidine-l-carboxylate (0.70 g, 2.40 mmol) was added as a solution in dry THF (5 mL). After about 10 minutes, the ice bath was removed and the resulting mixture was stirred at room temperature for 48 hours. The reaction mixture was filtered with suction and the resin was washed successively with dichloromethane then MeOH (3x swell/shrink cycles). After the final MeOH wash, the combined filtrate was concentrated in vacuo. The oily residue was partitioned between EtOAc (-200 mL) and Na₂CO₃ (sat. -70 mL). The EtOAc layer was washed with brine, dried (Na₂SO₄), and concentrated in vacuo to give a foam which was stored in a vacuum oven at 40°C overnight to afford tert-butyl 4-((2-(5-amino-l-tet-butoxy-l,5-

More KOtBu (0.722 mL, 0.722 mmol) was added to reaction mixture after 2.5 hours and stirring was continued at room temperature. After about 20 minutes, the mixture transferred to a chilled 0.5 N aq. Step 1 Methyl 5-amino-4-(4-(bromomethyl)benzyl-oxy)-1-oxoisoinolin-2-yl)-5-oxopentanoate:

1,4-bis(Bromomethyl)benzene (2.71 g, 10.26 mmol) was suspended in dry acetonitrile (40 mL). The slurry was warmed up to 60 °C until full dissolution occurred (~15 min). The temperature was reduced to 50 °C and to the solution was added K$_2$CO$_3$ (0.473 g, 3.42 mmol) as a solid followed by methyl 5-amino-4-(4-hydroxy-1-oxoisoinolin-2-yl)-5-oxopentanoate (1 g, 3.42 mmol, preparation described herein). The resulting white slurry was stirred at 50 °C for ~3 h at which time LCMS indicated the phenol starting material was consumed. The crude reaction mixture was swirled and filtered with suction. The remaining solid in flask and on the filter funnel was rinsed with minimal MeCN (~5 mL). The filtrate was concentrated in vacuo to give 2.6 g of a white solid. The solid was dissolved in minimal DCM and purified using a SiO$_2$ flash column (CombiFlash, 40 g SiO$_2$ prepacked column). The column was eluted with 100% DCM for ~15 min, a gradient to 5% MeOH in DCM over 5 min, and then held at 5% MeOH in DCM. Fractions were combined and concentrated to give methyl 5-amino-4-(4-(bromomethyl)benzyl-oxy)-1-oxoisoinolin-2-yl)-5-oxopentanoate as a white solid (1.3 g, 80% yield): H NMR (DMSO-d$_6$) δ 1.94 - 2.34 (m, 4H, CH$_2$, CH$_2$), 3.50 (s, 3H, CH$_3$), 4.33 - 4.62 (m, 2H, CH$_2$), 4.72 (s, 2H, CH$_2$), 5.25 (s, 2H, CH$_2$), 5.27 - 5.36 (m, 1H, CH), 7.19 (br. s., 1H, NH), 7.23 - 7.36 (m, 2H, Ar), 7.40 - 7.70 (m, 6H, Ar, NH); LC/MS M+H = 475, 477.
Step 2. 3-(4-(4-(Bromomethyl)benzyloxy)-1-oxoisindolin-2-yl)piperidine-2,6-dione:
Methyl 5-amino-4-(4-(bromomethyl)benzyloxy)-1-oxoisindolin-2-yl)-5-oxopentanoate (2.05 g, 4.31 mmol) was dissolved in THF (50 mL) and the solution was cooled in dry ice/acetone bath to -76 °C. While stirring, solid KO'Bu (0.532 g, 4.74 mmol) was added in one portion to the clear solution. The reaction mixture became a pale yellow color and was stirred for -90 min at -76 °C. A cooled solution of 1 N aq HCl (20 mL) was rapidly transferred to the the reaction mixture, maintaining temperature at -76 °C. The mixture immediately turned milky white and the dry C0.2/acetone bath was removed, allowing the mixture to warm up to while stirring. The mixture was concentrated on a rotovap to remove most of THF (concentrated to a fixed volume at 160 mbar and water bath -35 °C). Upon concentration of reaction mixture, a white solid precipitated out. The white slurry was diluted with more water (-80 mL) and then suction filtered. The cake was washed with copious water (total filtrate volume -150 mL) and suction dried. The cake was washed with Et2O (-50 mL), suction dried and then placed in vacuum oven at 40 °C overnight to give 3-(4-(4-(Bromomethyl)benzyloxy)-1-oxoisindolin-2-yl)piperidine-2,6-dione as a white solid (1.8 g, 94% yield): HPLC: Waters Symmetry C18, 5 μη, 3.9 x 150 mm, 1 ml/min, 240 nm, 50/50 CH3CN/0.1% H3PO4, 3.70 min (97.9%); mp, 123-125 °C; 1H NMR (DMSO-d6) δ 1.89 - 2.05 (m, 1H, CHH), 2.32 - 2.48 (m, 1H, CHH), 2.52 - 2.64 (m, 1H, CHH), 2.78 - 3.04 (m, 1H, CHH), 4.26 (d, J = 17.6 Hz, 1H, CHH), 4.43 (d, J = 17.6 Hz, 1H, CHH), 4.72 (s, 2H, CH2), 5.11 (dd, J = 5.0, 13.1 Hz, 1H, CH), 5.25 (s, 2H, CH2), 7.24 - 7.36 (m, 2H, Ar), 7.41 - 7.54 (m, 5H, Ar), 10.83 - 11.07 (m, 1H, NH); 13C NMR (DMSO-d6) δ 22.33, 31.18, 34.15, 45.06, 51.56, 59.12, 114.94, 115.28, 127.95, 128.33, 129.41, 129.80, 131.93, 133.31, 136.78, 153.36, 167.97, 170.95, 172.81; LC/MS M+H = 443, 445. Step 1: (S)-Methyl 5-amino-4-(4-(4-(bromomethyl)benzyl)oxy)-l-oxoisindolin-2-yl)-5-oxopentanoate

1,4-bis(Bromomethyl)benzene (2.71 g, 10.26 mmol) was suspended in dry acetonitrile (40 mL). The slurry was warmed up to 60 °C until full dissolution occurred (-15 min). The temperature was reduced to 50 °C and to the solution was added K₂CO₃ (0.473 g, 3.42 mmol) as a solid followed by (S)-methyl 5-amino-4-(4-hydroxy-l-oxoisindolin-2-yl)-5-oxopentanoate (1 g, 3.42 mmol, preparation described herein). The resulting white slurry was stirred at 50 °C for 3 h at which time LCMS indicated the phenol starting material was consumed. The crude reaction mixture was swirled and filtered with suction. The remaining solid in flask and on the filter funnel was rinsed with minimal MeCM (~5 mL). The filtrate was concentrated in vacuo to give 2.6 g of a white solid. The solid was dissolved in minimal DCM and purified using a SiO₂ flash column (CombiFlash, 40 g SiO₂ prepacked column). The column was eluted with 100% DCM for -15 min, a gradient to 5% MeOH in DCM over 5 min, and then held at 5% MeOH in DCM. Fractions were combined and concentrated to give (S) methyl 5-amino-4-(4-(4-(bromomethyl)benzyl)oxy)-l-oxoisindolin-2-yl)-5-oxopentanoate as a white solid (1.3 g, 80% yield): H NMR (DMSO-d₆) δ 1.94 - 2.34 (m, 4H, CH₂, CH₂), 3.50 (s, 3H, CH₃), 4.33 - 4.62 (m, 2H, CH₂), 4.72 (s, 2H, CH₂), 5.25 (s, 2H, CH₂), 5.27 - 5.36 (m, 1H, CH), 7.19 (br. s., 1H, NH), 7.23 - 7.36 (m, 2H, Ar), 7.40 - 7.70 (m, 6H, Ar, NH); LCMS: MH = 475, 477.

Step 2: (S)-3-(4-(Bromomethyl)benzyl)oxy)-l-oxoisindolin-2-yl)piperidine-2,6-dione

(S)-Methyl 5-amino-4-(4-(4-(bromomethyl)benzyl)oxy)-l-oxoisindolin-2-yl)-5-oxopentanoate (2.05 g, 4.31 mmol) was dissolved in THF (50 mL) and the solution was cooled in dry ice/aceton bath to ~76 °C. While stirring, solid KO'Bu (0.532 g, 4.74 mmol) was added in one portion to the clear solution. The reaction mixture became a pale yellow color and was stirred for ~90 min at ~76 °C. A cooled solution of 1N aq HCl (20 mL) was rapidly transferred to the reaction mixture, maintaining temperature at ~76 °C. The mixture immediately turned milky white and the dry C02/acetone bath was removed, allowing the mixture to warm up to while stirring. The mixture was concentrated on a rotovap to remove most of THF (concentrated to a fixed volume at 160 mbar and water bath ~35 °C). Upon concentration of reaction mixture, a white solid precipitated out. The white slurry was diluted with more water (~80 mL) and then suction filtered. The cake was washed with copious water (total filtrate volume ~150 mL) and suction dried. The cake was washed with Et₂O (~50 mL), suction dried and then placed in vacuum oven at 40 °C overnight to give
(S)-3-(4-(4-(bromomethyl)benzyloxy)-1-oxoisoindolin-2-yl)piperidine-2,6-dione as a white solid (1.8 g, 94% yield): HPLC: Waters Symmetry C18, 5 μm, 3.9 x 150 mm, 1 ml/min, 240 nm, 50/50 CH3CN/0.1% H3PO4, 3.70 min (97.9%); mp: 123-125 °C; 1H NMR (DMSO-d6) δ 1.89 - 2.05 (m, 1H, CHH), 2.32 - 2.48 (m, 1H, CHH), 2.52 - 2.64 (m, 1H, CHH), 2.78 - 3.04 (m, 1H, CHH), 4.26 (d, J = 17.6 Hz, 1H, CHH), 4.43 (d, J = 17.6 Hz, 1H, CHH), 4.72 (s, 2H, CH2), 5.11 (dd, J = 5.0, 13.1 Hz, 1H, CH), 5.25 (s, 2H, CH2), 7.24 - 7.36 (m, 2H, Ar), 7.41 - 7.54 (m, 5H, Ar), 10.83 - 11.07 (m, 1H, NH); 13C NMR (DMSO-d6) δ 22.33, 31.18, 34.15, 45.06, 51.56, 69.12, 114.94, 115.28, 127.95, 128.33, 129.41, 129.80, 131.93, 133.31, 136.78, 153.36, 167.97, 170.95, 172.81; LCMS: MH = 443, 445. The reaction mixture was stirred at room temperature and reaction progress was followed by LCMS. After -3 h, DIEA (3.29 mL, 18.82 mmol) was added and the reaction was stirred overnight. After -18 h, solid KI (1.6 g, 9.64 mmol) was added and the mixture was warmed to 40 °C and stirred for -2 days. The reaction mixture, containing a mixture of desired product and uncyclized glutarimide precursor, was warmed further to 80 °C for -30 h. The crude reaction mixture was cooled to rt, filtered on a fritted funnel, and the removed solids were washed with minimal MeCN. The combined filtrate and washes were concentrated on a rotovap until DMF started to distill. The concentrated mixture was diluted with aqueous 1N HCl (-150 mL) and water (-700 mL) and extracted with EtOAc (2 x 700 mL). The combined organic layer was washed with 1N HCl (200 mL), 1N Na2CO3 (2 x 300 mL), and brine. The solution was dried (Na2SO4) and concentrated in vacuo to -400 mL. [482] To a solution of (S)-3-(4-(4-(bromomethyl)benzyloxy)-1-oxoisoindolin-2-yl)piperidine-2,6-dione (200 mg, 0.451 mmol) in dry MeCN (5 mL), was added 3-propoxyazetidine hydrochloride (75 mg, 0.496 mmol) and DIEA (0.276 mL, 1.579 mmol). The mixture was stirred at room temperature for 3 h and LCMS indicated benzyl bromide starting material was consumed. The mixture was heated to 50 °C for ~30 min, cooled slowly to rt, and then stored at 4 °C overnight. The mixture containing the crude product was concentrated in vacuo and the residue was dissolved in minimal DMF (~5 mL) for Prep HPLC purification. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5% to 60% > MeCN over 20 minutes) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo to give a clear glass residue. 1 N HCl (2-3 mL) was added and the mixture was concentrated in vacuo to dryness. This process was repeated twice to obtain HCl salt. To the clear residue, MeCN and Et₂O were added in small portions and the mixture was sonicated until a white solid was obtained. The slurry was concentrated in vacuo to dryness and twice evaporated from Et₂O (3-4 mL portions) to a free flowing white solid was obtained. [483] To a suspension of (S)-3-(4-((bromomethyl)benzyloxy)-1-oxoisodolin-2-yl)piperidine-2,6-dione (250 mg, 0.564 mmol) in MeCN (5 mL), was added (3S,5S)-3,5-dimethylmorpholine (71.4 mg, 0.620 mmol). The mixture was stirred and sonicated briefly to give a clear solution then DIEA (0.197 mL, 1.128 mmol) was immediately added and the resulting mixture was stirred at room temperature for 2 days. The reaction mixture was concentrated in vacuo and the oily residue was partitioned between EtOAc (150 mL) and 1N NaHCO\textsubscript{3} (30 mL). The organic layer was washed with brine, dried (Na\textsubscript{2}SO\textsubscript{4}), and concentrated in vacuo to give a white solid. The solid was dissolved in DMF (8 mL) and purified using reversed-phase preparatory HPLC. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5% to 50% MeCN over 20 minutes) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo. 1N HCl (8 mL) was added to the concentrate and all solvents were evaporated to give a gummy solid. The solid was redissolved in minimal water, frozen and lyophilized to give ((S)-3-(4-(((3S,5S)-3,5-dimethylmorpholino)methyl)benzyl)oxy)-1-oxoisodolin-2-yl)piperidine-2,6-dione hydrochloride as a white fluffy solid (160 mg, 55% yield). [509] To a 20-mL reaction vial charged with 3-{4-(4-(bromomethyl)benzyl)oxy}-1-oxoisooindolin-2-yl)piperidine-2,6-dione (300 mg, 0.677 mmol) and 3-(4-fluorophenoxo)azetidine hydrochloride (145 mg, 0.711 mmol), was added dry MeCN (10 mL) followed by DIEA (0.355 mL, 2.0 mmol). The resulting suspension was warmed to 50 °C to give a clear solution. After ~30 min, the temperature was raised further to 70 °C and the reaction mixture was stirred for ~16 h at 70 °C. The reaction mixture was cooled to
room temperature and then concentrated under vacuum. The residue was diluted in EtOAc (-100 mL) and then extracted with IN NaHCO₃ (2 x 35 mL) and brine. Drying (Na₂SO₄) and concentration on a rotovap gave a glassy solid. Et₂O (-15 mL) was added to the glass in small portions and with intermittent sonication until a well-dispersed solid was formed. The slurry was agitated vigorously and then filtered on a 15-mL fine fritted funnel. The solid was dissolved in DMF (7 mL) and purified using reversed-phase preparatory HPLC. **[522]** Step 1 Preparation of dimethyl 3-{(4-hydroxymethyl)benzyl}oxyphthalate

Dimethyl 3-hydroxyphthalate (10 g, 47.6 mmol) and (4-(chloromethyl)phenyl)methanol (7.82 g, 50.0 mmol) were dissolved in dry DMF (60 mL). To the solution was added K₂CO₃ (6.90 g, 50.0 mmol) and the mixture was stirred at 80 °C for 16 h. The DMF was removed in vacuo and the residue was partitioned between EtOAc (300 mL) and water (100 mL). The organic layer was washed with additional water (100 mL) and brine, dried (Na₂SO₄), and concentrated in vacuo to dimethyl 3-{(4-hydroxymethyl)benzyl}oxy-phthalate as a viscous amber oil (19 g); LCMS: MH = 331; The crude product was used in the next step without further purification.

**[523]** Step 2 Preparation of 3-{(4-Hydroxymethyl)benzyl}oxyphthalic acid
Dimethyl 3-(4-(hydroxymethyl)benzyloxy)phthalate (19 g actual wt, 15.72 g, 47.6 mmol, assuming quantitative yield from previous step) was dissolved in THF (30 mL). To the solution was added water (30 mL). Aqueous NaOH (10 N, 25 mL, 250 mmol) was added and the mixture was vigorously stirred at 70 °C for 2.5 h. The mixture was allowed to cool to rt, concentrated in vacuo to a syrup, and then transferred to a flask containing 6 N HCl (45 mL) over ice. Immediately, solid precipitated out and the slurry was diluted with water (-60 mL). The mixture was filtered on a medium fritted funnel with suction. The cake was washed with additional water (-60 mL), suction dried, and then placed in a vacuum oven at 60 °C for 4 h to give 3-((4-(hydroxymethyl)benzyl)oxy)phthalic acid as a pale yellow solid (13.9 g, 97% yield from dimethyl 3-hydroxyphthalate): 1H NMR (DMSO-d₆) δ 4.41 - 4.58 (m, 2H, CH₂), 5.17 (s, 3H, CH₃, OH), 7.20 - 7.64 (m, 7H, Ar), 13.02 (br. s., 2H, 2 × COOH); ¹³C NMR (DMSO-de) δ 62.6, 69.73, 117.03, 121.56, 126.46, 126.88, 127.13, 128.91, 129.57, 134.87, 142.19, 154.50, 166.45, 167.71; LCMS: MH = 303, 94 area% at 240 nm. Step 3 Preparation of 2-(2,6-Dioxopiperidin-3-yl)-4-((4-(hydroxymethyl)benzyl)oxy)isoindoline-1,3-dione
3-Aminopiperidine-2,6-dione hydrochloride (0.915 g, 5.56 mmol) was added to a solution of 3-(4-(hydroxymethyl)benzyl)oxy)phthalic acid (1.4 g, 4.63 mmol) in dry pyridine (15 mL) and the mixture was heated to 118 °C in an oil bath for 16 h. The dark reaction mixture was allowed to cool to room temperature and was acidified with slow addition of 1 N HCl (-25 mL). The mixture was further diluted with water (-170 mL) and then sonicated for 30 minutes to help break up solid aggregates. The resulting dark slurry was filtered on a medium pore fritted funnel and the dark solid was washed with additional water (70 mL). The cake was suction dried and then placed in vacuum oven at 60 °C for 2.5 h to give 1.6 g of a dark blue solid. The solid was dissolved in a mixture of DCM, MeCN, and MeOH (-100 mL each) and treated with decolorizing charcoal. The mixture was stirred around and then gravity-filtered using filter paper. The filtrate/wash (dark amber color) was treated once again with decolorizing charcoal and then filtered on a bed of celite. The clear filtrate was concentrated in vacuo to dryness to give a solid which was triturated with water and filtered with suction. [527] Step 1: To a slurry of methyl 5-amino-4-(4-(3R,5S)-3,5-dimethylmorpholin-2-yl)-5-oxopentanoate (250 mg, 0.526 mmol) in acetonitrile (5 mL) was added (3R,5S)-3,5-dimethylmorpholine (79 mg, 0.684 mmol) as a solid. The mixture was stirred with intermittent sonication to give a clear solution and then DIEA (0.197 mL, 1.128 mmol) was added. The resulting clear solution was stirred at room temperature. After about 24 h, more (3R,5S)-3,5-dimethylmorpholine (79 mg, 0.526 mmol) was added and the mixture was allowed to stir for an additional 24 h at room temperature. The reaction mixture was concentrated in vacuo to give (S)-methyl 5-amino-4-(4-((3R,5S)-3,5-dimethylmorpholinomethyl)benzyl)oxy)-1-oxoisoindolin-2-yl)-5-oxopentanoate as an oily residue (268 mg). The crude product was used in the next step without further purification, LCMS: MH = 510.

To the solution was added anhydrous potassium carbonate (189 mg, 1.367 mmol) and the mixture was stirred at 85 °C for about 6 h. Heating was discontinued over weekend (sample stored at 4 °C) and then resumed again for an additional 24 h. The cooled reaction mixture was diluted with EtOAc (-100 mL) and then washed with IN aq. NaHCO₃ (30 mL) and brine. The organic layer was dried over Na₂SO₄ and then concentrated in vacuo to give a tan oil. The oil was dissolved in DMF (8 mL) and purified using reversed-phase preparative HPLC. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5 to 50%> MeCN over 20 minutes) and fractions were collected by mass trigger. The desired fractions were combined, treated with 1 N HCl (3 mL), and then concentrated in vacuo to give a glassy solid. The solid was treated with 2 N HCl in Et₂O (1 mL) and concentrated in vacuo. The resulting solid was placed in vacuum oven at 60 °C for several hours to give 3-(4-(4-(((3R,5S)-3,5-dimethylmorpholino)methyl)benzyl)oxy)-1-oxoisoindolin-2-yl)piperidine-2,6-dione hydrochloride as a white solid (130 mg, 48% yield): HPLC: Waters Symmetry C18, 5 μm, 3.9 x 150 mm, 1 ml/min, 240 nm, 5% grad 95% in 10 min, CH₃CN/0.1% H₃PO₄, 5.90 min (96.2%); mp: 235-237 °C; H NMR (DMSO-d₆ with D₂O) δ 0.89 (d, J = 6.2 Hz, 6H, CH₃, CH₃), 1.96 - 2.15 (m, 1H, CHH), 2.41 - 2.53 (m, 3H, CHH, CH, CH), 2.58 - 2.70 (m, 1H, CHH), 2.80 - 2.98 (m, 1H, CHH), 3.00 - 3.19 (m, 2H, morph. BENZYLOXY)-ISOINDOLE-1,3-DIONE

[537] Step 1: To a solution of dimethyl 3-hydroxyphthalate (1.0 g, 4.76 mmol) in THF (40 ml, 488 mmol), was added triphenyl phoshine on polystyrene resin (1.6 gm/mmol, 4.76 g, 7.61 mmol). After allowing the resin to swell for several minutes at room temperature, the reaction mixture was cooled in an ice bath at 0 °C. To the stirred mixture, DIAD (1.48 mL, 7.61 mmol) was added dropwise. After about 10 minutes, (4-(morpholinomethyl)phenyl)methanol (1.48 g, 7.14 mmol) was added in one portion. The resulting mixture was stirred at room temperature for 20 min. The resin was removed by filtration and rinsed on a fritted funnel with suction using alternating MeOH and DCM washes twice. The combined filtrate was concentrated in vacuo to give the crude product as a yellow oil (4 g). The oil was partitioned between EtOAc (200 mL) and 0.25 N HCl (150 mL). The organic layer was washed with an additional 100 mL of 0.25 N HCl. The aqueous layer, containing the product, was concentrated on a rotovap to a syrup (about 10 mL). The syrup was partitioned between EtOAc (300 mL) and 1 N NaOH (100 mL). The aqueous layer was washed with another portion of EtOAc (about 200 mL). The combined organic layers was washed with brine, dried (Na₂SO₄), concentrated in vacuo, and dried in a vacuum oven at 40 °C overnight to give 3-(4-morpholin-4-ylmethyl-benzyloxy)-phthalic acid dimethyl ester as a pale yellow oil (2.6 g). The crude product was used in the next step without further purification.

[538] Step 2: To a solution of dimethyl 3-(4-(morpholinomethyl)benzyloxy)phthalate (1.9 g, 4.76 mmol) in THF (20 ml, 244 mmol), was added water (0.180 ml, 9.99 mmol). With stirring at rt, KO’Bu (9.99 ml, 9.99 mmol, 1M in THF) was added dropwise. After about 24 h, water (1 mL) was added and the mixture was warmed up to 45 °C. After about 22 h, the mixture was diluted with Et₂O (100 mL) and filtered through a fritted funnel. The solid was acidified with aqueous 1 N HCl (10 mL) and the resulting mixture was concentrated to dryness on rotovap to give a white solid (2.2 g) that was determined by LCMS to be a ~1:3 mixture of 3-(4-morpholin-4-ylmethyl-benzyloxy)-phthalic acid 1-methyl ester and 3-(4-morpholin-4-ylmethyl-benzyloxy)-phthalic acid, respectively. The mixture was used in the next step without further purification.
Step 3: To a suspension of 3-(4-morpholin-4-ylmethyl-benzyloxy)-phthalic acid 1-methyl ester and 3-(4-morpholin-4-ylmethyl-benzyloxy)-phthalic acid (1.7 g, 3.75 mmol, assuming 82 wt%) in pyridine (30 mL), was added rac. 3-aminopiperidine-2,6-dione hydrochloride (0.803 g, 4.88 mmol) as a solid. A reflux condenser was placed on RBF and the resulting mixture was heated in an oil bath at 118 °C for about 24 h. The reaction mixture was allowed to cool down to rt and then concentrated in vacuo to remove most of the pyridine. The remaining dark solid residue was slurried in EtOAc (about 100 mL), stirred overnight at room temperature, then filtered on a medium fritted funnel. The solid was washed with copious EtOAc and then suction dried. The remaining solid was transferred to a flask with EtOAc (400 mL) and 0.5 N aq NaHCO$_3$ (100 mL). The mixture was vigorously stirred for overnight. The phases were separated and the aqueous layer was extracted with additional EtOAc (-300 mL). The combined organic layers was washed with brine and then treated with Na$_2$SO$_4$ and decolorizing charcoal. The slurry was mixed and then filtered on a bed of Supercell. The clear filtrate was concentrated in vacuo and the resulting white foam was dissolved in minimal MeCN (~3 mL). To the solution was added Et$_2$O in small portions (about 25 mL, total), resulting in a white precipitate. The slurry was sonicated to break up all solid aggregates into a well-dispersed suspension. The slurry was then filtered and the cake was washed with several small portions of Et$_2$O (~50 mL, total). The cake was suction dried and then further dried in a vacuum oven at 55 °C to give 2-(2,6-dioxo-piperidin-3-yl)-4-(4-morpholin-4-ylmethyl-benzyloxy)-isoindole-1,3-dione as a white solid (950 mg, 55% yield over Step 1-3): HPLC: Waters Symmetry C$_18$, 5 µm, 3.9 x 150 mm, 1 ml/min, 240 nm, 178/3 CH$_3$CN/0.1% H$_3$PO$_4$, 5.34 min (99.8%); mp: 205-207 °C; H NMR (DMSO-de) δ 1.92 - 2.14 (m, 1H, CHH), 2.28 - 2.42 (m, 4H, CH$_2$, CH$_2$), 2.43 - 2.66 (m, 2H, CHH, CHH), 2.78 - 3.00 (m, 1H, CHH), 3.46 (s, 2H, CH$_2$), 3.52 - 3.64 (m, 4H, CH$_2$, CH$_2$), 5.09 (dd, J = 5.4, 12.9 Hz, 1H, CH), 5.35 (s, 2H, CH$_2$), 7.29 - 7.39 (m, 2H, Ar), 7.42 - 7.52 (m, 3H, Ar), 7.60 (d, J = 8.5 Hz, 1H, Ar), 7.82 (dd, J = 7.4, 8.5 Hz, 1H, Ar), 11.1 1 (s, 1H, NH); $^1$C NMR (DMSO-d$_6$) δ 21.88, 30.84, 48.67, 53.06, 62.01, 66.08, 69.85, 115.42, 116.50, 120.1 1, 127.18, 128.93, 133.18, 134.72, 136.91, 137.61, 155.44, 165.21, 166.68, 169.80, 172.66; LCMS: MH = 464; Anal Calcd for C$_{25}$H$_{25}$N$_3$O$_6$ + 0.06 H$_2$O: C, 64.64; H, 5.45; N, 9.04; H$_2$O, 0.23; Found: C, 64.75; H, 5.13; N, 8.91; H$_2$O, 0.23.

The resulting solution was stirred for an additional 5 minutes at room temperature (LCMS indicated reaction has gone to completion) and the mixture was incubated at 4°C overnight. The reaction mixture was concentrated in vacuo to an oil which was diluted with EtOAc (-200 mL), transferred to a separatory funnel, and washed with aqueous 1 M KH\(_2\)PO\(_4\) (pH-5, 2 x 50 mL). The organic layer was washed with brine, dried (Na\(_2\)SO\(_4\)), and concentrated in vacuo. The residue was dried in a vacuum oven to give tert-butyl 2-(chloromethyl)-lH-benzo[d]imidazole-l-carboxylate as an amber oil.

**Step 2:** tert-Butyl 5-amino-2-(4-hydroxy-l-oxoisoindolin-2-yl)-5-oxopentanoate (500 mg, 1.495 mmol) and potassium carbonate (227 mg, 1.645 mmol) were suspended in DMF (7 mL) at room temperature. To the stirred mixture at room temperature, was added tert-butyl 2-(chloromethyl)-lH-benzo[d]imidazole-1-carboxylate (439 mg, 1.645 mmol) as a solution in DMF (3 mL). The resulting suspension was stirred at room temperature for about 15 hours. The crude reaction mixture was partitioned between EtOAc (150 mL) and water (~50 mL). The organic layer was washed with brine (50 mL), dried (Na\(_2\)SO\(_4\)), and concentrated in vacuo. The oily residue was diluted with dichloromethane (~10 mL), concentrated to dryness (2x from dichloromethane) and the resulting oil was placed in a vacuum oven at 40°C for several hours to afford tert-butyl 2-((2-(5-amino-1-tert-butoxy-1,5-dioxopentan-2-yl)-4-oxoindolin-4-yloxy)methyl)-lH-benzo[d]imidazole-1-carboxylate (1 g) as a tan oil, which was used in the next step without further purification. LCMS MH (-Boc) = 465.

**Step 3:** tert-Butyl 2-((2-(5-amino-1-tert-butoxy-1,5-dioxopentan-2-yl)-4-oxoindolin-4-yloxy)methyl)-lH-benzo[d]imidazole-1-carboxylate (844 mg, 1.495) was dissolved in THF (10 mL, 122 mmol). To the stirred solution at room temperature, was added KOtBu (2 mL, 2.0 mmol, 1.0 M in THF) in a rapid dropwise fashion via syringe and reaction progress was closely monitored by LCMS. After about 50 minutes, additional KOtBu (1 mL, 1 mmol) was added, and the mixture stirring was continued at room temperature for about 15 minutes. The reaction mixture was stored at -20°C overnight. The following morning, additional KOtBu (0.5 mL, 5 mmol) was added, followed by another treatment of KOtBu (0.5 mL, 0.5 mmol) after 3 hours. After about 80 minutes, the reaction mixture was transferred to a solution of 2 N HC1 in Et\(_2\)O (50 mL). The resulting pale yellow slurry was stirred at room temperature. After about 1 hour, the slurry was filtered and the solid was washed with additional Et\(_2\)O and then suction dried on filter funnel. Oven drying gave ~1g of crude product as a tan solid. The solid was dissolved in DMF/water (10 mL/3 mL), sonicated and then filtered. The filtrate was purified by injection onto a C-18 preparatory HPLC column. The product was eluted with an acetonitrile/water gradient
(0.1% formic acid in both mobile phases, 5% to 30% MeCN over 12 minutes) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo to give a solid residue which was redissolved in 1 N HCl/acetonitrile (~1 : 1, 40 mL). The mixture was concentrated in vacuo and the solid was transferred to a scintillation vial. The suspension was frozen and lyophilized to give and off-white solid (145 mg). This solid was slurried in water (5 mL) and the mixture was stirred for several hours then filtered. The solid was suction dried and then stored in vacuum oven overnight to give 3-(4-((1H-benzo[d]imidazol-2-yl)methoxy)-1-oxoisoindolin-2-yl)piperidine-2,6-dione hydrochloride as a white solid (90 mg, 15% yield). 5.163 4-a2-g,6-DIOXOPIPERIDIN-3-YL)-1-OXISOINDOLIN-4-YLOXY)METHYL)BENZAMIDE

[620] Step 1: In a 250-mL RB flask, L-glutamine a-tert-butyl ester (7.83 g, 32.8 mmol) and N,N'-diisopropylethylamine (11.46 ml, 65.6 mmol) were slurried in acetonitrile (100 mL) at room temperature. The suspension was stirred for about 10 minutes and then a solution of methyl 2-(bromomethyl)-3-(tert-butyldimethylsilyloxy)benzoate (11.4 g, 29.8 mmol) in acetonitrile (20 mL) was added dropwise over 10 minutes. The reaction mixture was heated in an oil bath to a slow reflux (-80 °C) for 4 hours. The reaction mixture was allowed to cool to room temperature for about 1 hour and then a solution of cesium fluoride (4.53 g, 29.8 mmol) in water (15 mL) was added. The resulting mixture was vigorously stirred at room temperature for 1 hour at which point LCMS indicated desilylation was complete. The reaction mixture was diluted with acetonitrile and filtered to remove undissolved solids. The solids were washed with additional acetonitrile. The filtrate and washes (total volume 200 mL) were diluted further with EtOAc (300 mL), transferred to a 1-L separatory funnel, and washed with 0.5 N Aqueous KH2PO4 (100 mL, pH -5). To the aqueous layer was added 1N HCl in portions (~20 mL, pH changed from pH 7-8 to pH - 5 using pH paper). NaCl (-10 g) and EtOAc (~200 mL) were added to aqueous layer. The
mixture was shaken vigorously in a separatory funnel. The organic layers were combined, washed with brine (50 mL), dried (Na₂SO₄), and concentrated on rotovap to give 15 g of an off-white solid. This solid containing the crude product was slurried in acetonitrile (200 mL) and the suspension was heated in an oil bath to reflux (-85 °C) for about 30 minutes with stirring. The mixture was allowed to cool down to room temperature over 1 hour then aged at 4°C for another 2 hours. The solid formed was collected by suction filtration. The remaining solid in the flask was transferred onto a filter funnel using some MTBE. The cake was washed with additional MTBE (total filtrate volume -300 mL), suction dried, and then placed in a vacuum oven at 40°C for several hours to afford tert-butyl 5-amino-2-(4-hydroxy-l-oxoisoindolin-2-yl)-5-oxopentanoate as a white solid (7.3 g 72% yield, adjusted for purity of starting material and product): mp: 198-200 °C; ¹H NMR (DMSO-d₆) δ 1.39 (s, 9H, tBu), 1.93 - 2.14 (m, 3H, CH₂, CHH), 2.15 - 2.33 (m, 1H, CHH), 4.35 (s, 2H, CH₂), 4.61 - 4.83 (m, 1H, CH), 6.76 (br. s., 1H, NH), 6.97 - 7.07 (m, 1H, Ar), 7.11 - 7.20 (m, 1H, Ar), 7.26 (br. s., 1H, NH), 7.29 - 7.36 (m, 1H, Ar), 10.10 (s, 1H, OH); ¹³C NMR (DMSO-d₆) δ 24.81, 27.56, 31.44, 44.71, 54.02, 81.38, 113.72, 117.96, 127.99, 129.36, 133.36, 152.50, 168.36, 169.88, 172.94; LCMS MH = 335; Anal Calcd for C₁₇H₂₂N₂O₅ + 0.19 H₂O: C, 60.45; H, 6.68; N, 8.29. [621] Step 2: tert-Butyl 5-amino-2-(4-hydroxy-l-oxoisoindolin-2-yl)-5-oxopentanoate (300 mg, 0.897 mmol), N,N-diisopropylethylamine (157 µL, 0.897 mmol), and K₂CO₃ (124 mg, 0.897 mmol) were slurred in DMF (5 mL). After 10 minutes, 4-(bromomethyl)benzamide (192 mg, 0.897 mmol) was added and the reaction mixture was stirred at room temperature for 2 days. Removal of DMF in vacuo gave a residue that was partitioned between EtOAc and 0.2 N aqueous HCl. The aqueous layer was saturated with NaCl and washed with additional EtOAc. The organic layers were combined (total volume ~400 mL), washed with brine, dried (Na₂SO₄), and concentrated in vacuo to give 400 mg of tert-butyl 5-amino-2-(4-hydroxy-l-oxoisoindolin-2-yl)-5-oxopentanoate as an oil. LCMS MH = 420. The oil was used in the next step without further purification.

The reaction mixture was concentrated in vacuo and trace volatiles were chased with a small portion of dichloromethane (2x) and concentrated again to give 400 mg of 4-carbamoyl-2-[4-(4-carbamoyl-benzzyloxy)-l-oxo-1,3-dihydro-isoindol-2-yl]-butyric acid as a white solid. This material was used without further purification.
Carbamoyl-2-[4-(4-carbamoyl-benzyloxy)-1-oxo-1,3-dihydro-isindol-2-yl]-butyric acid (369 mg, 0.897 mmol, assuming theoretical yield from previous step) was dissolved in DMF (10 mL). To the solution was added CDI (167 mg, 1.03 mmol), and the mixture was stirred at room temperature for 12 hours and then heated to 80°C for 6 hours. The reaction mixture was cooled on an ice bath and a 0.1 N HCl solution was slowly added until a white precipitate was obtained. The solid was filtered and washed with minimal water, then dried in a vacuum oven to give 150 mg of crude product. The crude product was dissolved in DMF and purified by injection onto a C-18 preparatory HPLC column. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5% to 60% acetonitrile over 30 minutes) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo to give 4-((2-(2,6-dioxopiperidin-3-yl)-1-oxoindolin-4-yl)methyl)benzamide as a white solid (85 mg, 24% combined yield for step 2 and step 3): HPLC: Waters Symmetry C18, 5 μm, 3.9 x 150 mm, 1 ml/min, 240 nm, 25/75 acetonitrile/0.1% H3PO4, 3.41 min (98.8%); mp: 278-280 °C; 1H NMR (DMSO-d6) δ 1.89 - 2.05 (m, 1H, CHH), 2.34 - 2.48 (m, 1H, CHH), 2.52 - 2.68 (m, 1H, CHH), 2.83 - 3.01 (m, 1H, CHH), 4.29 (d, J = 17.4 Hz, 1H, CHH), 4.45 (d, J = 17.4 Hz, 1H, CHH), 5.12 (dd, J = 5.0, 13.1 Hz, 1H, CH), 5.32 (s, 2H, CH2), 7.19 - 7.41 (m, 3H, Ar, NH), 7.43 - 7.52 (m, 1H, Ar), 7.56 (d, J = 8.1 Hz, 2H, Ar), 7.89 (d, J = 8.3 Hz, 2H, Ar), 7.97 (br. s., 1H, NH), 10.98 (s, 1H, NH); 13C NMR (DMSO-d6) δ 21.27, 30.11, 44.00, 50.50, 67.88, 113.91, 114.26, 126.08, 126.53, 128.72, 128.91, 132.26, 132.79, 138.72, 152.21, 166.42, 166.87, 169.88, 171.73; LCMS MH = 394; Anal. 5.166 3-ethyl-3-bromo-benzyloxy-OXO-1,3-DIHYDRO-ISOINDOL-2-YL-PIPERIDINE-2,6-DIONE

[627] Step 1: tert-Butyl 5-amino-2-(4-hydroxy-1-oxoisindolin-2-yl)-5-oxopentanoate (300 mg, 0.897 mmol), N,N-diisopropylethylamine (157 µL, 0.897 mmol), and K₂CO₃ (124 mg, 0.897 mmol) were slurried in DMF (5 mL). After 10 minutes, 1-bromo-3-bromomethyl-benzene (224 mg, 0.897 mmol) was added and the reaction mixture was stirred at room temperature for 2 days. Removal of DMF in vacuo gave a residue that was partitioned between EtOAc and 0.2 N aqueous HCl. The EtOAc layer was washed with brine, dried (Na₂SO₄), and concentrated in vacuo to give 450 mg of 2-[4-(3-bromo-benzyloxy)-l-oxo-l,3-dihydro-isoidol-2-yl]-4-carbamoyl-butyric acid tert-butyl ester as a tan oil. LCMS MH = 503, 505. The oil was used in the next step without further purification.

[628] Step 2: To a solution of 2-[4-(3-bromo-benzyloxy)-l-oxo-l,3-dihydro-isoidol-2-yl]-4-carbamoyl-butyric acid tert-butyl ester (450 mg) in dichloromethane (5 mL), was added TFA (1.5 mL), and the resulting mixture was stirred at room temperature for 4 hours (LCMS indicated deprotection was complete). The reaction mixture was concentrated in vacuo and the resulting solid was triturated with Et₂O and then collected by filtration. Drying of the solid in vacuo provided 400 mg of 2-[4-(3-bromo-benzyloxy)-l-oxo-l,3-dihydro-isoidol-2-yl]-4-carbamoyl-butyric acid as a tan solid. This material was used without further purification.

[629] Step 3: To a solution of 2-[4-(3-bromo-benzyloxy)-l-oxo-l,3-dihydro-isoidol-2-yl]-4-carbamoyl-butyric acid (400 mg, 0.897 mmol, assuming theoretical yield from previous step) in DMF (5 mL), was added CDI (145 mg, 0.897 mmol). The reaction mixture was warmed to 70°C and stirred overnight. After 21 hours, catalytic DMAP was added, followed by another equivalent of CDI. The mixture was stirred at 80°C for an additional 15 hours. The reaction mixture was cooled on an ice bath and the crude product
was precipitated by addition of 0.2 N aqueous HCl. The solid was collected by filtration, washed with copious water, and dried in vacuo to give 150 mg of crude product. The crude product was dissolved in DMF and purified by injection onto a C-18 preparatory HPLC column. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo to give 3-[4-((3-bromo-benzyl)oxy)-1-oxo-1,3-
dihydro-isoindol-2-yl]-piperidine-2,6-dione as a white solid (80 mg, 21% combined yield for step 1 and step 2): HPLC: Waters Symmetry C18 5 µm, 3.9 x 150 mm, 1 ml/min, 240 nm, 50/50 acetonitrile/0.1% H3PO4, 4.59 min (95.5%); mp: 238-240 ºC; 1H NMR (DMSO-

[630] Step 1: To a solution of 4-(N,N-dimethylsulfamoyl)benzoic acid (1 g, 4.36 mmol) in THF (10 mL), was slowly added the borane solution in THF (1M, 8.72 mL, 8.72 mmol), and the mixture was stirred at room temperature overnight. The reaction was quenched by adding water (1 mL) dropwise, and then 30 mL of water was added. The mixture was saturated with excess potassium carbonate and extracted with ethyl acetate (3 x 40 mL), and the combined organic layers were dried over MgSO4. The solvent was evaporated under vacuum to give 4-(hydroxymethyl)-N,N-dimethylbenzenesulfonamide (700 mg, 75% yield). 1H NMR (DMSO-d6) δ 2.59 (s, 6H, CH3, CH3), 4.61 (m, 1H, OH), 5.44 (s, 1H, CH2), 7.54 - 7.62 (m, 2H, Ar), 7.67 - 7.75 (m, 2H, Ar).

[631] Step 2: Polymer-supported triphenylphosphine (3 mmol/g, 0.69 g, 2.06 mmol) was added to a stirred suspension of methyl 5-amino-4-(4-hydroxy-1-oxoisoindolin-

After stirring for 10 minutes, 4-(hydroxymethyl)-N,N-dimethylbenzenesulfonamide (443mg, 2.06 mmol) was added. The mixture was stirred at room temperature overnight and filtered. The resin was washed with ethyl acetate (7 x 10 mL). The combined filtrate was washed with water and brine, the solvent was evaporated, and the crude was purified by ISCO (40 g column, MeOH/CH₂Cl₂ gradient from 0% to 4% in 40 min) to give methyl 5-amino-4-(4-(N,N-dimethylsulfamoyl)benzylox-y)-l-oxoisoindolin-2-yl)-5-oxopentanoate (340 mg, 68% yield).

The mixture was stirred at 0°C for 10 minutes, warmed up to room temperature and stirred for 4 hours. Additional potassium t-butoxide (40 mg, 0.4 mmol) was added, and the mixture was kept stirring for 2 hours. The reaction was quenched by adding aqueous HCl (IN, 2mL), and water (50 mL) was added dropwise. The precipitate formed was corrected by filtration, and the crude was reslurried with acetonitrile (10 mL) to give 4-((2-(2,6-dioxopiperidin-3-yl)-l-oxoisoindolin-4-yloxy)methyl)-N,N-dimethylbenzenesulfonamide as a white solid (260 mg, 48% yield); mp: 261-263 °C; H NMR (DMSO-d₆) δ 1.93 - 2.36 (m, 4H, CH₂, CH₃), 2.62 (s, 6H, CH₃, CH₃), 3.50 (s, 3H, CH₃), 4.40 - 4.66 (m, 2H, CH₂), 4.75 (dd, J = 4.7, 10.2 Hz, 1H, CUB), 5.39 (s, 2H, CH₂), 7.21 (s, 1H, NHII), 7.27 - 7.36 (m, 2H, Ar), 7.43 - 7.53 (m, 1H, Ar), 7.60 (s, 1H, NHII), 7.73 - 7.85 (m, 4H, Ar).

The mixture was stirred for 20 minutes at room temperature then concentrated in vacuo. The residue was dissolved in DMF, the solution passed through a syringe filter, and the filtrate injected onto a C-18 preparatory HPLC column. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5% to 60% acetonitrile over 20 min) and fractions were collected by mass trigger. Step 1: A solution of 3-acetoxy-2-bromomethyl-benzoic acid methyl ester (1.0 g, 3.48 mmol) in acetonitrile (10 mL) was added to a stirred suspension of tert-butyl 4,5-diamino-5-oxopentanoate hydrochloride and N,N-diisopropylethylamine (1.4 mL, 7.66 mmol) in acetonitrile (20 mL). The mixture was stirred at room temperature for 3.5 hours at room temperature. Acetic acid (0.5 mL) was added and the temperature was raised to 60°C.
After 3 days, water (2 mL) was added to the reaction mixture, the temperature was raised to 80 °C, and the mixture stirred for another 3 days. The reaction mixture was cooled to room temperature. The solvent was evaporated. The residue was purified by ISCO flash (40 g column, gradient EtOAc/Hexanes 50/50 to 100/0 in 30 min, eluting product at 80/20). The solvent was evaporated and methyl 5-amino-4-(4-(4-((tert-butoxycarbonylamino)methyl)benzylxy)-1-oxoisindolin-2-yl)-5-oxopentanoate was obtained as a sticky, transparent solid (0.34 g, 41% yield). [648] Step 1: In a round-bottomed flask was methyl 5-amino-4-(4-(4-
(chloromethyl)benzoyloxy)-1-oxoisodindolin-2-yl)-5-
oxopentanoate (1.0 g, 2.321 mmol) in
acetonitrile (Volume: 30 ml) to give a colorless solution. N,N-diethylpropane-1,3-
diamine (0.907 g, 6.96 mmol) was added. The mixture was stirred at room temperature
over weekend. The reaction was concentrated on a rotavap. The resulting oil was used in
next step without any purification.

[649] Step 2: To the CH2Cl2 solution (30 mL) of methyl 5-amino-4-(4-(4-
(diethylamino)propylamino)methyl)benzoyloxy)-
1-oxoisodindolin-2-yl)-5-
oxopentanoate
(1.218 g, 2.32 mmol), was added BOC2O (2.70 ml, 11.61 mmol). The mixture was stirred
at room temperature for 2 hours. The reaction mixture was concentrated and purified on
silica gel column eluted with methylene chloride and methanol to give methyl 5-amino-4-
(4-(4-((tert-butoxycarbonyl)3-(diethylamino)propylamino)methyl)benzoyloxy)-
1-oxoisodindolin-2-yl)-5-
oxopentanoate as a clear oil (500 mg, 35%).

[650] Step 3: To the THF solution (20 mL) of methyl 5-amino-4-(4-(4-((tert-
butoxycarbonyl)3-(diethylamino)propylamino)methyl)benzoyloxy)-
1-oxoisodindolin-2-yl)-5-
oxopentanoate
(0.5 g, 0.80 mmol), was added potassium tert-butoxide (0.090 g, 0.80 mmol).
The mixture was stirred at 0°C for 10 minutes and quenched by adding 1N HCl (2 mL)
followed by saturated NaHCO₃ (15 mL) and EtOAc (30 mL). The mixture was extracted and separated. The organic layer was washed with brine and concentrated on rota-vap. The resulting oil was purified on silica gel column and eluted with CH₂Cl₂/MeOH to give tert-butyl 3-(diethylamino)propyl(4-(2-(2,6-dioxopiperidin-3-yl)-1-oxoisoindolin-2-yl)-5-oxopentanoate as a white solid was obtained (0.23 g, 49%). mp: 140-142 °C. 5.187 3-(4-{4-[2-MORPHOLIN-4-YL-ETHYLAMINO]-METHYLL- BENZYL{OXY]}-1-OXO-1,3-DIHYDRO-ISOINDOL-2-YL)- PIPERIDINE-2,6-DIONE BIS HYDROCHLORIDE

[671] Step 1: To a stirred solution of methyl 5-amino-4-(4-(4- (chloromethyl)benzyl)-1-oxoisoindolin-2-yl)-5-oxopentanoate (1.18 g, 2.75 mmol) in acetonitrile (15 ml), was added 2-morpholinoethanamine (1.08 ml, 8.24 mmol). The reaction mixture immediately turned into a light green solution. The mixture was stirred at room temperature overnight and then evaporated to give a light green oil, which was not further characterized and used in the next step without purification.

[672] Step 2: To a stirred solution of methyl 5-amino-4-{4-(4-{ (2-morpholinoethylamino) methyl} benzyl)-1-oxoisoindolin-2-yl}-5-oxopentanoate (1.44 g, 2.75 mmol) in dichloromethane (15 ml), was added di-tert-butyl dicarbonate (1.80 g, 8.25 mmol). The weight of the limiting SM was assumed as 1.44 g, which was the theoretical yield of the previous step. The oil was purified on silica gel column (MeOH/CH₂Cl₂ gradient from 1% to 9% in 50 min) to give 4-{4-{4-{{[tert-butoxycarbonyl}methyl-{2- morpholin-4-yl-ethyl}-amino}-{methyl}-benzyl}oxy}-1-oxo-1,3-dihydro-isoindol-2-yl}-4-carbamoyl-butyr acid methyl ester as an oily solid (0.88 g, 51% yield over two steps).

[673] Step 3: To a stirred solution of methyl 5-amino-4-{4-{(tert-butoxycarbonyl{2-morpholinoethyl}amino)methyl}benzyl}oxy}-1-oxoisoindolin-2-yl)-5-oxopentanoate (0.36 g, 0.58 mmol) in THF (10 ml) at 0°C, was added potassium 2-methylpropan-2-olate (0.07 g, 0.58 mmol). The reaction mixture was stirred for ten minutes and was quenched with 1N HCl (2 mL) to give a clear colorless solution. It was neutralized with saturated sodium bicarbonate (4 ml to pH = 8) to give a cloudy mixture, which was extracted with ethyl acetate (2x20mL). The ethyl acetate phase was concentrated and purified on silica gel column (MeOH/CH₂Cl₂ gradient from 1% to 5% in
30 min) to give [(4-[2-(2,6-dioxo-piperidin-3-yl)-1-oxo-2,3-dihydro-IH-isooindol-4-yloxymethyl]-benzyl)-(2-morpholin-4-yl-ethyl)-amino]-acetic acid tert-butyl ester as a foamy solid (0.21 g, 62% yield); HPLC: Waters Symmetry C-18, 3.9 X 150 mm, 5 µη, 1 ml/min, 240 nm, gradient from 10/90 to 95/5 in 5 min, isocratic at 95/5 in 5 min (acetonitrile/0.1% H₃PO₄), 5.38 min (97.4%); mp: 110-1 12°C; ¹H NMR (DMSO-d₆) δ 1.29 - 1.49 (m, 9H, 3CH₃), 1.92 - 2.05 (m, 1H, CHH), 2.25 - 2.39 (m, 6H, 3CH₂), 2.44 (dd, J = 4.5, 13.0 Hz, 1H, CHH), 2.53 - 2.64 (m, 1H, CHH), 2.83 - 3.00 (m, 1H, CHH), 3.15 - 3.29 (m, 2H, CH₂), 3.52 (t, J = 4.6 Hz, 4H, 2CH₂), 4.19 - 4.49 (m, 4H, CH₂, CH₂), 5.11 (dd, J = 5.1, 13.2 Hz, 1H, NCH), 5.23 (s, 2H, CH₂), 7.23 - 7.37 (m, 4H, Ar), 7.41 - 7.53 (m, 3H, Ar), 10.97 (s, 1H, NH); ¹³C NMR (DMSO-d₆) δ 22.36, 28.02, 31.21, 43.30, 45.09, 49.37, 50.05, 51.58, 53.33, 55.95, 56.39, 66.17, 69.32, 78.84, 115.00, 115.23, 127.39, 127.83, 129.78, 129.97, 133.31, 135.30, 138.56, 153.43, 155.02, 168.01, 170.96, 172.83 (2 extra peaks in alkyl region possibly from the two alkyl groups close to the amide nitrogen atom due to the rotamer); LCMS MH = 593; Anal. [691] Step 2: To a solution of methyl 5-amino-2-(4-hydroxy-1-oxoisindolin-2-yl)-5-oxopentanoate (0.400 g, 1.369 mmol) in DMF (5.01 mL), was added DIEA (0.239 ml, 1.369 mmol), and potassium carbonate (0.189 g, 1.369 mmol). After stirring at room temperature for about 5 min, 4-(4-chloromethyl-benzoyl)-piperazine-1-carboxylic acid tert-butyl ester (0.455 g, 1.342 mmol) was added and the mixture was stirred at room temperature overnight. After about 17 h, the mixture was warmed to 50 °C for 3 h and then 60 °C for 22 h. The mixture was heated further to 80 °C for about 24 h. The crude mixture was transferred to a beaker with a 10% solution of AcOH in H₂O (50 mL). Immediately, a white solid formed upon transfer. The slurry was vigorously stirred and sonicated for 5 minutes then filtered on a medium pore fritted filter funnel. The solid was washed with copious water (total filtrate volume about 220 mL) and suction dried to give an off-white solid which was purified by silica gel flash chromatography (80 gm ISCO column, eluted with a MeCN in DCM gradient) to give 4-{4-[2-(2,6-dioxo-piperidin-3-yl)-1-oxo-2,3-

The mixture became increasingly cloudy with significant solid forming. The thick slurry was briefly sonicated and then stirred at room temperature for 26 h. The slurry was diluted with Et₂O (-40 mL) and then filtered. The collected white solid was suction dried and then washed on filter funnel with EtOAc (50 mL) followed by MeCN (~50 mL). The remaining solid was suction dried on filter funnel, then dried in vacuum oven to give 3-{1-oxo-4-[4-(piperazine-l-carbonyl)benzoyloxy]-l,3-dihydro-lH-isoindol-2-yl]-piperidine-2,6-dione hydrochloride as a white solid (300 mg, 97% yield): HPLC: Waters Symmetry C₁₈, 5 μm, 3.9 x 150 mm, 1 ml/min, 240 nm, 15/85 CH₃CN/0.1% H₃PO₄, 4.73 min (96.7%); mp: 285-287 °C; H NMR (DMSO-d₆) δ 1.92 - 2.05 (m, 1H, CHH), 2.33 - 2.46 (m, 1H, CHH), 2.54 - 2.65 (m, 1H, CHH), 2.83 - 3.02 (m, 1H, CHH), 3.02 - 3.24 (m, 4H, CH₂, CH₂), 3.50 - 4.03 (m, 4H, CH₂, CH₂), 4.28 (d, J = 17.6 Hz, 1H, CHH), 4.45 (d, J = 17.6 Hz, 1H, CHH), 5.13 (dd, J = 5.0, 13.3 Hz, 1H, CH), 5.32 (s, 2H, CH₂), 7.21 - 7.39 (m, 2H, Ar), 7.42 - 7.62 (m, 5H, Ar), 9.11 (br. s., 2H, NH₂ salt), 10.98 (s, 1H, NH); ¹³C NMR (DMSO-d₆) δ 24.11, 32.89, 46.57, 47.35, 53.72, 70.93, 117.11, 117.41, 128.97, 129.46, 131.79, 132.02, 134.89, 137.07, 139.91, 155.13, 172.08, 172.79, 175.11, 179.00; LCMS: MH = 463; Anal Calcd for C_{39}H_{26}N_{6}O_{7}·HCl + 0.6 H₂O: C, 58.90; H, 5.58; N, 10.99; Found: C, 58.91; H, 5.58; N, 10.78.

3-Aminopiperidine-2,6-dione hydrochloride (0.915 g, 5.56 mmol) was added to a solution of 3-(4-(hydroxymethyl)benzyl)phthalic acid (1.4 g, 4.63 mmol) in dry pyridine (15 mL) and the mixture was heated to 118 °C in an oil bath for 16 h. The dark reaction mixture was allowed to cool to room temperature and was acidified with slow addition of 1 N HCl (-25 mL). The mixture was further diluted with water (-170 mL) and then sonicated for -30 minutes to help break up solid aggregates. The resulting dark slurry was filtered on a medium pore fritted funnel and the dark solid was washed with additional water (70 mL). The cake was suction dried and then placed in vacuum oven at 60 °C for 2.5 h to give 1.6 g of a dark blue solid. The solid was dissolved in a mixture of DCM, MeCN, and MeOH (-100 mL each) and treated decolorizing charcoal. The mixture was swirled around and then gravity-filtered using filter paper. The filtrate/wash (dark amber color) was treated once again with decolorizing charcoal and then filtered on a bed of celite. The clear filtrate was concentrated in vacuo to dryness to give a solid which was triturated with water and filtered with suction. The cake was washed with additional water (-100 mL), suction dried, and then placed in vacuum oven at 60 °C for 4 h to give 2-(2,6-dioxopiperidin-3-yl)-4-(4-(hydroxymethyl)benzyl)oxy)isoindoline-1,3-dione as an off-white solid (1.2 gm, 68% yield): HPLC: Waters Symmetry C₁₈, 5 μm, 3.9 x 150 mm, 1 ml/min, 240 nm, 15/85 CH₃CN/0.1% H₃PO₄, 5.08 min (99.9%); mp: 250-252; H NMR (DMSO-d₆) δ 1.95 - 2.07 (m, 1H, CHH), 2.41 - 2.67 (m, 2H, CHH, CHH), 2.78 - 3.00 (m, 1H, CHH), 4.50 (d, J = 5.1 Hz, 2H, CH₂OH), 5.09 (dd, J = 5.4, 12.7 Hz, 1H, CH), 5.19 (t, J = 5.6 Hz, 1H, OH), 5.36 (s, 2H, CH₂O), 7.24 - 7.40 (m, 2H, Ar), 7.41 - 7.53 (m, 3H, Ar), 7.59 (d, J = 8.5 Hz, 1H, Ar), 7.82 (dd, J = 7.4, 8.5 Hz, 1H, Ar), 11.1 (s, 1H, NH); C NMR (DMSO-d₆) δ 21.88, 30.83, 48.67, 62.53, 69.91, 115.40, 116.52, 120.18, 126.44, 127.09, 133.17, 134.31, 136.86, 142.32, 155.42, 156.21, 166.68, 169.81, 172.66. [747] Step 1: tert-Butyl 5-amino-5-oxo-2-(l-oxo-4-(4-((4-(trifluoromethyl)piperidin-1-yl)methyl)benzyloxy)isoindolin-2-yl)pentanoate

To a solution of tert-butyl 5-amino-2-(4-(4-(chloromethyl)benzyloxy)-l-oxoisoindolin-2-yl)-5-oxopentanoate (450 mg, 0.95 mmol) and N,N-diisopropylethylamine (0.42 mL, 2.38 mmol) in MeCN (9 mL), was added 4-(trifluoromethyl)piperidine hydrochloride (271 mg, 1.43 mmol). The mixture was stirred for 5 h at 60 °C. The crude mixture was partitioned between EtOAc (150 mL) and IN NaHCO_{3} (30 mL). The basic aq layer was washed with additional EtOAc (-100 mL). The organic layers were combined, washed with brine, dried (Na_{2}SO_{4}), and concentrated in vacuo to give tert-butyl 5-amino-5-oxo-2-(l-oxo-4-(4-((4-(trifluoromethyl)piperidin-1-yl)methyl)benzyloxy)isoindolin-2-yl)pentanoate as an oil (570 mg). LC/MS M+H = 590. The crude product was used in the next step without further purification.

[748] Step 2: 3-(l-Oxo-4-(4-(4-trifluoromethyl)piperidin-1-yl)methyl)benzyloxy)isoindolin-2-yl)piperidine-2,6-dione

The ice bath was removed and the reaction mixture was stirred for ~2 h at room temperature. More KO'Bu (28 mg) was added and the reaction mixture was stirred for ~2 h. The reaction mixture was cooled in an ice bath and quenched with acetic acid (0.163 mL, 2.85 mmol). The mixture was concentrated in vacuo and the resulting solid was partitioned between EtOAc (100 mL) and IN NaHCO_{3} (30 mL). The aq. layer was extracted with EtOAc (50 mL), and the combined organic layer was washed with brine, dried (Na2SO4), and concentrated in vacuo to give a white solid (~400 mg). The solid was triturated with Et_{2}O (40 mL) with the aid of sonication, collected by filtration, and washed with additional Et_{2}O. The solid was suction dried and a second trituration was carried out using water (120

[752] To a suspension of tert-butyl 5-amino-2-(4-(4-(chloromethyl)benzyloxy)-1-oxoisindolin-2-yl)-5-oxopentanoate (450 mg, 0.951 mmol, preparation described herein) in MeCN (9 mL) was added piperazin-2-one (191 mg, 1.903 mmol) and N,N-diisopropylethylamine (0.249 mL, 1.427 mmol). The mixture was warmed up to 60 °C and stirred for ~18 h and then allowed to cool to room temperature. A solid formed upon cooling which was dispersed by addition of DMF (3 mL) and sonication. The mixture was cooled in ice bath and solid KO'Bu (299 mg, 2.66 mmol) was added in one portion. Dry THF(2 mL) was added and the ice bath was removed. The mixture was stirred at room temperature overnight. The mixture was cooled to 0 °C in an ice bath and then quenched with acetic acid (254 µl, 4.44 mmol). The mixture was concentrated in vacuo and the oily residue was partitioned between EtOAc (200 mL) and IN NaHCO3 (40 mL). The product partitioned in both aqueous and organic layers. All layers were combined, acidified with HCl, and concentrated to give a solid. The solid was triturated with copious DMF, the mixture was filtered, and the undissolved solids were washed with additional DMF (total filtrate volume ~150 mL). The filtrate was concentrated to an oily residue which was redissolved in DMF/1 N HCl (6 mL/4 mL) and then purified by injection onto a C-18 preparatory HPLC column. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5% to 30% MeCN over 20 minutes) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo to give 3-(1-oxo-4-(4-(3-oxopiperazin-1-yl)methyl)benzyloxy)isoindolin-2-yl)piperidine-2,6-dione as an off-white solid (177 mg, 43% yield): HPLC: Waters Symmetry C18, 5 µm, 3.9 x 150 mm, 1 ml/min, 240 nm, 15/85 CH3CN/0.1% H3PO4, 4.58 min (98.3%); mp: 245-247 °C; H NMR (DMSO-d6) δ 1.91 - 2.04 (m, 1H, CHH), 2.35 - 2.48 (m, 1H, CHH), 2.51 - 2.63 (m, 3H, CHH, CH2), 2.80 - 2.99 (m, 3H, CHH, CH2), 3.06 - 3.23 (m, 2H, CH2), 3.54 (s, 2H, CH2), 4.25 (d, J = 17.6 Hz, 1H, CHH), 4.42 (d, J = 17.6 Hz, 1H, CHH), 5.11 (dd, J = 5.1, 13.2 Hz, 1H, CH), 5.24 (s, 2H, CH2), 7.21 - 7.39 (m, 4H, Ar), 7.41 - 7.56 (m, 3H, Ar), 7.74 (s, 1H, NH), 10.96 (br. s., 1H, NH); 13C NMR (DMSO-d6) δ 22.33, 31.16, 45.07, 48.35, 51.55, 56.62, 60.40, 69.38, 114.97, 115.22, 127.70, 128.91, 129.80, 129.95, 133.30, 135.49, 137.28, 153.48, 167.56, 167.99, 170.96, 172.81; LC/MS

[782] Step 1: Preparation of 4-{4-[2-(1-Carbamoyl-3-methoxycarbonyl-propyl)-1-oxo-2,3-dihydro-1H-isooindol-4-yloxy-methyl]-benzyl}-piperidine-1-carboxylic acid tert-butyl ester

Triphenyl phosphene (polymer-supported, 1.6 mmol/g, 3.3 g) was added to a stirred white suspension of methyl 5-amino-4-(4-hydroxy-1-o xoisoindolin-2-yl)-5-oxopentanoate (2.444 g, 8.36 mmol) in THF (100 ml) at 0°C. After ten minutes, diisopropyl diazene-1,2-dicarboxylate (2.470 ml, 12.54 mmol) was added and stirred for 40 minutes and then tert-butyl 4-(4-(hydroxymethyl)benzyl)piperidine-1-carboxylate (3.32 g, 10.87 mmol) in THF (20 ml) was added. The mixture was stirred at 0°C and warmed up to room temperature overnight. The suspension was filtered, rinsed with MeOH (2 x 20 ml), CH₂C₂ (2 x 30 ml), and the filtrate was evaporated to give an oil, which was dissolved in CH₂C₂ (80 ml), washed with Sat NaHCO₃ (50 ml), concentrated and then purified by silica gel column to give 4-{4-[2-(1-Carbamoyl-3-methoxycarbonyl-propyl)-1-oxo-2,3-dihydro-1H-isooindol-4-yloxy-methyl]-benzyl}-piperidine-1-carboxylic acid tert-butyl ester as a foamy oil (2.2 g, 45% yield). It was used in the next step without further purification.

[783] Step 2: Preparation of 4-Carbamoyl-4-[1-oxo-4-(4-piperidin-4-ylmethyl-benzyloxy)-1,3-dihydro-isooindol-2-yl]-butyric acid methyl ester

After four hours, the suspension was filtered, rinsed with ether and the resulting yellow solid was dried to give 2.02 g, 111% crude yield (HCl salt). The product was used later in the next step without further purification.

[784] Step 3: Preparation of 4-{4-[4-(1-Benzyl-piperidin-4-ylmethyl)-benzyloxy]-1-oxo-1,3-dihydro-isooindol-2-yl]}-4-carbamoyl-butyrlic acid methyl ester

A mixture of (S)-3-(4-hydroxyl-1-oxoisooindol-2-yl)-3-methylpiperidine-2,6-dione (1.9 g, 6.93 mmol), (4-(chloromethyl)phenyl)methanol (1.085 g, 6.93 mmol), potassium iodide (0.115 g, 0.693 mmol) and potassium carbonate (1.053 g, 7.62 mmol) in DMF (50 mL) was stirred at room temperature for 9 days. The mixture was evaporated under vacuum. To the residue was added water (150 mL) and EtOAc (150 mL), and the resulting suspension was stirred for 16 h. The suspension was filtered, and the filter was rinsed with water (50 mL) and EtOAc (2 x 50 mL). The organic phase was washed with 10% aqueous sodium carbonate solution (2 x 75 mL), IN HCl (100 mL), and brine (100 mL), was dried (MgSO₄) and evaporated. The residue was combined with the solid precipitate that had been filtered off, to afford a total of 2.09 g of a crude product.
Step 2: (S)-4-(((2-(3-methyl-2,6-dioxopiperidin-3-yl)-1-oxoisoindolin-4-yl)oxy)methyl)benzyl methanesulfonate

Methanesulfonyl chloride (0.538 mL, 6.93 mmol) and DIEA (1.448 mL, 8.31 mmol) were added, and the mixture stirred at 0 °C for 30 min. Then, the mixture was quenched by the addition of AcOH (0.5 mL) and then water (5 mL), and was evaporated. The residue was partitioned between EtOAc (125 mL) and brine (125 mL). A solid that did not dissolve in either phase was filtered off, and the phases were separated. The solid was combined with the organic layer and evaporated. The residue was chromatographed using a methylene chloride-acetonitrile gradient. The product eluted at 40% ACN. The solids dissolved with agitation to give a yellow solution which was warmed up to 40 °C for 3 days. The reaction mixture was diluted with EtOAc (-150 mL) and washed with 1 N NaHCCh (2 x 30 mL) and brine. The clear organic layer was dried over Na2SC"4, filtered, and concentrated in vacuo to give a glassy residue. The residue was treated with water (30 mL) and the mixture was sonicated extensively to give a well-dispersed solid that was collected by filtration and washed with additional water (-45 mL). The cake was slurried in Et$_2$0, triturated with aid of a spatula, and then filtered. This process was repeated 4 times (total Et$_2$0 filtrate volume -125 mL). The cake was suction dried and then dried in a vacuum oven to give an off-white solid (143 mg). The solid was dissolved in DMF (10 mL) and purified using reversed-phase preparatory HPLC. The product was eluted with an acetonitrile/water gradient (0.1% formic acid in both mobile phases, 5% to 80% MeCN over 20 minutes) and fractions were collected by mass trigger. The desired fractions were combined and concentrated in vacuo and the residue was treated with water and sonicated to give a white slurry. To the mixture was added dry MeCN (5 mL) followed by DIEA (0.423 mL, 2.424 mmol). Agitation resulted in a clear yellow solution that stirred at room temperature overnight. The crude mixture was partitioned between EtoAc (~150 mL) and IN NaHCO₃ (~50 mL). The organic layer was washed twice more with 1N NaHCO₃ (2 x 35 mL) and brine (Na₂SO₄), and concentrated in vacuo to give a glassy solid. Et₂O (~30 mL) was added and the mixture was sonicated extensively until a well-dispersed slurry was obtained. The mixture was stirred at room temperature overnight and then filtered on a medium fritted funnel with suction. Residual solid in flask was transferred to funnel with more n-hexanes (~30 mL). The solid was suction dried and then triturated with H\(_2\)O (20 mL). SDI₂8369v1
To the stirred solution of tert-butyl piperazine-1-carboxylate (0.850 g, 4.56 mmol) and TEA (0.76 ml, 5.48 mmol) in THF (10 mL) at 0°C was added 2,2,2-trifluoroethane sulfonyl chloride (1.0 g, 5.48 mmol) in THF (0.5 mL). The resulting suspension was stirred at 0°C for 1.5 hrs and the reaction mixture was diluted by EtOAC (30 mL). The mixture was washed with water (15 mL), HCl (IN, aq, 15 mL) and NaHCO$_3$ (15 mL) and brine (20 mL). Organic layer was dried by MgSO$_4$ and concentrated under vacuo to give 4-(2,2,2-Trifluoro-ethanesulfonyl)-piperazine-1-carboxylic acid tert-butyl ester as a white solid (1.3 g, 86% yield). The compound was put to next step without further purification. $^1$H NMR (DMSO-d$_6$) $\delta$ 1.41 (s, 9H, tButyl), 3.12 - 3.26 (m, 4H, CH$_2$, CH$_2$), 3.36 - 3.48 (m, 4H, CH$_2$, CH$_2$), 4.52 (q, $J = 10.1$ Hz, 2H, CH$_2$); LCMS MH (without boc) = 233.

**Step 2:** 1-(2,2,2-Trifluoro-ethanesulfonyl)-piperazine

To the stirred solution of tert-butyl 4-(2,2,2-trifluoroethylsulfonyl)piperazine-1-carboxylate (1.3 g, 3.9 mmol) in DCM (20 mL) at room temperature was added TFA (3.0 mL, 39.1 mmol). The resulting solution was stirred at room temperature 15 hrs and the reaction mixture was diluted by DCM (30 mL) and added by NaHCC$_3$ (sat., aq, 15 mL) slowly to control the gas emission. The resulting mixture was stirred at room temperature for 10 mins and partitioned. The organic layer was washed with NaHCC$_3$ (sat., aq, 5 mL) and brine (20 mL). [829]  To a suspension of (S)-3-(4-(bromomethyl)benzyl)oxy)-1-oxoisodolin-2-
ylpiperidine-2,6-dione (1 g, 2.256 mmol) in MeCN (20 mL) at 0 °C, was added 4-
(trifluoromethyl)piperidine hydrochloride (0.470 g, 2.481 mmol). DIEA (0.788 mL, 4.51
mmol) was immediately added and the resulting mixture was stirred at 0 °C for 3 h.
Tetrabutylammonium bromide (0.036 g, 0.113 mmol) was added to the reaction mixture and
stirring was continued for 1 h at 0 °C then at room temperature for 18 h. The reaction
slurry was concentrated to dryness under vacuum to give ~1.2 g of a yellow solid. This solid
was partitioned between EtOAc (-250 mL) and aq IN NaHCO$_3$ (-100 mL). The organic
layer was washed with another 100 mL of IN NaHCO$_3$, water (-25 mL), and Brine (-50
mL). The solution was dried over Na$_2$SO$_4$, filtered, and concentrated on rotovap to a
minimum volume of EtOAc (-5-7 mL) at 40 °C to first sign of cloudiness. The flask was
removed from rotovap and allowed to stand at room temperature. More solids formed upon
standing.

[830]  An equal volume of MTBE (5-7 mL) was added to the slurry. The mixture
was swirled and then filtered on 30-mL fine fritted funnel with suction. Additional MTBE
was used to wash the cake and transfer residual solid from flask (-25 mL). The cake was
suction dried and then placed in vacuum oven overnight at 50 °C to give 850 mg (73% yield)
of a white to light cream colored solid. To remove unwanted residual solvents
(EtOAc and MTBE), a second recrystallization was carried out from warm MeCN/water.
The solid was collected on a fine fritted funnel, washed with water (-25 mL), and the cake
was dried in a vacuum oven at 60 °C overnight to give (S)-3-(l-oxo-4-((4-((4-

5.309 ASSAYS

5.309.1 TNFα Inhibition Assay in hPMBC

[896] Human peripheral blood mononuclear cells (hPBMC) from normal donors are obtained by Ficoll Hypaque (Pharmacia, Piscataway, NJ, USA) density centrifugation. Cells are cultured in RPMI 1640 (Life Technologies, Grand Island, NY, USA) supplemented with 10% AB+human serum (Gemini Bio-products, Woodland, CA, USA), 2 mM L-glutamine, 100 U/ml penicillin, and 100 μg/ml streptomycin (Life Technologies). PBMC (2 x 10$^5$ cells) are plated in 96-well fiat-bottom Costar tissue culture plates (Corning, NY, USA) in triplicate. Cells are stimulated with LPS (from Salmonella abortus equi, Sigma cat.no. L-1887, St.Louis, MO, USA) at 1 ng/ml final in the absence or presence of compounds. Compounds provided herein are dissolved in DMSO (Sigma) and further dilutions are done in culture medium immediately before use. The final DMSO concentration in all assays can be about 0.25%. Compounds are added to cells 1 hour before LPS stimulation. Cells are then incubated for 18-20 hours at 37°C in 5% CO$_2$, and supernatants are then collected, diluted with culture medium and assayed for TNFα levels by ELISA (Endogen, Boston, MA, USA). IC50S are calculated using non-linear regression,
sigmoidal dose-response, constraining the top to 100% and bottom to 0%, allowing variable slope (GraphPad Prism v3.02).

5.309.2 IL-2 and MIP-3a Production by T Cells

PBMC are depleted of adherent monocytes by placing 1 x 10^8 PBMC in 10 ml complete medium (RPMI 1640 supplemented with 10% heat-inactivated fetal bovine serum, 2 mM L-glutamine, 100 U/ml penicillin, and 100 µg/ml streptomycin) per 10 cm tissue culture dish, in 37°C, 5% CO_2 incubator for 30-60 minutes. The dish is rinsed with medium to remove all non-adherent PBMC. T cells are purified by negative selection using the following antibody (Pharmingen) and Dynabead (Dynal) mixture for every 1 x 10^8 non-adherent PBMC: 0.3 ml Sheep anti-mouse IgG beads, 15 µl anti-CD16, 15 µl anti-CD33, 15 µl anti-CD56, 0.23 ml anti-CD 19 beads, 0.23 ml anti-HLA class II beads, and 56 µl anti-CD14 beads. The cells and bead/antibody mixture is rotated end-over-end for 30-60 minutes at 4°C. Purified T cells are removed from beads using a Dynal magnet. Typical yield is about 50% T cells, 87-95% CD3+ by flow cytometry.

Tissue culture 96-well flat-bottom plates are coated with anti-CD3 antibody OKT3 at 5 µg/ml in PBS, 100 µl per well, incubated at 37°C for 3-6 hours, then washed four times with complete medium 100 µl/well just before T cells are added. Compounds are diluted to 20 times of final in a round bottom tissue culture 96-well plate. Final concentrations are about 10 µM to about 0.00064 µM. A 10 mM stock of compounds provided herein is diluted 1:50 in complete for the first 20x dilution of 200 µM in 2% DMSO and serially diluted 1:5 into 2% DMSO. Compound is added at 10 µl per 200 µl culture, to give a final DMSO concentration of 0.1%. Cultures are incubated at 37°C, 5% CO_2 for 2-3 days, and supernatants analyzed for IL-2 and MIP-3a by ELISA (R&D Systems). IL-2 and MIP-3a levels are normalized to the amount produced in the presence of an amount of a compound provided herein, and EC50S calculated using non-linear regression, sigmoidal dose-response, constraining the top to 100% and bottom to 0%, allowing variable slope (GraphPad Prism v3.02).

5.309.3 Cell Proliferation Assay

Cell lines (e.g., Namalwa, MUTZ-5, UT-7, and various NHL cell lines) are obtained from the Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH (Braunschweig, Germany). The cell line KG-1 is obtained from the American Type Culture Collection (Manassas, VA, USA). Cell proliferation as indicated by ³H-thymidine incorporation is measured in all cell lines as follows.
Cells are plated in 96-well plates at 6000 cells per well in media. The cells are pre-treated with compounds at about 100, 10, 1, 0.1, 0.01, 0.001, 0.0001 and 0 µM in a final concentration of about 0.25 % DMSO in triplicate at 37°C in a humidified incubator at 5 % CO₂ for 72 hours. One microcurie of ³H-thymidine (Amersham) is then added to each well, and cells are incubated again at 37°C in a humidified incubator at 5 % CO₂ for 6 hours. The cells are harvested onto UniFilter GF/C filter plates (Perkin Elmer) using a cell harvester (Tomtec), and the plates are allowed to dry overnight. Microscint 20 (Packard) (25 µl/well) is added, and plates are analyzed in TopCount NXT (Packard). Each well is counted for one minute. Percent inhibition of cell proliferation is calculated by averaging all triplicates and normalizing to the DMSO control (0 % inhibition). Each compound is tested in each cell line in three separate experiments. Final IC50s are calculated using non-linear regression, sigmoidal dose-response, constraining the top to 100 % and bottom to 0 %, allowing variable slope. (GraphPad Prism v3.02).

5.309.4 Immunoprecipitation and Immunoblot

Cells (e.g., various NHL cell lines) are treated with DMSO or an amount of a compound provided herein for 1 hour, then stimulated with 10 U/ml of Epo (R&D Systems) for 30 minutes. Cell lysates are prepared and either immunoprecipitated with Epo receptor Ab or separated immediately by SDS-PAGE. Immunoblots are probed with Akt, phospho-Akt (Ser473 or Thr308), phospho-Gabl (Y627), Gabl, IRS2, actin and IRF-1 Abs and analyzed on a Storm 860 Imager using ImageQuant software (Molecular Dynamics).

5.309.5 Cell Cycle Analysis

Cells are treated with DMSO or an amount of a compound provided herein overnight. Propidium iodide staining for cell cycle is performed using CycleTEST PLUS (Becton Dickinson) according to manufacturer's protocol. 5.309.6 Apoptosis Analysis

Cells are treated with DMSO or an amount of a compound provided herein at various time points, then washed with annexin-V wash buffer (BD Biosciences). 5.309.7 Luciferase Assay

Namalwa cells are transfected with 4 µg of API-luciferase (Stratagene) per 1 x 10⁶ cells and 3 µl Lipofectamine 2000 (Invitrogen) reagent according to manufacturer's instructions. Six hours post-transfection, cells are treated with DMSO or an amount of a
compound provided herein. Luciferase activity is assayed using luciferase lysis buffer and substrate (Promega) and measured using a luminometer (Turner Designs).
