01 REFORMING NAPHTHA WITH BORON-CONTAINING
02 LARGE-PORE ZEOLITES

03
04 BACKGROUND OF THE INVENTION

05
06 Catalytic reforming is a process for treating naphtha
07 fractions of petroleum distillates to improve their octane
08 rating by producing aromatic components and isomerizing
09 paraffins from components present in naphtha feedstocks.
10 Included among the hydrocarbon reactions occurring in
11 reforming processes are: dehydrogenation of naphthenes to
12 aromatics, dehydrocyclization of paraffins to aromatics, and
13 hydrocracking of paraffins to lighter gases with a lower
14 boiling point than gasoline. Hydrocracking reactions which
15 produce light paraffin gases are not desirable as they
16 reduce the yield of products in the gasoline range.

17
18 Natural and synthetic zeolitic crystalline aluminosilicates
19 and borosilicates are useful as catalysts. The use of
20 ZSM-type catalysts and processes are described in U.S.
21 Patent Nos. 3,546,102, 3,679,575, 4,018,711 and 3,574,092.
22 Zeolite L is also used in reforming processes as described
23 in U.S. Patent Nos. 4,104,320, 4,447,316, 4,347,394 and
24 4,434,311.

25
26 Borosilicate zeolites are especially useful in catalytic
27 reforming. Methods for preparing high silica content
28 zeolites that contain framework boron are described in U.S.
29 Patent No. 4,269,813.

30
31 The use of intermediate pore borosilicate zeolites for
32 catalytic reforming is described in European Patent
33 Application No. 188,913. In this application, ZSM-5,
34

-2-

01 ZSM-11, ZSM-12, ZSM-23, ZSM-35, ZSM-38, ZSM-48 and zeolite
02 beta have been identified as intermediate pore borosilicate
03 zeolites.

04

05 A method for controlling catalytic activity of large-pore
06 boron-containing zeolites is described in European Patent
07 Application No. 234,759.

08

09

SUMMARY OF INVENTION

10

11 According to the present invention, a process is provided
12 for catalytic reforming. The process comprises contacting a
13 hydrocarbon feedstream under catalytic reforming conditions
14 with a composition comprising large-pore borosilicate
15 zeolites having a pore size between 6 and 8 angstroms.
16 Preferably, the large-pore borosilicate zeolites are boron
17 beta zeolite, (B)SSZ-24, SSZ-31 and SSZ-33.

18

19 Boron beta zeolite is described in commonly assigned
20 co-pending application U.S. Serial No. 377,359 (Docket No.
21 B-3924), filed concurrently herewith, and entitled
22 "Low-Aluminum Boron Beta Zeolite", the disclosure of which
23 is incorporated herein by reference.

24

25 (B)SSZ-24 is described in commonly assigned co-pending
26 application U.S. Serial No. 377,357 (Docket No. B-3952),
27 filed concurrently herewith, and entitled "Zeolite
28 (B)SSZ-24", the disclosure of which is incorporated herein
29 by reference.

30

31 SSZ-33 is described in commonly assigned co-pending
32 application U.S. Serial No. 377,358 (Docket No. B-3889),
33 filed concurrently herewith, and entitled "Zeolite SSZ-33",
34 the disclosure of which is incorporated herein by reference.

SUBSTITUTE SHEET

-3-

01 SSZ-31 is described in commonly assigned co-pending
02 application U.S. Serial No. _____ (Docket No. B-3986),
03 filed concurrently herewith, and entitled "New Zeolite
04 SSZ-31", the disclosure of which is incorporated herein by
05 reference.

06
07 According to a preferred embodiment, the large-pore
08 borosilicate zeolites may be used in a multi-stage catalytic
09 reforming process. These zeolites may be located in one or
10 more of the reactors, with conventional platinum and rhenium
11 catalysts located in the remaining reactors.

12
13 The reforming process may be accomplished by using fixed
14 beds, fluid beds or moving beds for contacting the
15 hydrocarbon feedstream with the catalysts.

16
17 Among other factors, the present invention is based on our
18 finding that large-pore borosilicates including boron beta
19 zeolite [(B)Beta], SSZ-33, (B)SSZ-24 and SSZ-31 have
20 unexpectedly outstanding reforming properties. These
21 include high sulfur tolerance, high catalyst stability, and
22 high catalyst activity.

23

24 DETAILED DESCRIPTION OF THE INVENTION

25

26 The present invention relates to reforming processes
27 employing large-pore borosilicate zeolites. A large-pore
28 zeolite is defined herein as a zeolite having a pore size
29 between 6 and 8 angstroms. A method of determining this
30 pore size is described in Journal of Catalysis (1986);
31 Vol. 99, p. 335 (D. S. Santilli). A large-pore zeolite may
32 be identified by using the pore probe technique described in
33 Journal of Catalysis (1986); Vol. 99, p. 335 (D. S.
34 Santilli). This method allows measurement of the

-4-

01 steady-state concentrations of compounds within the pores of
 02 materials. 2,2-dimethylbutane (22DMB) enters the large
 03 pores and the concentration in the pores is measured using
 04 this technique.

05

06 According to preferred embodiments of our invention, SSZ-33,
 07 (B)SSZ-24, SSZ-31 and low-aluminum boron beta zeolite
 08 [(B)beta] are large-pore borosilicate zeolites with high
 09 catalyst activity in the reforming process.

10

11 SSZ-33 is defined as a zeolite having a mole ratio of an
 12 oxide selected from silicon, germanium oxide and mixtures
 13 thereof to an oxide selected from boron oxide or mixtures of
 14 boron oxide with aluminum oxide, gallium oxide or iron
 15 oxide, greater than about 20:1 and having the X-ray
 16 diffraction lines of Table 1. The X-ray diffraction lines
 17 of Table 1 correspond to the calcined SSZ-33.

27	26.83	3.323	40

28

29 (B)SSZ-24 is defined as a zeolite having a mole ratio of an
 30 oxide selected from silicon oxide, germanium oxide, and
 31 mixtures thereof to an oxide selected from boron oxide or
 32 mixtures of boron oxide with aluminum oxide, gallium oxide,
 33

34

-5-

01 and iron oxide, between 20:1 and 100:1 and having the X-ray
 02 diffraction lines of Table 2. The X-ray diffraction lines
 03 of Table 2 correspond to the calcined (B)SSZ-24.

20 Boron beta zeolite is a zeolite having a mole ratio of an
 21 oxide selected from silicon oxide, germanium oxide, and
 22 mixtures thereof to an oxide selected from boron oxide, or
 23 mixtures of boron oxide with aluminum oxide, gallium oxide
 24 or iron oxide, greater than 10:1 and wherein the amount of
 25 aluminum is less than 0.10% by weight and having the X-ray
 26 diffraction lines of Table 3. The X-ray diffraction lines
 27 of Table 3 correspond to the calcined boron beta zeolite.

-7-

01 The large-pore borosilicates can be used as reforming
02 catalysts to convert light straight run naphthas and similar
03 mixtures to highly aromatic mixtures. Thus, normal and
04 slightly branched chained hydrocarbons, preferably having a
05 boiling range above about 40°C and less than about 250°C,
06 can be converted to products having a substantial aromatics
07 content by contacting the hydrocarbon feed with the zeolite
08 at a temperature in the range of from about 400°C to 600°C,
09 at pressures ranging from atmospheric to 20 atmospheres,
10 LHSV ranging from 0.1 to 15, and a recycle hydrogen to
11 hydrocarbon ratio of about 1 to 10.

12

13 The reforming catalyst preferably contains a Group VIII
14 metal compound to have sufficient activity for commercial
15 use. By Group VIII metal compound as used herein is meant
16 the metal itself or a compound thereof. The Group VIII
17 noble metals and their compounds, platinum, palladium, and
18 iridium, or combinations thereof can be used. The most
19 preferred metal is platinum. The amount of Group VIII metal
20 present in the conversion catalyst should be within the
21 normal range of use in reforming catalysts, from about 0.05
22 to 2.0 wt. percent, preferably 0.2 to 0.8 wt. percent. In
23 addition, the catalyst can also contain a second Group VII
24 metal. Especially preferred is rhenium.

25

26 The zeolite/Group VIII metal catalyst can be used with or
27 without a binder or matrix. The preferred inorganic matrix,
28 where one is used, is a silica-based binder such as
29 Cab-O-Sil or Ludox. Other matrices such as alumina,
30 magnesia and titania can be used. The preferred inorganic
31 matrix is nonacidic.

32

33

34

SUBSTITUTE SHEET

-8-

01 It is critical to the selective production of aromatics in
02 useful quantities that the conversion catalyst be
03 substantially free of acidity, for example, by exchanging
04 the sites in the zeolite with metal ions, e.g., Group I and
05 Group II ions. The zeolite is usually prepared from
06 mixtures containing alkali metal hydroxides and thus, have
07 alkali metal contents of about 1-2 wt. %. These high levels
08 of alkali metal, usually sodium or potassium, are
09 unacceptable for most other catalytic applications because
10 they greatly deactivate the catalyst for cracking reactions
11 by reducing catalyst acidity. Therefore, the alkali metal
12 is removed to low levels by ion exchange with hydrogen or
13 ammonium ions. By alkali metals as used herein is meant
14 ionic alkali metals or their basic compounds. Surprisingly,
15 unless the zeolite itself is substantially free of acidity,
16 the alkali metal is required in the present process to
17 reduce acidity and improve aromatics production. Alkali
18 metals are incorporated by impregnation or ion exchange
19 using nitrate, chloride or carbonate salts.

20

21 The amount of alkali metal necessary to render the zeolites
22 substantially free of acidity can be calculated using
23 standard techniques based on the aluminum, gallium or iron
24 content of the zeolites. If a zeolite free of alkali metal
25 is the starting material, alkali metal ions can be ion
26 exchanged into the zeolite to substantially eliminate the
27 acidity of the zeolite. An alkali metal content of about
28 100%, or greater, of the acid sites calculated on a molar
29 basis is sufficient.

30

31 Where the metal ion content is less than 100% of the acid
32 sites on a molar basis, the test described in U.S. Patent
33 No. 4,347,394, which patent is incorporated totally herein

34

-9-

01 by reference, can be used to determine if the zeolite is
02 substantially free of acidity.

03

04 The preferred alkali metals are sodium, potassium, and
05 cesium, as well as other Groups IA and IIA metals. The
06 zeolites can be substantially free of acidity only at very
07 high silica:alumina mole ratios; by "zeolite consisting
08 essentially of silica" is meant a zeolite which is
09 substantially free of acidity without base poisoning.

10

11 A low sulfur feed is preferred in the reforming process; but
12 due to the sulfur tolerance of these catalysts, feed
13 desulfurization does not have to be as complete as with
14 conventional reforming catalysts. The feed should contain
15 less than 10 parts per million sulfur. In the case of a
16 feed which is not low enough in sulfur, acceptable levels
17 can be reached by hydrogenating the feed with a
18 hydrogenating catalyst which is resistant to sulfur
19 poisoning. An example of a suitable catalyst for this
20 hydrodesulfurization process is an alumina-containing
21 support and a minor catalytic proportion of molybdenum
22 oxide, cobalt oxide and/or nickel oxide. A platinum on
23 alumina hydrogenating catalyst can also work. In which
24 case, a sulfur sorber is preferably placed downstream of the
25 hydrogenating catalyst, but upstream of the present
26 reforming catalyst. Examples of sulfur sorbers are alkali
27 or alkaline earth metals on porous refractory inorganic
28 oxides, zinc, etc. Hydrodesulfurization is typically
29 conducted at 315-455°C, at 200-2000 psig, and at a LHSV of
30 1-5.

31

32

33

34

-10-

01 It is preferable to limit the nitrogen level and the water
02 content of the feed. Catalysts and processes which are
03 suitable for these purposes are known to those skilled in
04 the art.

05

06 After a period of operation, the catalyst can become
07 deactivated by coke. Coke can be removed by contacting the
08 catalyst with an oxygen-containing gas at an elevated
09 temperature. If the Group VIII metal(s) have agglomerated,
10 then it can be redispersed by contacting the catalyst with a
11 chlorine gas under conditions effective to redisperse the
12 metal(s). The method of regenerating the catalyst may
13 depend on whether there is a fixed bed, moving bed, or
14 fluidized bed operation. Regeneration methods and
15 conditions are well known in the art.

16

17 The reforming catalysts preferably contain a Group VIII
18 metal compound to have sufficient activity for commercial
19 use. By Group VIII metal compound as used herein is meant
20 the metal itself or a compound thereof. The Group VIII
21 noble metals and their compounds, platinum, palladium, and
22 iridium, or combinations thereof can be used. Rhenium and
23 tin may also be used in conjunction with the noble metal.
24 The most preferred metal is platinum. The amount of Group
25 VIII metal present in the conversion catalyst should be
26 within the normal range of use in reforming catalysts, from
27 about 0.05-2.0 wt. %.

Example 2

07

08

Reforming Test Results

09

10 (B)SSZ-24 from Example 1 was tested as a reforming catalyst.
 11 The conditions for the reforming test were as follows.
 12 The catalyst was prereduced for 1 hour in flowing hydrogen
 13 at 950°F and atmospheric pressure. Test conditions were:

14

15

Total Pressure = 200 psig

16

 H_2/HC Molar Ratio = 6.4

17

WHSV = 6 hr^{-1}

18

19 The catalyst was initially tested at 800°F and then at
 20 900°F. The feed was an iC_7 mixture supplied by Philips
 21 Petroleum Company. The catalyst from Example 1 was tested
 22 with these results.

Neutralized Platinum-Aluminum-Boron SSZ-24

08

09 Aluminum was substituted into the borosilicate version of
10 (B)SSZ-24 by refluxing the zeolite with an equal mass of
11 $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ overnight. Prior to use, the aluminum nitrate
12 was dissolved in H_2O at a ratio of 50:1. The product
13 contained acidity due to the aluminum incorporation, and
14 this would lead to unacceptable cracking losses. Two back
15 ion exchanges with KNO_3 were performed and the catalyst was
16 calcined to 1000°F . Next, a reforming catalyst was prepared
17 as in Example 1. It was tested as in Example 2.

17

18 By comparison with Example 4, the incorporating of cobalt
 19 gives a more active catalyst. The catalyst has good
 20 stability at 800°F.

21

22

Example 6

23

24

Preparation of Pt-SSZ-33

25

26 SSZ-33 was prepared for use as a reforming catalyst. The
 27 zeolite powder was impregnated with $\text{Pt}(\text{NH}_3)_4 \cdot 2\text{NO}_3$ to give
 28 0.8 wt. % Pt. The material was calcined up to 550°F in air
 29 and maintained at this temperature for three hours. The
 30 powder was pelletized on a Carver press at 1000 psi and
 31 broken and screened to 24-40 mesh.

Example 7Preparation of Pt-Zinc-SSZ-33

01
02
03
04
05 Zinc was incorporated into the novel large-pore borosilicate
06 SSZ-33 by refluxing $Zn(Ac)_2 \cdot H_2O$ as described in Example 3.
07 The product was washed, dried, and calcined to 1000°F, and
08 then impregnated with $Pt(NH_3)_4 \cdot 2NO_3$ to give 0.8 wt.% Pt.
09 The material was calcined up to 550°F in air and maintained
10 at this temperature for three hours. The powder was
11 pelletized on a Carver press at 1000 psig, broken, and
12 meshed to 24-40. It was tested as described in Example 2.

Example 8Testing of Pt-SSZ-33 and Pt-Zinc-SSZ-33

The catalysts of Examples 6 and 7 were tested with a partially reformed naphtha at:

Total Pressure = 50 psig
 H_2/HC Molar Ratio = 3
 LHSV = 2 hr^{-1}

These conditions simulate use of the catalyst in the last reactor of a multi-stage reforming process. An analysis of the feed and products is shown below.

	<u>Feed</u>	<u>Products</u>	
		Pt-SSZ-33	Pt-Zn-SSZ-33
Molecular Sieve			
Temperature, °F		780	860
Composition, wt. %			
C ₄ -	0	13.4	9.4
C ₅ 's Total	0	8.3	7.0
C ₆ Paraffins	8.7	8.3	7.7
C ₆ Naphthenes	1.0	0.9	0.9
Benzene	1.6	3.5	2.6

SUBSTITUTE SHEET

-17-

	<u>Feed</u>	<u>Products</u>		
01				
02				
03	C ₇ Paraffins	8.6	2.9	4.5
04	C ₇ Naphthenes	0.2	0.1	0
05	Toluene	8.8	13.3	11.6
06				
07	C ₈ Paraffins	5.8	0.5	0
08	C ₈ Naphthenes	0.1	0	0
09	C ₈ Aromatics	21.1	22.7	23.8
10				
11	C ₉ Paraffins	2.1	0	0
12				
13	C ₉ + Aromatics	32.3	26.4	31.4
14				
15	Octane, RON	94.6	101.0	101.0
16				
17	C ₅ + Yield, LV%	100.0	86.0	89.0
18	of the Feed			

19
 20 These examples illustrate the ability of both catalysts to
 21 upgrade partially reformed naphtha. Incorporation of zinc
 22 improves the liquid product selectivity, apparently by
 23 reducing dealkylation of existing aromatics.

24 Example 9

25 Comparison of Unsulfided and Sulfided 26 Platinum Boron Beta

27
 28
 29
 30 The borosilicate version of Beta was impregnated with
 31 Pt(NH₃)₄·2NO₃ as in Example 4. The catalyst was sulfided at
 32 950°F for 1 hour in the presence of hydrogen.

01 Test conditions were:

02

03 Temperature = 800°F

04 H₂/HC Molar Ratio = 6.4

05 WHSV = 6

Example 12Preparation and Testing of Pt-Boron-SSZ-31

The borosilicate version of SSZ-31 was prepared for use as a reforming catalyst. The zeolite powder was impregnated with Pt(NH₃)₄·2NO₃ to give 0.7 wt. % Pt. The material was calcined up to 600°F in air and maintained at this temperature for three hours. The powder was pelletized on a Carver press at 1000 psi, broken, and screened to 24-40 mesh.

Pt-Boron-SSZ-31 was tested for reforming using an iC₇ feed mixture (Philips Petroleum Company) as follows:

01 WHAT IS CLAIMED IS:

02

- 03 1. A catalytic reforming process which comprises
04 contacting a hydrocarbonaceous feedstream under
05 catalytic reforming conditions with a composition
06 comprising large-pore borosilicate zeolites having a
07 pore size greater than 6 and less than 8 angstroms.
08
- 09 2. A process in accordance with Claim 1 wherein said
10 large-pore borosilicate zeolites contain less than 1000
11 parts per million aluminum.
12
- 13 3. A process in accordance with Claim 2 wherein said
14 large-pore borosilicate zeolites are boron beta
15 zeolite, boron SSZ-24, boron SSZ-31, and SSZ-33.
16
- 17 4. A process in accordance with Claims 1, 2 and 3 wherein
18 the boron in the large-pore borosilicate zeolites is
19 partially replaced by a Group IIIA metal, or a first
20 row transition metal.
21
- 22 5. A process in accordance with Claim 4 wherein the
23 replacing metal is cobalt, zinc, aluminum, gallium,
24 iron, nickel, tin and titanium.
25
- 26 6. A process in accordance with Claims 1, 2, 3 and 4
27 wherein the hydrogenation/dehydrogenation component of
28 said large-pore borosilicate zeolites is a Group VIII
29 metal.
30
- 31 7. A process in accordance with Claim 6 wherein the
32 hydrogenation/dehydrogenation component of said
33 large-pore borosilicate zeolite comprises platinum.
34

SUBSTITUTE SHEET

-23-

- 01 8. A process in accordance with Claim 6 wherein said
02 large-pore borosilicate zeolite contains an alkali
03 metal component.
04
- 05 9. A process in accordance with Claims 1, 2, 3 and 4
06 wherein the hydrogenation/dehydrogenation component of
07 said large-pore borosilicate zeolite comprises rhenium
08 and platinum.
09
- 10 10. A process in accordance with Claims 1, 2, 3 and 4
11 wherein the hydrogenation/dehydrogenation component of
12 said large-pore borosilicate zeolites comprises
13 platinum and tin.
14
- 15 11. A process in accordance with Claims 1, 2 and 3
16 comprising using a fixed, moving or fluid bed reformer.
17
- 18 12. A process in accordance with Claims 1, 2 and 3 which is
19 a multi-stage catalytic reforming process.
20
- 21 13. A process in accordance with Claim 12 where the
22 large-pore borosilicate zeolite is used in the last
23 reactor to convert the remaining light paraffins not
24 converted by the Pt Re/Al₂O₃ or Pt Sn/Al₂O₃ catalysts
25 used in the upstream reactors.
26
- 27 14. A process in accordance with Claim 12 where the
28 large-pore borosilicate zeolite is used in the last
29 stage of a multi-stage catalytic reforming process
30 where the operating pressure of the last stage is much
31 lower than the upstream stage.
32
33
34
