A graphical user interface (GUI) includes a first window that displays video data of a first entertainment selection. A first area of the first window displays entertainment system data that corresponds to the first entertainment selection. The GUI includes a second window that displays video data of a second entertainment selection. A second area of the second window, displays entertainment system data that corresponds to the second entertainment selection. Upon selection by a user of the respective window, entertainment system data regarding the entertainment selection corresponding to the respective window is displayed.

METHOD AND APPARATUS FOR DISPLAYING ENTERTAINMENT SYSTEM DATA UPON SELECTION OF A VIDEO DATA DISPLAY

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation of prior application Ser. No. 09/166,134, filed Sep. 30, 1998.

FIELD OF THE INVENTION

[0002] The present invention relates to the field of entertainment systems. Specifically, the present invention relates to graphical user interfaces (GUI) in entertainment systems that display video data and entertainment system data.

BACKGROUND OF THE INVENTION

[0003] A current trend in the electronics and computer industry is the convergence of computer systems and more traditional entertainment system components. As this convergence continues, more components in these systems will be combined together resulting in an increase in entertainment selections and entertainment system data available to users.

[0004] Current mechanisms for storing and providing entertainment system data to users are component specific. For example, programming guides made available by many cable companies provide some entertainment system data relating to entertainment selections available to the users. Typically, the programming guides provide an on-screen display of programming information for channels supported by the cable system. The programming guides, however, do not store or display entertainment system data from sources other than the cable company to the user. Thus, for example, if a user's entertainment system includes a digital satellite system (DSS), a vertical blanking interval (VBI) decoder, a modem, a network connection, or a video library, the entertainment system data from these entertainment selections would not be available to the user on the cable system's programming guide.

[0005] In addition, the programming guides typically display limited information about an entertainment selection. The information is usually limited to the title of the entertainment selection, the time it is broadcasted, and the channel broadcasting the entertainment selection. The information is typically presented in a static text format.

SUMMARY

[0006] A graphical user interface (GUI) is disclosed. The GUI includes a first window that displays video data of a first entertainment selection from a first entertainment selection source. A first area of the first window, displays entertainment system data that corresponds to the first entertainment selection. The GUI includes a second window that displays video data of a second entertainment selection from a second entertainment selection source. A second area of the second window, displays entertainment system data that corresponds to the second entertainment selection. Upon selection by a user of the respective window, entertainment system data regarding the entertainment selection corresponding to the respective window is displayed.

BRIEF DESCRIPTION OF THE DRAWINGS

[0007] The present invention is illustrated by way of example and not by way of limitation in the figures of the accompanying drawings, in which like references indicate similar elements and in which:

[0008] FIG. 1 is a block diagram illustrating the system components of one embodiment of an entertainment system according to the present invention;

[0009] FIG. 2 is a block diagram illustrating one embodiment of a system controller according to the present invention;

[0010] FIG. 3 is a block diagram of modules implementing an embodiment of a database system according to an embodiment of the present invention;

[0011] FIG. 4 illustrates entertainment system data records stored in a database according to an embodiment of the present invention;

[0012] FIG. 5 is a block diagram of a channel scan unit according to an embodiment of the present invention;

[0013] FIG. 6 illustrates a graphical user interface according to a first embodiment of the present invention; and

[0014] FIG. 7 is a flow chart illustrating a method for managing entertainment system data according to an embodiment of the present invention.

DETAILED DESCRIPTION

[0015] FIG. 1 is a block diagram illustrating system components of an entertainment system 100 according to one embodiment of the present invention. The entertainment system includes a common input/output (I/O) bus 110 that connects the system components in the entertainment system 100 together. It should be appreciated that the common I/O bus 110 is illustrated to simplify the routing of signals between the computer system components. The common I/O bus 110 may represent a plurality of known mechanisms and techniques for routing I/O signals between the computer system components. For example, the common I/O bus 110 may include an appropriate number of independent audio "patch" cables that rout audio signals, coaxial cables that rout video signals, two-wire serial lines or infrared or radio frequency transceivers that rout control signals, or other routing mechanisms that rout other signals.

[0016] In the illustrated embodiment, the entertainment system 100 includes a television/monitor 121, video recorder/playback device 122, digital video disk (DVD) recorder/playback device 123, audio/video tuner and amplifier 124, audio playback/recorder device 125, and compact disk player 126 coupled to the common I/O bus. The video recorder/playback device 122, DVD recorder/playback device 123, audio playback/recorder device 125, and compact disk player 126 may be single disk or single cassette devices, or alternatively may be multiple disk or multiple cassette devices.

[0017] In addition, the entertainment system 100 includes a speaker system 131, microphone 132, video camera 133, and a wireless I/O control device 134. In one embodiment, wireless I/O control device 134 is an entertainment system remote control unit, which communicates with the components of the entertainment system 100 through IR signals. In

another embodiment, wireless I/O control device **134** may be a wireless keyboard and cursor-positioning device that communicates with the components of entertainment system **100** through IR signals or RF signals. In yet another embodiment, wireless I/O control device **134** may be an IR remote control device similar in appearance to a typical entertainment system remote control with the added feature of a track-ball or other navigational mechanisms which allows a user to position a cursor on a display of the entertainment system **100**.

[0018] The entertainment system **100** also includes a system controller **140**. According to one embodiment of the present invention, the system controller **140** operates to store and display entertainment system data available from a plurality of entertainment system data sources. According to another embodiment of the present invention, system controller **140** is configured to control a wide variety of features associated with each of the system components. As shown in FIG. 1, system controller **140** is coupled, either directly or indirectly, to each of the system components, as necessary, through I/O bus **110**. In one embodiment, in addition to or in place of I/O bus **110**, system controller **140** is configured with a wireless communication transmitter (or transceiver), which is capable of communicating with the system components via IR signals or RF signals **110'**. Regardless of the control medium, the system controller **140** is configured to control one or more of the entertainment system components of the entertainment system **100**, although it is understood that each of the components may be individually controlled with wireless I/O control device **134**.

[0019] As illustrated in FIG. 1, system **100** may be configured to receive entertainment selections and entertainment system data from various entertainment selection sources. In one embodiment, entertainment system **100** receives entertainment selections and entertainment system data from any or all of the following sources: cable broadcast **141**, satellite broadcast **142** (e.g., via a satellite dish), very high frequency (VHF) or ultra high frequency (UHF) radio frequency communication of the broadcast networks **143** (e.g., via an aerial antenna), telephone/computer network broadcast **144**, and/or information stored locally at system controller **140** or another component of the entertainment system **100**. Further, it will be appreciated by one skilled in the art, that cable broadcast input **141**, satellite broadcast input **142** and VHF/UHF input **143** may receive input from digital broadcast programming and digital cable programming. The cable broadcast input **141**, satellite broadcast input **142**, VHF/UHF broadcast input **143**, and telephone/computer network broadcast input **144** may be received by the audio/video tuner and amplifier **124**, the system controller **140**, or other component on the entertainment system **100**.

[0020] Although the present invention is described in the context of the exemplary embodiments presented in the figures, those skilled in the art will appreciate that the present invention is not limited to these embodiments and may be practiced in a variety of alternate embodiments. Accordingly, the innovative features of the present invention may be practiced in a system of greater or lesser complexity than that of the system depicted in FIG. 1.

[0021] FIG. 2 is a block diagram illustrating an embodiment of a computer system **200** that may be used to

implement the system controller **140** according to the present invention. The computer system **200** includes a processor **201** that processes data signals. The processor **201** may be a complex instruction set computer (CISC) microprocessor, a reduced instruction set computing (RISC) microprocessor, a very long instruction work (VLIW) microprocessor, a processor implementing a combination of instruction sets, or other processor device. FIG. 2 shows an example of the present invention implemented on a single processor computer system **200**. However, it is understood that the present invention may be implemented in a computer system having multiple processors. The processor **201** is coupled to a CPU bus **210**, which transmits data signals between processor **201** and other components in the computer system **200**.

[0022] As an example, memory **213** may be a dynamic random access memory (DRAM) device, a static random access memory (SRAM) device, or other memory device. The memory **213** stores data signals that are executed by the processor **201**. A bridge memory controller **211** is coupled to the CPU bus **210** and the memory **213**. The bridge memory controller **211** directs data signals between the processor **201**, the memory **213**, and other components in the computer system **200** and bridges the data signals from these components to a first I/O bus **220**.

[0023] The first I/O bus **220** may be a single bus or a combination of multiple buses. As an example, the first I/O bus **220** maybe a high performance I/O bus that operates at high throughput rates. The first I/O bus **220** may include for example a Peripheral Components Interconnect (PCI) bus, a Personal Computer Memory Card International Association (PCMCIA) bus, a NuBus, or other buses. The first I/O bus **220** provides communication links between components in the computer system **200**. A network controller **221** is coupled to the first I/O bus **220**. The network controller **221** links the computer system **200** to a network of computers and supports communication among the machines. A display device controller **222** is coupled to the first I/O bus **220**. The display device controller **222** allows coupling of a display device to the computer system **200** and acts as an interface between the display device and the computer system **200**. The display device controller **222** may be a monochrome display adapter (MDA) card, a color graphics adapter (CGA) card, an enhanced graphics adapter (EGA) card, an extended graphics array (XGA) card or other display device controller. The display device may be a television set, a computer monitor, a flat panel display or other display device. The display device receives data signals from the processor **201** through the display device controller **222** and displays the information and data signals to the user of the computer system **200**. According to an embodiment of the present invention, the display device may be implemented by the television/monitor **121** (shown in FIG. 1).

[0024] A second I/O bus **230** may be a single bus or a combination of multiple buses. The second I/O bus **230** may include an Industry Standard Architecture (ISA) bus, an Extended Industry Standard Architecture (EISA) bus, or other buses. The second I/O bus **230** provides communication links between components in the computer system **200**. A data storage device **231** is coupled to the second I/O bus **230**. The data storage device **231** may be a hard disk drive, a floppy disk drive, a CD-ROM device, or other mass storage device. A keyboard interface **232** is coupled to the

second I/O bus **230**. The keyboard interface **232** may be a keyboard controller or other keyboard interface. The keyboard interface **232** may be a dedicated device or can reside in another device such as a bus controller or other controller. The keyboard interface **232** allows coupling of a keyboard to the computer system **200** and transmits data signals from a keyboard to the computer system **200**. An audio controller **233** is coupled to the second I/O bus **230**. The second I/O bus **230** operates to coordinate the recording and playing of sounds is also coupled to the I/O bus **230**. A wireless communications interface **234** is coupled to the second I/O bus **230**. The wireless communications interface **234** may be an IR transceiver or a RF transceiver for transmitting and receiving signals between system components of the entertainment system **100** (shown in **FIG. 1**).

[0025] A bus bridge **223** couples the first I/O bus **220** to the second I/O bus **230**. The bus bridge **223** operates to buffer and bridge data signals between the first I/O bus **220** and the second I/O bus **230**.

[0026] According to one embodiment, configuring a graphical user interface that displays video data and corresponding entertainment system data of entertainment selections from multiple entertainment selection sources concurrently is performed by the computer system **200** in response to the processor **201** executing sequences of instructions contained in the memory **213**. Such instructions may be read into the memory **213** from other computer-readable mediums such as data storage device **231** or from a computer connected to the network via the network controller **211**. Execution of the sequences of instructions contained in the memory **213** causes the processor to configure a graphical user interface that displays video data and corresponding entertainment system data of entertainment selections from multiple entertainment selection sources concurrently, as will be described hereafter. In alternative embodiments, hard-wire circuitry may be used in place of or in combination with software instructions to implement the present invention. Thus, the present invention is not limited to any specific combination of hardware circuitry and software.

[0027] **FIG. 3** is a block diagram illustrating modules implementing a database system **300** according to an embodiment of the present invention. In a preferred embodiment of the present invention, the modules are implemented in software and reside in main memory **213** (shown in **FIG. 2**) of the computer system **200** (shown in **FIG. 2**) as sequences of instructions. It should be appreciated that the modules may be implemented by hardware as components coupled to the bus **220** (shown in **FIG. 2**) or a combination of both hardware and software. Block **310** represents a system control agent that receives entertainment system data from multiple sources. The system control agent **310** manages the organization and retrieval of the entertainment system data in the database **320**, and presents the entertainment system data to users. The system control agent **310** includes a data parser **311**, data engine **312**, and query interface **313**.

[0028] Entertainment system data may be received by the system control agent **310** from a plurality of sources. These sources may include modem transfer **341**, DSS **342**, VBI **343**, file input stream **344**, or other input streams **345**. Network transfer source **341** provides entertainment system data obtained from remote systems via a conventional

modem. According to one embodiment of the present invention, the remote systems are web servers accessed via the Internet using a plain old telephone service (POTS) connection, an integrated services digital network (ISDN) line, or other network connection. DSS source **342** provides entertainment system data obtained via a digital broadcast and a digital satellite receiver. According to one embodiment of the present invention, the entertainment system data is received via a separate digital channel by the DSS receiver. VBI source **343** provides entertainment system data from the vertical blanking interval of a television broadcast. The entertainment system data is decoded from the VBI of the television broadcast by a VBI decoder. File input stream **344** provides entertainment system data obtained from a computer file. The file may be located locally on the computer system **200** or remotely at another computer system. The file may contain, for example, a video clip, a movie review, a video game or other application. Other input streams **345** represent other conventional sources from which entertainment system data could be obtained. It is to be appreciated that any other conventional medium could be used to provide entertainment system data to system control agent **310**, including RF broadcasts, ultrasonic broadcasts, IR broadcasts, or other broadcasts. It should also be appreciated that entertainment system data may be provided by the users of the entertainment system **100** (shown in **FIG. 1**). Entertainment system data may be obtained from any one or more of the sources **341-345**.

[0029] Entertainment system data includes data related to entertainment selections. The entertainment selections may include programs, music selections, software applications, files, Internet broadcast and other selections that may be made available to users via the entertainment system **100**. Entertainment system data may include information describing an entertainment selection or other information related to the entertainment selection. Examples of entertainment system data include television program information, radio station information, "video-on-demand" program information, laser disc availability, compact disk availability, DVD availability, CD-ROM availability, VHS or 8 mm tape availability, software application titles, Interact™ broadcasts information, network identifiers such as Uniform Resource Locators (URLs), or other data.

[0030] In the illustrated embodiment, entertainment system data received from each of the sources **341-345** are in a different, source specific format. Data parser **311** receives the entertainment system data from the sources **341-345** and translates the entertainment system data into a unitary format. The entertainment system data received from the sources **341-345** may include a plurality of information related to an entertainment selection. The data parser **311** generates a record for data corresponding to each entertainment selection. Within each record, the data parser **311** organizes the entertainment system data related to each entertainment system data into traits. Each trait includes an identifier portion that provides a generic description of the trait and a data portion that provides specific data related to the trait or a location of where the specific data may be found. According to one embodiment of the present invention, an identifier portion may be "Title", "Actors", "Program Rating", "Source of Programming", or "Time of Broadcast" and the data portion may be the title of an entertainment selection, actors appearing in the entertainment selection, rating of the entertainment selection, the

station where the entertainment selection may be viewed, and the time the entertainment selection is broadcasted. According to another embodiment of the present invention, the identifier portion may be "Program Theme Song", "Video Trailer", "Audio Trailer", "Images of Cast", "Program's Home Page", "Program's Newsgroup", or "Articles about the Program and Cast" and the data portion may include a location of where the information relating to the identifier may be found. For example, the data portion may include a location such as a local address of a graphics file or an audio file stored in the data storage device 232 (shown in FIG. 2) that may be executed. Alternatively, the data portion may include a location such as an Internet address or an URL of a web server that includes a file that contains the information listed in the identifier portion.

[0031] The data engine 312 receives the entertainment data in the unitary format from the data parser 311 and stores the entertainment system data in the database 320. FIG. 4 illustrates entertainment system data record stored in a database 320 according to an embodiment of the present invention, database 320 includes multiple records 410, 420, and 430. Each of the records 410, 420, and 430 includes a source identifier 411, 421, and 431, respectively. The source identifiers identify sources from which entertainment system data was received to generate the record. It should be appreciated that a record may include entertainment system data received from one or more sources. Each of the records 410, 420, and 430 are shown to include a plurality of traits. It should be appreciated that each record may include any number of traits. Record 410 includes traits 412, 413, and 414. Record 420 includes traits 422, 423, and 424. Record 430 includes traits 432, 433, and 434. Each of the traits includes an identifier portion and a data portion. In an alternate embodiment of the present invention, the records 410, 420, and 430 do not include source identifiers. Referring back to FIG. 3, it should be appreciated that the data parser 311 may organize the entertainment system data using any known technique into any known format and that the data engine 312 may configure the database 320 according to any known format.

[0032] The query interface 313 configures a graphical user interface that allows a user to access the entertainment system data stored in the database 320. According to an embodiment of the present invention, the query interface 313 presents the entertainment system data stored in the database 320 in text form. According to another embodiment of the present invention, the query interface 313 presents the entertainment system data stored in the database 320 using multimedia identifiers that may include graphical images, animation, audio clips, or other multimedia identifiers. For example, the query interface 313 may present the identifiers of traits of an entertainment selection using the multimedia identifiers and make the multimedia identifiers user selectable. When a graphical image corresponding to an identifier is selected, the query interface 313 retrieves information in the data portion corresponding to the identifier and presents it to the user. According to an embodiment of the present invention, presenting the information to the user may include displaying the information stored in the data section when the information is specific data related to the trait. According to another embodiment of the present invention, presenting the information may include using the information in the data section to locate additional information when the information is a location. In this embodiment, the

multimedia identifier may be a hyper link to a remote web server or a link to a system component local to the graphical user interface.

[0033] FIG. 5 is a block diagram illustrating modules implementing a channel scan unit 500 according to an embodiment of the present invention. The channel scan unit 500 generates a graphical user interface that displays video data and entertainment system selection data from a plurality of entertainment selection sources. In a preferred embodiment of the present invention, the modules are implemented in software and reside in main memory 213 (shown in FIG. 2) of the computer system 200 (shown in FIG. 2) as sequences of instructions. It should be appreciated that the modules may be implemented by hardware as components coupled to the bus 220 (shown in FIG. 2) or a combination of both hardware and software. The channel scan unit 500 includes a channel scan control unit 510. The channel scan control unit 510 stores a list created by a user of the entertainment system 100 (shown in FIG. 1). According to an embodiment of the present invention, the list includes a number of specific entertainment selection sources that the user has a preference for. The entertainment selection sources on the list may include, for example, specific VHF/UHF channels, cable broadcast channels, satellite broadcast channels, Internet broadcast channels, or other entertainment selection sources accessible by the entertainment system 100 (shown in FIG. 1).

[0034] A database interface unit 520 is coupled to the channel scan control unit 510. The database interface unit 520 receives the list of entertainment selection sources from the channel scan control unit 510 and obtains entertainment system data corresponding to entertainment selections broadcasted on the listed entertainment selection sources at the present time from the database 320 (shown in FIG. 3).

[0035] A tuner interface unit 530 is coupled to the channel scan control unit 510. The tuner interface unit 530 receives the list of entertainment selection sources from the channel scan control unit 510 and programs the audio/video tuner amplifier 124 (shown in FIG. 1) to obtain video data from the entertainment selection sources. According to an embodiment of the channel scan unit 500, the tuner interface unit 530 receives the video data from the entertainment selection sources.

[0036] A display interface unit 540 is coupled to the database interface unit 520 and the tuner interface unit 530. The display interface unit 540 receives the entertainment system data corresponding to the entertainment selections from the database interface unit 520 and the video data of the entertainment selections from the interface unit 530. The display interface unit 540 interfaces with the display device controller 222 (shown in FIG. 2) to coordinate the displaying of the entertainment system data with the video data of an entertainment selection. According to an embodiment of the channel scan unit 500, the display interface unit 540 generates a graphical user interface on a display device. The graphical user interface has a first window that displays video data of a first entertainment selection from a first entertainment selection source. A first area, proximate to the first window, displays entertainment system data that corresponds to the first entertainment selection. A second window on the graphical user interface displays video data of a second entertainment selection from a second entertainment

selection source. A second area, proximate to the second window, displays entertainment system data that corresponds to the second entertainment selection.

[0037] It should be appreciated that in an embodiment of the channel scan unit **500** where the tuner interface unit **530** programs the audio/video tuner amplifier **124** to obtain video data from the entertainment selection sources without actually obtaining the video data from audio/video tuner amplifier **124**, the display interface unit **540** coordinates displaying the video data directly with the audio/video tuner amplifier **124**. The video data displayed on the first window and the second window may be continuous live feed from the entertainment system source, a still image, or other video data. The video data may correspond to entertainment selections that will be broadcasted or have already been broadcasted.

[0038] It should be appreciated that channel scan unit **500** may support other types of lists created by the user. For example, instead of listing preferred entertainment selections, the user may list a preferred actor or actors. In this embodiment of the present invention, the database interface unit **520** obtains the identity of entertainment selection sources broadcasting the entertainment selections with the actor or actors. The identity of the entertainment sources are transmitted to the tuner interface unit **530**, via the channel scan control unit **510**. The tuner interface unit **530** obtains video data of the entertainment selections. If the entertainment selection source is a component on the entertainment system **100**, such as the video recorder/playback device **122** (shown in FIG. 1) or the DVD recorder/playback device **123** (shown in FIG. 1), the tuner interface **530** may obtain video data corresponding to the entertainment selection from a source other than the component on the entertainment system **100**. The display interface unit **540** coordinates displaying the video data of the entertainment selections with entertainment system data corresponding to the entertainment selections.

[0039] The channel scan control unit **510**, the database interface unit **520**, the tuner interface unit **530**, and the display interface unit **540** may be implemented using any known circuitry or technique. According to an embodiment of the present invention where the channel scan unit **500** is implemented in hardware, the channel scan control unit **510**, the database interface unit **520**, the tuner interface unit **530**, and the display interface unit **540** all reside on a single semiconductor substrate.

[0040] FIG. 6 illustrates a graphical user interface **600** according to a first embodiment of the present invention. The graphical user interface includes a plurality of windows **610**, **620**, **630**, **640**, **650**, and **660**. According to an embodiment of the present invention where the list in the channel scan control unit **510** (shown in FIG. 5) includes a list of entertainment selection sources that the user prefers, each of the windows **610**, **620**, **630**, **640**, **650**, and **660** display video data of an entertainment selection from one of the entertainment selection sources. Each of the plurality of windows **610**, **620**, **630**, **640**, **650**, and **660** includes an area proximate to the window that may be used to display entertainment system data corresponding to the entertainment selection. Window **610** includes a first area **611** and a second area **612**. Window **620** includes a first area **621** and a second area **622**. Window **630** includes a first area **631** and a second area **632**.

Window **640** includes a first area **641** and a second area **642**. Window **650** includes a first area **651** and a second area **652**. Window **660** includes a first area **661** and a second area **662**. The area proximate to the window may be used to display entertainment system data corresponding to the entertainment selection. The entertainment system data may include a call sign and a channel of where the entertainment selection is broadcasted from, the entertainment selection title, rating information, time or length of broadcast, or other entertainment system data. The graphical user interface **600** also includes a navigational tool **670**, such as a scroll bar, that allows a viewer to prompt the graphical user interface **600** to display additional windows that display video data and entertainment system data corresponding to additional entertainment selections not originally displayed on the graphical user interface **600**. According to an embodiment of the graphical user interface **600**, a user may select one of the windows **610**, **620**, **630**, **640**, **650**, and **660**, to watch the entertainment selection corresponding to the selected window on a full screen of the television/monitor **121** (shown in FIG. 1). According to an alternate embodiment of the present invention, a user may select one of the windows **610**, **620**, **630**, **640**, **650**, and **660** to obtain additional entertainment system data corresponding to the entertainment selection corresponding to the selected window.

[0041] The graphical user interface **600** allows displaying of multiple video images concurrently, where each video image corresponds to a different one of multiple broadcast channels currently available for viewing. Descriptive information relating to the programs currently being broadcast on each channel is displayed along with a video image from that program. According to an aspect of the graphical user interface **600**, each of the multiple video images is a current still image, or a "snap shot" of the program being broadcast on the corresponding channel. According to a second aspect of the graphical user interface **600**, each of the multiple video images is taken from real-time broadcast of the program from the corresponding channel.

[0042] FIG. 7 is a flow chart illustrating a method for managing entertainment system data according to an embodiment of the present invention. At step **701**, the preferences of entertainment selection sources of an entertainment system user are determined. According to an embodiment of the present invention, determining the preference of entertainment selection sources is achieved by referencing a list stored in channel scan control unit.

[0043] At step **702**, video data corresponding to entertainment selections broadcasted on the entertainment sources is obtained. According to an embodiment of the present invention, obtaining the video data corresponding to the entertainment selections broadcasted on the entertainment sources is achieved by programming a video tuner to obtain the video data from the entertainment selection sources.

[0044] At step **703**, entertainment system data corresponding to the entertainment selections is obtained. According to an embodiment of the present invention, obtaining the entertainment system data corresponding to the entertainment selections broadcasted on the entertainment sources is achieved by accessing a database.

[0045] At step **704**, video data of a first entertainment selection from a first entertainment selection source is displayed on a first window.

[0046] At step 705, entertainment system data corresponding to the first entertainment selection in a location proximate to the first window is displayed.

[0047] At step 706, video data of a second entertainment selection from a second entertainment selection source is displayed on a second window.

[0048] At step 707, entertainment system data corresponding to the second entertainment selection in a location proximate to the second window is displayed.

[0049] In the foregoing specification, the invention has been described with references to specific embodiments thereof. It will, however, be evident that various modifications and changes may be made thereto without departing from the broader spirit and scope of the invention. The specification and drawings are, accordingly, to be regarded in an illustrative rather than restrictive sense.

What is claimed is:

1. A method for presenting entertainment selections, comprising:

displaying video data of a first entertainment selection on a first window;

displaying video data of a second entertainment selection on a second window; and

displaying entertainment system data regarding the entertainment selection corresponding to the respective window upon selection by a user of the respective window.

2. The method of claim 1, further comprising:

displaying further entertainment system data corresponding to the first entertainment selection in a first area of the first window; and

displaying further entertainment system data corresponding to the second entertainment selection in a first area of the second window;

wherein selection of the respective window comprises selection of the respective first areas of the respective windows.

3. The method of claim 2, further comprising:

displaying still further entertainment system data corresponding to the first entertainment selection in a second area of the first window; and

displaying still further entertainment system data corresponding to the second entertainment selection in a second area of the second window;

wherein selection of the respective window comprises selection of the respective second areas of the respective windows.

4. The method of claim 1, wherein the further entertainment system data in the first area comprises at least one of a call sign of the entertainment selection source, a channel of the entertainment selection source, a title of the entertainment selection, rating information of the entertainment selection, time of broadcast of the entertainment selection, and length of broadcast of the entertainment selection.

5. The method of claim 1, wherein the entertainment system data displayed upon selection of the respective window comprises at least one of a description of the respective entertainment selection and a critique of the respective entertainment selection.

6. The method of claim 1, wherein the video data comprises video images of the respective entertainment selections.

7. The method of claim 6, wherein the video images comprise a still image taken from a real-time broadcast of the respective entertainment selections.

8. The method of claim 1, further comprising providing a full-screen display of the corresponding entertainment selection upon selection by the user of the respective window.

9. The method of claim 1, further comprising:

determining a user's preference of entertainment selection sources;

obtaining video data corresponding to entertainment selections broadcasted on the preferred entertainment selection sources; and

wherein the first and second entertainment selections are selected from among the obtained video data.

10. The method of claim 1, further comprising:

receiving a preferred trait from the user, the trait being related to at least one entertainment selection;

identifying entertainment selections with the preferred trait by reference to a database of entertainment selections; and

wherein the first and second entertainment selections are selected from among the identified entertainment selections.

11. A graphical user interface (GUI), comprising:

a first window that displays video data of a first entertainment selection;

a second window that displays video data of a second entertainment selection;

the first and second windows comprising selectable multimedia identifiers that can be selected by a user to cause the display of descriptive information regarding the entertainment selection corresponding to the respective window.

12. The GUI of claim 11, further comprising:

a first area of the first window that displays an identification of the source of the first entertainment selection;

a second area of the first window, that displays a title of the first entertainment selection;

a first area of the second window, that displays an identification of the source of the second entertainment selection; and

a second area of the second window, that displays a title of the second entertainment selection;

wherein selection of the respective window comprises selection of the respective second areas of the respective windows.

13. The GUI of claim 11, further comprising a navigation tool that allows a user to view additional windows that display video data of additional entertainment selections on the GUI.

14. The GUI of claim 11, wherein the entertainment system data displayed upon selection of the respective window comprises at least one of a description of the respective entertainment selection, rating information of the

respective entertainment selection, and a critique of the respective entertainment selection.

15. The GUI of claim 11, further comprising:

a user selectable multimedia identifier of a trait of an entertainment selection; and

information stored in a database of entertainment selections related to the trait, displayed upon selection of the multimedia identifier.

16. The GUI of claim 15, wherein the selectable multimedia identifiers can further be selected by a user to cause a full-screen display of the entertainment selection corresponding to the respective window.

17. A machine-readable medium having stored thereon data representing sequences of instructions which, when executed by a machine, cause the machine to perform operations comprising:

displaying video data of a first entertainment selection on a first window;

displaying video data of a second entertainment selection on a second window; and

displaying entertainment system data regarding the entertainment selection corresponding to the respective window upon selection by a user of the respective window.

18. The medium of claim 17, wherein the instructions further comprise:

displaying further entertainment system data corresponding to the first entertainment selection in a first area of the first window; and

displaying further entertainment system data corresponding to the second entertainment selection in a first area of the second window;

wherein selection of the respective window comprises selection of the respective first areas of the respective windows.

19. The medium of claim 17, wherein the instructions further comprise:

displaying still further entertainment system data corresponding to the first entertainment selection in a second area of the first window; and

displaying still further entertainment system data corresponding to the second entertainment selection in a second area of the second window;

wherein selection of the respective window comprises selection of the respective second areas of the respective windows.

20. The medium of claim 17, wherein the instructions further comprise:

receiving a preferred trait from the user, the trait being related to at least one entertainment selection;

identifying entertainment selections with the preferred trait by reference to a database of entertainment selections; and

wherein the first and second entertainment selections are selected from among the identified entertainment selections.
