CLEANING AND POLISHING OUTFIT

James T. Miller, Utica, N. Y.

Application August 26, 1931. Serial No. 559,513

3 Claims. (Cl. 206—47)

My invention relates to a cleaning and polishing outfit and I declare the following to be a full, clear, concise and exact description thereof sufficient to enable anyone skilled in the art to which it appertains to make and use the same, reference being had to the accompanying drawing in which like reference characters refer to like parts throughout the specification.

The object of the invention is to provide a device in which all the essentials for cleaning and polishing an automobile, furniture or other object will be retained in a pack, whereby they will be accessible. To this end the invention utilizes a hollow cone upon which cotton yarn has been wound to a considerable thickness. A container with cleaning fluid is disposed within the hollow cone.

The device can be used also for cleaning one's hands.

The object of the invention will be further understood by referring to the drawing in which Fig. 1 is a perspective view of the device showing a stripping of a layer of yarn therefrom.

Fig. 2 is a central vertical section of the device. Referring more particularly to the drawing, the device comprises a paper cone 1 which is hollow and open at its larger end. Upon this paper cone 1 is wound in successive layers, cotton, woolen or other suitable yarn 2 adapted for cleaning purposes. Yarn 2 will be treated chemically with a cleaning composition comprising specific quantities of ethel alcohol, petroleum, acetate, aniline dyes. Within the hollow cone 1 is disposed a metal container 3 holding any suitable cleaning solution. The metal container 3 is of conical shape to conform to the interior of cone 1. It will be held in cone 1 by friction and tend to lend support to the contiguous wall of cone 1. It can be easily removed therefrom by grasping the side near the base 4 or by jarring cone 1.

At suitable intervals when winding the yarn 2 upon cone 1, paper or cloth strips or tabs 5 are disposed between successive layers in such manner that the upper ends of tabs 5 project beyond the upper surface of the yarn.

Tabs 5 designate the proper thickness or layer of yarn for stripping to form a suitable amount for cleaning and polishing purposes and also to facilitate the removal of successive layers of yarn from the remaining layers on cone 1. Each of the tabs 5 being embedded in successive layers of yarn on cone 1, a pull on the outermost tab 5 will cause the yarn wound on the cone 1 beyond or outside of the respective tab 5 to break from

its windings on cone 1 and fall down, whereby it can be stripped off as illustrated in Fig. 1.

When using the cleaning outfit, the operator grasps the upper end of one of the papers 5 and strips down the yarn the whole length of the cone and then severs the connecting thread. The yarn thus stripped down will be in the form of a skein through which the hand can be inserted as in the manner of a glove or it may be bunched and used in the ordinary manner of a cleaning and polishing cloth. The container 3 can be removed and sufficient of the cleaning fluid dropped upon the skein of yarn thus removed for cleaning purposes.

It will be observed that a great many cleaning cloths may thus be stripped from the cone 1 before the supply is exhausted.

Although I have described the outfit for use in cleaning an automobile it may be used also for cleaning the hands in which instance a container 3 will hold the liquid or dry powdered soap. Other uses will appear to those skilled in the art.

Having thus described my invention what I claim as new and desire to secure by Letters Patent is as follows:

1. In a cleaning and polishing outfit, a member adapted to hold successive layers of yarn thereon, and means embedded in said yarn for facilitating the removal of successive layers of yarn.

2. In a cleaning and polishing outfit, a member for holding yarn thereon and tabs embedded in said yarn to facilitate the stripping of successive layers from said member.

3. In a cleaning and polishing outfit, a conical member for holding yarn thereon, and tabs disposed between successive layers of said yarn to facilitate the stripping thereof.

JAMES T. MILLER.
