PYRIDO'[2,1-a]-ISOQUINOLINE DERIVATIVES AS DPP-IV INHIBITORS

In particular, the invention relates to compounds of the formula (I)

\[

R^3 \\
R^4
\end{array}
\]

wherein

R^1 is \(-\text{C(O)}-\text{N}(R^5)R^6\) or \(-\text{N}(R^5)R^6\);

and pharmaceutically acceptable salts thereof.

The enzyme dipeptidyl peptidase IV (EC.3.4.14.5, abbreviated in the following as DPP-IV) is involved in the regulation of the activities of several hormones. In particular
DPP-IV is degrading efficiently and rapidly glucagon like peptide 1 (GLP-1), which is one of the most potent stimulator of insulin production and secretion. Inhibiting DPP-IV would potentiate the effect of endogenous GLP-1, and lead to higher plasma insulin concentrations. In patients suffering from impaired glucose tolerance and type 2 diabetes mellitus, higher plasma insulin concentration would moderate the dangerous hyperglycaemia and accordingly reduce the risk of tissue damage. Consequently, DPP-IV inhibitors have been suggested as drug candidates for the treatment of impaired glucose tolerance and type 2 diabetes mellitus (e.g. Villhauer, WO98/19998). Other related state of the art can be found in WO 99/38501, DE 19616486, DE 19834591, WO 01/40180, WO 01/55105, US 6110949, WO 00/34241 and US6011155.

We have found novel DPP-IV inhibitors that very efficiently lower plasma glucose levels. Consequently, the compounds of the present invention are useful for the treatment and/or prophylaxis of diabetes, particularly non-insulin dependent diabetes mellitus, and/or impaired glucose tolerance, as well as other conditions wherein the amplification of action of a peptide normally inactivated by DPP-IV gives a therapeutic benefit. Surprisingly, the compounds of the present invention can also be used in the treatment and/or prophylaxis of obesity, inflammatory bowel disease, Colitis Ulcerosa, Morbus Crohn, and/or metabolic syndrome or β-cell protection. Furthermore, the compounds of the present invention can be used as diuretic agents and for the treatment and/or prophylaxis of hypertension. Unexpectedly, the compounds of the present invention exhibit improved therapeutic and pharmacological properties compared to other DPP-IV inhibitors known in the art, such as e.g. in context with pharmacokinetics and bioavailability.

In another preferable embodiment, $R^1$, the amino group in position 2 and the hydrogen in position 11b of the pyrido[2,1-a]isoquinoline backbone are all in R configuration, i.e.

It will be appreciated, that the compounds of general formula (I) in this invention may be derivatised at functional groups to provide derivatives which are capable of conversion back to the parent compound in vivo.

The present invention also relates to a process for the manufacture of compounds of formula I. The compounds of the present invention can be prepared as below:

In the following reaction schemes (Scheme 1 to 6) substituents $R^1$, $R^2$, $R^3$, $R^4$, $R^5$ and $R^6$ have the meanings as defined above, unless otherwise indicated.

Compounds of general formula I are synthesized from carbamate A by methods known in the art, preferably using hydrogen chloride in dioxane or trifluoroacetic acid in dichloromethane when $P$ is Boc. Carbamate A can be obtained from N-benzylcarbamate A' by methods known in the art, preferably by hydrogenation at a pressure of about 3 bar, in the presence of palladium on activated charcoal, in a solvent such as ethanol (Scheme 1).
Scheme 1

P is a suitable amino protecting group such as benzylxycarbonyl (Z), allyloxycarbonyl (Aloc), and, preferably, tert-butoxycarbonyl (Boc).

Converting of a compound of formula A into a compound of formula I is done by cleaving the amino protecting group. The cleavage of the amino protecting group can be done by conventional methods as they are for example described in P. Kocienski, Protecting groups, Thieme Verlag Stuttgart New York 1994, pages 192-201. Preferably, cleavage of the amino protecting group is done under acidic conditions. The preferred carbamate amino protecting group is tert-butoxycarbonyl which can be cleaved by acidolysis with strong acids such as hydrogen chloride or trifluoroacetic acid, or with Lewis acids. Preferably, it is cleaved with 4M hydrogen chloride solution in dioxane. Alternatively, the amino protecting group is cleaved by catalytic hydrogenation under conditions well-known to the skilled person.

The synthesis of amide derivatives A1 is outlined in Scheme 2 and starts with the β-ketoester B (R^1 = methyl or ethyl). Compounds of formula B are well known in the art (e.g., Helv. Chim. Acta 1958, 41, 119). Reaction of B with ammonium acetate in a solvent such as methanol produces the β-enamino-ester C, which is reduced, preferably with sodium borohydride/trifluoroacetic acid, to the corresponding the β-amino-ester. The amino group is optionally benzylated and then converted to the tert-butyl carbamate of formula D. The ester group of D is hydrolyzed using a base, preferably potassium hydroxide or sodium hydroxide in a water/tetrahydrofuran mixture, to yield the acid E. Compound E is reacted with an appropriate amine in the presence of a suitable coupling agent, e.g., O-(7-azobenzotriazol-1-yl)-1,1,3,3-tetramethylduronium hexafluorophosphate (HATU), and a base, e.g., N-ethylidiisopropylamine, to yield amide A2.
Scheme 2

\[ R^8 = \text{methyl or ethyl, } R^9 = \text{H or PhCH}_2. \]

The synthesis of lactam or sultam derivatives A2 starts from carboxylic acid E and is outlined in Scheme 3. Acid E is converted into carbamate F through a Curtius rearrangement, using methods known in the art (e.g., Tetrahedron 1974, 30, 2157 or Tetrahedron Lett. 1984, 25, 3515). Amine G is produced from carbamate F via standard methods (H\textsubscript{2}, Pd-C, acetic acid in the case of R\textsuperscript{b} = benzyl; Bu\textsubscript{4}NF/THF, Et\textsubscript{3}NF/CH\textsubscript{2}CN, or CsF/DMF in the case of R\textsuperscript{b} = Me\textsubscript{3}SiCH\textsubscript{2}CH\textsubscript{2}). Amine G is reacted with acid chloride, sulfonyl chloride, or chloroformate H in the presence of a base (e.g., triethylamine) to afford amide or sulfonamide K. Alternatively, amide K is obtained from G by reaction with lactone J, followed by conversion of the newly formed hydroxyl into a leaving group, using methods known in the art. Finally, cyclisation of K using a base, e.g., sodium hydride, in a solvent such as N,N-dimethylformamide, optionally in the presence of sodium iodide, leads to A2.
Scheme 3

\[ \text{R}^b = \text{Me}_3\text{SiCH}_2\text{CH}_2 \text{or PhCH}_2; \text{R}^p = \text{H or PhCH}_2; \text{W} = \text{C or S(=O)}; \text{X} = \text{leaving group, e.g., Cl, Br, or OTs.} \]

Unsaturated lactams of the formula A3 are synthesized from amine G according to Scheme 4. Thus, alkylation of G with alkenyl halide L (in the presence of a base, e.g., triethylamine), followed by acylation (in the presence of a base, e.g., triethylamine) with acyl halide M, affords amide N. Compound N is subjected to ring-closing metathesis (Acc. Chem. Res. 2001, 34, 18), using a ruthenium catalyst, e.g., bis(tricyclohexylphosphine)-benzylideneruthenium(IV)dichloride, and optionally a Lewis acid, e.g., tetraisopropyl-orthotitanate, to afford A3.

Scheme 4

\[ \text{R}^p = \text{H or PhCH}_2; \text{X} = \text{leaving group, e.g., Cl or Br.} \]
Amides and sulfonamides of formula A4 are prepared according to Scheme 5, by treatment of amine G (in the case of $R^5 = H$) or P (in the case of $R^5 \neq H$) with appropriate acid chlorides or sulfonyl chlorides. The transformation of G into secondary amine P is performed, e.g., by alkylation, reductive alkylation, or acylation and subsequent reduction, using methods known in the art.

\[ \text{R}^P = \text{H or PhCH}_2. \]

Ketoester B can be produced from 1,2,3,4-tetrahydro-1-isoquinolineacetate Q via diester intermediate R (Scheme 6), according to literature procedures (e.g., *Helv. Chim. Acta* 1958, *41*, 119). Compounds of formula Q are well known in the art and can be produced by a wide variety of methods (e.g., *Synthesis* 1987, 474 and references cited therein).

\[ \text{R}^n = \text{methyl or ethyl}. \]

The compounds of formula I have three or more asymmetric carbon atoms and can exist in the form of optically pure enantiomers, mixtures of diastereomers, racemates, or mixtures of diasteroisomeric racemates. The optically active forms can be obtained for example by fractional crystallization or asymmetric chromatography (chromatography with a chiral adsorbent or eluant) of the racemates of the compounds of formula I. Likewise, synthetic precursors of the compounds of formula I can be separated into the pure enantiomers.
In particular, the optically pure forms of 1,2,3,4-tetrahydro-1-isoquinolineacetate ($Q^*$) can be used as a starting material for the synthesis of optically pure compounds of formula I. Optically pure forms of $Q$ are well known in the literature and can be produced from the racemates by fractional crystallization using chiral resolving agents, e.g., tartranilic acids, as described by Montzka et al. (US3452086). Alternatively, the pure enantiomers $Q^*$ can be synthesized from achiral precursors, e.g., by addition of ketene silyl acetals $S$ to nitrones of formula $T$ in the presence of chiral Lewis acids, followed by reduction of the intermediate $U$ with zinc, as described by Murahashi and co-workers (J. Am. Chem. Soc. 2002, 124, 2888, Scheme 7).

The compounds of formula (I) can be manufactured by the methods given below, by the methods given in the Examples or by analogous methods. Appropriate reaction conditions for the individual reaction steps are known to the person skilled in the art. Starting materials are either commercially available or can be prepared by methods analogous to the methods given below or in the Examples or by methods known in the art.

The following tests were carried out in order to determine the activity of the compounds of formula I.

Activity of DPP-IV inhibitors are tested with natural human DPP-IV derived from a human plasma pool or with recombinant human DPP-IV. Human citrate plasma from different donors is pooled, filtered through a 0.2 micron membrane under sterile conditions and aliquots of 1 ml are shock frozen and stored at -120°C until used. In the colorimetric DPP-IV assay 5 to 10 μl human plasma and in the fluorometric assay 1.0 μl of human plasma in a total assay volume of 100 μl is used as an enzyme source. The cDNA of the human DPP-IV sequence of amino acid 31 - to 766, restricted for the N-terminus and the transmembrane domain, is cloned into Pichia pastoris. Human DPP-IV is expressed and purified from the culture medium using conventional column chromatography including size exclusion and anion and cation chromatography. The purity of the final enzyme preparation of Coomassie blue SDS-PAGE is > 95 %. In the colorimetric DPP-IV assay 20 ng rec.-h DPP-IV and in the fluorometric assay 2 ng rec.-h DPP-IV in a total assay volume of 100 μl is used as an enzyme source.

In the fluorogenic assay Ala-Pro-7-amido-4-trifluoromethylcoumarin (Calbiochem No 125510) is used as a substrate. A 20 mM stock solution in 10 % DMF/H₂O is stored at -20°C until use. In IC₅₀ determinations a final substrate concentration of 50 μM is used. In assays to determine kinetic parameters as Kₘ, Vₘ₉₉, Kᵢ, the substrate concentration is varied between 10 μM and 500 μM.

In the colorimetric assay H-Ala-Pro-pNA.HCl (Bachem L-1115) is used as a substrate. A 10 mM stock solution in 10% MeOH/H₂O is stored at −20°C until use. In IC₅₀ determinations a final substrate concentration of 200 μM is used. In assays to determine kinetic parameters as Kₘ, Vₘ₉₉, Kᵢ, the substrate concentration is varied between 100 μM and 2000 μM.

Fluorescence is detected in a Perkin Elmer Luminesence Spectrometer LS 50B at an excitation wavelength of 400 nm and an emission wavelength of 505 nm continuously every 15 seconds for 10 to 30 minutes. Initial rate constants are calculated by best fit linear regression.
The absorption of pNA liberated from the colorimetric substrate is detected in a Packard SpectraCount at 405 nm continuously every 2 minutes for 30 to 120 minutes. Initial rate constants are calculated by best fit linear regression.

DPP-IV activity assays are performed in 96 well plates at 37°C in a total assay volume of 100 µl. The assay buffer consists of 50 mM Tris/HCl pH 7.8 containing 0.1 mg/ml BSA and 100 mM NaCl. Test compounds are solved in 100 % DMSO, diluted to the desired concentration in 10% DMSO/H₂O. The final DMSO concentration in the assay is 1 % (v/v). At this concentration enzyme inactivation by DMSO is < 5%.

Compounds are with (10 minutes at 37°C) and without preincubation with the enzyme. Enzyme reactions are started with substrate application followed by immediate mixing.

IC₅₀ determinations of test compounds are calculated by non-linear best fit regression of the DPP-IV inhibition of at least 5 different compound concentrations. Kinetic parameters of the enzyme reaction are calculated at at least 5 different substrate concentrations and at least 5 different test compound concentrations.

The compounds of formula I and/or their pharmaceutically acceptable salts can be used as medicaments, e.g. in the form of pharmaceutical preparations for enteral, parenteral or topical administration. They can be administered, for example, perorally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, rectally, e.g. in the form of suppositories, parenterally, e.g. in the form of injection solutions or infusion solutions, or topically, e.g. in the form of ointments, creams or oils. Oral administration is preferred.
The production of the pharmaceutical preparations can be effected in a manner which will be familiar to any person skilled in the art by bringing the described compounds of formula I and/or their pharmaceutically acceptable salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

Suitable carrier materials are not only inorganic carrier materials, but also organic carrier materials. Thus, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts can be used as carrier materials for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carrier materials for soft gelatine capsules are, for example, vegetable oils, waxes, fats and semi-solid and liquid polyols (depending on the nature of the active ingredient no carriers might, however, be required in the case of soft gelatine capsules). Suitable carrier materials for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar and the like. Suitable carrier materials for injection solutions are, for example, water, alcohols, polyols, glycerol and vegetable oils. Suitable carrier materials for suppositories are, for example, natural or hardened oils, waxes, fats and semi-liquid or liquid polyols. Suitable carrier materials for topical preparations are glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene glycols and cellulose derivatives.

Usual stabilizers, preservatives, wetting and emulsifying agents, consistency-improving agents, flavour-improving agents, salts for varying the osmotic pressure, buffer substances, solubilizers, colorants and masking agents and antioxidants come into consideration as pharmaceutical adjuvants.

The dosage of the compounds of formula I can vary within wide limits depending on the disease to be controlled, the age and the individual condition of the patient and the mode of administration, and will, of course, be fitted to the individual requirements in each particular case. For adult patients a daily dosage of about 1 to 1000 mg, especially about 1 to 100 mg, comes into consideration. Depending on severity of the disease and the precise pharmacokinetic profile the compound could be administered with one or several daily dosage units, e.g. in 1 to 3 dosage units.

The pharmaceutical preparations conveniently contain about 1-500 mg, preferably 1-100 mg, of a compound of formula I.

The following Examples serve to illustrate the present invention in more detail. They are, however, not intended to limit its scope in any manner.

Form PCT/ISA/210 (second sheet) (January 2004)
Box II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☑ Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   
   Although claims 19–21 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2.☐ Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3.☐ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple Inventions in this International application, as follows:

1.☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2.☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3.☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4.☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant’s protest.

☐ No protest accompanied the payment of additional search fees.
