(54) Title: POLISH ROD CLAMPING DEVICE

(57) Abrégé/Abstract:

A polish rod clamping device, for use as part of a wellhead production pumping tree to secure a polish rod. The device includes a pressure-containing body forming a central vertical and opposed first and second side bores. A pair of clamping rams are

(57) Abrégé(suite)/Abstract(continued):

positioned in the side bores for sliding movement therealong, each clamping ram having a front and a rear end, the front ends of the clamping rams being configured to accommodate at least a portion of the polish rod between their front ends when the clamping rams are advanced across the central bore. The front end of at least one of the clamping rams is configured with a vertical V-groove for gripping the polish rod. An actuator is connected to the rear end of each clamping ram for advancing and withdrawing the ram in the side bore, between a polish rod gripping position when the rams are advanced across the central bore into contact with the polish rod, and a polish rod releasing position when the rams are withdrawn from the polish rod. The invention extends to the V-groove rams themselves and to composite wellhead assemblies containing the V-groove clamping device.

ABSTRACT

A polish rod clamping device, for use as part of a wellhead production pumping tree to secure a polish rod. The device includes a pressure-containing body forming a central vertical and opposed first and second side bores. A pair of clamping rams are positioned in the side bores for sliding movement therealong, each clamping ram having a front and a rear end, the front ends of the clamping rams being configured to accommodate at least a portion of the polish rod between their front ends when the clamping rams are advanced across the central bore. The front end of at least one of the clamping rams is configured with a vertical V-groove for gripping the polish rod. An actuator is connected to the rear end of each clamping ram for advancing and withdrawing the ram in the side bore, between a polish rod gripping position when the rams are advanced across the central bore into contact with the polish rod, and a polish rod releasing position when the rams are withdrawn from the polish rod. The invention extends to the V-groove rams themselves and to composite wellhead assemblies containing the V-groove clamping device.

POLISH ROD CLAMPING DEVICE

FIELD OF INVENTION

The invention relates to a device capable of clamping, and preferably also sealing, the polish rod of a pumping wellhead.

BACKGROUND OF THE INVENTION

A conventional wellhead comprises an assembly of spools, valves and assorted adapters which provide pressure control of a production well. In a rotary pumping oil well typical components include, from the bottom up:

- a flanged casing head attached to the well casing;
- a flanged tubing head having an internal hanger from which the well tubing string is suspended;
- a tubing head adapter having a flanged connection at its bottom end and a threaded connection of smaller diameter at its top end;
- a production blowout preventer (BOP) body having top and bottom threaded connections and including side openings for receiving the BOP ram components;
- a flow tee body having threaded bottom and top connections and a threaded or flanged side opening for connecting with a flow line;
- a polish rod stuffing box; and
- a rotary drive assembly for rotating the well's rod string to power a downhole progressive cavity pump.

These components, except for the rotary drive assembly, combine to form a vertical central bore extending through the pressure-containing wellhead body members. The polish rod of the rod string extends through this central bore in the pressure zone maintained in the wellhead body members. The polish rod rotationally drives a drive string or "sucker rods" which in turn drive the progressing cavity pump

1 located at the bottom of the installation to produce well fluids to the surface through the
2 wellhead.

3 The combination of the tubing head adapter, BOP body and flow tee body
4 components is commonly collectively referred to as a "pumping tree." The assembly of
5 wellhead components above the tubing head is usually referred to collectively as the
6 "Christmas tree."

7 Composite wellhead assemblies exist which include, between a top connector
8 and bottom connector, one or more of the following components, in any sequence,
9 adapter, valve, gate valve, flow tee, blowout preventer, and polish rod clamp. To that
10 end, attention is directed to the devices disclosed in the following U.S. Patents, all of
11 which are owned by Stream-Flo Industries Ltd., the assignee of the present application:

12 U.S. 5,743,332, issued April 28, 1998, entitled "Integral Wellhead Assembly for
13 Pumping Wells. This patent teaches integrating the tubing head adapter, BOP body
14 and flow tee body into a unitary structure, referred to as an `integral or composite
15 pumping tree`, by forging, casting or machining a single steel body. This composite
16 pumping tree forms the lower end of the Christmas tree.

17 U.S. 6,457,530, issued October 1, 2002, entitled "Wellhead Production Pumping
18 Tree". This patent is similar to U.S. 5,743,332, but includes a Y-arm to provide access
19 for coiled tubing.

20 U.S. 6,176,466, issued January 23, 2001, entitled "Composite Pumping Tree
21 with Integral Shut-Off Valve. This patent application teaches integrating a tubing head
22 adapter, shut-off valve body, BOP body, and flow tee body into a composite pumping
23 tree.

24 U.S. 6,595,278, issued July 22, 2003, entitled "Assembly for Locking a Polished

1 Rod in a Pumping Wellhead". This patent includes multiple embodiments to
2 incorporate a polish rod locking device in a composite pumping tree.

3 Each of the above patents discloses wellhead equipment used in connection with
4 pumping oil wells, but in a composite form, meaning that one or more functional
5 components of a conventional pumping tree are included in an integral pressure-
6 containing wellhead body between a top and a bottom connector.

7 Canadian Patent No. 2,349,988 to Oil Lift Technology Inc. issued on May 7,
8 2002, discloses a polish rod lock out clamp for securing the polish rod in an oil well
9 installation. In one embodiment, the polish rod lock out clamp is integrated with a
10 blowout preventer. The pistons, or BOP rams, are of metal and include an arcuate
11 recess (or radial groove) at their front or inner ends to accommodate and grip the polish
12 rod in metal to metal contact. An elastomeric seal across the arcuate recess is
13 provided to seal against the polish rod. To grip the polish rod, the arcuate recess has a
14 diameter which is undersize relative to that of the polish rod. However, the smaller
15 diameter of the arcuate recess in the ram can cause difficulty in aligning and gripping of
16 an off-centre polish rod. As well, with repeated use in gripping the polish rod, the polish
17 rod becomes scored or damaged as the clamp bites into the polish rod to achieve a
18 sufficient gripping action. Damaging the polish rod in this manner can effectively
19 reduce the diameter of the polish rod in this area, making it more difficult to clamp.
20 Eventually, the damage to the polish rod can lead to an inability to seal against the
21 downhole pressure in this area.

22 U.S. Patent No. 7,000,888, issued February 21, 2006, naming Andrew Wright et.
23 al., as inventors, discloses a polish rod clamp or combination BOP/clamp for gripping a
24 polish rod, without requiring the metal to metal contact set forth in the above Oil Lift
25 patent. The clamping members in the Wright et al. patent application include gripping
26 inserts, which may be coated with non-metallic ceramic materials, to clamp the polish
27 rod without scoring or damaging the rod surface. This patent application still includes

1 the arcuate recess (generally semi-circular in cross section) at the front ends of the
2 clamping members, which can cause difficulties as set forth above in aligning with an
3 off-centre polish rod.

4 SUMMARY OF THE INVENTION

5 With this background in mind, it is an objective of the present invention to
6 provide a polish rod clamping device for use in a pressure-containing wellhead pumping
7 tree operative to clamp onto the polish rod to prevent back-spin and to grip the polish
8 rod with sufficient force so as to suspend the weight of the rod string. Preferably, the
9 polish rod clamping device of this invention will also act as a blowout preventer to seal
10 both against the polish rod and across the central bore. Preferably the sealing function
11 is located separately from the clamping function in order to overcome the above-noted
12 deficiencies of other prior art polish rod clamp/BOP devices. Preferably the polish rod
13 clamping device is included as an integral component of a composite pumping tree.

14 In one broad aspect, the invention provides a polish rod clamping device, for use
15 as part of a wellhead production pumping tree to secure a polish rod forming the upper
16 end of a rod string extending through a vertical bore formed by the tree, comprising:

17 a pressure-containing body forming a central bore, which extends vertically
18 through the body and through which the polish rod may extend, and opposed first and
19 second side bores extending radially outwardly in opposite directions through the body
20 and intersecting the central bore;

21 a pair of clamping rams positioned in the side bores for sliding movement
22 therealong, each clamping ram having a front and a rear end, the front ends of the
23 clamping rams being configured to accommodate at least a portion of the
24 circumference of the polish rod between their front ends when the clamping rams are
25 advanced across the central bore;

26 the front end of at least one of the clamping rams being configured with a vertical
27 V-groove for gripping the polish rod; and

1 actuator means connected to the rear end of each clamping ram for advancing
2 and withdrawing the ram in the side bore, between a polish rod gripping position when
3 the rams are advanced across the central bore into contact with the polish rod, and a
4 polish rod releasing position when the rams are withdrawn from the polish rod.

5 The clamping device of the present invention, while illustrated herein in
6 association with a polish rod, has broad application to the clamping of other tubular
7 members such as a tubing string in a pressure-containing wellhead body member.

8 The polish rod clamping device of this invention, alone or as an integral
9 composite assembly with other components, includes top and bottom connectors for
10 connecting to the wellhead components located above and below. Such connectors
11 may be of any type, as is known in the industry, including for example studded
12 connectors, flange connections, welded connections, clamp connections and threaded
13 connections.

14 The rams and side bores may be of any shape or configuration as is known for in
15 the BOP art. While the figures show the rams and ram bores as being cylindrical, they
16 may be alternatively shaped, such as oval or rectangular in cross section. As used
17 herein, the term “cylindrical” is understood to include rams and ram bores which are
18 generally circular or oval in cross section.

19 It should be understood that the terms “front”, “rear”, “top”, “bottom”, “side” and
20 “lateral” as used herein and in the claims with reference to the wellhead components,
21 the clamping ram or its parts, refer to the ram as it is designed to be positioned in one
22 of the horizontal side bores, for movement forwardly into the central bore or rearwardly
23 into the side bores out of the central bore. By “front”, as used herein, is meant the
24 portion or end of the ram or its parts at the central bore. By “rear” is meant the portion
25 or end of the ram or its parts opposite the front. By “outer” is meant the outer
26 circumferential portion of the ram or its parts. The term “central” in reference to the

1 “central bore” is not meant to exclude a generally vertical bore which may be somewhat
2 off-centre in the wellhead assembly in which it is included.

3 By “V-groove”, as described herein and in the claims is meant a generally V-
4 shaped groove (in cross section) formed in or at the front of a ram, extending at least a
5 portion of the vertical length along the front of the ram, and sized to accommodate a
6 tubular member, such that the circumference of the tubular member is at least partially
7 within the V-groove at the contact points to the V-groove. The term “V-groove” is not
8 meant to include only a strict V-shaped, rather it is meant to include all vertical grooves
9 having leg portions which are inclined relative to each other at the contact points where
10 the legs contact the tubular shaped member, and which converge toward an apex
11 portion (which may be triangular, rounded or flat). Thus, the front leading edge of the
12 “V-groove” may be shaped other than in a strict V-opening. For example, at the
13 opening, the legs may have a different enclosed angle compared to the enclosed angle
14 at the contact points to the tubular member, or the legs may be parallel to each other at
15 the opening. As well, “V-groove” is meant to include a V-shaped groove that is V-
16 shaped for only a portion of the vertical length of the front groove of the ram. Other
17 portions of the front groove may be shaped differently, such as an arcuate, radial
18 groove portion, provided the front groove overall still accommodates a portion of the
19 tubular member. The size and geometry of the V-groove will vary with the diameter of
20 the tubular member, the weight of to be suspended, and other well parameters such as
21 wellhead pressure and conditions.

22 For sealing against the polish rod, the central bore and/or the side bores, the
23 rams may carry elastomeric or thermoplastic seals, in any manner known in the art.
24 “Elastomeric” materials include rubber type seal materials such as nitrile rubber seals.
25 “Thermoplastic” materials include polytetrafluoroethylene (PTFE), ex. Teflon®, but
26 preferably modified with fillers such as carbongraphite or glass, which strengthen the
27 polymers. For environments which expose seals to chemicals, the strengthened
28 thermoplastic polymers are preferred. Thermoplastic seals to the polish rod may be

1 designed, for example, in accordance with U.S. Patent No. 7,137,610 issued November
2 22, 2006, naming Tony M. Lam as inventor, and assigned to Stream-Flo Industries Ltd.
3 In U.S. Patent 7,137,610, the thermoplastic seal is formed as an L-shaped seal
4 component or wedge-shaped seal component which slides on a seat formed at the front
5 of the steel ram body.

6 As well, the clamping ram of this invention finds application as an extended BOP
7 ram designed to seal against either the polish rod, or against the central bore when the
8 polish rod is not in place. This type of extended ram is described in detail in U.S.
9 Patent Application No. 11/627,674, filed January 26, 2007, naming Tony M. Lam as
10 inventor, and owned by Stream-Flo Industries Ltd. In any of these BOP rams, the front
11 vertical radial groove as formed in the steel body of the ram can be replaced, at least
12 over a portion of groove, by the V-groove of this invention.

13 The invention extends to wellhead assemblies including the polish rod clamping
14 device of this invention alone, or together in an integral composite assembly with one or
15 more other components which might include, in any sequence, adaptors, control valves,
16 additional BOP rams, check valves, and flow tee. The wellhead assembly of this
17 invention includes top and bottom connectors for connecting to wellhead components
18 located above and below. Such connectors may be of any type, as is known in the
19 industry, including for example studded connectors, flange connections, welded
20 connections, clamp and threaded connections. Importantly, the clamping device, when
21 designed to also seal the central bore, may allow one or more of the extra BOP or shut-
22 off valves in the wellhead or the composite wellhead assembly, to be omitted.

23
24 As used herein and in the claims, a reference to "a connection," "connected" or
25 "connect(s)" is a reference to a sealed pressure-containing connection unless the
26 context otherwise requires.

27 As used herein and in the claims, "comprising" is synonymous with "including,"

1 "containing," or "characterized by," and is inclusive or open-ended and does not
2 exclude additional, unrecited elements.

3 The use of the indefinite article "a" in the claims before an element means that
4 one or more of the elements is specified, but does not specifically exclude others of the
5 elements being present, unless the contrary clearly requires that there be one and only
6 one of the elements.

7 BRIEF DESCRIPTION OF THE DRAWINGS

8 Figure 1 is a side section view of one embodiment of the polish rod clamping
9 device of this invention, shown functioning as a combined blowout preventer/polish rod
10 clamp in a composite pumping tree of the type disclosed in U.S. 5,743,332;

11 Figure 2 is a section taken along line 2-2 of Figure 1, showing the V-shaped
12 profile of the vertical groove at the front of the clamping (BOP) rams;

13 Figure 3 is a front perspective view of one of the clamping rams of Figure 1,
14 showing the V-shaped groove and a polish rod seal located across the central portion of
15 the clamping ram face, the sealing area being separate from the clamping or gripping
16 area of the V-groove located above and below the seal;

17 Figure 4 is a front perspective view of an alternate clamping ram for a clamping
18 device of this invention, in which the seal of Figure 3 is omitted, such that the device
19 functions only as a polish rod clamp;

20 Figure 5 is a front perspective view of a conventional prior art BOP ram, showing
21 the normal profile for the radial groove at the front of the BOP ram, which is generally
22 semi-circular in cross-section;

1 Figure 6 is a front perspective view of an alternate clamping ram for a clamping
2 device of this invention. The ram differs from that of Figure 3 in that the leading edge of
3 the V-groove is rearwardly recessed relative to the leading edge of the polish rod anti-
4 extrusion sealing area. In this embodiment the size of the opening of the V-groove can
5 be equal to or smaller than the diameter of the polish rod;

6 Figure 7 is a partial sectional view of another embodiment of the clamping
7 device, similar to the section of Figure 2, but showing one of the clamping rams with a
8 V-groove, while the opposing ram has a radial groove, to accommodate and clamp the
9 polish rod; and

10 Figure 8 is a front perspective view of an alternate clamping ram of this
11 invention, which differs from that in Figure 3 in that the V-groove is present at the top of
12 the ram, above the polish rod seal, while a radial groove is present at the bottom of the
13 ram, below the polish rod seal.

14 **DESCRIPTION OF PREFERRED EMBODIMENTS**

15 Multiple preferred embodiments of the production polish rod clamping device of
16 the present invention are shown in the Figures. In Figures 1, 2 and 3, the invention is
17 shown as a production blowout preventer (BOP) in a composite pumping tree. In
18 Figure 4, an embodiment of a polish rod clamping ram of this invention is shown without
19 the central seals of Figures 1 - 3. Figure 5 is included only to contrast the clamping
20 rams of Figures 3 and 4 with a prior art BOP ram as shown in Figure 5. In Figure 5, the
21 ram R has an arcuate or radial vertical groove A, and a central polish rod seal S which
22 extends across the front face of the ram and longitudinally along its sides. In the front
23 face, the seal S is formed on an machined metal anti-extrusion ridge B. Figures 6 - 8
24 show further alternate embodiments of the clamping rams of this invention.

25 It will be understood that the polish rod clamping device of this invention, with or

1 without a sealing member, can be provided on its own, in a pressure-containing
2 wellhead body member, or it may be combined integrally with one or more other
3 composite wellhead members. In the Figures, like members are labeled with the same
4 reference numerals.

5 The polish rod clamping device of this invention is shown in a first embodiment in
6 Figures 1 - 3, as part of a composite pumping tree, and functioning as a combined
7 blowout preventer/polish rod clamp.

8 Turning to Figures 1 - 3, the composite pumping tree, shown generally at 10
9 includes a pressure-containing steel body 12 forming a central bore 13 extending
10 vertically therethrough. The central bore 13 forms part of the vertical internal bore of
11 the pressure-containing wellhead, through which the polish rod P extends and through
12 which fluid is produced. Top and bottom connections 14, 15 are formed to connect and
13 seal to the wellhead components (not shown) located above and below. Typically, the
14 top connection will be to a stuffing box (not shown), and the bottom connection will be
15 to a tubing head (not shown). These connections 14, 15 may take any form, for
16 example flanged, threaded, clamp-hub, rotatable flange, welded or studded
17 connections, as is known in the art. The composite pumping tree 10 includes multiple
18 side openings communicating with the central bore 13 to house the desired wellhead
19 components. In Figure 1, the pumping tree is shown to include side openings 16 for
20 connection to a conventional flow line (not shown) through which well fluid is produced.

21 Below the side openings 16 is located the polish rod clamping device of this
22 invention. The body 12 forms a pair of opposed horizontal side bores 17 which intersect
23 the central bore 13. The side bores 17 as shown have diameters slightly larger than
24 that of the central bore 13, as is common in BOP devices, but this is not necessary if
25 the device is to function only as a clamping device. The polish rod P is shown in place
26 in the central bore 13. Clamping rams 18, 19 are located within the side bores 17. The
27 rams 18, 19 are shown in the most of the figures to be symmetrical, so like parts are

1 labeled with the same numerals. The rams 18, 19 are shown in the Figures to include
2 generally cylindrical steel ram bodies (when assembled, if in multiple parts) which
3 preferably form full bore rams. The rams 18, 19 have front and rear ends 20, 21.

4 The rams 18, 19 are shown to be mechanically actuated by a pair of threaded
5 rams screws 22 connected at the rear ends 21 of the rams 18, 19. The ram screws 22
6 can be turned to advance or retract the rams 18, 19 into or out of the central bore 13
7 with mechanical screw jacks (not shown). However, any known actuators may be used,
8 such as hydraulic, pneumatic or electrical. The actuators move the rams 18, 19 along
9 the side bores 17 between a polish rod gripping position (see Figures 1, 2) in which the
10 front ends 20 of the rams 18, 19 contact the polish rod P, and a polish rod releasing
11 position, in which the rams 18, 19 are open, and not in contact with the polish rod P.

12 Actuators may be single or double acting, as known in the art. Any of these
13 mechanical screw jacks or alternate actuators thus illustrate actuator means for
14 advancing and withdrawing the first and second rams 18, 19 between their open,
15 sealing and central bore closing positions within the patent claims.

16 It should be understood that the side bores 17 and corresponding rams 18, 19
17 are not necessarily strictly cylindrical in shape. The rams 18, 19 and bores 17 may take
18 alternate shapes, such as oval in cross section, or even rectangular in cross section, as
19 is known in the art, and as included within the patent claims.

20 The ram screws 22 each are externally threaded and extend through an
21 internally threaded locking gland 23 held in place in the side bore 17 by a retainer gland
22 24, which is threaded into the body 12. The outer end of the ram screws 22 protrudes
23 out of the locking gland 23 to be accessible for rotation. The ram screws 22 each have
24 a T-shaped head 25 at their inner ends. The T-shaped head 25 is received in a
25 correspondingly T-shaped slot 26 formed in the rear end 21 of each ram 18, 19. As a
26 result of this connection and the offset center lines (see Figure 1) , the ram screws 22

1 and rams 18, 19 are connected for axial movement together, but the screws 22 can be
2 turned without rotating the rams 18, 19.

3 The rams 18, 19 preferably each carry a circumferential ring seal 27 held in
4 circumferential grooves (not shown) at the rear ends 21 in order to seal in the side
5 bores 17. The ring seal 27 is optional, as the gland assembly 23, 24 at the ends of the
6 side bores 17 may alternatively be adapted to seal the side bores 17.

7 The front ends 20 of the rams 18, 19 are formed with a vertical V-groove 28
8 which extends vertically along at least a portion of its front end. The V-groove 28 is
9 sized and generally V-shaped to accommodate the polish rod P along at least a portion
10 of its vertical length. To accommodate a portion of the polish rod P, so that it is gripped
11 within the V-groove 28, the diameter of the opening of the V-groove 28 may be sized
12 larger than the diameter of the polish rod P. This is shown in Figure 2, wherein the
13 groove 28 is generally V-shaped in cross section, with its opening at the leading edge
14 29 preferably being larger than the diameter of the polish rod P. As noted in Figure 6,
15 described below, the leading edge 29 may alternatively be rearwardly recessed to
16 accommodate the polish rod P, in which case the opening size of the V-groove 28 might
17 be equal to or smaller than the diameter of the polish rod P. The V-groove 28 is formed
18 by leg portions 30 which converge toward its apex portion 31 (which may be triangular,
19 rounded or flat) in a manner such that at least a portion of the circumference of the
20 polish rod P may be held in secure gripping contact (i.e., wedged) within the V of the leg
21 portions 30 (see Figure 2).

22 In Figures 1 - 3, the front ends of the rams 18, 19 are shown to carry a polish rod
23 seal 32 (generally an elastomeric seal) which is installed or molded into grooves (not
24 shown but located behind the seal 32) formed in the ram body. The seal 32 includes a
25 front seal face portion 33 which extends horizontally across the entire front face 34 of
26 the ram and protrudes from the front of the ram to seal both against the polish rod P
27 and against the opposing ram when in the polish rod gripping position. This seal 32 is

1 preferably located generally centrally (top to bottom) on the front face of the ram 18, 19,
2 but it could be located higher or lower on the front face of the rams if desired. In the V-
3 groove 28, the seal face portion 33 is generally semi-circular (in cross section) adjacent
4 the apex portion 31 of the V-groove 28, in order to seal to the polish rod P. Behind the
5 seal face portion 33 in the semi-circular sealing area, the ram body is shown to
6 preferably include a semi-circular backing section 36. In Figure 3, this backing section
7 36 is machined from the steel body of the ram, but it may also be provided by a
8 separate anti-extrusion ring part (ex. a non-metallic half ring from a material such as
9 Teflon®), as is known in the art. This backing section 36 (or anti-extrusion ring)
10 prevents the seal 32 from being extruded under pressure. This semi-circular sealing
11 area (also termed anti-extrusion sealing area) is shown as 33a in Figure 3. The leading
12 edge 29a of this semi-circular sealing area 33a (i.e., the leading edge of the metal
13 backing section 36 in this area) can have an opening diameter which is slightly larger
14 than the diameter of the polish rod P, since this area need only seal to the polish rod P,
15 and does not need to serve the clamping function which is achieved by the V-groove 28
16 itself. The diameter of the semi-circular sealing area 33a is preferably equal to, or
17 preferably slightly greater than, the diameter of the polish rod P.

18 The seal 32 preferably also includes longitudinal side (or lateral) rib portions 35
19 which extend radially outwardly from the sides of the steel ram body to seal the central
20 bore 13 when in the polish rod gripping position.

21 A front seal somewhat as disclosed herein, but without the V-groove, is also
22 shown in U.S. Patent No. 5,765, 813, issued June 16, 1998 to Lam et. al., and owned
23 by Stream-Flo Industries Ltd. However, alternate front seal configurations may be
24 used, as is known in the art. Alternatively, the front seals may be omitted, as shown in
25 the ram in Figure 4. In this configuration, the device of this invention functions only as a
26 polish rod clamp.

27 The V-groove clamping rams of this invention can be configured as BOP rams in

1 virtually any BOP design. The invention has particular application in a BOP ram
2 carrying thermoplastic seals at its front face, such as are shown in U.S. Patent
3 7,137,610. The steel body portion of such rams can be readily altered to include the V-
4 groove at its front face. As well, the invention has application in an extended BOP ram
5 of the type shown in co-pending U.S. Patent Application No. 11/627,674, filed January
6 26, 2007, This extended BOP ram has an extended central bore sealing section formed
7 behind its front face, operative to seal across the central bore when the polish rod is
8 removed from the central bore. Hereagain, the front radial groove of this extended
9 BOP ram can be readily replaced by the V-groove of this invention. All such BOP ram
10 designs are meant to be included within the claims of this application.

11 It should also be understood that the rams of this invention, although shown as
12 symmetrical, may be varied one from another, provided at least one of the rams 18, 19
13 is configured with at least a portion of its front end forming a vertical V-groove to
14 accommodate the polish rod in a gripping mode.

15 Several alternate embodiments of the clamping rams of this invention are shown
16 in Figures 6 - 8. In Figure 6, the rams 18, 19 differs from that of Figure 3 in that the
17 leading edge 29 of the V-groove 28 is machined such that it is rearwardly recessed
18 relative to the leading edge 29a of the semi-circular polish rod seal portion 33a of the
19 groove. In this embodiment, the size of the opening at the leading edge 29 of the V-
20 groove can be equal to or smaller than the diameter of the polish rod P.

21 In Figure 7, one of the clamping rams 19 is formed with a V-groove 28, while the
22 opposing ram 18 has a radial groove 37, to accommodate and clamp the polish rod P
23 These rams may be configured with or without polish rod seals such as shown in
24 previous embodiments, depending on whether the device is to function as a clamp only,
25 or as a BOP/polish rod clamping device.

26 In Figure 8, the clamping ram 18, 19 differ from that in Figure 3 in that the V-

1 groove 28 is present at the top of the rams 18, 19, above the polish rod seal 32, while a
2 radial groove 38 is present at the bottom of the rams 18, 19, below the polish rod seal
3 32. The V-shaped, and radial-shaped portions of the front groove can be reversed if
4 desired, but generally, they will have mirror symmetry with the other opposing ram in
5 order to effectively seal and grip the polish rod P.

6 The metal steel surface of the V-groove 28 may be textured, coated, or modified
7 to carry inserts which may be textured, coated or uncoated. Coatings may be non-
8 metallic or metallic coatings (not shown) such as ceramics and frictional materials.
9 Texturing can be added by machining grooves or roughened portions at the gripping
10 surface of the V-groove. These textured surfaces, coatings or inserts can reduce
11 damage to the polish rod P, while improving the frictional contact with the polish rod P.
12 As well, the surface of the V-groove 28, or an insert in the V-groove (not shown), may
13 be hardened, such as by nitride heat treatment, to improve the grip to the polish rod P.

14 The clamping rams of this invention provide several advantages over polish rod
15 clamps of the prior art. The vertical V-groove 28 at the front of the rams 18, 19
16 accommodates and better guides into place, a polish rod P which is off-centre. The V-
17 groove rams 18, 19 of this invention are easier to align with and centralize the polish
18 rod P. The clamping function of the V-groove ram is preferably separated from the
19 sealing function of any seals 32 carried at the front face of the rams 18, 19, which may
20 improve the life of the rams 18, 19, seals 32 and polish rod P. Importantly, the V-
21 groove rams 18, 19 have been demonstrated to require less torque or force to grip and
22 suspend a polish rod P, than is required by polish rod clamps of the prior art which are
23 designed with semi-circular grooves in their front faces. For a polish rod of diameter
24 1.25", the V-groove rams of Figures 1-3 were tested and shown to be capable of
25 suspending a rod weight of 60000 lb using a torque on the operating screw of 400 ft*lb.
26 A comparable BOP ram configured as in Figure 5 (with a radial groove having a
27 diameter slightly larger than that of the polish rod) was tested and found to be capable
28 of suspending a rod weight of only 40000 lb with a torque of 800 ft*lb.

1 The invention also extends to a composite wellhead assembly including,
2 between its top connector and bottom connector, a polish rod clamping device as
3 described above, together with one or more of the following components, in any
4 sequence, adapters, valves, gate valves, flow tee, and additional blowout preventers.
5 To that end, attention is directed to the devices disclosed in the following U.S. Patents,
6 all of which are commonly owned by Stream-Flo Industries Ltd.: U.S. 5,743,332, issued
7 April 28, 1998, entitled "Integral Wellhead Assembly for Pumping Wells"; U.S.
8 6,457,530, issued October 1, 2002, entitled "Wellhead Production Pumping Tree"; U.S.
9 6,176,466, issued January 23, 2001, entitled "Composite Pumping Tree with Integral
10 Shut-Off Valve"; and U.S. 6,595,278, issued July 22, 2003, entitled "Assembly for
11 Locking a Polished Rod in a Pumping Wellhead". Each of these patents discloses
12 wellhead equipment used in connection with pumping oil wells, but in a composite form,
13 meaning that one or more functional components of a conventional pumping tree are
14 included in an integral body housing between a top and a bottom connector. Such
15 components may include a shut off valve, a blowout preventer, a flow tee and an
16 adapter.

17 The invention also extends to the clamping rams themselves, formed with or
18 without the front face seals.

19 All references mentioned in this specification are indicative of the level of skill in
20 the art of this invention. Some references provided herein are referenced herein to
21 provide details concerning the state of the art prior to the filing of this application, other
22 references may be cited to provide additional or alternative device elements, additional
23 or alternative materials, additional or alternative methods of analysis or application of
24 the invention.

25 The terms and expressions used are, unless otherwise defined herein, used as
26 terms of description and not limitation. There is no intention, in using such terms and
27 expressions, of excluding equivalents of the features illustrated and described, it being

1 recognized that the scope of the invention is defined and limited only by the claims
2 which follow. Although the description herein contains many specifics, these should not
3 be construed as limiting the scope of the invention, but as merely providing illustrations
4 of some of the embodiments of the invention. One of ordinary skill in the art will
5 appreciate that elements and materials other than those specifically exemplified can be
6 employed in the practice of the invention without resort to undue experimentation. All
7 art-known functional equivalents, of any such elements and materials are intended to
8 be included in this invention. The invention illustratively described herein suitably may
9 be practiced in the absence of any element or elements, limitation or limitations which is
10 not specifically disclosed herein.

1 WHAT IS CLAIMED IS:

2 1. A clamping device for use as part of a wellhead to secure a tubular member,
3 comprising:

4 a pressure-containing body forming a central bore, which extends vertically
5 through the body and through which the tubular member may extend, and opposed side
6 bores extending radially outwardly in opposite directions through the body and
7 intersecting the central bore;

8 a pair of clamping rams positioned in the side bores for sliding movement
9 therealong, each clamping ram having a front and a rear end, the front ends of the
10 clamping rams being configured to accommodate at least a portion of the circumference
11 of the tubular member between their front ends when the clamping rams are advanced
12 across the central bore;

13 the front end of at least one of the clamping rams being configured with a vertical
14 V-groove for gripping the tubular member such that a portion of the circumference of the
15 tubular member is accommodated within the V-groove at contact points in the V-groove;
16 and

17 an actuator connected to the rear end of each clamping ram for advancing and
18 withdrawing the ram in the side bore, between a gripping position when the rams are
19 advanced across the central bore into contact with the tubular member with the portion
20 of the circumference of the tubular member accommodated within the V-groove, and a
21 releasing position when the rams are withdrawn from the tubular member.

22 2. A polish rod clamping device, for use as part of a wellhead production pumping
23 tree to secure a polish rod forming the upper end of a rod string extending through a
24 vertical bore formed by the pumping tree, comprising:

25 a pressure-containing body forming a central bore, which extends vertically
26 through the body and through which the polish rod may extend, and opposed side
27 bores extending radially outwardly in opposite directions through the body and
28 intersecting the central bore;

1 a pair of clamping rams positioned in the side bores for sliding movement
2 therealong, each clamping ram having a front and a rear end, the front ends of the
3 clamping rams being configured to accommodate at least a portion of the circumference
4 of the polish rod between their front ends when the clamping rams are advanced across
5 the central bore;

6 the front end of one or both of the clamping rams being configured with a vertical
7 V-groove for gripping the polish rod such that a portion of the circumference of the
8 polish rod is accommodated within the V-groove at contact points in the V-groove; and

9 an actuator connected to the rear end of each clamping ram for advancing and
10 withdrawing the ram in the side bore, between a polish rod gripping position when the
11 rams are advanced across the central bore into contact with the polish rod with the
12 portion of the circumference of the polish rod accommodated within the V-groove, and a
13 polish rod releasing position when the rams are withdrawn from the polish rod.

14 3 The clamping device of claim 2, wherein:

15 to accommodate the polish rod, both of the clamping rams are configured with a
16 vertical groove extending the entire length of the front end of the clamping ram;

17 one or more portions of the vertical groove are configured with the V-groove;

18 one or more portions of the vertical groove are configured with an arcuate radial
19 groove located above, below or between the one or more V-groove portions; and

20 the clamping rams are configured to have mirror symmetry with each other.

21 4. The clamping device of claim 2, wherein both of the clamping rams are
22 configured with the vertical V-groove and the V-grooves on each clamping ram aligns
23 with each other when in the polish rod gripping position for gripping the polish rod.

24 5 The clamping device of claim 4, wherein the front end of each of the clamping
25 rams carries one or more polish rod seals for sealing against the polish rod.

26 6. The clamping device of claim 2, wherein the front end of one or both of the

1 clamping rams carries one or more polish rod seals for sealing against the polish rod,
2 and wherein the one or more seals are located separately from a portion of the V-
3 groove that grips the polish rod, such that a sealing area to the polish rod is separate
4 from the gripping portion of the V-groove.

5 7. The clamping device of claim 5, wherein the clamping rams are steel bodied
6 rams.

7 8. The clamping device of claim 7, wherein the one or more polish rod seals are
8 provided by a seal which extends horizontally across the front face of the rams and
9 across a semi-circular anti-extrusion sealing area formed adjacent the apex of the V-
10 groove.

11 9. The clamping device of claim 8, wherein the semi-circular anti-extrusion sealing
12 area is has a diameter which is equal to or greater than the diameter of the polish rod.

13 10. The clamping device of claim 9, wherein the semi-circular anti-extrusion sealing
14 area is located generally centrally within the V-groove.

15 11. The clamping device of claim 10, wherein the seal also extends longitudinally
16 along the sides of the ram body to seal across the central bore.

17 12. The clamping device of claim 7, wherein the one or more polish rod seals is
18 provided by a thermoplastic seal insert carried at the front end of the steel bodied ram,
19 and wherein the V-groove is formed in the steel bodied ram.

20 13. The clamping device of claim 2, wherein the V-groove extends vertically along
21 the entire front end of the clamping ram.

22 14. The clamping device of claim 4, wherein the V-groove extends vertically along

1 the entire front end of both of the clamping rams.

2 15. The clamping device of claim 7, wherein the one or more polish rod seals are
3 located separately from a portion of the V-groove that grips the polish rod, such that a
4 sealing area to the polish rod is separate from the gripping portion of the V-groove.

5 16. The clamping device of claim 8, wherein the V-groove extends vertically along
6 the front end of each of the clamping rams above and below the seal.

7 17. The clamping device of claim 11, wherein the V-groove extends vertically along
8 the entire front end of each of the clamping rams, above and below the seal.

9 18. The clamping device of claim 7, wherein the front ends of the clamping rams are
10 configured such that the one or more polish rod seals contact each other in sealing
11 relationship to seal the central bore, with the polish rod being gripped and sealed within
12 the aligned V-grooves, when the clamping rams are in the polish rod gripping position.

13 19. The clamping device of claim 11, wherein the front ends of the clamping rams
14 are configured such that the seals contact each other in sealing relationship to seal the
15 central bore, with the polish rod being gripped within the aligned V-grooves and sealed
16 within the semi-circular anti-extrusion sealing area, when the clamping rams are in the
17 polish rod gripping position.

18 20. The clamping device of claim 19, wherein the semi-circular anti-extrusion sealing
19 area forms an opening at its leading edge which is equal to or larger than the diameter
20 of the polish rod.

21 21. The clamping device of claim 19, wherein the V-groove forms an opening at its
22 leading edge which is larger than the diameter of the polish rod.

1 22. The clamping device of claim 19, wherein the V-groove and the semi-circular
2 anti-extrusion sealing area form openings at their leading edges, and wherein the
3 leading edge of the V-groove is rearwardly recessed relative to the leading edge of the
4 semi-circular anti-extrusion sealing area.

5 23. The clamping device of claim 2, wherein the V-groove is hardened, textured,
6 coated or modified to carry an insert which may be hardened, textured, or coated, in
7 order to enhance frictional contact or grip to the polish rod.

8 24. The clamping device of claim 19, wherein the V-groove is hardened, textured,
9 coated or modified to carry an insert which may be hardened, textured, or coated, in
10 order to enhance frictional contact or grip to the polish rod.

11 25. The clamping device of claim 2, wherein the clamping rams and side bores are
12 generally cylindrical, and wherein the rams carry one or more seals at their rear ends for
13 sealing against the side bores.

14 26. The clamping device of claim 19, wherein the clamping rams and side bores are
15 generally cylindrical, and wherein the rams carry one or more seals at their rear ends for
16 sealing against the side bores.

17 27. The clamping device of claim 2, wherein the body provides top connector and a
18 bottom connector for connecting and sealing to wellhead components located above
19 and below the body.

20 28. The clamping device of claim 26, wherein the body provides a top connector and
21 a bottom connector for connecting and sealing to wellhead components located above
22 and below the body.

23 29. A composite wellhead assembly including, between a top connector and a

1 bottom connector, a clamping device together with one or more of the following
2 wellhead components, in any sequence: adapter, valve, gate valve, flow tee, and
3 blowout preventer, said clamping device comprising:

4 a pressure-containing body forming a central bore, which extends vertically
5 through the body and through which the polish rod may extend, and opposed side bores
6 extending radially outwardly in opposite directions through the body and intersecting the
7 central bore;

8 a pair of clamping rams positioned in the side bores for sliding movement
9 therealong, each clamping ram having a front and a rear end, the front ends of the
10 clamping rams being configured to accommodate at least a portion of the circumference
11 of the polish rod between their front ends when the clamping rams are advanced across
12 the central bore;

13 the front end of one or both of the clamping rams being configured with a vertical
14 V-groove for gripping the polish rod such that a portion of the circumference of the
15 polish rod is accommodated within the V-groove at contact points in the V-groove; and

16 an actuator connected to the rear end of each clamping ram for advancing and
17 withdrawing the ram in the side bore, between a polish rod gripping position when the
18 rams are advanced across the central bore into contact with the polish rod with the
19 portion of the circumference of the polish rod accommodated within the V-groove, and a
20 polish rod releasing position when the rams are withdrawn from the polish rod.

21 30. The clamping device of claim 28, further comprising the clamping device together
22 with one or more of the following wellhead components, in any sequence: adapter,
23 valve, gate valve, flow tee, and blowout preventer located between the top connector
24 and the bottom connector.

25 31. A clamping ram, for use as part of a wellhead production pumping tree to secure
26 a polish rod forming the upper end of a rod string extending through a vertical bore
27 formed by the pumping tree, the pumping tree providing a pressure-containing body
28 forming a central bore, which extends vertically through the body and through which the

1 polish rod may extend, and opposed side bores extending radially outwardly in opposite
2 directions through the body and intersecting the central bore, the clamping ram
3 comprising:

4 a clamping ram adapted to be positioned in one of the side bores for sliding
5 movement therealong, the clamping ram having a front and a rear end, the front end
6 being configured to accommodate, with an opposing clamping ram, at least a portion of
7 the circumference of the polish rod when the clamping ram and the opposing clamping
8 ram are advanced across the central bore, and the front end being configured with a
9 vertical V-groove for gripping the polish rod such that a portion of the circumference of
10 the polish rod is accommodated within the V-groove at contact points in the V-groove.

11 32. The clamping ram of claim 31, wherein:

12 the clamping ram is a steel bodied ram;

13 the front end of the clamping ram is configured to contact and seal to an
14 opposing mirror image clamping ram;

15 the front end of the clamping ram carries one or more polish rod seals extending
16 horizontally across the front face of the ram and across a semi-circular anti-extrusion
17 sealing area located generally centrally within the V-groove, the semi-circular anti-
18 extrusion sealing area being formed adjacent the apex of the V-groove and having a
19 diameter which is equal to or greater than the diameter of the polish rod; and

20 the clamping ram further includes seals extending longitudinally along the sides
21 of the ram body to seal across the central bore.

22 33. The clamping ram of claim 32, wherein the V-groove is hardened, textured,
23 coated or modified to carry an insert which may be hardened, textured, or coated, in
24 order to enhance frictional contact or grip to the polish rod.

25 34. The clamping ram of claim 33, wherein the clamping ram is generally cylindrical,
26 and carries one or more seals at the rear end for sealing against the side bores.
