# UNITED STATES PATENT OFFICE.

WILLIAM ERDMANN, OF MADISON, WISCONSIN.

#### SCRAPER.

No. 876,789.

Specification of Letters Patent.

Patented Jan. 14, 1908.

Application filed August 28, 1907. Serial No. 390,520.

To all whom it may concern:

Be it known that I, William Erdmann, residing at Madison, in the countyof Dane and State of Wisconsin, have invented a new and 5 Improved Scraper, of which the following is

a specification.

My invention relates to certain new and useful improvements in scrapers for dressing floors and the like, and the invention pri-10 marily has for its object to provide a scraper of an improved construction which can be easily and cheaply manufactured and which will readily and effectively serve its intended In my invention means are propurposes. vided for holding and clamping the scraping blade, which means can be easily and quickly adjusted to permit insertion or withdrawal of the blade, as the case may be.

Another object of my invention is to pro-20 vide a scraper having a yielding pad against which the blade rests to absorb or prevent vibration when the implement is in use.

The invention also embodies certain novel construction, combination and arrangement 25 of parts, all of which will be first described in detail and then be specifically pointed out in the appended claims, reference being had to the accompanying drawings, in which,

Figure 1, is a perspective view of my inven-on. Fig. 2, is a central, vertical section thereof. Fig. 3, is a horizontal section on the line 3—3 of Fig. 2. Fig. 4, is a perspective view of the metallic gage and blade holding clamp member. Fig. 5, is a similar view 35 of the stock and handle member. Fig. 6, is a perspective view of the bridge members.

Referring now to the accompanying drawings in which like letters and numerals of reference indicate like parts in all of the figures, 40 1 designates the stock with which the handles 1ª merge, and the stock 1 has its under face plane, while its front face 1° is in a plane held at an obtuse angle to the plane containing the horizontal surfaces 1b of the stock.

Cemented or otherwise held in contact with the front face 1° of the stock 1, is a pad 2, of leather or other similar yielding material of substantially even thickness throughout, and against which the scraping blade 3 50 is held.

The blade 3 may be of the ordinary type and have the usual cutting edge 3a, as shown.

On the rear the stock 1 is formed with an elongated countersunk portion 1d to receive 55 the bow shaped bridge member 4 and the set screw carrying bridge bar 5, the bar 5 having

a threaded aperture to receive the set screw 6 and having its ends cut away as at 5b to form nut holding sockets.

The ends of the bars 4 and 5 have alining 60 apertures 4ª and 5ª which register with the bolt holes 1× in the stock 1, to permit passage of the clamping bolts 7 which cooperate with the nuts 8, as shown.

9 designates the combined gage and blade 65 holding clamp member which has the usual body 9a whose under face 9b lies in the same plane with that containing the face 1b of the stock 1. The body 9a has an upwardly projecting rear face 9° held at an acute angle to 70 the face 9b and it also has upwardly projecting arms 9° having depressed blade receiving portions 9d and bolt apertures 9e together with a clearance space 9<sup>f</sup> to permit passage for the shavings

In practice, the parts are arranged as shown in Figs. 1, 2 and 3. To loosen the member 9 and release the blade, it is only necessary to turn the set screw to ease up on the tension exerted on the bolt, when the 80 blade may be easily withdrawn for sharpening or otherwise. When it is desired to reing or otherwise. When it is desired to re-insert the blade it is only necessary to replace the same in the position shown in Fig. 1. within the recesses 9d and tighten up on 85 the set screw, thus exerting a tension on the bolts and drawing the member 9 against the blade, and tightly clamping the blade against the yieldable cushion or pad.

By constructing a scraper as shown and 90 described, the same can be easily and cheaply manufactured at a minimum expense and the blade can be readily adjusted to its proper position as well as easily and quickly removed for sharpening, the provision of the yieldable 95 pads serving to take up any vibrations which may occur during the operation of the implement and prevent chattering of the blade.

It will be noticed that the cut away ends of the set screw carrying bridge member 5 to- 100 gether with the countersunk portion of the stock 1 in which the bridge members are held, serve as a nut lock and prevent the nuts becoming loose, it being understood that the heads 7ª of the bolts have their faces held at 105 a slight angle to the longitudinal axis of the bolts, thus preventing turning of the bolt when the set screw is tightened up.

From the foregoing description, taken in connection with the accompanying drawings, 110 it is thought the complete construction, opoperation and numerous advantages of my

invention will be readily understood by those skilled in the art to which the invention ap-

What I claim is,-

1. The combination with the stock, the blade holding clamp member, and means for mounting the blade holding clamp member on the stock, of means carried by the stock and cooperatively connected with the aforesaid 10 mounting means for causing the blade carrying clamp member to clamp the blade against the stock substantially as shown and

2. The combination with the stock, the 15 blade holding clamp member having blade receiving recesses and the blade therein, of securing means passed through the clamping member and the stock for holding the clamping member to the stock, and means for tight-20 ening up or loosening said securing means to clamp or release the blade, substantially as

shown and described.

3. The combination with the stock, the blade holding clamp member having blade 25 receiving recesses and the blade therein, of securing means passed through the clamping member and the stock for holding the clamping member to the stock, means for tightening up or loosening said securing means to 30 clamp or release the blade, said last named means comprising a pair of bridge members carried by the stock and cooperatively connected with the securing means, and means carried by one of said bridge members for 35 exerting a tension on said securing means to draw the blade holding clamp member tightly against the blade, substantially as shown and described.

4. The combination with the stock, the 40 blade holding clamp member having blade receiving recesses and the blade therein, of securing means passed through the clamping member and the stock for holding the clamping member to the stock, means for tighten-45 ing up or loosening said securing means to clamp or release the blade, said last named means comprising a pair of bridge members carried by the stock and coöperatively connected with the securing means, means car-50 ried by one of said bridge members for exerting a tension on said securing means to draw the blade holding clamp member tightly against the blade, and a yieldable pad interposed between the blade and the blade holding clamp member and the stock, substan- 55 tially as shown and described.

5. The combination with the stock, the blade holding clamp member and the blade, and bolts for securing the blade holding member to the stock, of tension devices for said 60 bolts to cooperate with the blade holding clamp members, substantially as shown and described.

6. The combination with the stock, the blade holding clamp member and the blade, 65 and bolts for securing the blade holding member to the stock, of tension devices for said bolts to cooperate with the blade holding clamp members, said tension devices comprising a bridge member connected with said 70 bolts, and means cooperating with the bridge member for exerting a tension on said bolts.

7. The combination with the stock, the blade holding clamp member and the blade, and bolts for securing the blade holding mem- 75 ber to the stock, of tension devices for said bolts to cooperate with the blade holding clamp members, said tension devices comprising a bridge member connected with said bolts, means cooperating with the bridge 80 member for exerting a tension on said bolts. said last named means comprising a set screw passing through said bridge member, substantially as shown and described.

8. The combination with the stock, the 85 blade holding clamp member and the blade, and bolts for securing the blade holding member to the stock, of tension devices for said bolts to cooperate with the blade holding members, said tension devices comprising a 90 bridge member connected with said bolts. means cooperating with the bridge member for exerting a tension on said bolts, said last named means comprising a set screw passing through said bridge member, and a supple- 95 mental bridge member held within said stock and adapted to be cooperatively engaged by said set screw, substantially as shown and described.
