TITLE OF THE INVENTION
BENZYLETHER AND BENZYLAMINO BETA-SECRETASE INHIBITORS FOR THE TREATMENT OF ALZHEIMER'S DISEASE

5 CROSS-REFERENCE TO RELATED APPLICATIONS
This application claims priority under 35 U.S.C. § 119(e) of U.S. Provisional applications serial no. 60/524,454, filed November 24, 2003, 60/570,239, filed May 12, 2004, and 60/602,434, filed August 18, 2004.

10 FIELD OF THE INVENTION
The invention is directed to the field of compounds which are inhibitors of the activity of the β-secretase enzyme, and to the use of the compounds for the treatment of diseases in which the β-secretase enzyme is involved, such as Alzheimer's disease.

15 BACKGROUND OF THE INVENTION
Alzheimer's disease is characterized by the abnormal deposition of amyloid in the brain in the form of extra-cellular plaques and intra-cellular neurofibrillary tangles. The rate of amyloid accumulation is a combination of the rates of formation, aggregation and egress from the brain. It is generally accepted that the main constituent of amyloid plaques is the 4kD amyloid protein (βA4, also referred to as Aβ, β-protein and βAP) which is a proteolytic product of a precursor protein of much larger size. The amyloid precursor protein (APP or AβPP) has a receptor-like structure with a large ectodomain, a membrane spanning region and a short cytoplasmic tail. The Aβ domain encompasses parts of both extra-cellular and transmembrane domains of APP, thus its release implies the existence of two distinct proteolytic events to generate its NH2- and COOH-termini. At least two secretory mechanisms exist which release APP from the membrane and generate soluble, COOH-truncated forms of APP (APPs). Proteases that release APP and its fragments from the membrane are termed "secretases." Most APPs is released by a putative α-secretase which cleaves within the Aβ protein to release α-APP, and precludes the release of intact Aβ. A minor portion of APPs is released by a β-secretase ("β-secretase"), which cleaves near the NH2-terminus of APP and produces COOH-terminal fragments (CTFs) which contain the whole Aβ domain.

Thus, the activity of β-secretase or β-site amyloid precursor protein-cleaving enzyme ("BACE") leads to the abnormal cleavage of APP, production of Aβ, and accumulation of β amyloid plaques in the

The compounds of the present invention are useful for treating Alzheimer's disease by inhibiting the activity of β-secretase or BACE, thus preventing the formation of insoluble Aβ and arresting the production of Aβ.

SUMMARY OF THE INVENTION

The present invention is directed to benzylether and benzylamino derivative compounds that are inhibitors of the β-secretase enzyme, and are useful in the treatment of diseases in which the β-secretase enzyme is involved, such as Alzheimer's disease. The invention is also directed to pharmaceutical compositions comprising these compounds, and the use of these compounds and compositions in the treatment of such diseases in which the β-secretase enzyme is involved.

As used herein, the term “alkyl,” by itself or as part of another substituent, means a saturated straight or branched chain hydrocarbon radical having the number of carbon atoms designated (e.g., C₁-10 alkyl means an alkyl group having from one to ten carbon atoms). Preferred alkyl groups for use in the invention are C₁-6 alkyl groups, having from one to six carbon atoms. Exemplary alkyl groups include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, tert-butyl, pentyl, hexyl, and the like.

As used herein, the term “cycloalkyl,” by itself or as part of another substituent, means a saturated cyclic hydrocarbon radical having the number of carbon atoms designated (e.g., C₃-₈ cycloalkyl means a cycloalkyl group having from three to eight carbon atoms). Exemplary cycloalkyl groups include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and the like.

As used herein, the term “alkenyl,” by itself of as part of another substituent, means a straight or branched chain hydrocarbon radical having a single carbon-carbon double bond and having the number of carbon atoms designated (e.g., C₂-10 alkenyl means an alkenyl group having from one to ten carbon atoms). Preferred alkenyl groups for use in the invention are C₂-₆ alkenyl groups, having from two to six carbon atoms. Exemplary alkenyl groups include ethenyl, n-propenyl, isopropenyl, butenyl, and the like.

As used herein, the term “alkynyl”, by itself or as part of another substituent, means a saturated straight or branched chain hydrocarbon radical having the number of carbon atoms designated (e.g., C₂-₁₀ alkynyl means an alkynyl group having from two to ten carbon atoms). Preferred alkynyl groups for use in the invention are C₂-₆ alkynyl groups, having from two to six carbon atoms. Exemplary alkynyl groups include ethynyl and propynyl.

The term “halo” or “halogen” includes fluoro, chloro, bromo and iodo.

The compounds of the instant invention have at least one asymmetric center. Additional asymmetric centers may be present depending upon the nature of the various substituents on the molecule. Compounds with asymmetric centers give rise to enantiomers (optical isomers), diastereomers (configurational isomers) or both, and it is intended that all of the possible enantiomers and diastereomers in mixtures and as pure or partially purified compounds are included within the scope of this invention. The present invention is meant to encompass all such isomeric forms of these compounds.

The independent syntheses of the enantiomerically or diastereomerically enriched compounds, or their chromatographic separations, may be achieved as known in the art by appropriate modification of
the methodology disclosed herein. Their absolute stereochemistry may be determined by the x-ray crystallography of crystalline products or crystalline intermediates that are derivatized, if necessary, with a reagent containing an asymmetric center of known absolute configuration.

If desired, racemic mixtures of the compounds may be separated so that the individual enantiomers are isolated. The separation can be carried out by methods well known in the art, such as the coupling of a racemic mixture of compounds to an enantiomerically pure compound to form a diastereomeric mixture, followed by separation of the individual diastereomers by standard methods, such as fractional crystallization or chromatography. The coupling reaction is often the formation of salts using an enantiomerically pure acid or base. The diastereomeric derivatives may then be converted to the pure enantiomers by cleavage of the added chiral residue. The racemic mixture of the compounds can also be separated directly by chromatographic methods utilizing chiral stationary phases, which methods are well known in the art.

Alternatively, any enantiomer of a compound may be obtained by stereoselective synthesis using optically pure starting materials or reagents of known configuration by methods well known in the art.

The compounds of the present invention are prepared by the methods outlined in Schemes 1-10, below.

In Scheme 1, an amino acid derivative of type 1 is converted to the corresponding alcohol 2, which can be protected as its Boc derivative 2a. A two step alkylation of glycine Schiff base 3 gives protected quaternary amino acid derivatives such as 4. Schiff base deprotection, followed by ester reduction, provides an alternate route to compound 2. The alkylation of 3 for the synthesis of 4 may be performed in an enantioselective manner as described in the literature (see K. Maruoka et al, J. Am. Chem. Soc. 2000, 122, 5228-5229 and M. North et al, Tetrahedron Lett. 2003, 44, 2045-2048).
In Scheme 2, below, dimethyl 5-aminoisophthalate 5 is converted to bromide 6 via a 6-step sequence involving sulfonylation, alkylation, hydrolysis, amine coupling, reduction, and bromination. Deprotonation of alcohol 2 followed by alkylation with bromide 6 gives access to derivative 7.

Scheme 4 illustrates the preparation of bromides of type 13 which are then coupled to diol 2 as described in scheme 2. Installation of both side chains using Pd⁰ coupling methodology followed by reduction of the ester moiety and subsequent bromination provides 13.

Scheme 5 illustrates the preparation of bromides of type 17 and 20 that are then coupled to alcohol 2 as described in scheme 2. Phenol 14 is alkylated and the methyl ester is converted to a bromomethyl functionality giving access to intermediate 15. The cyano-cycloalkyl group is introduced via TMS-CN and the necessary dibromoalkane. Subsequent cyclopropanation provides 16 that is converted to bromide 17. The preparation of bromide 20 relies on similar methodology regarding the \( R^{12}\)-bearing side chain and a Curtius rearrangement for the introduction of \( R^7\)NSO_2R^4.

Scheme 8 describes the preparation of amides of type 30 and amines of type 31. Acid 27 is obtained from dimethyl 5-aminoisophthalate 5 using similar transformations as described before. Amides 30 are prepared using standard coupling reagents while amines 31 are derived from bromide 29 obtained from acid 28 by reduction and bromination.
The general preparation of benzyl bromides of type 33 is shown as Scheme 9. Starting with 32, bromination of the benzyl alcohol, cyanide displacement of the resulting benzyl bromide and alkylation with the appropriate dibromomethane provides the corresponding cyanocarboxcycle. Ester monohydrolysis, acid reduction and bromination gives access to benzyl bromide 33. Etherification with amino alcohol 2a and ester hydrolysis yields acid 34, which can be coupled with the desired amine. Removal of the Boc protecting group gives the desired final product 35.
The general preparation of benzyl amino compounds of type 37 and 38 is shown as Scheme 10.

Starting with amino acid 1, esterification and Boc protection, followed by reduction with DIBAL afforded the Boc protected aminoalcohol. The alcohol was oxidized to the aldehyde and reductively aminated with benzyl amine. The resulting benzyl group was removed using Pd(OH)$_2$ and a H$_2$ atmosphere to afford the desired amine precursor 36. Displacement of benzyl bromide 6 with 36 and deprotection gives access to final compounds of type 37. Ester hydrolysis of 12, followed by EDC coupling with 36, borane reduction of the resulting amine and removal of the Boc protecting group gives the desired final products of type 38.

demonstrates symptoms of the disease or disorder.

The compositions containing compounds of the present invention may conveniently be presented

Pharmaceutical compositions of the present invention may be provided in a formulation comprising about 0.5 mg to 1000 mg active ingredient; more preferably comprising about 0.5 mg to 500 mg active ingredient; or 0.5 mg to 250 mg active ingredient; or 1 mg to 100 mg active ingredient. Specific pharmaceutical compositions useful for treatment may comprise about 1 mg, 5 mg, 10 mg, 30 mg, 80 mg, 100 mg, 150 mg, 300 mg and 500 mg of active ingredient.

It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

The utility of the compounds in accordance with the present invention as inhibitors of β-secretaese enzyme activity may be demonstrated by methodology known in the art. Enzyme inhibition is determined as follows.
FRET Assay: A homogeneous end point fluorescence resonance energy transfer (FRET) assay is used with the substrate ([TAMRA-5-CO-EEISEVNLDAEF-NHQSYY] QFRET), which is cleaved by BACE 1 to release the fluorescence from TAMRA. The K_m of the substrate is not determined due to the limit of solubility of the substrate. A typical reaction contains approximately 30 nM enzyme, 1.25 μM of the substrate, and buffer (50 mM NaOAc, pH 4.5, 0.1 mg/ml BSA, 0.2% CHAPS, 15 mM EDTA and 1 mM deferoxamine) in a total reaction volume of 100 μl. The reaction proceeds for 30 min and the liberation of TAMRA fragment is measured in a 96-well plate LJL Analyst AD using an excitation wavelength of 530 nm and an emission wavelength of 580 nm. Under these conditions, less than 10% of substrate is processed by BACE 1. The enzyme used in these studies was soluble (transmembrane domain and cytoplasmic extension excluded) human protein produced in a baculovirus expression system. To measure the inhibitory potency of compounds, solutions of inhibitor in DMSO (four concentrations of the inhibitors were prepared: 1 mM, 100 μM, 10 μM, 1 μM) were included in the reactions mixture (final DMSO concentration is 0.8%). All experiments were conducted at rt using the standard reaction conditions described above. To determine the IC_{50} of the compound, competitive equation V_{0}/V_{i} = 1 + [I]/[IC_{50}] was used to predict the inhibitory potency of the compounds. The errors in reproducing the dissociation constants are typically less than two-fold.

HPLC assay: A homogeneous end point HPLC assay is used with the substrate (coumarin-CO-REVNFEEVEFR), which is cleaved by BACE 1 to release the N-terminal fragment attached with coumarin. The K_m of the substrate is greater than 100 μM and can not be determined due to the limit of solubility of the substrate. A typical reaction contains approximately 2 nM enzyme, 1.0 μM of the substrate, and buffer (50 mM NaOAc, pH 4.5, 0.1 mg/ml BSA, 0.2% CHAPS, 15 mM EDTA and 1 mM deferoxamine) in a total reaction volume of 100 μl. The reaction proceeds for 30 min and the reaction is stopped by the addition of 25 μL of 1 M Tris-HCl, pH 8.0. The resulting reaction mixture is loaded on the HPLC and the product is separated from substrate with 5 min linear gradient. Under these conditions, less than 10% of substrate is processed by BACE 1. The enzyme used in these studies was soluble (transmembrane domain and cytoplasmic extension excluded) human protein produced in a baculovirus expression system. To measure the inhibitory potency for compounds, solutions of inhibitor in DMSO (12 concentrations of the inhibitors were prepared and the concentration rage was dependent on the potency predicted by FRET) were included in the reaction mixture (final DMSO concentration is 10 %). All experiments were conducted at rt using the standard reaction conditions described above. To determine the IC_{50} of the compound, four parameters equation is used for curve fitting. The errors in reproducing the dissociation constants are typically less than two-fold.
In particular, the compounds of the following examples had activity in inhibiting the beta-secretase enzyme in the aforementioned assays, generally with an IC₅₀ from about 1 nM to 100 μM. Such a result is indicative of the intrinsic activity of the compounds in use as inhibitors the beta-secretase enzyme activity.

To a solution of rac-α-methyl-phenylalanine (1.74 g, 9.71 mmol) in 30 mL THF at rt was added NaBH₄ (0.92 g 24.27 mmol) in one portion. The solution was cooled to 0 °C. Iodine (2.46 g, 9.71 mmol) in 5 mL THF was added dropwise over 30 min. After the addition was complete, the reaction was heated to reflux for 2 days. The reaction was then cooled to 0 °C and quenched by the addition of methanol until the bubbling subsided. The reaction mixture was acidified by the addition of 6N HCl until pH 1, stirred at 50 °C for 30 min and concentrated in vacuo. Purification using ion exchange chromatography (SCX cartridge) afforded 2-amino-2-methyl-3-phenylpropan-1-ol I as a white solid. ¹H NMR (400 MHz, CDCl₃) δ 7.35-7.18 (m, 5H), 3.36 (A of AB, d, J = 10.4 Hz, 1H), 3.31 (B of AB, d, J = 10.4 Hz, 1H), 2.70 (s, 2H), 1.04 (s, 3H).

Intermediate II: 2-amino-2-benzylhexan-1-ol (Scheme 1)

Step A: Alkylation
To a solution of rac-methyl-N-(diphenylmethylene)phenylalaninate (0.50 g, 1.4 mmol) (for synthesis see: O'Donnell et al, *J. Org. Chem. 1982, 47, 2663-2666*) in 6 mL DMF at 0 °C was added 95% NaH (0.14g, 5.6 mmol). After 30 min, butyl iodide was added via syringe to the dark red reaction. After 30 min at 0 °C, the reaction was warmed to rt for 14 h, then quenched by the addition of water. The aqueous layer was extracted with EtOAc (2x), the combined organics were washed with brine, dried over Na₂SO₄, filtered and concentrated. Purification by silica gel chromatography (40g silica, 0 ->8% EtOAc/hexanes) afforded methyl-α-butyl-N-(diphenylmethylene)phenylalaninate as a viscous oil. ¹H NMR (400 MHz, CDCl₃) δ 7.57 (m, 2H), 7.37-7.17 (m, 11H), 7.05-7.03 (m, 2H), 3.36 (d, J = 11.5 Hz, 1H), 3.32 (d, J = 11.5 Hz, 1H), 3.24 (s, 3H), 1.78 (m, 2H), 1.41 (m, 2H), 1.29-1.24 (m, 2H), 0.89 (t, J = 7.2 Hz, 3H).

LC/MS M+H = 400.

Step B: Deprotection

To a solution of methyl-α-butyl-N-(diphenylmethylene)phenylalaninate (0.31 g, 0.78 mmol) from step A in 10 mL MeOH was added 3.33M hydrochloric acid (0.69 mL, 2.3 mmol). After 1.5 h at rt, the reaction was concentrated in vacuo to remove volatiles, then redissolved in saturated aqueous NaHCO₃. The aqueous layer was extracted with EtOAc (2x), the combined organics were washed with water, brine, dried over Na₂SO₄, filtered and concentrated. Purification by silica gel chromatography (20g silica, 0 ->30% EtOAc/hexanes) afforded methyl-α-butylphenylalaninate as a viscous oil. ¹H NMR (400 MHz, d₄-MeOH) δ 7.30-7.23 (m, 3H), 7.14-7.12 (m, 2H), 3.68 (d, J = 13.1, 1H), 3.18 (d, J = 13.1, 1H), 1.92 (m, 1H), 1.61 (m, 1H), 1.51-1.32 (m, 3H), 1.12 (m, 1H) M + H = 236.

Step C: Reduction

To a solution of methyl ester (0.13 g, 0.55 mmol) from step B in 7.8 mL THF was added LiBH₄ (2.3 mL, 4.6 mmol, 2M in THF). After 2 h at reflux, the reaction was cooled to rt and quenched by the dropwise addition of MeOH, followed by acetone. After the volatiles were removed in vacuo, the remaining residue was redissolved in 23 mL 1N HCl and heated to 45 °C for 1.5 h. The volatiles were removed in vacuo, and the remaining residue was redissolved in saturated aqueous NaHCO₃. The aqueous layer was extracted with CHCl₃ (4x), the combined organics layers were dried over Na₂SO₄, filtered and concentrated to afford 2-amino-2-benzylhexan-1-ol which was used for the next reaction without further purification. ¹H NMR (400 MHz, CDCl₃) δ 7.32-7.18 (m, 5H), 3.32 (m, 2H), 7.70 (m, 2H), 1.53-1.31 (m, 6H), 0.93 (t, J = 6.8 Hz, 3H) LCMS M+H = 208.

**Intermediate XXII:** tert-butyl (2- amino-1-benzyl-1-methylethyl) carbamate (Scheme 10).
Step A: Boc protection
In a flask α-methyl-dl-phenylalanine methyl ester hydrochloride (5.1g, 22 mmol) in THF (75 mL) at rt
was added TEA (2.9 mL, 22 mmol). The contents were filtered (remove TEA-HCl) and the filtrate
treated with tert-butoxycarbonyl anhydride (4.8 g, 22 mmol). The mixture was placed in 50° oil bath and
stirred overnight. The crude mixture was poured onto EtOAc and washed withaq. NH₄Cl followed by
water and brine. After drying over Na₂SO₄ and solvent removal, 6.6 g methyl methyl N-(tert-
butoxycarbonyl)-α-methylphenylalaninate was obtained as a white solid (quant): ¹H NMR (400 MHz,
CD₃OD) δ 7.34 (m, 3H), 7.05 (m, 2H), 5.12 (br s, 1H), 3.74 (s, 3H), 3.34 (broad AB, J = 9.6 Hz, 1H),
3.18 (AB, J = 13.6 Hz, 1H), 1.55 (s, 3H), 1.45 (s, 9H); LC-MS [M-99, loss of Boc] = 194.3.

Step B: Reduction
In a flask containing methyl N-(tert-butoxycarbonyl)-α-methylphenylalaninate (6.5 g, 22.1 mmol) in
methylene chloride 80 mL at -78 °C was added dropwise di-iso-butyl aluminum hydride (1M toluene
solution, 22 mL, 22 mmol) over 20 min. The reaction was maintained at or below -70 °C for 2h, then
warmed to rt for 1h, re-cooled to 0 °C and quenched with 100 mL 1N HCl. The product was extracted
repeatedly with methylene chloride, the organic layers combined, washed with brine, and dried over
Na₂SO₄. Upon solvent removal under reduced pressure 5.8 g of methyl tert-butyl (1-benzyl-2-hydroxy-1-
methylethyl)carbamate was obtained (99%): LC-MS [M-99, loss of Boc] = 166.3.

Step C: Oxidation

methylethyl)carbamate (3.6 g, 13.5 mmol) in DCM (50mL) and DMSO (13mL) at 0 °C was added SO₃-
pyridine (5.4 g, 13.6 mmol). The mixture was warmed to rt and stirred for 5h. Dilute with EtOAc,
wash organic layer successively with H₂O (100mL), 10% aq. KHSO₄, aq. NaHCO₃, 3M aq. LiCl
followed by brine. Upon drying over Na₂SO₄ and solvent removal 3g of crude was obtained.

NaHB(OAc)₃ (2.1 g, 9.7 mmol) was added as a solid in portions. The reaction was allowed to stir at rt for 48h, diluted with aq. NaHCO₃, concentrated to 1/2 volume and extracted with EtOAc (2 x 20 mL). The combined organic layers were washed with brine, dried over Na₂SO₄ and concentrated to dryness to give 2.4 g crude product. SCX ion exchange chromatography was performed to give 610 mg clear oil identified as desired product, tert-butyl [1-benzyl-2-(benzylamino)-1-methylethyl]carbamate (27%): LC-MS [M+H] = 355.2.

Step E: Benzyl removal

To an argon purged EtOH solution containing tert-butyl [1-benzyl-2-(benzylamino)-1-methylethyl]carbamate (600 mg, 1.7 mmol), intermediate from step D above, was added 20% Pd(OH)₂ (12 mg, 0.1 mmol).
