(54) Title: 7-DEAZAGUANINES AS IMMUNOMODULATORS

(57) Abstract

Various 7-deazaguanines of formula (I), wherein R_6 is OH or SH, R_2 is hydrogen or NH_{2}, R_7 and R_8 are hydrogen or NH_{2}, n is an integer of from one through four, Ar is (i) phenyl unsubstituted or substituted by halogen, trifluoromethyl, alkyl, hydroxy or alkoxy, (ii) 2- or 3-thienyl, or (iii) 2- or 3-furanyl; having activity as immunomodulators. Also included are pharmaceutical compositions and methods of use thereof.

7-DEAZAGUANINES AS IMMUNOMODULATORS

This is a continuation-in-part of US Application Serial Number 923,521 filed October 24, 1986.

BACKGROUND OF THE INVENTION

The pyrrolo[2,3-d]pyrimidin-4-ones of the following formula 2, 3 and 4

\[
\text{HN} \quad 2 \quad \text{N} \\
\text{HN} \quad 1 \\
\text{O} \\
\text{HN} \quad 4 \\
\text{HN} \quad 5 \\
\text{HN} \quad 7 \\
\text{HN} \quad 6 \\
\text{H}_2\text{N} \quad \text{R} \\
1 \\
2, R is n-C_3H_7 \\
3, R is CH_2C_6H_5 \\
4, R is cyclopentyl
\]

Of lesser interest the following references provide a background in which a 7-(substituted phenyl)pyrrolo[2,3-d]pyrimidin-4-one having a methyl at each of the five (5) and six (6) positions for treating CNS illnesses or inflammations is disclosed generically in US Patent No. 4,229,453. Similarly, 4-mercapto-7-(phenyl substituted or unsubstituted)pyrrollo[2,3-d]pyrimidine derivatives requiring an alkyl or phenyl at the five (5) and six (6) positions are disclosed in German 3145287 (Derwent Abstract No. 49344 K/21). Other pyrrolo[2,3-d]pyrimidin-4-one or thione, distinguished by having
various substituents at the five (5) position, are found in US Patent No. 4,435,570 and 4,140,851; European publications 160,910 (Derwent Abstract No. 85-284574/46); 89,055 (corresponding to US Patent No. 4,571,423); 119,591 (Derwent Abstract No. 84-238735/39); 79,447 (corresponding to US Patent No. 4,435,569); German 3,306-390 (Derwent Abstract No. 39438 E/20); German 3145287 (Derwent Abstract No. 49344 K/21); British Patent No. 981,458 (Derwent Abstract No. 15,454); Japanese J6 0204,788 (Derwent Abstract No. 85/298810/48); and Japanese J5 9036615 (Derwent Abstract No. 84-086061/84).

Finally, hydroxy and mercapto analogs of the antibiotic sparsomycin A are pyrrolo[2,3-d]pyrimidin-4-one or thione having a sugar moiety in the seven (7) position are disclosed by Upjohn in Netherlands 6,407,785 (Derwent Abstract No. 15,466) and similarly by Warner Lambert in European publication 57,548 (Derwent Abstract No. 68572 E/33).

Copending Applications Serial Number PD-3557 and Serial Number 767,202 filed August 22, 1985, now pending, which is a continuation-in-part of US Serial No. 660,152 filed October 12, 1984, now abandoned, disclose similar activity as now found in the present invention for different ring systems.

SUMMARY OF THE INVENTION

The present invention relates to a compound of the formula (I)
wherein \( R_6 \) is OH or SH, \( R_2 \) is hydrogen or NH\(_2\), \( R_7 \) and \( R_8 \) are independently hydrogen or NH\(_2\) with the proviso that both cannot be NH\(_2\) at once, \( n \) is an integer of from one through four, \( \text{Ar} \) is (i) phenyl unsubstituted or substituted by halogen, trifluoromethyl, alkyl of one to four carbon atoms, hydroxy, or alkoxy of from one to four carbon atoms, (ii) 2- or 3-thienyl, or (iii) 2- or 3-furanyl with the proviso that when \( R_6 \) is OH, and \( R_2 \) is H, N, and \( R_7 \) and \( R_8 \) are both hydrogen then \( \text{Ar} \) cannot be unsubstituted phenyl; or a pharmaceutically acceptable base or acid addition salt thereof.

The present invention also includes methods of manufacturing and novel intermediates therein, and a pharmaceutical composition for treating autoimmune diseases such as arthritis, systemic lupus erythematosus, inflammatory bowel diseases, juvenile diabetes, myasthenia gravis, multiple sclerosis, gout and gouty arthritis, as well as psoriasis, viral infections and cancer, or rejection of transplantation, comprising an anti-psoriatic, immunomodulator or antirejection effective amount such as an advantageously cytotoxic to T-cell amount, of a compound of the formula (I)

\[
\text{I}
\]

or a pharmaceutically acceptable base or acid addition salt thereof wherein \( R_6 \) is OH or SH, \( R_2 \) is hydrogen or NH\(_2\), \( R_7 \) and \( R_8 \) are independently hydrogen and NH\(_2\) with the proviso that both cannot be NH\(_2\) at once, \( n \) is an integer of from one to four, \( \text{Ar} \) is (i) phenyl unsubstituted or substituted by halogen, trifluoromethyl, alkyl of one to four carbon atoms, hydroxy, alkoxy of from one to four carbon atoms, (ii) 2- or 3-thienyl,
or (iii) 2- or 3-furanyl with a pharmaceutically acceptable carrier. Thus, the invention is also a method of treating psoriasis, an autoimmune disease, such as is listed above, or rejection of transplantation comprising administering to a host, such as a mammal including a human, suffering from psoriasis, the autoimmune disease or rejection of transplantation comprising administering an effective amount; i.e. an amount advantageously affecting T-cells by toxicity thereto, of a pharmaceutical composition of the formula I as defined above in unit dosage form. It is understood, an ordinarily skilled physician would begin treatment with a less than effective amount and increase the dose until the desired effect is obtained exercising care to administer an amount less than the amount toxic to the host of the disease.

The novel intermediates of the present invention are compounds of formula (X)

\[
\begin{align*}
\text{Cl} & \quad \text{C}=\text{N} \\
\text{H}_2\text{N} & \quad \text{C}=\text{N} \\
\text{C}=\text{N} & \quad \text{Cl}
\end{align*}
\]

The method of manufacture of the present invention is a novel process for the preparation of a compound of the formula I as defined above; which comprises treating a compound of the formula (X)
with a compound of the formula (V)

wherein Ar and n are as defined above and then treating with an acid to obtain the compound of formula I wherein R₆ is oxygen and R₈ is NH₂ and alternatively, if desired, further deaminating by known methods or treating also by known methods, to obtain a compound of formula I wherein R₆ is sulfur and then, if desired, deaminating.

The compound of formula X is prepared by treating a compound of the formula (IX)
with a cyanation agent, such as O,N-bistrifluoroacetyl-hydroxylamine, in the presence of a base, such as pyridine to obtain the compound of formula IX.

The above preparations use standard synthetic techniques or techniques as shown or similar to those as shown in the examples hereinafter. The starting materials for the preparation are readily available, known or can be prepared by known methods.

The methods of manufacture for the compounds of the present invention are summarized in the following Schemes I and II.
Scheme I

\[
\text{EtO} - \text{CO} - \text{CO} - \text{Et} + \text{H}_2\text{N} - \text{NH}_2 \xrightleftharpoons{\text{NaOEt/EtOH}} \xrightarrow{50\%} \text{H}_2\text{N} - \text{NH} - \text{OH} \xrightarrow{\text{POCl}_3/\text{PCl}_5} \text{Cl} - \text{N} - \text{N} - \text{Cl}
\]

\[
\xrightarrow{\text{O}_3 \ 98\%} \text{Cl} - \text{N} - \text{N} - \text{Cl}
\]

\[
\xrightarrow{\text{EtOH/NH}_4\text{Cl} \ 20\%} \text{Cl} - \text{N} - \text{N} - \text{Cl}
\]

\[
\xrightarrow{\text{Ar} / \text{EtOH}} \text{Cl} - \text{N} - \text{Ar}
\]

wherein \( R_2 \) is \( \text{NH}_2 \), \( R_6 \) is \( \text{O} \),
and \( R_7 \) and \( R_8 \) are both hydrogen
Scheme II

wherein \( R_2 \) is \( \text{NH}_2 \) and \( R_8 \) and \( R_7 \) both are hydrogen and \( R_6 \) is \( \text{O} \)

wherein \( R_2 \) is \( \text{NH}_2 \), \( R_6 \) is \( \text{O} \), \( R_7 \) is \( \text{NH}_2 \) and \( R_8 \) is hydrogen
Under certain circumstances it may be necessary to protect either the N or O of intermediates in the above noted process with suitable protecting groups which are known. Introduction and removal of such suitable oxygen and nitrogen protecting groups are well-known in the art of organic chemistry; see for example, (1) "Protective Groups in Organic Chemistry," J. F. W. McOmie, ed., (New York, 1973), pp 43ff, 95ff; (2) J. F. W. McOmie, Advances in Organic Chemistry, Vol. 3, 191-281 (1963); (3) R. A. Borssonas, Advances in Organic Chemistry, Vol. 3, 159-190 (1963); and (4) J. F. W. McOmie, Chem. & Ind., 603 (1979).

Examples of suitable oxygen protecting groups are benzyl, t-butyldimethylsilyl, methyl, isopropyl, ethyl, tertiary butyl, ethoxyethyl, and the like. Protection of an N-H containing moiety is necessary for some of the processes described herein for the preparation of compounds of this invention. Suitable nitrogen protecting groups are benzyl, triphenylmethyl, trialkylsilyl, trichloroethylcarbamate, trichloroethoxycarbonyl, vinylloxy carbamate, and the like.

Under certain circumstances it is necessary to protect two different oxygens with dissimilar protecting groups such that one can be selectively removed while leaving the other in place. The benzyl and t-butyldimethylsilyl groups are used in this way; either is removable in the presence of the other, benzyl being removed by catalytic hydrogenolysis, and t-butyldimethylsilyl being removed by reaction with, for example, tetra-n-butylammonium fluoride.

In the process described herein for the preparation of compounds of this invention the requirements for protective groups are generally well recognized by one skilled in the art of organic chemistry, and accordingly the use of appropriate protecting groups is necessarily implied by the processes of the charts herein, although not expressly illustrated.

The products of the reactions described herein are isolated by conventional means such as extraction, distillation, chromatography, and the like.
The salts of compounds of formula I described above are prepared by reacting the appropriate base with stoichiometric equivalent of the acid compounds of formula I to obtain pharmacologically acceptable salts thereof.

The compounds of this invention may also exist in hydrated or solvated forms.

DETAILED DESCRIPTION

The compounds of formula I of the present invention exist in tautomeric forms as purines or guanines as illustrated below. Both forms are included as part of the invention and are indiscriminately described in the specification.

The term "alkyl of one to four carbon atoms" means a straight or branched hydrocarbon chain up to four carbon atoms such as, for example, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, secondary butyl or tertiary butyl. Alkoxy of one to four carbon atoms includes methoxy, ethoxy, propoxy, butoxy and isomers thereof. Halogen is fluorine, chlorine, bromine, or iodine.

The compounds of formula I are useful both in the free base form, in the form of base salts where possible, and in the form of acid addition salts. The three forms are within the scope of the invention. In practice, use of the salt form amounts to use of the base form. Appropriate pharmaceutically acceptable salts within the scope of the invention are those derived from mineral acids such as hydrochloric acid and
sulfuric acid, and organic acids such as methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonate, and the like, respectively, or those derived from bases such as suitable organic and inorganic bases. Examples of suitable inorganic bases for the formation of salts of compounds of this invention include the hydroxides of ammonia, sodium, lithium, potassium, calcium, magnesium, aluminum, zinc, and the like.

Salts may also be formed with suitable organic bases. Bases suitable for the formation of pharmaceutically acceptable base addition salts with compounds of the present invention include organic bases which are nontoxic and strong enough to form such salts. These organic bases form a class whose limits are readily understood by those skilled in the art. Merely for purposes of illustration, the class may be said to include mono-, di-, and trialkylamines, such as methylamine, dimethylamine, and triethylamine; mono-, di-, or trihydroxyalkylamines such as mono-, di-, and triethanolamine; amino acids such as arginine, and lysine; guanidine; N-methylglucamine; L-glutamine; N-methylpiperazine; morpholine; ethylenediamine; N-benzylphenethylamine; tri(hydroxymethyl)aminomethane; and the like. (See for example, "Pharmaceutical Salts," J. Pharm. Sci. (1977) 66(1):1-19.)

The acid addition salts of said basic compounds are prepared either by dissolving the free base of compound I in aqueous or aqueous alcohol solution or other suitable solvents containing the appropriate acid or base and isolating the salt by evaporating the solution, or by reacting the free base of compound I with an acid as well as reacting compound I having an acid group thereon with a base such that the reactions are in an organic solvent, in which case the salt separates directly or can be obtained by concentration of the solution.

A preferred embodiment of the present invention is a compound of formula I wherein R₂ is OH or SH; R₂ and R₃ are NH₂, n is one, and Ar is 2- or 3-thienyl. A more preferred embodiment is 2-amino-7-(2-thienylmethyl)-4-pyrrolo[2,3-d] pyrimidine.
The compositions having compounds of the formula I of the present invention are shown to exhibit significant enzyme inhibition activity and cytotoxicity activity. In the purine nucleoside phosphorylase (PNP-4) enzyme assay, an IC$_{50}$ is achieved at a dose of 1.0 micromoles on a selected compound of the present invention. PNP-4 activity for the compound of formula I is measured radiochemically by measuring the formation of $[^{14}$C]hypoxanthine from $[^{14}$C]inosine [Biomedicine, 33, 39 (1980)] using human erythrocyte as the enzyme source.

It is known that an in vivo inhibition of purine nucleoside phosphorylase (HPLC-1) enzyme assay may also be used essentially as disclosed in the Annals of New York Academy of Sciences, Volume 451, Page 313 (1985) to further show the activity for compositions of the compounds of formula I of the present invention. The present invention compositions also are generally shown by a standard test (HTBA-1) [Science, 214, 1137, (1981)] to be selectively cytotoxic for T-cells in the presence of 2'-deoxyguanosine at a similar concentration range and nontoxic to B-cell in the presence of the same amount of 2'-deoxyguanosine by the compound of Example 2, thus demonstrating utility for the compounds of formula I in pharmaceutical compositions as described herein. Since PNP inhibition and removal of T-cells or modulation of T-cells are known to be characteristics of compounds beneficial in the treatment of psoriasis, rejection phenomenon in transplantation, and autoimmune diseases, the present invention compositions of compounds being selectively cytotoxic to T-cells and being PNP inhibitors will, therefore, also be useful in such treatment. For example, 8-Aminoguananosine, a known PNP-inhibitor, has been shown to be efficacious for inhibiting rejection of skin graft in dogs [J. B. Benear, et al, Transplantation, 1986, 41:274]. Clinically it has been shown that modulation and/or removal of T-cells by thoracic duct drainage, lymphapheresis or total lymphoid irradiation gave partial to complete relief from rheumatoid arthritis in patients who were totally refractory to other forms of therapy.

Representative examples from the present invention are shown in the following activity table to provide the activity discussed above.

Th = Thiophene

In vivo studies based on the above noted disclosures may be used to determine activity in the particular disease states noted.

Since T-cells play a central role in immune response, use of the compounds of the invention is contemplated for the immunoregulation to prevent rejection in transplantation or in the treatment of psoriasis and in the treatment of autoimmune disease such as rheumatoid arthritis, systemic lupus erythematosus, inflammatory bowel disease, multiple sclerosis, myasthenia gravis, gout or gouty arthritis, juvenile diabetes, cancer, and viral diseases. The present invention thus includes compositions containing a compound of formula I in treating rejection of transplantation or disease such as psoriasis in humans or autoimmune disease characterized by abnormal immune response in primates or humans. According to this aspect of the invention, the properties of the compounds of the invention are utilized by administering to a warmblooded animal an effective amount of a pharmaceutical composition.
containing as the active ingredient at least about 0.1 percent by weight, based on the total weight of the composition of at least one such compound of the invention.

Pharmaceutical compositions of the invention can be formulated in any suitable way, preferably with an inert carrier for administration orally, parenterally, ophthalmically, topically, or by suppository.

For example, the compounds of the present invention are formulated into dosage forms such as tablets or syrups by blending with an inert pharmaceutical carrier such as lactose or simple syrup by methods well-known in the art. For injectable dosage forms, they are formulated with vehicles such as water, propylene glycol, peanut oil, sesame oil, and the like. In these dosage forms, the active ingredient is from about 0.05 grams to 0.5 grams per dosage unit.

The present invention is further illustrated by way of the following examples.

**Example 1**

2-Amino-6-[(2-thienylmethyl)amino]-4-pyrimidinol

2-Amino-6-chloro-4-pyrimidinol, monohydrate (85%, 100 g, 0.5197 mol) was suspended in methoxyethanol (700 ml) and 2-thienylmethylamine (96%, 61.3 g, 0.5197 mol) was added to the suspension. The mixture was heated under reflux for two hours and then 73 ml (d = 0.726; 0.52 mol) of triethylamine was added and the refluxing continued for an additional 18 hours. The reaction mixture was poured into ice water (1000 ml), acidified with acetic acid (pH 4.0) and the precipitated solid was filtered, washed, and dried. Yield: 110 g (72.6%). This was used in the next step without further purification.

**Example 2**

2-Amino-7-(2-thienylmethyl)-4-pyrrolo[2,3-d]pyrimidones

Chloroacetaldehyde dimethyl acetal (14 ml) was added to water (50 ml) and concentrated HCl (2.0 ml). The mixture was heated at reflux temperature for 30 minutes and then
neutralized with sodium acetate (10 g). The resulting solution
was added in one portion to a mixture of 2-amino-4-
(2-thienylmethyl)-6-pyrimidone (10 g; 45 mmol), sodium acetate
(5.0 g) and hot water (50 ml). The mixture was allowed to stir
on a steam bath (80°C) for 30 minutes, and the precipitated
solid was filtered, washed with water, and dried in vacuo. The
crude product was dissolved in methanol and concentrated HCl
and treated with charcoal to remove coloring matter. The
product (3.2 g) thus obtained was recrystallized from methanol
and 1N HCl (100 ml) to give 1.68 g (13.5%) of the desired
product as light brown solid, mp 243-245°C (dec).

2-Amino-4-chloro-6-[2-thienylmethyl]amino]-5-(2,2-diethoxy-
ethyl)pyrimidine

A solution of 2-amino-4,6-dichloro-5-(2,2-diethoxyethyl)
28:1477) (906 mg, 3.20 mmol) in 40 ml of n-butanol containing
Et$_3$N (1 ml) and 2-thienylamine (425 mg, 3.75 mmol) was heated
at 100°C for 48 hours. The reaction mixture was cooled to 25°C
and concentrated. The residue was cooled to 25°C and
concentrated. The residue was purified by column
chromatography over silica gel and eluted with chloroform to
give the desired product (1.045 g) (91.5%) as a yellow oil.

2-Amino-4-chloro-7-(2-thienylmethyl)pyrrolo[2,3-d]pyrimidine

A suspension of 2-amino-4-chloro-6-[2-thienylmethyl]
amino]-5-(2,2-diethoxyethyl)pyrimidine (1.0 g, 2.80 mmol) in
65 ml of 0.3N HCl and ethanol (2.25:1) was stirred at 25°C for
24 hours. The reaction mixture was neutralized with ammonium
hydroxide solution and the product collected by filtration.
TLC analysis showed that the reaction was not complete, so, the
product was resuspended in 50 ml of 0.2N HCl and stirred for 48
hours. The reaction mixture was neutralized with NH$_4$OH
solution and concentrated. The residue was taken up in water
and then evaporated to dryness to give yellow solid (573 mg)
(77.3%). This was used in the next step without further
purification.
2-Amino-7-(2-thienylmethyl)-4-pyrrolo[2,3-d]pyrimidone

2-Amino-4-chloro-7-(2-thienylmethyl)pyrrolo[2,3-d]
pyrimidine (563 mg, 2.10 mmol) was suspended in 30 ml of 1N HCl and ethanol (1:1) and the mixture was heated at reflux for 8 hours. Removal of solvent gave a residue which was chromatographed over silica gel and eluted with a mixture of hexane-ethyl-acetate (10:1) to give 139 mg of a mixture of 4-chloro and 4-ethoxy derivatives. So, it was dissolved in 30 ml of 3N HCl and the solution was heated to reflux for 2 hours and then allowed to cool. The precipitated solid was filtered and then recrystallized from methanol - 1N HCl (1:1) mixture to give 55 mg of the desired product as hydrochloride salt, mp 235-237°C (dec).
CLAIMS

1. A compound of the formula (I)

wherein R₆ is OH or SH, R₂ is hydrogen or NH₂, R₇ and R₈ are independently hydrogen or NH₂ with the proviso that both cannot be NH₂ at once, n is an integer of from one through four, Ar is (i) phenyl unsubstituted or substituted by halogen, trifluoromethyl, alkyl of one to four carbon atoms, hydroxy or alkoxy of from one to four carbon atoms, (ii) 2- or 3-thienyl, or (iii) 2- or 3-furanyl; or a pharmaceutically acceptable base or acid addition salt thereof.

2. A compound of Claim 1 wherein R₇ is hydrogen.

3. A compound of Claim 2 wherein R₈ is hydrogen.

4. A compound of Claim 2 wherein R₈ is amino.

5. A compound of Claim 3 and being 2-amino-7-(2-thienylmethyl)-4-pyrrolo[2,3-d]pyrimidone.

6. A compound of Claim 5 and being the hydrochloride salt thereof.

7. A pharmaceutical composition for treating psoriasis, autoimmune diseases or rejection of transplantation
comprising an antipsoriatic, antiautoimmune disease or antirejection of transplantation effective amount of a compound of formula (I)

$$\begin{array}{c}
\text{R}_6 \quad \text{R}_7 \\
\text{N} \quad \text{N} \\
\text{R}_2 \quad \text{R}_8 \\
\text{Ar} \quad \text{R}_9 \quad \text{n}
\end{array}$$

or a pharmaceutically acceptable base or acid addition salt thereof; wherein R₆ is OH or SH, R₂ is hydrogen or NH₂; R₇ and R₈ are independently hydrogen and NH₂ with the proviso that both cannot be NH₂ at once, n is an integer of from one to four, Ar is (i) phenyl unsubstituted or substituted by halogen, trifluoromethyl, alkyl of one to four carbon atoms, hydroxy, alkoxy of from one to four carbon atoms, (ii) 2- or 3-thienyl, or (iii) 2- or 3-furanyl and a pharmaceutically acceptable carrier.

8. A method for treating autoimmune disease or rejection of transplantation which comprises administering a composition of Claim 7 in unit dosage form.

10. A process for preparing a compound of Claim 1 which comprises treating a compound of the formula (X)
with a compound of the formula (V)

wherein Ar and n are as defined above and then treating with an acid to obtain the compound of formula I wherein \( R_6 \) is oxygen and \( R_8 \) is \( \text{NH}_2 \) and, alternatively, if desired, further deaminating by known methods, or treating by also known methods to obtain a compound of formula I wherein \( R_6 \) is sulfur and then, further deaminating.

11. A compound of the formula (X)
