(54) Title: 1-PHENYLPYRROLE COMPOUNDS

(57) **Abstract:** The present invention comprises a compound for the prevention and/or treatment of cardiovascular diseases, nephropathy, fibrosis, primary aldosteronism or edema. The compound is of the following general formula (I): wherein R¹ represents a C1 -C3 alkyl group; R² represents a hydroxy -C1 -C4 alkyl group and the like; R³ represents a halogeno group, a halogeno-C1 -C3 alkyl group and the like; R⁴ represents a hydrogen atom, a halogeno group and the like, - R⁵ represents a sulfamoyl group or a C1-C3 alkylsulf onyl group; R⁶ represents a hydrogen atom, a halogeno group and the like] or an N-oxide, atropisomer of the foregoing, or pharmaceutically acceptable salt of the foregoing.

1-PHENYLPYRROLE COMPOUNDS

BACKGROUND OF THE INVENTIONField of the Invention

The present invention relates to 1-phenylpyrrole compounds, to atropisomers thereof, and to such compounds as preventive or therapeutic drugs and their uses for the prevention or treatment of hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism and edema, which compounds have exceptional mineralocorticoid receptor antagonist activity.

Summary of the Related Art

Mineralocorticoid receptor (MR) (aldosterone receptor) is known to play an important role in controlling electrolyte balance in the body and blood pressure (for example, Advances in Physiology Education, 26(1) : 8-20 (2002)), and mineralocorticoid receptor antagonist such as spironolactone and eplerenone having a steroid structure is known to be useful for treating hypertension and heart failure (for example, Clinical Science and molecular medicine. 3(Suppl), 329s-332s (1976); and Clinical Science and molecular medicine. 45(Suppl 1), 219s-224s (1973)).

Hypertension is not only a primary cause of the development of cardiovascular, cardiac and renal diseases, but a risk factor for the progression of these diseases initiated by other mechanisms such as atherosclerosis, cardiovascular disease, ischemic heart disease, diabetes, diabetic nephropathy, chronic glomerulonephritis and polycystic kidney disease (J. Am. Soc. Nephrol., 14 :2395-2401 (2003)).

In renal failure, as with the case of chronic heart failure, a number of clinical trials have established that interruption of the RAAS cascade with ACE inhibitors is beneficial in limiting renal

disease (Am. J. Kid. Dis., 37 (4): 677-688 (2001). Additional studies have also established that aldosterone antagonists can attenuate proteinuria and renal damage typically observed in progressive renal disease and offer further therapeutic benefit compared to ACE inhibitors alone (Hypertension., 31 :451-458 (1998)).

However, spironolactone has low selectivity for MR, and side effects such as menstrual irregularity in women and gynecomastia in men are reported (e.g., Circulation, 107, 2512-2518 (2003)). In contrast, since eplerenone has relatively weak effect against MR (for example, Nature Reviews, 2, 177-178 (2003)) and thus induces hyperkalemia, it is not suitable for patients having renal failure.

Here, as a mineralocorticoid receptor antagonist having a non-steroidal skeleton, pyrrole derivatives described in pamphlet of International Publication No. WO 2006/012642 have been known; however, atropisomers of a compound represented by the general formula (I) of the present invention have not been known.

SUMMARY OF THE INVENTION

As a result of conducting extensive studies on various 1-phenylpyrrole compounds for the intension to develop a superior preventive drug or a therapeutic drug for cardiovascular disease, the present inventors have found that there are atropisomers of the compound represented by the general formula (I), and that one of them in particular is extremely effective in sustention of mineralocorticoid receptor antagonistic action (both in vitro and in vivo) and drug efficacy. Furthermore, it was found that it has good solubility, oral absorbability, blood concentration, metabolic stability and safety and the like, and it is useful as a medicament, preferably as a preventive drug or a therapeutic drug (especially a therapeutic drug) for diseases such as hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism, heart disease or edema, more preferably for congestive heart failure, nephropathy, including diabetic nephropathy, hypertension and the like, particularly preferably for hypertension, and particularly

preferably for diabetic nephropathy, thereby completing the invention.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides compounds represented by the general formula (I) (including an atropisomer thereof), pharmaceutical composition comprising it (e.g., and a medicament as a preventive or therapeutic drug (especially a therapeutic drug)), and their uses for prevention or treatment of hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism or heart disease (more preferably for congestive heart failure, nephropathy, including diabetic nephropathy, and hypertension; particularly preferably for hypertension). The compounds of the invention have excellent mineralocorticoid receptor antagonist activity. Preferred compounds/compositions comprise the atropisomer of the compound of the invention having superior mineralocorticoid receptor antagonist activity compared to the other atropisomer(s) of that structure.

The present invention comprises,

(1): a compound represented by the following general formula (I):

an N-oxide thereof; diastereomer, compound enriched in a diastereomer, or racemate thereof; an atropisomer, compound enriched in an atropisomer, or an equal mixture of atropisomers; or a pharmaceutically acceptable salt of the foregoing, wherein,

R¹ represents a C1-C3 alkyl group;

R² represents a hydroxy-C1-C4 alkyl group, a fluoro-C1-C4 alkyl group, a carbamoyl-C1-C2 alkyl group, a N-mono(C1-C3 alkyl)carbamoyl-C1-C2 alkyl group or a N,N-di(C1-C3 alkyl)carbamoyl-C1-C2 alkyl group;

R³ represents a halogeno group, a C1-C3 alkyl group, a C1-C3 alkoxy group, a halogeno-C1-C3 alkyl group, a halogeno-C1-C3 alkoxy group, a 4-halogenophenyl group or a 4-halogenophenoxy group;

R⁴ represents a hydrogen atom, a halogeno group or a C1-C3 alkyl group;

R⁵ represents a sulfamoyl group or a C1-C3 alkylsulfonyl group;

R⁶ represents a hydrogen atom, a halogeno group, a C1-C3 alkyl group or a C1-C3 alkoxy group],
or atropisomers thereof.

In addition, the present invention comprises,

(2): the compound according to the aforementioned (1), wherein R¹ is a methyl group or an ethyl group;

(3): the compound according to the aforementioned (1), wherein R¹ is a methyl group;

(4): the compound according to any one of the aforementioned (1) through (3), wherein R² is a 2-hydroxyethyl group, a 2-hydroxypropyl group, a 2-fluoropropyl group or a 2-fluoroethyl group;

(5): the compound according to any one of the aforementioned (1) through (3), wherein R² is a 2-hydroxypropyl group;

(6): the compound according to any one of the aforementioned (1) through (5), wherein R³ is a methyl group, a chlorine atom, a halogenomethyl group or a halogenomethoxy group;

(7): the compound according to any one of the aforementioned (1) through (5), wherein R³ is a methyl group, a chlorine atom, a difluoromethyl group, a trifluoromethyl group, a difluoromethoxy group or a trifluoromethoxy group;

(8): the compound according to any one of the aforementioned (1) through (5), wherein R³ is a trifluoromethyl group, a difluoromethoxy group or a trifluoromethoxy group;

(9): the compound according to any one of the aforementioned (1) through (8), wherein R⁴ is a halogeno group;

(10): the compound according to any one of the aforementioned (1) through (8), wherein R⁴ is a fluorine atom;

(11): the compound according to any one of the aforementioned (1) through (10), wherein R⁵ is a sulfamoyl group or a methylsulfonyl group;

(12): the compound according to any one of the aforementioned (1) through (10), wherein R⁵ is a methylsulfonyl group;

(13): the compound according to any one of the aforementioned (1) through (12), wherein R⁶ is a hydrogen atom, a chlorine atom or a methyl group; and

(14): the compound according to any one of the aforementioned (1) through (12), wherein R⁶ is a hydrogen atom.

Furthermore, the present invention comprises

(15): the following compounds:

- 1- [4-chloro-2- (trifluoromethyl)phenyl] -5- (2-hydroxyethyl) -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;

N-oxides thereof; diastereomers, racemates, and compounds enriched in a diastereomer thereof; atropisomers, equal mixtures of atropisomers, and compounds enriched in an atropisomer thereof; and pharmaceutically acceptable salts of any of the foregoing.

In addition, the present invention comprises

(16): the following compounds:

1- [4-fluoro-2- (trifluoromethyl)phenyl] -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 1- [4-chloro-2- (trifluoromethyl)phenyl] -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;

 1- [4-chloro-2- (difluoromethoxy)phenyl] -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 1- [4-fluoro-2- (trifluoromethoxy)phenyl] -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 1- [2- (difluoromethyl) -4-fluorophenyl] -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 1- (2-chloro-4-fluorophenyl) -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 1- [4-chloro-2- (trifluoromethoxy)phenyl] -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 and 1- (2,4-dichlorophenyl) -5- [(2S) -2-hydroxypropyl] -2-methyl-N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 and N-oxides; diastereomers, racemates, and compounds enriched in a diastereomer, and racemates thereof; atropisomers, compounds enriched in an atropisomer, and equal mixtures of atropisomers thereof; and pharmaceutically acceptable salts of any of the foregoing.

Further, the present invention comprises

(17): the atropisomers of the compound according to any one of the aforementioned (1) through (16) having a greater mineralocorticoid receptor antagonistic activity than the other atropisomer of the compound.

In addition, the present invention comprises

(18): a medicament comprising the compound according to any one of the aforementioned (1) through (17) as an active ingredient;

(19): a preventive drug or a therapeutic drug for a cardiovascular disease, comprising the compound according to any one of the aforementioned (1) through (17) as an active ingredient;

(20): a preventive drug or a therapeutic drug for hypertension, angina pectoris, acute coronary syndrome, congestive

heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism or edema, comprising the compound according to any one of the aforementioned (1) through (17) as an active ingredient;

(21): a preventive drug or a therapeutic drug for nephropathy, comprising the compound according to any one of the aforementioned (1) through (17) as an active ingredient;

(22): a preventive drug or a therapeutic drug for hypertension, comprising the compound according to any one of the aforementioned (1) through (17) as an active ingredient; and

(23): a preventive drug or a therapeutic drug for diabetic nephropathy, comprising the atropisomer according to any one of the aforementioned (1) through (17) as an active ingredient.

Furthermore, the present invention comprises

(24): a pharmaceutical composition comprising the compound according to any one of the aforementioned (1) through (17) and a pharmacologically/pharmaceutically acceptable carrier.

Because one of the atropisomers of the 1-phenylpyrrole compounds of the present invention shows stronger mineralocorticoid receptor antagonistic activity than the other, it is useful as a preventive drug or a therapeutic drug (especially a therapeutic drug) for diseases such as hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism, heart disease or edema, more preferably for congestive heart failure, nephropathy, including diabetic nephropathy, hypertension and the like, particularly preferably for hypertension, and particularly preferably diabetic nephropathy.

The atropisomers of the compound represented by the general formula (I) of the present invention have excellent mineralocorticoid receptor antagonistic activity, show high oral absorbability, plasma concentration levels, and long half-life in the blood, and have excellent pharmacological properties. In addition, the atropisomers of the compound represented by general formula (I) of the present invention have superior internal

pharmacokinetic properties, such as body distribution, retention in blood and the like, and low toxicity in organs such as the kidney and liver. Furthermore, the atropisomers of the compound represented by the general formula (I) of the present invention are extremely stable; for example, no racemization was observed after letting it stand in methanol at room temperature for 7 days, and in acetonitrile-phthalic acid buffer at 60°C for 4 hours.

Therefore, the atropisomers of the compound represented by the general formula (I) of the present invention are, for example, useful as a medicament, particularly as a medicament to prevent or treat various cardiovascular diseases (preferably hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism, heart disease or edema).

Definitions

(1) A "halogeno group" is a fluoro group, a chloro group or a bromo group, and preferably a fluoro group or a chloro group.

(2) A "C1-C4 alkyl group" is a linear or branched alkyl group having 1 to 4 carbon atoms such as a methyl group, an ethyl group, a n-propyl group, an isopropyl group, a n-butyl group, an isobutyl group and a tert-butyl group, preferably a methyl group and an ethyl group, and particularly preferably a methyl group.

(3) A "C1-C3 alkoxy group" is a C1-C3 alkyloxy group structured from the "C1-C3 alkyl group", and represents for example, a linear or branched alkoxy group having 1 to 3 carbon atoms such as a methoxy group, an ethoxy group, a n-propoxy group and an isopropoxy group, and preferably represents a methoxy group.

(4) A "hydroxy C1-C4 alkyl group" is a group in which the aforementioned "C1-C4 alkyl group" is substituted with one hydroxy group, including, for example, a 2-hydroxyethyl group, a 2-hydroxy-1-methylethyl group, a 2-hydroxypropyl group, a 3-hydroxypropyl group and a 3-hydroxybutyl group, preferably a 2-hydroxyethyl group and a 2-hydroxypropyl group, and more preferably a 2-hydroxypropyl group.

(5) A "halogeno-C1-C3 alkyl group" is a group in which the aforementioned "C1-C3 alkyl group" is substituted with 1 to 5 of the

same or different halogeno groups, including, for example, a fluoromethyl group, a difluoromethyl group, a trifluoromethyl group, a chlorodifluoromethyl group, a 2-fluoroethyl group, a 2-fluoro-1-methylethyl group, a 2,2,2-trifluoroethyl group, a pentafluoroethyl group and a 3-fluoropropyl group, preferably a difluoromethyl group, a trifluoromethyl group, a 2-fluoroethyl group, a 2-fluoropropyl group and a 2-fluoro-1-methylethyl group and the like.

(6) A "halogeno-C1-C3 alkoxy group" is a group in which the aforementioned "C1-C3 alkoxy group" is substituted with 1 to 5 of the same or different halogeno groups, including for example, a fluoromethoxy group, a difluoromethoxy group, a trifluoromethoxy group, a 2-fluoroethoxy group, a 1,1-difluoroethoxy group, a pentafluoroethoxy group and a 3-fluoropropoxy group, preferably a difluoromethoxy group, a trifluoromethoxy group and the like.

(7) A "carbamoyl-C1-C2 alkyl group" is a group in which a methyl group or an ethyl group is substituted with one carbamoyl group, including, for example, a carbamoylmethyl group, a 2-carbamoylethyl group and a 1-carbamoylethyl group, preferably a carbamoylmethyl group.

(8) A "N-mono(C1-C3 alkyl)carbamoyl-C1-C2 alkyl group" is a group in which the nitrogen atom of the carbamoyl group of the aforementioned "carbamoyl-C1-C2 alkyl group" is substituted with one C1-C3 alkyl group, including, for example, a (N-methylcarbamoyl)methyl group and a (N-ethylcarbamoyl)methyl group.

(9) A "N,N-di(C1-C3 alkyl)carbamoyl-C1-C2 alkyl group" is a group in which the nitrogen atom of the carbamoyl group of the aforementioned "carbamoyl-C1-C2 alkyl group" is substituted with two of the same or different C1-C3 alkyl groups, including, for example, a (N,N-dimethylcarbamoyl)methyl group and a (N-ethyl-N-methylcarbamoyl)methyl group.

Hereinafter, the present invention will be explained in greater detail.

R^1 , R^2 , R^3 , R^4 , R^5 and R^6 in the general formula (I) will be explained.

R¹ in the general formula (I) represents:

- (a) C1-C3 alkyl;
- (b) methyl or ethyl; or
- (c) methyl.

R² in the general formula (I) represents:

- (a) hydroxy-C1-C4 alkyl, fluoro-C1-C4 alkyl, carbamoyl-C1-C2 alkyl, N-mono(C1-C3 alkyl)carbamoyl-C1-C2 alkyl or N,N-di(C1-C3 alkyl)carbamoyl-C1-C2 alkyl;
- (b) hydroxy-C1-C4 alkyl or fluoro-C1-C4 alkyl group;
- (c) 2-hydroxyethyl or 2-hydroxypropyl;
- (d) 2-hydroxypropyl; or
- (e) 2-fluoroethyl or 2-fluoropropyl.

R³ in the general formula (I) represents:

- (a) halogeno, C1-C3 alkyl, C1-C3 alkoxy, halogeno-C1-C3 alkyl, halogeno-C1-C3 alkoxy, halogeno-C1-C3 alkyl, halogeno-C1-C3 alkoxy, 4-halogenophenyl, or 4-halogenophenoxy;
- (b) as the halogeno group, a chloro group is preferable; as the C1-C3 alkyl group, a methyl group is preferable; as the C1-C3 alkoxy group, a methoxy group is preferable; as the halogeno-C1-C3 alkyl group, difluoromethyl, and trifluoromethyl groups are preferable; as the halogeno-C1-C3 alkoxy group, difluoromethoxy and trifluoromethoxy groups are preferable; as the 4-halogenophenyl group, 4-fluorophenyl, and 4-chlorophenyl groups are preferable; or and as the 4-halogenophenoxy group, a 4-fluorophenoxy group is preferable;
- (b) chloro, methyl, difluoromethyl, trifluoromethyl, difluoromethoxy, or trifluoromethoxy; or

- (c) difluoromethyl, trifluoromethyl, difluoromethoxy, or trifluoromethoxy.

R⁴ in the general formula (I) represents:

- (a) hydrogen, halogeno, or C1-C3 alkyl;
 (b) halogeno; or
 (c) fluoro.

R⁵ in the general formula (I) represents:

- (a) sulfamoyl or C1-C3 alkyl sulfonyl;
 (b) sulfamoyl or methylsulfonyl; or
 (c) methylsulfonyl .

R⁶ in the general formula (I) represents:

- (a) hydrogen, halogeno, C1-C3 alkyl, or C1-C3 alkoxy;
 (b) hydrogen, chloro, or methyl; or
 (c) a hydrogen atom.

All combinations of definitions of each of the forgoing substituents are contemplated.

Preferable compounds represented by the general formula (I), include, (a) racemic mixtures, diastereomers, and compounds enriched in a diastereomer, (b) atropisomers, equal mixtures of atropisomers, and compounds enriched in an atropisomer (preferably the atropisomer having stronger mineralocorticoid receptor antagonist activity than the other atropisomer), and (c) pharmaceutically acceptable salts of any of the foregoing, of one of the following:

- 1- [4-chloro-2- (trifluoromethyl)phenyl] -5- (2-hydroxyethyl) -2-methyl-
 N- [4- (methylsulfonyl)phenyl] -1H-pyrrole-3-carboxamide;
 1- [4-fluoro-2- (trifluoromethyl)phenyl] -5- [(2S) -2-hydroxypropyl] -2-

an N-oxide thereof, or a pharmaceutically acceptable salt of any of the foregoing.

Here, "congestive heart failure" in the present specification includes "chronic cardiac failure" and "CHF (chronic heart failure)".

Specific examples of "fibrosis" in the present specification, include endocardial fibrosis, vascular fibrosis, kidney fibrosis and hepatic fibrosis.

"Heart disease" in the present specification means ischemic heart disease, heart failure, heart systolic dysfunction, cardiac dilatation dysfunction, myocardial necrosis, pulmonary venous

congestion, atrial fibrillation, myocardial infarction, myocardial fibrosis and chronic heart failure.

"Renal disease" or "kidney disease" or "nephropathy" in the present specification include diabetic nephropathy, chronic glomerulonephritis, polycystic kidney, non-diabetic nephropathy and chronic renal disease.

Hereinafter, the production process for the compound represented by the formula (I) of the present invention will be explained.

The compound of formula (I) of the present invention can be produced by the method shown in the following [Scheme 1].

The compound of formula (I) can be produced by preparing a pyrrole carboxylic acid ester derivative (3) by a cyclization reaction of a diketone derivative (1) and an aniline derivative or a salt thereof, and then condensing the pyrrole carboxylic acid ester derivative (3) with an aniline derivative (4). During such production, in a case where the compound has isomers stemming from an asymmetric atom, axial asymmetry and the like, (I-isomer), which is a single isomer, can be obtained by carrying out an optical resolution as necessary.

[Chem 1]

(Here, R^7 represents a C1-C4 alkyl group or an aryl group; and R^1 , R^2 , R^3 , R^4 , R^5 and R^6 represent the same as described above.)

In the cyclization reaction of the diketone derivative (1) and the aniline derivative (2) or a salt thereof, a cyclization method carried out under an acidic condition such as the one described in a patent document (WO 2006/012642) can be used. As an acid catalyst, inorganic acids such as hydrochloric acid, sulfuric acid, sodium bisulfate and the like, and organic acids such as acetic acid, tosyl acid and camphorsulfonic acid can be used. Further, Lewis acids such as scandium (III) triflate and tin (II) chloride that are described in the method of Chen, J. et al [Tetrahedron Lett., 47, 5358-5387 (2006)] can also be used. Preferably, it is acetic acid, tosyl acid or scandium (III) triflate. With respect to the reaction solvent, the reaction can also be carried out in the absence of a solvent, while halogenohydrocarbon solvents such as methylene chloride, hydrocarbon solvents such as toluene, ether solvents such as tetrahydrofuran, or polar solvents such as N,N-dimethylformamide and the like can be used. Preferably, it is carried out in the absence of a solvent or in toluene and the like. As the reaction temperature, it is in the range of 0°C to boiling point of the solvent, preferably room temperature to boiling point of the solvent. As the reaction time, it is usually from about 0.5 to about 24 hours.

(Here, R^1 , R^2 , R^3 , R^4 , R^5 , R^6 and R^7 represent the same as described above.)

In the production of compound of formula (I), the method described in Patent Document (WO 2006/012642) can be used as the amide formation reaction of the pyrrolicarboxylic acid ester derivative (3) with the aniline derivative (4).

That is, when producing the compound of formula (I) directly by an ester-amide exchange reaction from the pyrrolicarboxylic acid ester derivative (3) and the aniline derivative (4) as in [Scheme 1A], trialkyl aluminum, n-butyl lithium, potassium t-butoxide and the like can be used as the reagent, and trimethyl aluminum can be mentioned preferably. As a solvent for reaction, hydrocarbon solvents such as toluene, benzene and hexane, ether solvents such as tetrahydrofuran, or polar solvents such as N,N-dimethylformamide and the like can be used. Preferably, toluene and tetrahydrofuran can be mentioned. As the reaction temperature, it is in the range of 0°C to boiling point of the solvent, preferably in the range of room temperature to boiling point of the solvent. As the reaction time, it is usually from about 0.5 to about 24 hours.

In addition, the compound of the formula (I) can be produced by converting a pyrrolicarboxylic acid (3-1), which is obtained from alkaline hydrolysis treatment of the pyrrolicarboxylic acid ester derivative (3), to an acid chloride (3-2), and then carrying out a condensation reaction of the acid chloride (3-2) with the aniline (4). As the method for converting the pyrrolicarboxylic acid (3-1)

to the acid chloride (3-2), a known production process may be used. As a condensation agent, the one described in a patent document (WO 2006/012642) may be used. As a solvent for the condensation reaction, halogenohydrocarbon solvents such as methylene chloride, hydrocarbon solvents such as toluene, and ether solvents such as tetrahydrofuran are preferable. As the reaction temperature, it is in the range of -20°C to the boiling point of the solvent, and is preferably in the range of room temperature to the boiling point of the solvent. In the condensation reaction, organic bases such as triethylamine can be used. The reaction time is usually from about 2 to about 24 hours.

The compound of the formula (I) has two atropisomers that stem from axial asymmetry which arises from restriction of the rotation of the bond connecting the phenyl group having a R^3 group as a substituent and the substituted pyrrole ring, due to steric hindrance. Regarding a method for optical resolution of the atropisomers, direct resolution can be conducted by high performance liquid chromatography using a chiral column. As the chiral column, there can be mentioned for example, CHIRALPAK AD-H, AS-H, CHIRALCEL OJ-RH (DAICEL), etc.

Hereinafter, a production process for a diketone derivative (1), an aniline derivative (2), and a pyrrole carboxylic acid ester derivative (3) and their intermediates, which are the compounds used in [Scheme 1], will be described.

The diketone (1) used in [Scheme 1] can be produced by the following method.

(Here, R^7 and R^{7a} are the same or different from each other, and represent a C1-C4 alkyl group or an aryl group; X represents a halogeno group; R^1 and R^2 represent the same as described above.)

Diketone (1) can be produced from an ester (2-1), by preparing a N-methoxyamide (2-2) by the method of Weinreb et. al [Tetrahedron Lett., 22, 3815 (1981), J., Am. Chem. Soc., 112, 2998 (1990), J. Org. Chem., 56, 2911 (1991)], followed by reaction with Grignard reagent, alkyl lithium and the like to give a methylketone (2-3), continued with preparation of a halogenomethylketone (2-4) by a halogenating agent, and then carrying out an alkylation reaction of the halogenomethylketone (2-4) and a β -ketoester (2-5). As the halogenating agent, N-bromosuccinimide, N-chlorosuccinimide, bromine, chlorine and the like can be used, and bromine is preferable. As a reaction solvent for the aforementioned alkylation reaction, alcohol solvents such as ethanol and methanol, ether solvents such as tetrahydrofuran, or polar solvents such as N,N-dimethylformamide can be used, and ethanol and methanol are preferable. In addition, with respect to the present alkylation reaction, it is preferable to carry it out in the presence of a base, and preferable as a base are sodium ethoxide, sodium methoxide, and sodium hydride.

The aniline derivative (2) used in [Scheme 1] is a commercialized product, or can be produced by each of the routes shown in the following [Scheme 3].

(Here, R^{6a} represents a C1-C3 alkyl group or a halogeno-C1-C3 alkyl group; R^{6b} represents a halogeno group; R^{7b} represents a C1-C4 alkyl group or an aryl group; and R^4 represents the same as described above.)

As shown in (Route 3A) of [Scheme 3], compound (3A-3) which is an aniline derivative can be produced by nitrating compound (3A-1) with a known method, followed by catalytic reduction. As a catalyst used for the catalytic reduction, palladium-carbon, platinum oxide, or palladium hydroxide can be mentioned, and palladium-carbon or palladium hydroxide is preferable. As a reaction solvent for the catalytic reduction, alcohol solvents such as ethanol and methanol, ether solvents such as tetrahydrofuran can be mentioned, and ethanol or methanol is preferable. As the hydrogen pressure, it is in the range of normal pressure to 10 Mpa, and normal pressure to 1.5 Mpa is preferable. As the reaction temperature for the catalytic reduction, it is in the range of 0 to 100°C, and preferably in the range of 20 to 60°C. As the reaction time, it is usually from about 3 to about 24 hours.

As shown in (Route 3B) of [Scheme 3], compound (3B-4) which is an aniline derivative can be produced by alkylation and decarboxylation of compound (3B-1) by the method described in the patent document (WO 1996/23754) to give compound (3B-3), and then conducting catalytic reduction of compound (3B-3). As the

alkylating agent, α -haloacetic acid esters can be used, and preferably, bromoacetic acid ethyl ester, bromoacetic acid methyl ester, chlorodifluoroacetic acid methyl ester can be mentioned. In the catalytic reduction, the catalyst, reaction solvent and reaction conditions described in aniline (3A-3) of (Route 3A) can be applied correspondingly.

As shown in (Route 3C) of [Scheme 3], compound (3C-3) which is an aniline derivative can be produced by preparation of difluoromethyl derivative (3C-2) by benzaldehyde (3C-1) and a fluorinating agent, followed by catalytic reduction of the nitro group of the difluoromethyl derivative (3C-2). As a fluorinating agent, dimethylaminosulfur trifluoride (DAST), bis(2-methoxyethyl)aminosulfur trifluoride (BAST) and the like can be used, and DAST is preferable. In the catalytic reduction, the catalyst, reaction solvent and reaction conditions described in aniline (3A-3) of (Route 3A) can be applied correspondingly.

The aniline derivative (4) used in [Scheme 1] is a commercialized product, or can be produced by the method shown in the following [Scheme 4].

[Scheme 4]

(Here, Ac represents an acetyl group; and R⁶ represents the same as described above.)

A sulfonamide derivative (4-4) can be produced from compound (4-1) in accordance with the method described in Scheme 23 of the patent document (WO 2006/012642). In addition, compound (4-7) which is an alkylsulfonylaniline derivative can be produced from compound

(4-2) which is a chlorosulfonyl derivative, via compound (4-5) and compound (4-6) in accordance with the method of Ballini, R. et al [Tetrahedron, 45, 6791 (1989)].

Compound (5-1) shown in [Scheme 1], which is a derivative of formula (I), can be converted into an alcohol derivative (5-2) by conducting a deprotection reaction if necessary.

[Scheme 5]

(Here, Bn represents a benzyl group; R^{2a} represents a hydrogen atom or a C1-C2 alkyl group; and R¹, R³, R⁴, R⁵ and R⁶ represent the same as described above.)

As a protecting group used for compound (5-1) which is a protected alcohol derivative, a protecting group generally used when protecting alcohols can be used, and a benzyl group can be mentioned preferably. In addition, regarding the selection of a protecting group, and the conditions for introduction and cleavage of the protecting group, documents described in the review books such as Protective Groups in Organic Synthesis (T. W. Greene and P. G. M. Wuts, John Wiley & Sons, Inc., New York, 1999) can be referred to.

For the deprotection of the benzyl group, general deprotection conditions for the benzyl group can be used, and is preferably catalytic reduction, acid treatment, and boron tribromide. As a catalyst, reaction solvent and reaction conditions used in the catalytic reduction, the catalyst, reaction solvent and reaction conditions described in the aforementioned (Route 3A) of [Scheme 3] can be applied correspondingly. As an acid used in the acid treatment, acids such as hydrochloric acid, sulfuric acid, trifluoromethanesulfonic acid can be used, and is preferably trifluoromethanesulfonic acid. As a reaction solvent, the reaction can also be carried out in the absence of a solvent, while halogenohydrocarbon solvents such as methylene chloride, hydrocarbon

solvents such as toluene, ether solvents such as tetrahydrofuran, and the like can be used, and is preferably methylene chloride. As the reaction temperature, it is in the range of 0°C to the boiling point of the solvent, preferably in the range of room temperature to boiling point of the solvent. As the reaction time, it is usually from about 0.5 to about 24 hours. In the case of the reaction with boron tribromide, halogenohydrocarbon solvents such as methylene chloride are preferable as the reaction solvent. As the reaction temperature, it is in the range of -70°C to room temperature, preferably -40°C to room temperature. As the reaction time, it is usually from about 0.5 to about 24 hours.

[Scheme 6] shows a production process of a compound of formula (I) having a fluoro-C1-C4 alkyl group as R².

[Scheme 6]

(Here, R¹, R^{2a}, R³, R⁴, R⁵ and R⁶ represent the same as described above.)

Compound (6-1), which is a fluoroalkylpyrrole derivative having an asymmetric carbon, can be produced by fluorination of compound (5-2) which is an alcohol derivative. In addition, compound (6-4), which is a stereoisomer of compound (6-1), can be produced via Mitsunobu Reaction of compound (5-2).

As a fluorinating agent, dimethylaminosulfur trifluoride (DAST) and bis(2-methoxyethyl)aminosulfur trifluoride (BAST) are preferable.

In the Mitsunobu Reaction, a combination of trialkylphosphine, triarylphosphine and azodicarboxylic acid ester, or Tsunoda reagent

and the like can be used, and is preferably a combination of triphenylphosphine and diisopropyl azodicarboxylate. In such case, the carboxylic acid used is preferably 4-nitrobenzoic acid and the like. As a reaction solvent, ether solvents such as tetrahydrofuran are preferable.

[Scheme 7] shows a production process of a compound of formula (I) having a carbamoyl-C1-C2 alkyl group as R^2 .

[Scheme 7]

(Here, R^{2b} and R^{2c} are the same or different from one another, and represent a hydrogen atom or a C1-C3 alkyl group; and R^1 , R^3 , R^4 , R^5 , and R^6 represent the same as described above.)

Compound (7-3), which is a carbamoyl-C1-C2 alkyl derivative, can be produced by oxidation of compound (7-1) to give compound (7-2) which is a carboxylic acid derivative, and then conducting condensation with amines or salts thereof. As the oxidation reaction, a one-step or two-step oxidation reaction known to produce a carboxylic acid from an alcohol derivative can be used. Preferably, a method in which a carboxylic acid is produced by sodium dihydrogenphosphate, 2-methyl-2-butene and sodium chlorite, after producing an aldehyde derivative by Dess-Martin oxidation [J. Am. Chem. Soc. 100, 300 (1978), J. Am. Chem. Soc. 101, 5294 (1979)], can be mentioned.

In the condensation reaction, a condensation agent used in general amide-forming reaction can be used, and a combination of 1-(3-dimethyl-aminopropyl)-3-ethylcarbodiimide hydrochloride salt

(water soluble carbodiimide) and 1-hydroxybenzotriazole monohydrate is preferable.

The atropisomers in the present invention are structural isomers based on an axial or facial chirality, arising from constrained intramolecular rotation. The compound having the general formula (I) of the present invention has two atropisomers that stem from axial asymmetry which arises from restriction of the rotation of the bond connecting the phenyl group having R³ group as a substituent and the substituted pyrrole ring, due to steric hindrance. With respect to the atropisomers of the present invention, in a case where the compound having the general formula (I) has isomers arising from an asymmetric carbon and the like, it means either one of a pair of atropisomers that exist for each of such isomeric compounds. The atropisomer which has superior pharmacological/pharmacokinetic activity, stability, internal kinetics, safety and the like, and has preferable properties as a medicament is preferred.

Here, the present invention comprises, among the atropisomers existing for the compound of the general formula (I), the atropisomer having superior or preferred pharmacological and/or pharmacokinetic activity, stability, internal kinetics, safety and the like, and has preferable properties as a medicament. However, the present invention also comprises compounds/compositions enriched in the atropisomer having the preferable properties as a major component, or also includes a mixture with the other atropisomer at any ratio, so long as it demonstrates such preferable properties. In compounds/compositions enriched in the atropisomer having superior and/or preferred properties, the atropisomer having such properties is present in greater concentration than the other atropisomer(s). Preferably, the preferred atropisomer comprises greater than 50%, 60%, 70%, 80%, 90%, 95%, 98%, or 99% of the atropisomers of the same structure. In a preferred embodiment, atropisomers of the same structure other than the preferred atropisomer are undetectable.

As separation and purification methods for the atropisomers produced by the aforementioned methods include, for example, chromatography, although the method is not limited thereto.

Hereinafter, details of a general optical resolution method by chromatography will be described.

In the optical resolution method using chromatography, when a stationary phase which incorporates an asymmetric element bonded with a derivative such as sugar is used as a carrier, the retention time of the chromatography becomes differentiated, thereby allowing resolution. By utilizing this property, direct resolution can be conducted by using the high performance liquid chromatography. Chiral columns include, for example, CHIRALPAK AD-H, CHIRALCEL OJ-RH (DAICEL), etc.

In a case where the atropisomer of the present invention is used as a medicament, the atropisomer of the compound having the aforementioned general formula (I) can be administered as itself (or a composition enriched in that atropisomer), or it (or a compound/composition enriched in it) can be mixed with an appropriate excipient, diluent and the like that are pharmacologically acceptable, and be administered orally as a tablet, a capsule, granules, powders, syrup and the like, or can be administered parenterally as injection, suppository, adhesive preparation or external preparation.

These pharmaceutical preparations are produced through known methods by using additives such as excipients, lubricants, binders, disintegrants, emulsifiers, stabilizers, correctives and diluents.

The present invention also comprises methods of inhibiting mineralocorticoid receptor activity, both in vitro and in vivo, the method comprising contacting the mineralocorticoid receptor with an effective inhibiting amount of compound of the invention. In one preferred embodiment, the receptor is in a cell. Preferably, the cell is within an animal body, preferably a human body. Such methods are useful, irrespective of any therapeutic effect, to study the role of the mineralocorticoid receptor in biological processes in vitro and in vivo.

The present invention also comprises a method of preventing or treating a mineralocorticoid receptor mediated condition or disease. Such conditions or diseases including, for, example, hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis,

WO 2010/042626

PCT/US2009/059852

cerebral infarction, fibrosis, primary aldosteronism and edema. The methods of prevention and/or treatment comprise administering to the animal (preferably human) an effective amount of a compound of the invention (alone or in a pharmaceutical composition). As used herein, "treatment" encompasses both curative as well as palliative treatments.

The dosage amount varies depending on the symptom, age and the like, the dose in the case of oral administration for a human adult is from 0.02 mg/kg (preferably 0.1 mg/kg) per dosage as a lower limit to 100 mg/kg (preferably 10 mg/kg) per dosage as an upper limit, and the dose in the case of parental administration is from 0.002 mg/kg (preferably 0.01 mg/kg) per dosage as a lower limit to 10 mg/kg (preferably 1 mg/kg) per dosage as an upper limit, and the dosage can be administered from one to six times per day depending on the symptoms.

The atropisomer of the compounds of the invention having preferred pharmacological and/or pharmacokinetic activity can be routinely determined and identified using the methods described herein and/or known to those skilled in the art.

EXAMPLES

Hereinafter, the present invention will be specifically explained with reference to Comparative Examples, Examples and Test Examples; however, the present invention is by no means limited to these. As used herein, "referential" and "comparative" are used interchangeably.

Here, the symbols "NMR" and "MS" in the Examples respectively mean "nuclear magnetic resonance" and "mass spectroscopy". The ratio of solvent for elution described in the portion of separation and purification using chromatography refers to volume ratio, unless otherwise noted. "NMR" means ¹H-NMR unless otherwise noted, content of the parenthesis shows the solvent for measurement, and TMS (tetramethylsilane) was used as internal standard for all cases. Further, "Anal. Calcd for RATIONAL FORMULA" and "required" respectively means a calculated value for elemental analysis and high resolution mass spectroscopy (HRMS), and the measured value was

provided following "found". In addition, in high performance liquid chromatography, analysis and purification were carried out by using either one of the following conditions of LC1 to LC10.

(Comparative Example 1) (4S)-4-(Benzyloxy)pentan-2-one

Under a nitrogen atmosphere, to a solution of (S)-(+)-3-hydroxybutyric acid ethyl ester (100 g, 0.76 mol) in methylene chloride (1.0 L), benzyl 2,2,2-trichloroacetoimidate (381 g, 1.5 mol) and trifluoromethanesulfonic acid (6.7 mL, 76 mmol) were gradually added, and the mixture was stirred at room temperature overnight. The precipitated solid was filtered, and after the mother liquid was successively washed with a saturated aqueous sodium hydrogencarbonate solution, water and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure. Hexane was added to the residue, and after the solid was filtered again, the solvent of the mother liquid was distilled off under reduced pressure to give (3S)-3-(benzyloxy)butanoic acid ethyl ester (339 g) as a mixture. The present compound was used for the subsequent reaction without further purification.

To a solution of the above ethyl (3S)-3-(benzyloxy)butanoic acid ethyl ester (339 g) in 1,4-dioxane (1.5 L), 2N aqueous sodium

hydroxide solution (0.75 L, 1.5 mol) was added, and the mixture was stirred at room temperature for 3 hours. After the reaction, the solvent was distilled off under reduced pressure, and after the aqueous phase was washed with diethyl ether, concentrated hydrochloric acid (0.14 L) was added to acidify it. After it was extracted with ethyl acetate, it was successively washed with water and saturated brine, and then it was dried with sodium sulfate and the solvent was distilled off under reduced pressure to give (3S)-3-(benzyloxy)butanoic acid (254 g) as a mixture. The present compound was used for the subsequent reaction without further purification.

Under a nitrogen atmosphere, to a solution of the above (3S)-3-(benzyloxy)butanoic acid (225 g) in DMF (1.5 L), N,O-dimethylhydroxylamine hydrochloride (111 g, 1.1 mol) and triethylamine (0.32 mL, 2.3 mol) were added, and the mixture was stirred at room temperature for 40 minutes. Subsequently, 1-hydroxybenzotriazole (112 g, 0.83 mol) and 1-ethyl-3-(3'-dimethylaminopropyl)carbodiimide hydrochloride (160 g, 0.83 mol) were successively added, and the mixture was stirred at room temperature for 5 hours. After the reaction, the reaction mixture was poured to ice-water, and it was extracted with diethyl ether. After it was successively washed with 1N hydrochloric acid, water, a saturated aqueous sodium hydrogencarbonate solution and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure to give (3S)-3-(benzyloxy)-N-methoxy-N-methylbutanamide (196 g) as a mixture. The present compound was used for the subsequent reaction without further purification.

Under a nitrogen atmosphere, to a solution of the above (3S)-3-(benzyloxy)-N-methoxy-N-methylbutanamide (196 g) in THF (1.5 L), a 3M methyl magnesium bromide/diethyl ether solution (0.38 mL, 1.1 mol) was gradually added under ice-cooling, and the mixture was stirred at the same temperature for 3 hours. After the reaction, the reaction mixture was poured to 2N hydrochloric acid, and after THF was distilled off under reduced pressure, it was extracted with diethyl ether. After it was successively washed with water, a saturated aqueous sodium hydrogencarbonate solution and saturated brine, it was dried with sodium sulfate and the solvent was

distilled off under reduced pressure to give a crude product. This was purified by reduced pressure distillation to give a title compound (44 g) as an oil.

(Comparative Example 2) (6S)-2-Acetyl-6-(benzyloxy)-4-oxoheptanoic acid ethyl ester

Under a nitrogen atmosphere, to a solution of the compound (54 g, 0.28 mol) of Comparative Example 1 in methanol (0.28 L), a solution of bromine (14 mL, 0.28 mmol) in methanol (45 mL) was gradually added under ice-cooling, and the mixture was stirred at room temperature for 1 hour. A 1M aqueous sodium hydrogencarbonate solution was added to stop the reaction and after methanol was distilled off under reduced pressure, it was extracted with diethyl ether. After it was successively washed with water and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure. Subsequently, 1M sulfuric acid (0.42 L, 0.42 mol) was added to a solution of the residue in THF (0.84 L), and the mixture was heated under reflux for 2 hours. After the reaction, THF was distilled off under reduced pressure and it was extracted with diethyl ether. After it was successively washed with water, a saturated aqueous sodium hydrogencarbonate solution and saturated brine, it was dried with sodium sulfate, and the solvent was distilled off under reduced pressure to give (4S)-4-(benzyloxy)-1-bromopentan-2-one (75 g, 99%) as a mixture.

^1H -NMR (400 MHz, CDCl_3) δ : 7.38-7.28 (5H, m), 4.58 (1H, d, J = 11.3 Hz), 4.43 (1H, d, J = 11.4 Hz), 4.08-4.03 (1H, m), 3.93 (2H, s), 2.94 (1H, dd, J = 15.7, 7.9 Hz), 2.70 (1H, dd, J = 15.5, 4.9 Hz), 1.27 (3H, d, J = 6.3 Hz).

Under a nitrogen atmosphere, to a solution of ethyl acetoacetate (1.0 g, 7.7 mmol) in ethanol (30 mL), 20% sodium

ethoxide/ethanol solution (3.1 mL, 7.7 mmol) was gradually added under ice-cooling, and the mixture was stirred at room temperature for 30 minutes. Thereafter, under ice-cooling, a solution of the above (4S)-4-(benzyloxy)-1-bromopentan-2-one (2.1 g, 7.7 mmol) in ethanol (6.0 mL) was gradually added, and the mixture was stirred at room temperature for 3 hours. After the reaction, ethanol was distilled off under reduced pressure and 1N hydrochloric acid (0.20 L) was added to acidify it. After it was extracted with ethyl acetate and successively washed with water, a saturated aqueous sodium hydrogencarbonate solution and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure. It was purified by silica gel column chromatography (ethyl acetate/hexane, 1:3, v/v) to give the title compound (1.6 g, 65%) as an oil.

¹H-NMR (400 MHz, CDCl₃) δ: 7.38-7.25 (5H, m), 4.55 (1H, dd, J = 9.4, 1.6 Hz), 4.44 (1H, dd, J = 11.8, 3.5 Hz), 4.21-4.16 (2H, m), 4.05-3.98 (2H, m), 3.18-3.10 (1H, m), 2.98-2.91 (1H, m), 2.84-2.78 (1H, m), 2.55-2.49 (1H, m), 2.34 (3H, d, J = 6.3 Hz), 1.29-1.23 (6H, m).
(Comparative Example 3) (6S)-6-(Benzyloxy)-4-oxo-2-propionylheptanoic acid methyl ester

After (4S)-4-(benzyloxy)-1-bromopentan-2-one (15 g, 52 mmol) was prepared from the compound of Comparative Example 1 in the process similar to Comparative Example 2, it was reacted with 3-oxopentanoic acid methyl ester (6.5 mL, 52 mmol) to give the title compound (7.8 g, 47%).

¹H-NMR (400 MHz, CDCl₃) δ: 7.38-7.25 (5H, m), 4.55 (1H, d, J = 11.3 Hz), 4.44 (1H, dd, J = 11.3, 3.4 Hz), 4.04-3.99 (2H, m), 3.72 (3H, d, J = 2.4 Hz), 3.22-3.11 (1H, m), 3.00-2.93 (1H, m), 2.84-2.60 (3H, m), 2.55-2.47 (1H, m), 1.23 (3H, d, J = 6.3 Hz), 1.09-1.05 (3H, m).

The title compound was obtained from the compound of Comparative Example 1 in the process similar to Comparative Example 2.

^1H NMR (400 MHz, CDCl_3) δ : 7.35-7.25 (5H m), 4.55 (1H, dd, $J = 0.8$, 11.2), 4.44 (1H, dd, $J = 4.0$, 11.2), 4.21-4.14 (2H, m), 4.04-3.98 (2H, m), 3.20-3.10 (1H, m), 2.99-2.92 (1H, m), 2.84-2.60 (3H, m), 2.55-2.48 (1H, m), 1.28-1.22 (6H, m), 1.09-1.05 (3H, m).

(Comparative Example 5) 2-Acetyl-6-(benzyloxy)-4-oxohexanoic acid ethyl ester

After 4-(benzyloxy)-1-bromobutan-2-one [^1H -NMR (400 MHz, CDCl_3) δ : 7.38-7.29 (5H, m), 4.51 (2H, s), 3.95 (2H, s), 3.77 (2H, t, $J = 6.1$ Hz), 2.92 (2H, t, $J = 6.1$ Hz).] was prepared in the process similar to Comparative Example 2 using 4-(benzyloxy)butan-2-one (61 g, 0.34 mol) as a starting material, the title compound (61 g, 67%) was obtained as an oil.

^1H -NMR (400 MHz, CDCl_3) δ : 7.38-7.28 (5H, m), 4.50 (2H, s), 4.19 (2H, q, $J = 7.0$ Hz), 4.04 (1H, dd, $J = 8.2$, 5.9 Hz), 3.76-3.70 (2H, m), 3.16 (1H, dd, $J = 18.4$, 8.2 Hz), 2.97 (1H, dd, $J = 18.4$, 5.9 Hz), 2.75 (2H, td, $J = 6.3$, 2.0 Hz), 2.35 (3H, s), 1.27 (3H, t, $J = 7.0$ Hz).

(Comparative Example 6) 4-Fluoro-1-nitro-2-(trifluoromethoxy)benzene

Fuming nitric acid (20 mL) was added dropwise to concentrated sulfuric acid (40 mL) under cooling (-10°C), and subsequently, 1-fluoro-3-(trifluoromethoxy)benzene (15 g, 83 mmol) was added to the

mixture at -10°C , and the mixture was stirred for 0.5 hours. After the mixture was added into ice-water to stop the reaction, it was extracted with dichloromethane. After the obtained organic layer was washed with a 1N aqueous sodium hydroxide solution and water, it was dried with anhydrous sodium sulfate. After filtration, the solution was concentrated and the residue was purified by silica gel column chromatography (100:0-97:3, hexane: ethyl acetate) to give the title compound (3.1 g, 16%) as an oil.

$^1\text{H-NMR}$ (400 MHz, CDCl_3) δ : 8.10 (1H, dd, $J = 5.5, 9.4$ Hz), 7.23-7.15 (2H, m).

(Comparative Example 8) 2-(Difluoromethoxy)-4-fluoro-1-nitrobenzene

To a solution of 5-fluoro-2-nitrophenol (3.1 g, 20 mmol) in DMF (40 mL), potassium carbonate (4.2 g, 30 mmol) and chlorodifluoroacetic acid methyl ester (3.2 mL, 30 mmol) were successively added at room temperature. Subsequently, the temperature of the mixture was raised to 100°C , and the mixture was stirred for 2 hours. The mixture was cooled to room temperature, and water (100 mL) was added to the reaction mixture, followed by

extraction with diethyl ether (200 mL) once. The organic layer was successively washed with water (100 mL) and a saturated aqueous sodium chloride solution (100 mL), and after it was dried with sodium sulfate, the solvent was distilled off under reduced pressure. The obtained residue was purified by silica gel column chromatography to give the title compound (3.1 g, yield: 75%).

$^1\text{H-NMR}$ (400 MHz, CDCl_3) δ : 8.03 (1H, dd, $J = 9.0, 5.9$ Hz), 7.17-7.06 (2H, m), 6.65 (1H, t, $J = 72.3$ Hz).

(Comparative Example 9) 2-(Difluoromethoxy)-4-fluoroaniline

To a solution of the compound (1.0 g, 4.8 mmol) of Comparative Example 8 in ethanol (25 mL), palladium-carbon (0.51 g) was added. The inside of the system was made to be a hydrogen atmosphere, and the mixture was stirred at room temperature for 4 hours. The reaction mixture was filtered by Celite, and the filtrate was concentrated. The obtained residue was purified by silica gel column chromatography to give the title compound (0.79 g, yield: 92%).

$^1\text{H-NMR}$ (400 MHz, CDCl_3) δ : 6.86-6.69 (3H, m), 6.47 (1H, t, $J = 73.5$ Hz), 3.71 (2H, s).

(Comparative Example 10) 4-Chloro-2-(difluoromethyl)aniline

Under a nitrogen atmosphere, to a solution of 5-chloro-2-nitrobenzaldehyde (6.0 g, 32 mmol) in methylene chloride (40 mL), diethylaminosulfur trifluoride (5.0 mL, 38 mmol) was gradually added under ice-cooling, and the mixture was stirred at the same temperature for 1 hour. Saturated brine was added to stop the reaction, and after the precipitated solid was filtered, the mother liquid was extracted with methylene chloride. After it was dried with sodium sulfate, the solvent was distilled off under reduced pressure to give 4-chloro-2-(difluoromethyl)-1-nitrobenzene (6.0 g)

as a crude product. The present compound was used for the subsequent reaction without further purification. Under a nitrogen atmosphere, to a solution of the above 4-chloro-2-(difluoromethyl)-1-nitrobenzene (6.0 g) in ethanol (0.10 L), stannous chloride dihydrate (28 g, 0.13 mol) and concentrated hydrochloric acid (20 mL) were successively added under ice-cooling, and the mixture was stirred at room temperature for 40 minutes. After the reaction, ethanol was distilled off under reduced pressure and a 5M aqueous sodium hydroxide solution was added under ice-cooling to make it basic. Thereafter, it was extracted with ethyl acetate and after it was successively washed with water and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure. The residue was purified by silica gel column chromatography (ethyl acetate/hexane, 1:3, v/v) to give the title compound (4.2 g, 76%) as a solid.

$^1\text{H-NMR}$ (400 MHz, CDCl_3) δ : 7.24-7.18 (2H, m), 6.67 (1H, d, $J = 8.6$ Hz), 6.57 (1H, t, $J = 55.1$ Hz), 4.06 (2H, brs).

(Comparative Example 11) 2-(Difluoromethyl)-4-fluoroaniline

Under a nitrogen atmosphere, to a solution of 5-fluoro-2-nitrobenzaldehyde (6.0 g, 36 mmol) in methylene chloride (40 mL), diethylaminosulfur trifluoride (5.6 mL, 43 mmol) was gradually added under ice-cooling, and the mixture was stirred at the same temperature for 1 hour. Saturated brine was added to stop the reaction, and after the precipitated solid was filtered, the mother liquid was extracted with methylene chloride. After it was dried with sodium sulfate, the solvent was distilled off under reduced pressure. The residue was purified by silica gel column chromatography (ethyl acetate/hexane, 1:6, v/v) to give 2-(difluoromethyl)-4-fluoro-1-nitrobenzene (5.9 g, 87%) as an oil.

(Comparative Example 12) 4-Amino-2-methylbenzenesulfonamide

To chlorosulfuric acid (20 mL, 302 mmol), m-acetotoluidine (10 g, 67 mmol) was added at room temperature over 20 minutes, and subsequently, the mixture was heated to 70°C and stirred for 8 hours. The mixture was cooled to room temperature, ice (50 g) was added to the reaction mixture, and the produced solid was collected by removing an aqueous layer by decantation. Subsequently, the obtained solid was washed with water (50 mL) to obtain a crude product. A solution of the obtained crude product in THF (50 mL) was cooled to 0°C, and concentrated ammonia water (20 mL) was added. Subsequently, the temperature of the mixture was raised to room temperature and the mixture was stirred for 2 hours. The reaction mixture was concentrated, water (100 mL) was added to the obtained solid, and filtration was carried out to give a crude product. To a solution of the obtained crude product in ethanol (200 mL), 6N hydrochloric acid (200 mL) was added at room temperature, and the mixture was heated under reflux and stirred for 3 hours. The reaction mixture was concentrated, methylene chloride (200 mL) was

added to the obtained solid, and filtration was carried out to give the title compound (7.1 g, yield: 48%).

Under a nitrogen atmosphere, to 3-acetotoluidine (5.0 g, 34 mmol), chlorosulfuric acid (10 mL, 0.15 mol) was gradually added at room temperature, and the mixture was stirred at 70°C for 10 hours. After the reaction, ice was added to the mixture to stop the reaction under ice-cooling and an aqueous phase was removed. To a suspension of the residue in THF (0.10 L), hydrazine monohydrate (5.1 mL, 0.10 mol) was gradually added, and the mixture was stirred at room temperature for 1.5 hours. After the reaction, THF was distilled off under reduced pressure. Thereafter, the produced solid was washed with water and diisopropyl ether, and it was dried to give the title compound (3.5 g, 43%) as an oil.

(Comparative Example 22) 4-Chloro-2-(4-fluorophenoxy)aniline

To a solution of 4-chloro-2-fluoronitrobenzene (3.0 g, 17.0 mmol) in DMF (8.7 mL), 4-fluorophenol (2.0 g, 17.9 mmol) and potassium carbonate (2.46 g, 17.9 mmol) were successively added, and the mixture was stirred at 70°C for 2 hours. After the reaction, the mixture was cooled to room temperature and ethyl acetate was added to the mixture. After the organic phase was washed with water (30 mL), 1N sodium hydroxide (aq., 30 mL) and saturated brine (20 mL), it was dried with sodium sulfate. The solvent was distilled off under reduced pressure to give 4-chloro-2-(4-fluorophenoxy)-1-nitrobenzene as a crude product. The obtained compound was used for the subsequent reaction without further purification.

To a solution of 4-chloro-2-(4-fluorophenoxy)-1-nitrobenzene (4.56 g, 17.0 mmol) and iron powder (3.07 g, 55.0 mmol) in ethanol (20 mL), a saturated aqueous ammonium chloride solution (aq., 8.0

(Comparative Example 23) 5-Chloro-4'-fluorobiphenyl-2-amine

To water (2 mL) and dimethoxyethane (20 mL), 5-chloro-2-nitrophenylboronic acid (3.27 g, 16.4 mmol), 1-fluoro-4-iodobenzene (3.65 g, 16.4 mmol), tetrakis(triphenylphosphine)palladium (0.95 g, 0.82 mmol) and potassium carbonate (6.81 g, 49.3 mmol) were added, and the mixture was stirred under a nitrogen atmosphere at 60°C for 2 hours. After the reaction, the reaction mixture was cooled to room temperature and ethyl acetate (30 mL) was added. After the organic phase was washed with water (30 mL) and saturated brine (20 mL), it was dried with sodium sulfate. The solvent was distilled off under reduced pressure to give 5-chloro-4'-fluoro-2-nitrobiphenyl as a crude product. The obtained compound was used for the subsequent reaction without further purification.

To a solution of the above 5-chloro-4'-fluoro-2-nitrobiphenyl (4.20 g, 15.7 mmol) and iron powder (2.75 g, 49.3 mmol) in ethanol (20 mL), a saturated aqueous ammonium chloride solution (aq., 8.0 mL) was added, and the mixture was stirred at 90°C for 30 minutes. After the reaction, the reaction mixture was cooled to room temperature and ethyl acetate (30 mL) was added. After the organic phase was washed with water (30 mL), it was dried with sodium sulfate. After the filtration and concentration, the residue was

purified by silica gel column chromatography (ethyl acetate/hexane, 1:20-1:3, v/v) to give the title compound (2.43 g, 11.0 mmol, 67%).

To a solution of (6S)-2-acetyl-6-(benzyloxy)-4-oxoheptanoic acid ethyl ester (2.5 g, 7.8 mmol) in acetic acid (8 ml), 4-chloro-2-methylaniline (1.1 g, 7.8 mmol) was added, and the mixture was stirred at 110°C for 15 hours. 15 ml of water was poured to the reaction mixture, and after the organic layer was extracted with diethyl ether, it was washed with 1N aqueous sodium hydroxide solution, water, a saturated aqueous ammonium chloride solution and saturated brine, and dried with sodium sulfate. The solvent was distilled off under reduced pressure and the residue was crudely purified by silica gel column chromatography. Subsequently, the product was dissolved in a 5M aqueous sodium hydroxide solution (30 mL) and methanol (40 mL), and the mixture was stirred at 100°C for 4 hours. After the reaction, 2M hydrochloric acid (80 mL) was added under ice-cooling to neutralize it, and it was extracted with ethyl acetate. The obtained organic layer was washed with water and saturated brine and dried with sodium sulfate. The solvent was distilled off under reduced pressure and the residue was purified by silica gel column chromatography to give the title compound (2.3 g, 73%).

Aniline A: 4-methylsulfonylaniline

Aniline B: 4-aminosulfonylaniline

Aniline C: 4-aminosulfonyl-3-chloroaniline [Synthesized by the method described in Patent document (WO2006/012642)].

(Comparative Example 60) 5-[2-(Benzyloxy)ethyl]-1-[4-chloro-2-(trifluoromethyl)phenyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide

To a solution of the compound (75 g, 0.16 mol) of Comparative Example 34 in methanol (0.95 L), a 5N aqueous sodium hydroxide solution (0.64 L, 3.2 mol) was added, and the mixture was heated under reflux for 4 hours. After the reaction, methanol was distilled off under reduced pressure, and after 5N hydrochloric acid was added to acidify it, it was extracted with ethyl acetate. After it was successively washed with water and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure. The residue was purified by silica gel column chromatography (ethyl acetate/hexane, 1:2, v/v) to give pyrrolecarboxylic acid (63 g, 89%). Under a nitrogen atmosphere, to a solution of pyrrolecarboxylic acid (63 g, 0.14 mol) in methylene chloride, oxalyl chloride (15 mL, 0.17 mol) was added, and after the mixture was stirred at room temperature for 2 hours, methylene chloride was distilled off under reduced pressure. Tetrahydrofuran (0.43 L) was added to the residue, aniline A (31 g, 0.15 mol) and

diisopropylethylamine (75 mL, 0.43 mol) were successively added, and the mixture was stirred at 70°C overnight. After the reaction, tetrahydrofuran was distilled off under reduced pressure. After 5N hydrochloric acid was added to acidify it, it was extracted with diethyl ether. After it was successively washed with water, a saturated aqueous sodium hydrogencarbonate solution and saturated brine, it was dried with sodium sulfate and the solvent was distilled off under reduced pressure. The residue was purified by silica gel column chromatography (ethyl acetate/hexane, 1:1, v/v) to give the desired compound (77 g, 81 %) as a solid.

In the following Test Examples, 1-[2-(trifluoromethyl)phenyl]-2,5-dimethyl-N-[4-(methanesulfonyl)phenyl]-1H-pyrrole-3-carboxamide (Comparative compound A) and 1-[4-fluoro-2-(trifluoromethyl)phenyl]-2,5-dimethyl-N-[4-(methanesulfonyl)phenyl]-1H-pyrrole-3-carboxamide (Comparative compound B) were selected from the compounds described in the prior art (WO 2006/012642) as the most suitable Comparative compounds, and were used.

Comparative compound A

Comparative compound B

(Test Example 1)

A plasmid pM-hMR-LBD expressing GAL4-hMR receptor, which has a ligand binding domain (LBD, corresponding to approximately 308 amino acids at the carboxy terminus) of human mineralocorticoid receptor (hMR, NM_000901) bonded to a DNA binding domain of yeast transcription factor GAL4 (corresponding to 147 amino acids at the amino terminus), was prepared. Reporter assay was conducted by using a reporter plasmid (such as plasmid pFR-Luc of STRATAGENE CLONING SYSTEMS) including a luciferase gene, having a sequence (UAS sequence) which binds to the DNA binding domain of GAL4.

The plasmid pM-hMR-LBD and the reporter plasmid as obtained above were gene transferred into renal cell line HEK293 of human fetus by lipofection. On the next day, cells were collected by trypsin treatment, and dispensed with DMEM culture medium containing 5% of FBS treated by activated charcoal, to a white 96-well plate (Costar) with the amount of 95 microliter per well.

The test compounds were used as dissolved in dimethyl sulfoxide at a predetermined concentration, and the test compounds suitably diluted with culture media were added to the cells on the white 96-well plate so that the final concentration becomes 0.1%. When adding the test compounds, they were accompanied with 1 nM aldosterone. The well group of Control group 1 was added with dimethyl sulfoxide, and the well group of Control group 2 was added

with 1 nM aldosterone. After the addition, cultivation was carried out overnight.

On the next day, the culture media was removed, and then luciferase substrate (Wako Pure Chemical Industries, Ltd.) was prepared in accordance with the attached document and were added to each well by 50 microliters. Stirring was conducted for approximately 30 minutes, and the amount of luminescence was measured for each well by using Analyst (Molecular Devices), to obtain luciferase activity. A graph which plots relative luciferase activity values, when the luciferase activity value of Control group 1 was taken as 0% and the luciferase activity value of Control group 2 was taken as 100%, for each of the amount of the test compound addition group was made. From the graph, concentration of the test compound which shows the maximum value was calculated as I_{max} (%), and the concentration which shows $I_{max}/2$ was calculated as $IC_{max_{50}}$ (nM). $IC_{max_{50}}$ values are shown in Table 15.

(Results)

As shown in the following (Table 15), the atropisomers of the present invention showed significant mineralocorticoid receptor antagonistic action when compared with the corresponding racemic compound.

(Test Example 2)

Cynomolgus monkey (male) was used, and it was fasted from the day before administration of the test compound.

Administration samples were prepared by adding a 0.5% MC (methyl cellulose) solution to the Test Compound, so that the dose becomes 3 mg/2 mL/kg. Each of the administration samples was administered intragastrically to the cynomolgus monkey by using a tube. After the samples were administered, approximately 5 mL of 0.5% MC was administered. For each of the administration samples, a group of two cynomolgus monkeys was administered.

With respect to collection of blood, it was conducted by collecting approximately 0.5 mL of blood from crotch vein using a glass syringe treated with heparin, before administration, and 30 minutes, 1, 2, 4, 6, 8, 24 and 48 hours after administration. Blood was centrifuged (1,700 × g, 15 min, 4°C) to obtain plasma. Plasma was stored in a freezer (-20°C) until pretreatment.

Preparation of standard solution and internal standard (IS) solution: Each of the Test Compounds was dissolved in DMSO (dimethyl sulfoxide) to prepare a solution of 10 mM each. Each of the compound solution was diluted with acetonitrile, and thus standard solution was prepared. Further, niflumic acid (Wako Pure Chemical Industries, Ltd.) was dissolved in DMSO at the concentration of 2 mM, followed by dilution with acetonitrile to prepare an IS solution of 2 μ M.

Pretreatment of plasma samples: 20 μ L of plasma sample was collected, and then 25 μ L of purified water, 100 μ L of acetonitrile, and 100 μ L of methanol was added. For the preparation of a calibration curve, 25 μ L of purified water, 20 μ L of each of the standard solutions (acetonitrile solution), 80 μ L of acetonitrile, and 100 μ L of methanol were added to 20 μ L of blank plasma. 40 μ L of the acetonitrile solution of IS was added to all of the samples, and then the samples were stirred, filtered by suction using Captiva filter plate (Varian, Inc.), and then the filtrate was used as the sample for LC-MS/MS analysis.

Quantitative Determination of Test Compound: Concentration in plasma was analyzed by LC-MS/MS method for each Test Compound.

[HPLC Analysis Conditions]

HPLC: WATERS 2795 (Waters Corporation);

Column: CAPCELL PAK C8, 2.0 mm I.D. $\times$ 50 mm, 5 μ m (Shiseido Co., Ltd.)

Mobile Phase: A = 5 mM ammonium acetate aqueous solution, B = acetonitrile

[MS/MS Analysis Conditions]

MS: Quattro micro API (Waters Corporation)

Ionization Method: Electrospray Ionization (ESI)

Ionization Mode: Positive

Detection Mode: MRM

Analysis: Pharmacokinetic parameter was calculated from concentration of each of the drugs in plasma, by using WinNonlin Professional (Ver. 4.0.1, Pharsight Corporation). Here, Noncompartment model was used as the model for parameter calculation.

(Results)

As a result of evaluating Reference compound A and Reference compound B, and the Example compounds listed below, the atropisomer mentioned in Test Example 1 having high activity showed considerably improved concentration in plasma when compared with the Reference drug, as shown in (Table 16). In addition, the compound of Example 62 having 2-hydroxyethyl group as R², showed considerably improved concentration in plasma, when compared with Reference compound A and Reference compound B which have a methyl group as R².

[INDUSTRIAL APPLICABILITY]

Since the atropisomers of a compound represented by the general formula (I) of the present invention shows pharmacological activities such as particularly good mineralocorticoid receptor

antagonistic activity, antihypertensive action, vasodilation action, cardioprotective action, nephropathy inhibitory action, antiarteriosclerotic action and diuretic action, and is high in safety, it is useful as a preventive drug or a therapeutic drug for hypertension, angina cordis, acute coronary syndrome, congestive heart failure, nephropathy, including diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis and primary aldosteronism.

We claim:

1. A mineralocorticoid receptor antagonist of general formula (I):

an N-oxide thereof; a diastereomer, racemate, or compound enriched in a diastereomer thereof; an atropisomer, equal mixture of atropisomers, or compound enriched in an atropisomer thereof; or a pharmaceutically acceptable salt of any of the foregoing, wherein,

R^1 represents a C1-C3 alkyl group;

R^2 represents a hydroxy-C1-C4 alkyl group, a fluoro-C1-C4 alkyl group, a carbamoyl-C1-C2 alkyl group, a N-mono(C1-C3 alkyl)carbamoyl-C1-C2 alkyl group or a N,N-di(C1-C3 alkyl)carbamoyl-C1-C2 alkyl group;

R^3 represents a halogeno group, a C1-C3 alkyl group, a C1-C3 alkoxy group, a halogeno-C1-C3 alkyl group, a halogeno-C1-C3 alkoxy group, a 4-halogenophenyl group or a 4-halogenophenoxy group;

R^4 represents a hydrogen atom, a halogeno group or a C1-C3 alkyl group;

R^5 represents a sulfamoyl group or a C1-C3 alkylsulfonyl group; and

R^6 represents a hydrogen atom, a halogeno group, a C1-C3 alkyl group or a C1-C3 alkoxy group.

2. The compound according to claim 1, wherein R^1 is a methyl group or an ethyl group.
3. The compound according to claim 1, wherein R^1 is a methyl group.
4. The compound according to any one of claims 1 to 3, wherein R^2 is a 2-hydroxyethyl group, a 2-hydroxypropyl group, a 2-fluoropropyl group or a 2-fluoroethyl group.
5. The compound according to any one of claims 1 to 3, wherein R^2 is a 2-hydroxypropyl group.

6. The compound according to any one of claims 1 to 5, wherein R^3 is a methyl group, a chlorine atom, a halogenomethyl group or a halogenomethoxy group.
7. The compound according to any one of claims 1 to 5, wherein R^3 is a methyl group, a chlorine atom, a difluoromethyl group, a trifluoromethyl group, a difluoromethoxy group or a trifluoromethoxy group.
8. The compound according to any one of claims 1 to 5, wherein R^3 is a trifluoromethyl group, a difluoromethoxy group or a trifluoromethoxy group.
9. The compound according to any one of claims 1 to 8, wherein R^4 is a halogeno group.
10. The compound according to any one of claims 1 to 8, wherein R^4 is a fluorine atom.
11. The compound according to any one of claims 1 to 10, wherein R^5 is a sulfamoyl group or a methylsulfonyl group.
12. The compound according to any one of claims 1 to 10, wherein R^5 is a methylsulfonyl group.
13. The compound according to any one of claims 1 to 12, wherein R^6 is a hydrogen atom, a chlorine atom or a methyl group.
14. The compound according to any one of claims 1 to 12, wherein R^6 is a hydrogen atom.
15. A compound that is:
1-[4-chloro-2-(trifluoromethyl)phenyl]-5-(2-hydroxyethyl)-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
1-[4-fluoro-2-(trifluoromethyl)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
1-[4-chloro-2-(trifluoromethyl)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
1-(4-fluoro-2-methylphenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
1-[2-(difluoromethoxy)-4-fluorophenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
N-[4-(aminosulfonyl)-3-methylphenyl]-1-[4-fluoro-2-(trifluoromethyl)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-1H-pyrrole-3-carboxamide;

1-[4-chloro-2-(difluoromethoxy)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 N-[4-(aminosulfonyl)-3-chlorophenyl]-1-[4-fluoro-2-(trifluoromethyl)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-1H-pyrrole-3-carboxamide;
 1-[4-fluoro-2-(trifluoromethoxy)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[2-(difluoromethoxy)-4-fluorophenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[3-methyl-4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[2-(difluoromethyl)-4-fluorophenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(4-fluoro-2-methylphenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[3-methyl-4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[2-(difluoromethoxy)-4-fluorophenyl]-2-ethyl-5-[(2S)-2-hydroxypropyl]-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(2-chloro-4-fluorophenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(4-chloro-2-methylphenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[4-chloro-2-(trifluoromethoxy)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(2,4-dichlorophenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(2-chloro-4-fluorophenyl)-2-ethyl-5-[(2S)-2-hydroxypropyl]-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(2,4-dichlorophenyl)-2-ethyl-5-[(2S)-2-hydroxypropyl]-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(4-chloro-2-methylphenyl)-5-(2-fluoroethyl)-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 5-(2-fluoroethyl)-1-(4-fluoro-2-methylphenyl)-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[2-(difluoromethoxy)-4-fluorophenyl]-5-(2-fluoroethyl)-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;

1-[4-chloro-2-(trifluoromethyl)phenyl]-5-[(2R)-2-fluoropropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[4-chloro-2-(difluoromethoxy)phenyl]-5-[(2R)-2-fluoropropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 and 1-[4-chloro-2-(trifluoromethyl)phenyl]-5-[2-(dimethylamino)-2-oxoethyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 or an N-oxide; a diastereomer, racemate, or compound enriched in a diastereomer; an atropisomer, equal mixtures of atropisomers, or compound enriched in an atropisomer thereof; or pharmaceutically acceptable salt of one of the foregoing.

16. A compound that is:

1-[4-fluoro-2-(trifluoromethyl)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[4-chloro-2-(trifluoromethyl)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[2-(difluoromethoxy)-4-fluorophenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[4-chloro-2-(difluoromethoxy)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[4-fluoro-2-(trifluoromethoxy)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[2-(difluoromethyl)-4-fluorophenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-(2-chloro-4-fluorophenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 1-[4-chloro-2-(trifluoromethoxy)phenyl]-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 and 1-(2,4-dichlorophenyl)-5-[(2S)-2-hydroxypropyl]-2-methyl-N-[4-(methylsulfonyl)phenyl]-1H-pyrrole-3-carboxamide;
 or an N-oxide, a diastereomer, racemate, or compound enriched in a diastereomer; an atropisomer, equal mixtures of atropisomers, or compound enriched in an atropisomer thereof; or pharmaceutically acceptable salt of one of the foregoing.

17. An atropisomer of the compound according to any one of claims 1 to 16 that shows stronger mineralocorticoid receptor antagonist activity compared to the other atropisomer(s) of the compound.
18. A medicament comprising the compound according to any one of claims 1 to 17.
19. A preventive drug or a therapeutic drug for cardiovascular disease, comprising the compound according to any one of claims 1 to 17.
20. A preventive drug or a therapeutic drug for hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism or edema, comprising the compound according to any one of claims 1 to 17.
21. A preventive drug or a therapeutic drug for nephropathy, comprising the compound according to any one of claims 1 to 17.
22. A preventive drug or a therapeutic drug for hypertension, comprising the compound according to any one of claims 1 to 17.
23. A preventive drug or a therapeutic drug for diabetic nephropathy, comprising the compound according to any one of claims 1 to 17.
24. A pharmaceutical composition comprising the compound according to any one of claims 1 to 17 and a pharmacologically acceptable carrier, diluent, or excipient.
25. Use of an effective inhibiting amount of a compound of any one of claims 1-17, or a composition of claim 24 to inhibit mineralocorticoid receptor activity.
26. The use according to claim 25 wherein the receptor is in a cell.
27. The use according to claim 26 wherein the cell is within an animal body.
28. The use according to claim 27 wherein the animal is a human.
29. A use of an amount of a compound of any one of claims 1-17, or a composition of claim 24 for preventing or treating a mineralocorticoid receptor-mediated condition or disease in an animal.

30. The use according to claim 29 wherein the condition or disease is hypertension, angina pectoris, acute coronary syndrome, congestive heart failure, nephropathy, diabetic nephropathy, arteriosclerosis, cerebral infarction, fibrosis, primary aldosteronism or edema.
31. The use according to claim 29 or 30 wherein the animal is a human.
32. Use of an effective amount of a compound of any one of claims 1-17, or a composition of claim 24 for treatment of diabetic nephropathy in an animal.
33. The use according to claim 32 wherein the animal is a human.
