MDM2 PROTEIN DEGRADERS

BACKGROUND OF THE INVENTION

Field of the Invention

The present disclosure provides MDM2 protein degraders and therapeutic methods of treating conditions and diseases wherein degradation of MDM2 provides a benefit.

Background

The p53 tumor suppressor is a principal mediator of growth arrest, senescence, and apoptosis in response to a broad array of cellular damage. Rapid induction of high p53 protein levels by various stress types prevents inappropriate propagation of cells carrying potentially mutagenic, damaged DNA. p53 can kill cells via a dual transcription-dependent and -independent function in the nucleus and at the mitochondria. It has been demonstrated that cellular p53 protein levels are the single most important determinant of its function. In normal unstressed cells, p53 is a very unstable protein with a half-life ranging from 5 to 30 min, which is present at very low cellular levels owing to continuous degradation largely mediated by MDM2. Conversely, a hallmark of many cellular stress pathways such as DNA damage, hypoxia, telomere shortening, and oncogene activation is the rapid stabilization of p53 via a block of its degradation. MDM2 has emerged as the principal cellular antagonist of p53 by limiting the p53 tumor suppressor function. Moll and Petrenko, Molecular Cancer Research 1:1001-1008 (2003).

MDM2 is transcriptionally activated by p53 and MDM2, in turn, inhibits p53 activity by at least three mechanisms. Wu et al., Genes Dev. 7:1126 (1993). First, MDM2 protein directly binds to the p53 transactivation domain and thereby inhibits p53-mediated transactivation. Second, MDM2 protein contains a nuclear export signal sequence, and upon binding to p53, induces the nuclear export of p53, preventing p53 from binding to the targeted DNAs. Third, MDM2 protein is an E3 ubiquitin ligase and upon binding to p53 is able to promote p53 degradation.

Phthalimide-based drugs, e.g., thalidomide or lenalidomide, bind to protein-degradation machinery, e.g., cereblon (CRBN; part of an ubiquitin E3 ligase complex). This may promote the recruitment of two transcription factors (IKZF1 and IKZF3) that are essential to disease progression, resulting in drug-induced ubiquitylation and degradation by the proteasome. *See, e.g.*, Ito et al., *Science* 327:1345-1350 (2010) and Winter et al., *Science* 348:1376-1381 (2015).

There is an ongoing need for new agents, e.g., small molecules, for treating cancer and other diseases responsive to the disruption or prevention of the MDM2-p53 interaction.

[0617] Compounds of the Disclosure degrade MDM2 proteins and are useful in the treatment of a variety of diseases and conditions. In particular, Compounds of the Disclosure are useful in methods of treating a disease or condition wherein degradation MDM2 proteins provides a benefit, for example, cancers and proliferative diseases. The therapeutic methods of the disclosure comprise administering a therapeutically effective amount of a Compound of the Disclosure to an individual in need thereof. The present methods also encompass administering a second therapeutic agent to the individual in addition to the Compound of the Disclosure. The second therapeutic agent is selected from drugs known as useful in treating the disease or condition afflicting the individual in need thereof, e.g., a chemotherapeutic agent and/or radiation known as useful in treating a particular cancer.

[0618] Salts, hydrates, and solvates of the Compounds of the Disclosure can also be used in the methods disclosed herein. The present disclosure further includes all possible stereoisomers and geometric isomers of Compounds of the Disclosure to include both racemic compounds and optically active isomers. When a Compound of the Disclosure is desired as a single enantiomer, it can be obtained either by resolution of the final product or by stereospecific synthesis from either isomerically pure starting material or use of a chiral auxiliary reagent, for example, see Z. Ma et al., Tetrahedron: Asymmetry, 8(6), pages 883-888 (1997). Resolution of the final product, an intermediate, or a starting material can be achieved by any suitable method known in the art. Additionally, in situations where tautomers of the Compounds of the Disclosure are possible, the present disclosure is intended to include all tautomeric forms of the compounds.

[0619] The present disclosure encompasses the preparation and use of salts of Compounds of the Disclosure. As used herein, the pharmaceutical "pharmaceutically acceptable salt" refers to salts or zwitterionic forms of Compounds of the Disclosure. Salts of Compounds of the Disclosure can be prepared during the final isolation and purification of the compounds or separately by reacting the compound with a suitable acid. The pharmaceutically acceptable salts of Compounds of the Disclosure can be acid addition salts formed with pharmaceutically acceptable acids. Examples of acids which can be employed to form pharmaceutically acceptable salts include inorganic acids such as nitric, boric, hydrochloric, hydrobromic, sulfuric, and phosphoric, and organic acids
such as oxalic, maleic, succinic, and citric. Non-limiting examples of salts of compounds of the disclosure include, but are not limited to, the hydrochloride, hydrobromide, hydroiodide, sulfate, bisulfate, 2-hydroxyethansulfonate, phosphate, hydrogen phosphate, acetate, adipate, alginate, aspartate, benzoate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerolphosphate, hemisulfate, heptanoate, hexanoate, formate, succinate, fumarate, maleate, ascorbate, isethionate, salicylate, methanesulfonate, mesitylenesulfonate, naphthylenesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, trichloroacetate, trifluoroacetate, phosphate, glutamate, bicarbonate, paratoluenesulfonate, undecanoate, lactate, citrate, tartrate, gluconate, methanesulfonate, ethanedisulfonate, benzene sulfonate, and p-toluenesulfonate salts. In addition, available amino groups present in the compounds of the disclosure can be quaternized with methyl, ethyl, propyl, and butyl chlorides, bromides, and iodides; dimethyl, diethyl, dibutyl, and diamyl sulfates; decyl, lauryl, myristyl, and steryl chlorides, bromides, and iodides; and benzyl and phenethyl bromides. In light of the foregoing, any reference Compounds of the Disclosure appearing herein is intended to include compounds of Compounds of the Disclosure as well as pharmaceutically acceptable salts, hydrates, or solvates thereof.

The present disclosure encompasses the preparation and use of solvates of Compounds of the Disclosure. Solvates typically do not significantly alter the physiological activity or toxicity of the compounds, and as such may function as pharmacological equivalents. The term "solvate" as used herein is a combination, physical association and/or solvation of a compound of the present disclosure with a solvent molecule such as, e.g. a disolvate, monosolvate or hemisolvate, where the ratio of solvent molecule to compound of the present disclosure is about 2:1, about 1:1 or about 1:2, respectively. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances, the solvate can be isolated, such as when one or more solvent molecules are incorporated into the crystal lattice of a crystalline solid. Thus, "solvate" encompasses both solution-phase and isolatable solvates. Compounds of the Disclosure can be present as solvated forms with a pharmaceutically acceptable solvent, such as water, methanol, and ethanol, and it is intended that the disclosure includes both solvated and unsolvated forms of Compounds of the Disclosure. One type of solvate is a hydrate. A "hydrate" relates to a particular subgroup of solvates where the solvent molecule is water. Solvates typically can
function as pharmacological equivalents. Preparation of solvates is known in the art. See, for example, M. Caira et al, J. Pharmaceut. Sci., 93(3):601-611 (2004), which describes the preparation of solvates of fluconazole with ethyl acetate and with water. Similar preparation of solvates, hemisolvates, hydrates, and the like are described by E.C. van Tonder et al, AAPS Pharm. Sci. Tech., 5(1):Article 12 (2004), and A.L. Bingham et al, Chem. Commun. 603-604 (2001). A typical, non-limiting, process of preparing a solvate would involve dissolving a Compound of the Disclosure in a desired solvent (organic, water, or a mixture thereof) at temperatures above 20°C to about 25°C, then cooling the solution at a rate sufficient to form crystals, and isolating the crystals by known methods, e.g., filtration. Analytical techniques such as infrared spectroscopy can be used to confirm the presence of the solvent in a crystal of the solvate.

A "monovalent radical of a ligand for an E3 ubiquitin ligase protein" is derived from the removal of a hydrogen or other suitable atom, e.g., Br, I, or group, e.g., -OH, from a parent E3 ubiquitin ligase protein ligand. The removal of a hydrogen atom or other suitable atom or group facilitates the linkage of the parent E3 ubiquitin ligase protein ligand to a target protein inhibitor to give a heterobifunctional compound having any one of Formulae I-A or I-III, as defined above. In one embodiment, a hydrogen atom is removed from any suitable -NH₂ group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable -OH group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable -N(H)- group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a hydrogen atom is removed from any suitable -CH₃, -CH₂-, -CH= group of the parent E3 ubiquitin ligase protein ligand. In another embodiment, a Br or I atom is removed from any suitable aryl or heteroaryl group of the parent E3 ubiquitin ligase protein ligand. Exemplary non-limiting monovalent radicals of E3 ubiquitin ligase protein ligands include:
A "ligand for an E3 ubiquitin ligase protein" or "parent ligand for an E3 ubiquitin ligase protein" or "E3 ubiquitin ligase protein ligand" and the like refers to a compound that binds, e.g., inhibits, an E3 ubiquitin ligase protein, including the von Hippel-Lindau protein (VHL). Ligands for E3 ubiquitin ligase proteins are known to those of ordinary skill in the art. Exemplary non-limiting ligands for an E3 ubiquitin ligase protein include phthalimide-based drugs such as thalidomide.

A "monovalent radical of a MDM2 inhibitor" is derived from the removal of a hydrogen or other suitable atom, e.g., Br, I, or group, e.g., -OH, from a parent MDM2 inhibitor. The removal of a hydrogen atom or other suitable atom or group facilitates the linkage of the MDM2 inhibitor to an E3 ubiquitin ligase protein ligand to give a heterobifunctional compound having any one of Formulae I-A or I-III, as defined above. In one embodiment, a hydrogen atom is removed from any suitable -N\(^\ddagger\) group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -OH group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -N(H)- group of the parent MDM2 inhibitor. In another embodiment, a hydrogen atom is removed from any suitable -C\(^\ddagger\)-, -C\(^\ddagger\)=, or -C≡CH group of the parent MDM2 inhibitor. In another embodiment, the hydrogen
atom is removed from any suitable -OH group of the parent MDM2 inhibitor. In another embodiment, the -OH group is removed from any suitable -C(=0)OH group of the parent MDM2 inhibitor. In another embodiment, a Br or I atom is removed from any suitable aryl or heteroaryl group of the parent MDM2 inhibitor.

A "linker" is a divalent chemical moiety that joins a monovalent radical of a ligand for an E3 ubiquitin ligase protein and a monovalent radical of a MDM2 inhibitor.

The present disclosure provides Compounds of the Disclosure as MDM2 protein 
degraders for the treatment of a variety of diseases and conditions wherein degradation of 
MDM2 proteins has a beneficial effect. Compounds of the Disclosure typically have a 
binding affinity \( (IC_{50}) \) to MDM2 of less than 100 \( \mu \text{M} \), e.g., less than 50 \( \mu \text{M} \), less than 
25 \( \mu \text{M} \), and less than 5 \( \mu \text{M} \), less than about 1 \( \mu \text{M} \), less than about 0.5 \( \mu \text{M} \), or less than 
about 0.1 \( \mu \text{M} \). In one embodiment, the present disclosure relates to a method of treating 
an individual suffering from a disease or condition wherein degradation of MDM2 
proteins provides a benefit comprising administering a therapeutically effective amount

of a Compound of the Disclosure to an individual in need thereof.

[0685]  Since Compounds of the Disclosure are degraders of MDM2 protein, a number of 
diseases and conditions mediated by MDM2 can be treated by employing these 
compounds. The present disclosure is thus directed generally to a method for treating a 
condition or disorder responsive to degradation of MDM2, in an animal, e.g., a human, 
suffering from, or at risk of suffering from, the condition or disorder, the method 
comprising administering to the animal an effective amount of one or more Compounds 
of the Disclosure.
[0686] The present disclosure is further directed to a method of degrading MDM2 protein in an animal in need thereof, said method comprising administering to the animal an effective amount of at least one Compound of the Disclosure.

[0687] The methods of the present disclosure can be accomplished by administering a Compound of the Disclosure as the neat compound or as a pharmaceutical composition. Administration of a pharmaceutical composition, or neat compound of a Compound of the Disclosure, can be performed during or after the onset of the disease or condition of interest. Typically, the pharmaceutical compositions are sterile, and contain no toxic, carcinogenic, or mutagenic compounds that would cause an adverse reaction when administered. Further provided are kits comprising a Compound of the Disclosure and, optionally, a second therapeutic agent useful in the treatment of diseases and conditions wherein degradation of MDM2 protein provides a benefit, packaged separately or together, and an insert having instructions for using these active agents.

[0688] In one embodiment, a Compound of the Disclosure is administered in conjunction with a second therapeutic agent useful in the treatment of a disease or condition wherein degradation of MDM2 protein provides a benefit. The second therapeutic agent is different from the Compound of the Disclosure. A Compound of the Disclosure and the second therapeutic agent can be administered simultaneously or sequentially to achieve the desired effect. In addition, the Compound of the Disclosure and second therapeutic agent can be administered from a single composition or two separate compositions.

[0689] The second therapeutic agent is administered in an amount to provide its desired therapeutic effect. The effective dosage range for each second therapeutic agent is known in the art, and the second therapeutic agent is administered to an individual in need thereof within such established ranges.

[0690] A Compound of the Disclosure and the second therapeutic agent can be administered together as a single-unit dose or separately as multi-unit doses, wherein the Compound of the Disclosure is administered before the second therapeutic agent or vice versa. One or more doses of the Compound of the Disclosure and/or one or more dose of the second therapeutic agent can be administered. The Compound of the Disclosure therefore can be used in conjunction with one or more second therapeutic agents, for example, but not limited to, anticancer agents.

[0691] Diseases and conditions treatable by the methods of the present disclosure include, but are not limited to, cancer and other proliferative disorders, inflammatory diseases, sepsis, autoimmune disease, and viral infection. In one embodiment, a human
patient is treated with a Compound of the Disclosure, or a pharmaceutical composition comprising a Compound of the Disclosure, wherein the compound is administered in an amount sufficient to degrade MDM2 protein in the patient.

[0692] In one embodiment, the disease to be treated by the Compound of the Disclosure is cancer. Examples of treatable cancers include, but are not limited to, any one or more of the cancers of Table 9.

Toxicity and therapeutic efficacy of the Compounds of the Disclosure can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., for determining the maximum tolerated dose (MTD) of a compound, which defines as the highest dose that causes no toxicity in animals. The dose ratio between the maximum tolerated dose and therapeutic effects (e.g. inhibiting of tumor growth) is the therapeutic index. The dosage can vary within this range depending upon the dosage form employed, and the route of administration utilized. Determination of a therapeutically effective amount is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.

A therapeutically effective amount of a Compound of the Disclosure required for use in therapy varies with the nature of the condition being treated, the length of time that

maintain the desired therapeutic effects. The desired dose conveniently can be
administered in a single dose, or as multiple doses administered at appropriate intervals,
for example as one, two, three, four or more subdoses per day. Multiple doses often are

The above-mentioned second therapeutically active agents, one or more of which can be used in combination with a Compound of the Disclosure, are prepared and administered as described in the art.

Compounds of the Disclosure typically are administered in admixture with a pharmaceutical carrier selected with regard to the intended route of administration and standard pharmaceutical practice. Pharmaceutical compositions for use in accordance with the present disclosure are formulated in a conventional manner using one or more physiologically acceptable carriers comprising excipients and/or auxiliaries that facilitate processing of Compound of the Disclosure.

These pharmaceutical compositions can be manufactured, for example, by conventional mixing, dissolving, granulating, dragee-making, emulsifying, encapsulating, entrapping, or lyophilizing processes. Proper formulation is dependent upon the route of
administration chosen. When a therapeutically effective amount of the Compound of the Disclosure is administered orally, the composition typically is in the form of a tablet, capsule, powder, solution, or elixir. When administered in tablet form, the composition additionally can contain a solid carrier, such as a gelatin or an adjuvant. The tablet, capsule, and powder contain about 0.01% to about 95%, and preferably from about 1% to about 50%, of a Compound of the Disclosure. When administered in liquid form, a liquid carrier, such as water, petroleum, or oils of animal or plant origin, can be added. The liquid form of the composition can further contain physiological saline solution, dextrose or other saccharide solutions, or glycols. When administered in liquid form, the composition contains about 0.1% to about 90%, and preferably about 1% to about 50%, by weight, of a Compound of the Disclosure.

When a therapeutically effective amount of a Compound of the Disclosure is administered by intravenous, cutaneous, or subcutaneous injection, the composition is in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such parenterally acceptable solutions, having due regard to pH, isotonicity, stability, and the like, is within the skill in the art. A preferred composition for intravenous, cutaneous, or subcutaneous injection typically contains, an isotonic vehicle.

Compounds of the Disclosure can be readily combined with pharmaceutically acceptable carriers well-known in the art. Standard pharmaceutical carriers are described in Remington's Pharmaceutical Sciences, Mack Publishing Co., Easton, PA, 19th ed. 1995. Such carriers enable the active agents to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by adding the Compound of the Disclosure to a solid excipient, optionally grinding the resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients include, for example, fillers and cellulose preparations. If desired, disintegrating agents can be added.

Compound of the Disclosure can be formulated for parenteral administration by injection, e.g., by bolus injection or continuous infusion. Formulations for injection can be presented in unit dosage form, e.g., in ampules or in multidose containers, with an added preservative. The compositions can take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, and can contain formulatory agents such as suspending, stabilizing, and/or dispersing agents.
Pharmaceutical compositions for parenteral administration include aqueous solutions of the active agent in water-soluble form. Additionally, suspensions of a Compound of the Disclosure can be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils or synthetic fatty acid esters. Aqueous injection suspensions can contain substances which increase the viscosity of the suspension. Optionally, the suspension also can contain suitable stabilizers or agents that increase the solubility of the compounds and allow for the preparation of highly concentrated solutions. Alternatively, a present composition can be in powder form for constitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use.

Compounds of the Disclosure also can be formulated in rectal compositions, such as suppositories or retention enemas, e.g., containing conventional suppository bases. In addition to the formulations described previously, the Compound of the Disclosure also can be formulated as a depot preparation. Such long-acting formulations can be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the Compound of the Disclosure can be formulated with suitable polymeric or hydrophobic materials (for example, as an emulsion in an acceptable oil) or ion exchange resins.

In particular, the Compounds of the Disclosure can be administered orally, buccally, or sublingually in the form of tablets containing excipients, such as starch or lactose, or in capsules or ovules, either alone or in admixture with excipients, or in the form of elixirs or suspensions containing flavoring or coloring agents. Such liquid preparations can be prepared with pharmaceutically acceptable additives, such as suspending agents. Compound of the Disclosure also can be injected parenterally, for example, intravenously, intramuscularly, subcutaneously, or intracoronarily. For parenteral administration, the Compound of the Disclosure are typically used in the form of a sterile aqueous solution which can contain other substances, for example, salts or monosaccharides, such as mannitol or glucose, to make the solution isotonic with blood.

In another embodiment, the present disclosure provides kits which comprise a Compound of the Disclosure (or a composition comprising a Compound of the Disclosure) packaged in a manner that facilitates their use to practice methods of the present disclosure. In one embodiment, the kit includes a Compound of the Disclosure (or a composition comprising a Compound of the Disclosure) packaged in a container, such as a sealed bottle or vessel, with a label affixed to the container or included in the kit that describes use of the compound or composition to practice the method of the
disclosure. In one embodiment, the compound or composition is packaged in a unit dosage form. The kit further can include a device suitable for administering the composition according to the intended route of administration.

[0745] The term "a disease or condition wherein degradation of MDM2 protein provides a benefit" pertains to a disease or condition in which MDM2 and/or an action of MDM2 is important or necessary, e.g., for the onset, progress, expression of that disease or condition, or a disease or a condition which is known to be treated by a MDM2 inhibitor or degrader. Examples of such conditions include, but are not limited to, a cancer, a chronic autoimmune disease, an inflammatory disease, a proliferative disease, sepsis, and a viral infection. One of ordinary skill in the art is readily able to determine whether a compound treats a disease or condition mediated by MDM2 for any particular cell type, for example, by assays which conveniently can be used to assess the activity of particular compounds.

[0746] The term "second therapeutic agent" refers to a therapeutic agent different from a Compound of the Disclosure and that is known to treat the disease or condition of interest. For example when a cancer is the disease or condition of interest, the second therapeutic agent can be a known chemotherapeutic drug, like taxol, or radiation, for example.

[0747] The term "disease" or "condition" denotes disturbances and/or anomalies that as a rule are regarded as being pathological conditions or functions, and that can manifest themselves in the form of particular signs, symptoms, and/or malfunctions. As demonstrated in the examples below, a Compound of the Disclosure is a degrader of MDM2 protein and can be used in treating diseases and conditions wherein degradation of MDM2 provides a benefit.

[0748] As used herein, the terms "treat," "treating," "treatment," refer to eliminating, reducing, or ameliorating a disease or condition, and/or symptoms associated therewith. Although not precluded, treating a disease or condition does not require that the disease, condition, or symptoms associated therewith be completely eliminated. As used herein, the terms "treat," "treating," "treatment," may include "prophylactic treatment," which refers to reducing the probability of redeveloping a disease or condition, or of a recurrence of a previously-controlled disease or condition, in a subject who does not have, but is at risk of or is susceptible to, redeveloping a disease or condition or a recurrence of the disease or condition. The term "treat" and synonyms contemplate
administering a therapeutically effective amount of a Compound of the Disclosure to an individual in need of such treatment.

Within the meaning of the disclosure, "treatment" also includes relapse prophylaxis or phase prophylaxis, as well as the treatment of acute or chronic signs, symptoms and/or malfunctions. The treatment can be orientated symptomatically, for example, to suppress symptoms. It can be effected over a short period, be oriented over a medium term, or can be a long-term treatment, for example within the context of a maintenance therapy.

The term "therapeutically effective amount" or "effective dose" as used herein refers to an amount of the active ingredient(s) that is(are) sufficient, when administered by a method of the disclosure, to efficaciously deliver the active ingredient(s) for the treatment of condition or disease of interest to an individual in need thereof. In the case of a cancer or other proliferation disorder, the therapeutically effective amount of the agent may reduce (i.e., retard to some extent and preferably stop) unwanted cellular proliferation; reduce the number of cancer cells; reduce the tumor size; inhibit (i.e., retard to some extent and preferably stop) cancer cell infiltration into peripheral organs; inhibit (i.e., retard to some extent and preferably stop) tumor metastasis; inhibit, to some extent, tumor growth; reduce MDM2 signaling in the target cells; and/or relieve, to some extent, one or more of the symptoms associated with the cancer. To the extent the administered compound or composition prevents growth and/or kills existing cancer cells, it may be cytostatic and/or cytotoxic.

The term "container" means any receptacle and closure therefore suitable for storing, shipping, dispensing, and/or handling a pharmaceutical product.

The term "insert" means information accompanying a pharmaceutical product that provides a description of how to administer the product, along with the safety and efficacy data required to allow the physician, pharmacist, and patient to make an informed decision regarding use of the product. The package insert generally is regarded as the "label" for a pharmaceutical product.

"Concurrent administration," "administered in combination," "simultaneous administration," and similar phrases mean that two or more agents are administered concurrently to the subject being treated. By "concurrently," it is meant that each agent is administered either simultaneously or sequentially in any order at different points in time. However, if not administered simultaneously, it is meant that they are administered to an individual in a sequence and sufficiently close in time so as to provide the desired
therapeutic effect and can act in concert. For example, a Compound of the Disclosure can be administered at the same time or sequentially in any order at different points in time as a second therapeutic agent. A Compound of the Disclosure and the second therapeutic agent can be administered separately, in any appropriate form and by any suitable route. When a Compound of the Disclosure and the second therapeutic agent are not administered concurrently, it is understood that they can be administered in any order to a subject in need thereof. For example, a Compound of the Disclosure can be administered prior to (e.g., 5 minutes, 15 minutes, 30 minutes, 45 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, 6 weeks, 8 weeks, or 12 weeks before), concomitantly with, or subsequent to (e.g., 5 minutes, 15 minutes, 30 minutes, 45 minutes, 1 hour, 2 hours, 4 hours, 6 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 1 week, 2 weeks, 3 weeks, 4 weeks, 5 weeks, 6 weeks, 8 weeks, or 12 weeks after) the administration of a second therapeutic agent treatment modality (e.g., radiotherapy), to an individual in need thereof. In various embodiments, a Compound of the Disclosure and the second therapeutic agent are administered 1 minute apart, 10 minutes apart, 30 minutes apart, less than 1 hour apart, 1 hour apart, 1 hour to 2 hours apart, 2 hours to 3 hours apart, 3 hours to 4 hours apart, 4 hours to 5 hours apart, 5 hours to 6 hours apart, 6 hours to 7 hours apart, 7 hours to 8 hours apart, 8 hours to 9 hours apart, 9 hours to 10 hours apart, 10 hours to 11 hours apart, 11 hours to 12 hours apart, no more than 24 hours apart or no more than 48 hours apart. In one embodiment, the components of the combination therapies are administered at about 1 minute to about 24 hours apart.

The combined organic layers were washed with brine, dried over Na₂SO₄ and concentrated in vacuo. The crude product was purified by flash chromatography to afford tert-butyl (5-(2-(2,6-dioxopiperidin-3-yl)-1-oxoisoindolin-4-yl)pent-4-yn-1-yl)carbamate as white solid.
Step 2: Synthesis of 3-(4-(5-aminopentyl)-1-oxoisoindolin-2-yl)piperidine-2,6-dione (Cpd. No. 78)

To a solution of tert-butyl (5-(2-(2,6-dioxopiperidin-3-yl)-1-oxoisoindolin-4-yl)pent-4-yn-1-yl)carbamate (210 mg, 0.5 mmol) in EtOH (5 mL) was added Pd/C (20 mg). The reaction was stirred under H2-atmosphere for 2 hr. Then the mixture was filtered by celite and the solvent was removed by vacuo. The residue was dissolved in 10 mL DCM and 2 mL trifluoroacetic acid. The reaction was stirred for 30 min and then the solvent was removed by vacuo. The residue was purified by reverse phase chromatography over C18 column to 3-(4-(5-aminopentyl)-1-oxoisoindolin-2-yl)piperidine-2,6-dione as colorless oil.

Step 3: Synthesis of Cpd. No. 31

HATU (13.3 mg, 1.2 eq.) and N,N-diisopropylethylamine (0.026 mL, 0.15 mmol) were added to a solution of Cpd. A (20 mg, 0.029 mmol) in 0.5 mL DMF and stirred. After 10 minutes, 3-(4-(5-aminopentyl)-1-oxoisoindolin-2-yl)piperidine-2,6-dione (0.35 mL, 0.1 M in DMSO) was added to the reaction. After 30 minutes, the solvent was removed and the crude was dissolved in 3:1 methanol/water, acidified with trifluoroacetic acid and purified by reverse-phase preparative HPLC. The purified fractions were combined, concentrated in vacuo, re-dissolved in H2O, frozen and lyophilized to give Cpd. No. 31 (TFA salt) as a white powder.

Synthesis of (25,4R)-1-((S)-2-(5-(4-((15,45)-4-(((4-(4-chlorophenyl)-7-isopropoxy-6-methoxy-3-oxo-3,4-dihydroisoquinolin-2(1H)-yl)phenyl)(methyl)amino)methyl)cyclohexyl)piperazin-l-yl)pentanamido)-3,3-dimethylbutanoyl)-4-hydroxy-N-((S)-1-(4-(4-methylthiazol-5-yl)phenyl)ethyl)pyrrolidine-2-carboxamide (Cpd. No. 233)
To a solution of RRM-01-146 (30 mg, 0.047 mmol) and DIPEA (0.12 ml, 0.70 mmol) in DMF (1 ml) was added tert-butyl 5-bromopentanoate (23 mg, 0.95 mmol) and the resulting solution stirred for overnight at 80 °C. The solvent was evaporated and purified by silica gel DCN/MeOH (95:5) to give 27 mg (75%) of the desired product.

A solution of tert-butyl 5-(4-((lS,4r)-4-(((4-((S)-1-(4-chlorophenyl)-7-isopropoxy-6-methoxy-3-oxo-3,4-dihydroisoquinolin-2(1H)-yl)phenyl)(methyl)amino)methyl)cyclohexyl)piperazin-1-yl)pentanoate (27 mg) in DCM:TFA (2:1, 3 mL) was stirred at room temperature for 2 h. The solvent was evaporated to give the desired product which was carried to the next step without further purification.

5-(4-((lS,4r)-4-(((4-((S)-1-(4-chlorophenyl)-7-isopropoxy-6-methoxy-3-oxo-3,4-dihydroisoquinolin-2(1H)-yl)phenyl)(methyl)amino)methyl)cyclohexyl)piperazin-1-yl)pentanoic acid was coupled with (2S,4R)-l-((S)-2-amino-3,3-dimethylbutanoyl)-4-hydroxy-N-((S)-l-(4-(4-methylthiazol-5-yl)phenyl)ethyl)pyrrolidine-2-carboxamide to give Cpd. EXAMPLE 21

In vitro activity

[1060] Cell growth inhibitory activity of representative MDM2 protein degraders was determined using CellTiter-Glo® Luminescent Cell Viability Assay. Cells were seeded in 384-well white opaque cell culture plates at a density of 2,000 cells/well with serially diluted compounds and incubated at 37°C in an atmosphere of 95% air and 5% CO$_2$ for 4 days. Cell viability was determined using the CellTiter-Glo® Luminescent Cell Viability Assay Kit (Promega, Madison, WI) according to the manufacturer's instruction. Briefly, a volume of CellTiter-Glo® Reagent equal to the volume of cell culture medium was added to each well, and then the plates were incubated at room temperature for 10-20 minutes. The luminescent signal was measured using a Tecan Infinite M1000 multimode microplate reader (Tecan, Morrisville, NC). The half maximal inhibitory concentration (IC$_{50}$) was calculated using the GraphPad Prism 5 software (GraphPad Software, La Jolla, CA). Cpd. A (a MDM2 inhibitor; see Compound Example No. 22 of US 8,629,141) has an IC$_{50}$ of 0.086 µM in the RS4;11 cell line and an IC$_{50}$ of 0.100 µM in the MV4-11 cell line. The structure of Cpd. A is:

EXAMPLE 22

MDM2 degradation and p53 activation in the RS4;11 cell line

RS4;11 cells were treated with Cpd. A, Cpd. B, Cpd. No. 15, and Cpd. No. 22 for 2 hours, then harvested and lysed. The cell lysates were subjected to western blotting analysis. See Fig. 1. The protein level of MDM2 was significantly decreased after treatment with Cpd. No. 15 and Cpd. No. 22 as compared to Cpd. A, indicating MDM2 degradation. The structure of Cpd. B is:

EXAMPLE 23

MDM2 degradation and p53 activation in the MV-4-11 cell line

MV-4-11 cells were treated with Cpd. A, Cpd. B, Cpd. No. 15, and Cpd. No. 22 for 2 hours, then harvested and lysed. The cell lysates were subjected to western blotting analysis. See Fig. 2. The protein level of MDM2 was significantly decreased after
treatment with Cpd. No. 15 and Cpd. No. 22 as compared to Cpd. A, indicating MDM2 degradation.

EXAMPLE 24

Activation of p53 downstream target genes by the MDM2 degraders

RS4;11 cells were treated with Cpd. A (0.3 μM), Cpd. No. 15 (10 nM), and Cpd. No. 22 (10 nM) for 3, 6, or 12 hours, and then harvested and washed. Cellular mRNA samples were extracted from the cells and then subjected to Reverse Transcription and quantitative real-time PCR for the analysis of the mRNA levels of three representative p53 target genes: p21, that induces cell cycle arrest, and PUMA and BAX that leads to apoptosis. Significant activation of these p53 downstream target genes was detected with Cpd. A, Cpd. No. 15, and Cpd. No. 22. See Fig. 3, Fig. 4, and Fig. 5.

EXAMPLE 25

MDM2 degradation by Compounds of the Disclosure

RS4;11 cells were pre-incubated with the proteasome inhibitor MG-132 (20 μM) or without any pre-incubation for 2 hours. Next, the cells were treated with Cpd. A (0.3 μM), Cpd. No. 14 (0.03 μM), Cpd. No. 15 (0.01 μM), and Cpd. No. 22 (0.01 μM) for 2 hours, then harvested and lysed. The cell lysates were subject to western blotting analysis. See Fig. 6. In the absence of pre-incubation with MG-132, the protein level of MDM2 was significantly decreased after treatment with the Compounds of the Disclosure as compared to Cpd. A. However, in the presence of MG-132, no significant MDM2 degradation was detected with the Compounds of the Disclosure, indicating that the degradation of MDM2 by the Compounds of the Disclosure is proteasome dependent.

EXAMPLE 26

MDM2 degradation by Compounds of the Disclosure is cereblon (CRBN)-dependent

RS4;11 cells were pre-incubated with different concentrations of Cpd. C to compete for the binding of phthalimide to CRBN, or DMSO, for 2 hours before adding Cpd. A, Cpd. No. 14, Cpd. No. 15, and Cpd. No. 22. The cells were then co-treated with 10, 20, or 30 μM Cpd. C and increasing concentrations of Cpd. A, Cpd. No. 14, Cpd. No. 15, and Cpd. No. 22 for 4 days, with a starting cell concentration of ~15,000/well. Cell growth inhibition was determined by the WST assay. See Tables 4, 5, and 6. Significant rightward shifts of the dose response curves were observed with Cpd.
No. 14, Cpd. No. 15, and Cpd. No. 22 with co-treatment of Cpd. C. The structure of Cpd. C is:

EXAMPLE 27

MDM2 degradation by Compounds of the Disclosure is cereblon (CRBN)-dependent

RS4;11 cells were pre-incubated with 30 µM Cpd. C to compete for the binding of phthalimide to CRBN, or DMSO, for 2 hours before adding Cpd. A, Cpd. No. 14, Cpd. No. 15, and Cpd. No. 22. In the Western blot RS4;11 cells were then co-treated with the indicated compounds at the indicated concentrations after pre-incubation. See Fig. 7. These data suggest that both MDM2 degradation and p53 activation by Cpd. No. 14, Cpd. No. 15, and Cpd. No. 22 were significantly competed by Cpd. C, indicating that they are CRBN binding-dependent.

EXAMPLE 28

RS4;11 cells with stable shRNA knockdown of p53 or those transfected shRNA control vector were treated with Cpd. A, Cpd. B, Cpd. No. 14, Cpd. No. 21, Cpd. No. 15, and Cpd. No. 22 for 4 days, with a cell concentration of ~15,000/well. Cell growth inhibition was determined by WST assay. See Table 7 (p53) and Table 8 (control). Significant increases in IC$_{50}$ of the Compounds of the Disclosure in the p53 knockdown RS4;11 cells were observed compared with that in the sh control cells. These results show that activities of the Compounds of the Disclosure are largely p53-dependent. The p53 knockdown efficiency was determined by western blot for p53 protein levels with or without treatment of Cpd. A (1 µM) for 2 hours. See Fig. 8.

**INTERNATIONAL SEARCH REPORT**

**Box No. II**  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. [x] Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

   see FURTHER INFORMATION sheet PCT/ISA/210

3. □ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III**  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

   see additional sheet

1. □ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. [x] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of additional fees.

3. □ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. [x] No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

   1, 41, 42, 44, 46-70, 72-78, 83-92, 94, 95, 97-121 (al l pa rt i a lly)

**Remark on Protest**

- [ ] The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

- [ ] The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

- [x] No protest accompanied the payment of additional search fees.
This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

Claims Nos.: 1, 41, 42, 44, 46-70, 72-78, 83-92, 94, 95, 97-121 (all partially)

The present claims 1, 41, 42, 44, 46-70, 72-78, 83-92, 94, 95, 97-121 of invention 1 relate to an extremely large number of possible compounds, pharmaceutically compositions and uses thereof, due to the fact that formula L 1 and B-la of claim 1 accordingly contain so many options, various able and possible permutations. Support and disclosure within the meaning of Article 6 PCT and Article 5 PCT are to be found, however, for only a very small portion of the compounds claimed, see especially the examples.

Non-compliance with the substantive provisions is such that a meaningful search of the whole claimed subject-matter of invention 1 could not be carried out.

It is furthermore stressed that, in the initial phase of the search of invention 1 reveal ed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of claim 1 according to invention 1 may be said to define subject-matter for which protection might legitimately be sought. For these reasons, a meaningful search of the whole claimed subject-matter of invention 1 could not be carried out. The extent of the search was consequently restricted to those claimed compounds, which appear to be supported and to a general satisfaction of their structural formulæ, namely compounds wherein L 1 means X1 -L2 -Y1 with X1 is X2 meaning N(H), 0 or CH2; R5 is hydrogen and Al to A3 mean a carbon atom.

The applicant’s attention is drawn to the fact that claims relating to invention ones in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examination Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the applicant proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination on before the EPO (see EPO Guidelines C-IV, 7.2), should the problems which led to the Article 17(2) declaration be overcome.
